[*See also* 1,1-*dichloro*-2,2-*bis*-(*p-chlorophenyl*)*ethane*, " *DDD* " (3:3320).]

Note that C̄ is the remarkable insecticide to which so much publicity is currently being given. Despite the general fanfare the amount of real scientific data which has been released at this writing is small, although very rapid publication is inevitable in the near future. No attempt can be made in this text to cover the utilization of C̄, but attention is drawn to two bibliographies (7) (8) containing respectively 174 and 418 references, although most of these are to general and nontechnical reports. For an extensive review of chemistry of C̄ see (30).

[For patents on utilization of " DDT " as insecticide see (9) (10). — For studies of toxicology and pharmacology of " DDT " see (11) (12) (13) (14). — Note that C̄ is by rabbits in part excreted as di-(*p*-chlorophenyl)acetic acid (3:4612), m.p. 166–166.5° u.c. (24).]

Colorless cryst. from 95% alc. — C̄ is spar. sol. in 95% alc.; viz., 0.8 wt. % at 0°, 3.9 wt. % at 48° (3); spar. sol. pet. ether of b.p. 30–60° (3); C̄ is moderately sol. in CCl_4, ether, or $CHCl_3$ (3); eas. sol. in pyridine, dioxane, C_6H_6, or acetone (3); for data and graph of *wt. % solubility/temp.* over range 0–48° see (3) cf. (25); for soly. of C̄ in kerosenes see (31). [For detn. of C̄ in technical samples, i.e., in pres. of " DDD " (3:3320), by recrystn. from satd. alc. soln. of " DDT " see (26).]

Note that technical C̄ may contain some of the isomeric 1,1,1-trichloro-2-(*p*-chlorophenyl)-2-(*o*-chlorophenyl)ethane (3:1820) and/or polymers of chloral (3:5210); in fact, technical C̄ *of setting point* 88° *contains* about 70% C̄ accompanied by 18% of the *o-p* isomer + 6% of the *o,o'* isomer (25). — For extensive report on the compn. of technical grade C̄ see (29).

{*For optical crystallographic props. of* C̄ *see* (28).}

PREPARATION OF C̄

C̄ is universally prepd by condensation of chloral or chloral hydrate with chlorobenzene.

From chloral hydrate. {For prepn. of C̄ from chloral hydrate (3:1270) with chlorobenzene (3:7903) + fumg H_2SO_4 (8–10% SO_3) (70% yield (2) (4)) or $ClSO_3H$ (77% yield (32)) see indic. refs}

From chloral. {For prepn. of C̄ from anhydrous chloral (3:5210) with chlorobenzene (3:7903) + conc. H_2SO_4 see (6) (15) (16).}

CHEMICAL BEHAVIOR OF C̄

Reduction of C̄. C̄ on reduction with Na/alc. gives up all its chlorine quant. detn. of which comprises a method for the quant. detn. of C̄ (14)

{C̄ on hydrogenation with H_2 + Pd/$CaCO_3$ in various solvents on slight warming gives according to conditions (18) various products of bimolecular reduction; these include 2,2,3,3-tetrachloro-1,1,4,4-tetra-(*p*-chlorophenyl)butane, cryst. from AcOEt, m.p. 271.5° (28% yield (18)), both higher-melting (229°) and lower-melting (174°) stereoisomers of 2,3-dichloro-1,1,4,4-tetra-(*p*-chlorophenyl)butene-2 (former 36% yield, latter in traces) (18), and perhaps other products; for much further study of these reaction products see the original reference (18)}

{C̄ *on electrolytic reduction in alc. HCl soln. gives* (13% *yield* (19)) *at the cathode* 1,1,4,4-tetra-(*p*-chlorophenyl)butyne-2, pr. from AcOEt, m.p 174° (19); note that this prod. on oxdn. with CrO_3/AcOH gives (91% yield (19)) 4,4'-dichlorobenzophenone (3:4270), *m p* 145°.}

Oxidation of C̄. Attempts to oxidize C̄ with CrO_3/AcOH have given (5) no identifiable products.

Dehydrochlorination of C̄. [illegible] *ions can be caused to split out* 1 HCl yielding 1,1-[illegible]

C̄ with alc. [illegible] 15–20 min. (21) (for study of rate see (20) (27)) *gives* (*yi*[illegible] (21), 81% (5)) *1,1-dichloro-bis-(p-chlorophenyl)ethylene* (3:2438) {for use of this reaction by detn. of ionized chlorine as means for detn. of C̄ in spray deposit see (21)}

C̄ *with excess* $Ba(OH)_2 \cdot 8H_2O$ *in ethylene glycol refluxed* 10–12 *hrs. gives* (33% *yield* (24)) di-(*p*-chlorophenyl)acetic acid (3:4612), m.p. 166–166.5° u.c ; this results by initial loss of HCl as above and further degradation.

C̄ *in the pres. of minute amts.* (*e.g.*, 0.01%) *of* $FeCl_3$ *or* $AlCl_3$ *at* 110–120° *loses* HCl giving (22) cf. (34) 1,1-dichloro-2,2-*bis*-(*p*-chlorophenyl)ethylene (3:2438). (See also below under behavior of C̄ with $AlCl_3$ + C_6H_6.)

SUBSTITUTION REACTIONS OF C̄

Bromination. No study of the behavior of C̄ toward Br_2 appears yet to have been reported.

Chlorination. C̄ in CCl_4 soln. with Cl_2 + trace of PCl_3 in light at b p. of mixture for 3 hrs. gives (73% yield (5)) 1,2,2,2-tetrachloro-1,1-*bis*-(*p*-chlorophenyl)ethane (3:2477), m.p. 91–92° (5).

Nitration. C̄ on introduction of two nitro groups (no details) gives (6) a prod., ndls. from alc., m.p. 148.0–148.3° (29), which is presumably 1,1,1-trichloro-1,2-*bis*-(4-chloro-2-nitrophenyl)ethane; note that this *dinitro* compd. has same m.p. as corresp. dinitro deriv. from "*o,p*-DDT" (3:1820) but m.p. of a mixt. of the two is depressed (29).

C̄ on tetranitration with a mixt. (1:1 by volume) of fumg. HNO_3 and conc. H_2SO_4 at 100° for 1 hr. gives (23) 1,1,1-trichloro-2,2-*bis*-(4-chloro-3,5-dinitrophenyl)ethane, m.p. 223.5–224.5° cor. (23). — [Note that similar tetranitration of "DDD" (1,1-dichloro-2,2-*bis*-(*p*-chlorophenyl)ethane (3:3320) gives (23) 1,1-dichloro-2,2-*bis*-(4-chloro-3,5-dinitrophenyl)ethane, m.p. 224.5–225.5° cor. (23); similar tetranitration of the *o-p* isomer of "DDT" (viz., 1,1,1-trichloro-2-(*o*-chlorophenyl)ethane) (3:1820) gives a prod., m.p. 229.5–230° cor. (23). — For color reactions of these tetranitro derivs. with MeOH/NaOMe and its use in detn. of C̄ see (23) (33).]

Behavior with $AlCl_3$ + C_6H_6. C̄ with anhydrous $AlCl_3$ (1 mole) in large excess of C_6H_6 reacts at room temp. evolving 2 moles HCl and giving (10% yield (1)) 1,1,2,2-tetraphenylethane [Beil. V-739, V_1-(371), V_2-(673)], m.p. 211°. [Note that the mechanism of this surprising result has not yet been explained; that by similar treatment the same tetraphenylethane is also obtd. in 25% yield from 1,1-dichloro-2,2-*bis*-(*p*-chlorophenyl)-ethane (3:3320), in 10% yield from 1,1,1-trichloro-2,2-diphenylethane (3:1420), and from the *o-p* isomer of "DDT" (viz., 1,1,1-trichloro-2-(*o*-chlorophenyl)-2-(*p*-chlorophenyl)-ethane) (3:1820), but *not* at all from 1,1-dichloro-2,2-*bis*-(*p*-chlorophenyl)ethylene (3:2438); and that if chlorobenzene is substituted for C_6H_6 no tetraphenylethane results from any of them (1).]

[C̄ treated with $ClSO_3H$ in CS_2 and reactn. prod. conv. to sodium salt as directed (1) yields sodium 1,3,7-trichloronaphthalenesulfonate-7 (corresp. sulfonyl chloride, m.p. 138° (1).]

B.P. [310° at 20 mm. (22)]
230–235° at 20 mm. (23)

Colorless (12) or pale greenish-yellow (7) (8) cryst. from hexane + AcCl (1), dry ether (9), lgr. (7) (8), or dry C_6H_6 + pet. ether (12) (17). — Ord. C̄ frequently conts. two kinds of crysts., white and yellow, both melting at 110–112° (13). — C̄ from CCl_4 cryst. with

1 mole solvent; Č from acetone cryst. with ½ mole solvent; in both cases solvent is lost at 92° but not readily in air at ord. temp. (24). — [For study of x-ray crystallography of Č see (25).] — Note that Č cannot be recrystd. from MeOH or EtOH without more or less complete conversion to the corresp. trityl ethers (see also below under behavior of Č with alcohols).

Č may be stored satisfactorily in ord. *screw-top bottles, provided they are well sealed* with paraffin (7) — On long exposure to moist air, however, Č is hydrolyzed (see also below) to triphenylcarbinol (1:5985), m p. 161–162°; for f p./compn. diagram of system Č + triphenylcarbinol, eutectic, m.p. 100°, contg. 90% Č, see (26). — Samples of partially hydrolyzed Č may be purified by recrystn. from ½ wt. of C_6H_6 contg. 5–25% acetyl chloride, the latter reconverting the triphenylcarbinol to Č (7).

Č is eas sol. in ether, C_6H_6 (100 g. C_6H_6 dis. 85.8 g. Č at 25° (35)), CCl_4, $CHCl_3$, or CS_2, but is much less sol. in pet. ether (19). — Solns. of Č in acetyl chloride (27) (29), benzoyl chloride (27), hot 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (27) (28), dichloroethylene (28), nitrobenzene (27), $SOCl_2$ (27), SO_2Cl_2 (29) are yellow; for study of effect of temp see (27) — Solns. of Č in liq. SO_2 are also yellow (29) and conduct electric current (30) (31) (32); for study of molecular weight of Č in liq SO_2 see (33). — Č is very sparingly sol. in liq. NH_3 but soln conducts elect. current (34).

[The protracted arguments on the constitution of Č and of trityl derivatives in general (controversy over carbonium and quinonoid forms, etc.) cannot be detailed within the scope of this book; however, for leading references since 1920 see (36) (37) (38) (39) (40) (41) (42) (43) (44) (45); for earlier references see Beil. V-700]

PREPARATION OF Č

The two best-studied preparations of Č are those from triphenylcarbinol (1:5985) with AcCl (3:7065) in C_6H_6 (93–95% yield (12)) and from CCl_4 (3:5100) with C_6H_6 + $AlCl_3$ (84–86% yield on $AlCl_3$ used (7) (8)). Note, however, that many other methods have also been used as recorded below.

From triphenylcarbinol (1:5985). [For prepn. of Č from triphenylcarbinol with AcCl (3:7065) *directly* (79% *yield* (46)) or in C_6H_6 soln. (93–95% *yield* (12)); with oxalyl (di)chloride (3:5060) (47); with HCl gas in dry C_6H_6 (48) (for study of equilibrium see (49)) contg. $CaCl_2$ (9) or in dioxane at 50° for 22 hrs. (86% yield (14)); with conc. HCl in AcOH (79% yield (50)) or in C_6H_6 + $ZnCl_2$ (85% yield (51)); with PCl_5 directly (52) or in lgr. (53) or in C_6H_6 (29) or in C_6H_6 + $ZnCl_2$ (90% yield (51)); with PCl_3 + $ZnCl_2$ in C_6H_6 (92% yield (51)); with $SOCl_2$ in C_6H_6 (97% yield (51)); with $SiCl_4$ in C_6H_6 or lgr. at 40° (54), or with $COCl_2$ (3:5000) in C_6H_6 + $CaCl_2$ (5) see indic. refs.]

From other triphenylcarbinol derivatives. [For prepn. of Č from K triphenylcarbinolate with $COCl_2$ (3:5000) *in toluene* (5); *from triphenylmethoxy—MgBr*, $(C_6H_5)_3C$—OMgBr (from benzophenone + C_6H_5MgBr), with AcCl in C_6H_6 (37% yield (55)) or with $COCl_2$ in toluene (14% yield (55)); from triphenylcarbinol ethyl ether (see also below) with $AlCl_3$ in CS_2 (56) or with AcCl (46) (57) see indic. refs.]

From various other trityl derivatives and relatives. [For prepn. of Č from α-bromotriphenylmethane (*trityl bromide*) with AgCl in C_6H_6 in s.t. at 200° *for several days* (50% yield (57)); from α-aminotriphenylmethane (tritylamine) [Beil. XII-1343, XII₁-(557)] with NH_4Cl in liq. NH_3 (34), from triphenylmethylphosphinic acid $[(C_6H_5)_3C(PO)(OH)_2]$ with PCl_5 (3 *moles*) at 70° (91% yield (20)); from triphenylmethane (1:7220) with PCl_5 at 160° for 2 hrs. (65% yield (58)) or with NOCl at 150° (59) see indic. refs.]

[For prepn. of Č from triphenylacetyl chloride [Beil. IX-713, IX₁-(309)] by loss of CO on htg. at 120–150° (60) or at 170–180° (61); from *bis*-(triphenylmethyl) peroxide [Beil.

VI-716, VI_1-(350)] with Cl_2 + a little I_2 in boilg. CCl_4 soln. for 3 hrs. (40% yield (23)) see indic. refs.]

From benzene with various polyhalogenated methanes. [For prepn. of C̄ from C_6H_6 (1:7400) with CCl_4 (3:5100) in pres. of $AlCl_3$ (84–86% yield on $AlCl_3$ used (7) (8); 70–85% yield (18)) cf. (62) (63) (64) in CS_2 (97% yield (19)) see indic. refs.; for use of $FeCl_3$ (31% yield against 77% with $AlCl_3$ under otherwise same conditions (10) cf. (65)) see indic. refs.]

[For prepn. of C̄ from C_6H_6 (1:7400) with $CHCl_3$ (3:5050) + $AlCl_3$ at 50° see (22).]

[For formn. of C̄ from C_6H_6 with dichloro-difluoro-methane (" Freon ") + $AlCl_3$ see (66).]

From various chlorotoluenes. [*For formn. of C̄ from benzotrichloride (3:6540) with* C_6H_6 in pres. of metallic U (67), Ti (68), Ce (69), or Cr (21) see indic. refs.; from benzal (di)chloride (3:6327) with C_6H_6 + $AlCl_3$ see (22).]

From various chlorodiphenylmethanes. [For formn. of C̄ from α-chlorodiphenylmethane (benzohydryl chloride) (3:0060) (22) or from α,α-dichlorodiphenylmethane (benzophenone chloride) (3:6960) (70) with C_6H_6 + $AlCl_3$ see indic. refs.]

From other miscellaneous sources. [For formn. of C̄ from pentaphenylethane [Beil. V-755, V_1-(386), V_2-(711)] with PCl_5 at 170° for 2 hrs. or refluxed in C_6H_6 (58), or (together with other products) with HCl at 150° (71) or on evapn. of soln. in SO_2Cl_2 (72).]

CHEMICAL BEHAVIOR OF C̄

Pyrolysis of C̄. C̄ on htg. at 200° (52) (73) or 250° (53) or at 150° in pres. of P_2O_5 (74) loses HCl and yields both triphenylmethane (1:7220), m.p. 92°, and 9-phenylfluorene [Beil. V-720, V_1-(355), V_2-(630)], m.p. 147–148°; note that 9-phenylfluorene is also formed from C̄ in various other reactions such as with $POCl_3$ on distn. (23) or with 1/10 wt. of mossy zinc refluxed in C_6H_6 for 5 hrs. (75).

Reduction of C̄. *C̄ is reduced to triphenylmethane by many different types of reducing* agent [e.g., C̄ in anhydrous formic acid (1:1005) at 100° evolves CO_2 + HCl and gives (yield: 79% in 30 min., 90% in 2 hrs. (4)) triphenylmethane (1:7220); C̄ in EtOH treated with conc. H_2SO_4 at 70–80° gives (76) (17) triphenylmethane accompanied by acetaldehyde (1:0100); C̄ is reduced by diethyl ether in the presence of $AlCl_3$ (56) (77), $FeCl_3$ (65), or $ZnCl_2$ (78) to triphenylmethane (1:7220), acetaldehyde (1:0100) and ethyl chloride (3:7015) also being formed; other reagents which effect reduction of C̄ to triphenylmethane (1:7220) include hydrazobenzene in boiling C_6H_6 (79), cyclohexadiene-1,3 (dihydrobenzene) + $HgCl_2$ (80); Zn + AcOH (50) (reaction here is complex, and various other prods. may be formed according to conditions), and dry H_2S at 150° (81)].

Oxidation of C̄. C̄ is *not* readily oxidized: C̄ with silver oxide in dry C_6H_6 or ether gives (78) a little fuchsone, $(C_6H_5)_2{=}C_6H_4{=}O$ [Beil. VII-520, VII_1-(290)], m.p. 168°, together with other amorphous products difficult to purify; note, however, that C̄ in alcohol-free acetone with $KMnO_4$ in same solvent instantly reduces the $KMnO_4$ and gives (100% yield (85)) triphenylcarbinol (1:5985).

Hydrolysis of C̄. C̄ with aq. hydrolyzes to triphenylcarbinol (1:5985) + HCl: e.g., C̄ on shaking with aq. at ord. temp. is 85% hydrolyzed in 48 hrs. (26) cf. (82) (83) (*in this connection note m.p./compn. diagram* (26) of C̄ + *triphenylcarbinol*); C̄ with boilg. aq. rapidly and completely yields only triphenylcarbinol.

[For study of hydrolysis of C̄ by aq. in acetone (84), in dioxane (14), or by aq. HCl (35) see indic. refs.]

C̄ dissolves in cold conc. H_2SO_4 yielding (86) (48) (87) a golden-yellow soln. with evolution of HCl (88) (86) (48) and formn. of triphenylcarbinyl hydrogen sulfate; dilution of this soln. with aq. ppts. (99% yield (86) (48)) triphenylcarbinol (*1:5985*).

[C̄ dissolves in phenol with deep brown color; on dilution of the freshly prepd. soln. with aq. it becomes colorless and both HCl and triphenylcarbinol are detectable; if, however, the phenol soln. has stood for some time prior to dilution some *p*-tritylphenol [Beil. VI-731, VI_1-(364)], m.p. 282°, is also formed (89) (see also below under behavior of C̄ with phenols).]

BEHAVIOR OF C̄ WITH OTHER INORGANIC REACTANTS

With Salts of Various Inorganic Acids

With Salts of Hydrogen Peroxide

[C̄ in acetone with 30% H_2O_2 in freezing mixt. treated with 50% KOH gives (90) trityl hydroperoxide, $(C_6H_5)_3C—O—OH$ (isolated as its addn. cpd. with pyridine hydrochloride, viz., $(C_6H_5)_3C—O—OH.C_5H_5N.HCl$, cryst. from alc., m.p. 133° dec.), accompanied by some triphenylcarbinol (1:5985).]

[C̄ in C_6H_6 with aq. Na_2O_2 as directed (91) gives (5–11% yield) *bis*-trityl peroxide, $(C_6H_5)_3C—O—O—C(C_6H_5)_3$, cryst. from hot CS_2, m.p. 185–186°, accompanied by much triphenylcarbinol; the *bis*-trityl peroxide is also obtainable from the trityl hydroperoxide (above) by reaction with C̄ in C_6H_6 on addn. of aq. alk. (90).]

With Salts of Halogen Hydrides

With alkali or alkaline-earth salts. [C̄ with alkali fluorides seems not to have been studied; note, however, that trityl fluoride, cryst. from CCl_4, m.p. 104° (6), has been prepd. by other means, viz., from triphenylcarbinol with HF (6) or with acetyl fluoride (85).]

[C̄ with anhydrous $CaBr_2$ in C_6H_6 at room temp. for 5–6 hrs. (92) or C̄ with HBr in C_6H_6 at room temp. for 20 hrs. (92) is largely converted to trityl bromide [Beil. V-704, V_1-(348), V_2-(617)], m.p. 152°.]

[For study of rate of reaction of C̄ with KI in dry acetone at 0° see (93); note, however, that, although trityl iodide [Beil. V-706], m.p. 132°, is doubtless formed, yet more or less sepn. of I_2 and formn. of triphenylmethyl (or its reaction prods.) occurs also.]

With metal chlorides. C̄ with many metallic chlorides forms double salts [e.g., C̄ with $AlCl_3$ forms (19) (87) a cpd., C̄.$AlCl_3$, dark-yellow very hygroscopic cryst. from nitrobenzene + CS_2, dec. abt. 122–125°; C̄ in nitrobenzene with $SnCl_4$ gives on addn. of dry CS_2 or.-yel. cryst. of a cpd., C̄.$SnCl_4$ (30) (57) (87) (94); C̄ with $SbCl_5$ gives (57) a cpd., C̄.$SbCl_5$, red cryst.; C̄ with BCl_3 gives a cpd., C̄.BCl_3 (6), etc.].

With Salts of Hydrogen Sulfide

[C̄ with alc. NaSH (from alc. NaOEt satd. with H_2S) (81) cf. (95) (96), or C̄ with KSH in C_6H_6 (96), gives triphenylthiocarbinol [Beil. VI_1-(352)], cryst. from abs. alc. or alc. + $CHCl_3$, m.p. 107° (81) (95). — C̄ with alc. Na_2S as directed gives (21% yield (95)) *bis*-trityl sulfide, m.p. 182° dec. — Note also that *bis*-trityl disulfide, cryst. from C_6H_6 + pet. ether, m.p. 157° dec. (95) [Beil. VI_1-(353)], is also known but prepd. indirectly (81) (95) (96).]

With Other Salts of Inorganic Acids

[C̄ with Ag_2SO_4 in liq. SO_2 (23), C_6H_6 (97), or at 120–130° for 15–20 min. (98) cf. (48) gives di-trityl sulfate [Beil. VI-717, VI_1-(351)]. — C̄ with $AgClO_4$ in nitrobenzene + C_6H_6 gives (99) trityl perchlorate [Beil. VI-717, VI_1-(351)]. — C̄ with $AgCrO_4$ in C_6H_6 gives (48) cf. (100) di-trityl chromate [Beil. VI-717]; note that this salt is also obtd. from C̄ with CrO_3 in C_6H_6 or CCl_4 (101).]

[C̄ with NaN_3 in C_6H_6 refluxed 20 hrs. gives (100% yield (102)) trityl azide [Beil V-708, V_1-(349), V_2-(618)], colorless cryst., m.p. 64° (102), 65° (103). — For study of reaction of C̄ with silver hyponitrite and decompn. of the transient trityl hyponitrite see (104).]

With Metal Oxides

[C̄ with HgO in dry C_6H_6, ether, CS_2, or $CHCl_3$ as directed (78) cf. (105) (106) gives (50–85% yield (78)) di-trityl oxide, cryst. from xylene, m.p. 237–238° (106), 235–237° (78) (105). — Note that C̄ with Ag_2O in C_6H_6 undergoes oxidation (cf. above); note that C̄ with CrO_3 in C_6H_6 or CCl_4 gives (101) di-trityl chromate [Beil. VI-717].]

With Metals

With alkali metals (or their amalgams). [C̄ in dry ether with 1% Na/Hg on shaking at room temp. (2) (8) (107) (108) (109) or C̄ with Na in liq. NH_3 (112) gives tritylsodium (sodium triphenylmethyl) [Beil. XVI_1-(589)]. C̄ with K in liq. NH_3 gives (112) tritylpotassium. — C̄ in dry ether with excess Li/Hg, Rb/Hg, or Cs/Hg in absence of air gives (113) corresp. trityllithium, tritylrubidium, or tritylcesium. — For behavior of C̄ with calcium in liq. NH_3 see (112). — In this connection note that C̄ in dry ether, C_6H_6, or CS_2 in absence of air and under CO_2 with molecular Ag (91) cf. (117), Hg (91), Zn (91) (114) (115), or C̄ with Cu bronze in C_6H_6 + EtOAc (116) or in s.t. at 80–110° in dark (117) gives triphenylmethyl (trityl); note also that C̄ with Zn + AcOH in the cold gives (50) triphenylmethane (1:7220) + trityl, but the same mixture if heated gives triphenylmethane + 1-benzohydryl-4-tritylbenzene [Beil. V-761], m.p. 231° (118), 230° cor. (119), the latter under certain conditions attaining as high as 70% (50) (118).]

With Zn. [C̄ with $\frac{1}{10}$ wt. of mossy zinc refluxed in C_6H_6 for 5 hrs. gives (75) 9-phenylfluorene (see also above under pyrolysis of C̄). — For behavior of C̄ with Zn in EtOAc see (120).]

With Mg (in dry ether). C̄ with Mg in dry ether in the pres. of I_2 as directed gives (96% yield (13)) cf. (121) of corresp. R—Mg—Cl cpd., viz., trityl—Mg—Cl [Beil. XVI-942, XVI_1-(556)]. — [The former controversy as to whether this can exist in a more reactive quinonoid structure (α) or a relatively less reactive carbonium (β) structure cannot be reported here (for references see above Beilstein citation), nor can space be taken for a full account of its reactions.] — Note, however, that this RMgCl cpd. with CO_2 gives (yields: 91% (2), 87.5% (121)) (122) (59) triphenylacetic acid [Beil. IX-712, IX_1-(309)], m.p. 264–265° dec. (122); for study of adverse influence of triphenylcarbinol or of benzaldehyde see (121).

With Nitrogenous Inorganic Reactants

[C̄ dislvd. in C_6H_6 and satd. with dry NH_3 gas (123) (124) repeatedly (125), or C̄ in naphthalene with dry NH_3 gas at 130° (126), gives (45% yield (126)) tritylamine (triphenylmethyl-amine) [Beil. XII-1343, XII_1-(557)], pr. from abs. alc., m.p. 102° (126), 103–104° (124), 105° (127) (corresp. B.HCl, spar. sol. aq., m.p. 244° (127)).]

[C̄ with NH_2OH (from NH_2OH.HCl in MeOH/NaOMe) in C_6H_6 gives (73–75% yield (3)) (128) cf. (129) *N*-tritylhydroxylamine [Beil. XV-33, XV_1-(11)], pr. from C_6H_6/pet. ether, m.p. 130–135° (3), 124–135° u.c. (128); for study of rearr. of this prod. see (129). — For study of *N*-methyl ether of this prod., viz., *N*-trityl-*N*-methylhydroxylamine (similarly prepd. from C̄ with *N*-methylhydroxylamine) see (130) (131); for study of the isomeric O-methyl ether, viz., *N*-trityl-O-methylhydroxylamine (from C̄ with methoxyamine), see (132).]

[C̄ with hydrazine hydrate (2 moles) in alc. at ord. temp. (232) or in dry ether under reflux (233) or in dry pyridine at 45–50° (234) gives (63% yield (234)) *N*,*N'*-di-tritylhydra-

zine (α,α'-hydrazotriphenylmethane) [Beil. XV-582, XV_1-(184)], m.p. 212° (234), 219–220° dec. (235), often accompanied (232) (233) by some *N*-tritylhydrazine [Beil. XV-581, XV_1-(184)]]

BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

With Organic Hydroxy or Mercapto Compounds

With Alcohols

$\bar{C}$ with alcohols gives the corresp. ethers of triphenylcarbinol. With the lower monohydric alcs this conversion can occur merely on solution and warming, but higher alcs. usually require htg., use of metal alcoholate, use of an acid acceptor (pyridine), etc.

With methyl alcohol. $\bar{C}$ with MeOH (1:6120) in C_6H_6 for 10 min. (133), or $\bar{C}$ with MeOH/NaOMe refluxed 4 hrs. (134), gives (55% yield (134)) triphenylcarbinyl methyl ether (α-methoxytriphenylmethane), cryst. from MeOH, m.p. 83.5–84° (133), 82.5–83° (134), 82.6–82.9° (134) (136), 82° (64); note, however, that this product exists in dimorphous forms; the lower-melting form just mentioned sometimes (134) (135) changes to a higher-melting form, m.p. 96.0–96.5° (134) (135); note also that the m.p. of this *methyl* ether is close to that of the *ethyl* ether (see below) but that a mixed m.p. of the two is depressed (136). — [For studies of hydrolysis of the methyl trityl ether to triphenylmethane (1:7220) and formaldehyde (1:0145) see (134) (136); for prepn. of its addn. cpd., m.p. 90–91°, with PkOH see (138)]

With ethyl alcohol. $\bar{C}$ with abs. EtOH (1:6130) on warming (1) (4) (5) (52) or even shaking 1 min. at ord. temp. (139), or $\bar{C}$ with abs. EtOH/NaOEt (9) (56) (134) (139), gives (yields: 83% (138), 50% (134)) triphenylcarbinyl ethyl ether (α-ethoxytriphenylmethane), cryst. from abs. alc., ether, or pet. ether, m.p. 84° (5), 83° (1) (9), 81.2–81.8° (134), 81.3° (56), 81° (4) — Note that the m.p. of this prod. is almost identical with that of triphenylcarbinyl methyl ether (above) but that a mixed m.p. of the two is depressed (137). — [For study of pyrolysis of this ethyl trityl ether yielding triphenylmethane (1:7220) and acetaldehyde see (134) (136); for study of its cleavage with AcCl (3:7065) (57) (46), with $AlCl_3$ in CS_2 (56), or with EtOH/HCl (26) see indic. refs.; for conversion with boilg. anhydrous formic acid to triphenylmethane (1:7220) see (4).]

With other monohydric alcs. [$\bar{C}$ with *n*-PrOH (1:6150) in dry pyridine at room temp. for 20 hrs. (140), or $\bar{C}$ with *n*-PrOH/NaO *n*-Pr refluxed 4 hrs. (134), gives (10% yield (134)) trityl *n*-propyl ether, cryst. from *n*-PrOH/pet. ether, m.p. 55° (140), 50.5–52.5° (134). — $\bar{C}$ with isopropyl alc. (1:6135) in dry pyridine at room temp. for 20 hrs. (140) or $\bar{C}$ with isopropyl alc/Na isopropylate under reflux gives (50% yield (134)) trityl isopropyl ether, m.p. 113° (140), 112.9–113.8° (134), 111.7° (56). — $\bar{C}$ with *n*-BuOH (1:6180) + sodium *n*-butylate gives (40% yield (134)) trityl *n*-butyl ether, oil, b.p. 196–198° at 5 mm. (134). — For prepn. of corresp. trityl ethers from *sec*.-butyl alc (1:6155) (134), isobutyl alc. (1:6165) (134), isoamyl alc. (1:6200) (134), cetyl alc. (1:5945) (140), allyl alc. (1:6145) (140), benzyl alc. (1:6480) (134), cyclohexanol (1:6415) (140), see indic. refs.]

[For prepn. of corresp. trityl ethers from *l*-menthol (1:5940) (152) (153) (154), *d*-borneol (1:5990) (152) (153), or cholesterol (1:5975) (152) see indic. refs.]

[Note, however, that $\bar{C}$ with K triphenylcarbinolate does *not* give the expected prod. but rather (96) *p*-hydroxytriphenylcarbinol in the form of its anhydride fuchsone; the expected ditrityl ether has been obtd. from $\bar{C}$ by action of HgO (see above).]

With various important substituted monohydric alcohols. [$\bar{C}$ with β-methoxyethanol (methyl "cellosolve") (1:6405) in pyridine gives (80–85% yield (141)) trityl β-methoxyethyl ether, m.p. 105.5–106.0° u.c. (141), 104° (142). — $\bar{C}$ with β-ethoxyethanol ("cellosolve") (1:6410) in pyridine at 100° for 5 hrs. gives (92% yield (141)) trityl β-ethoxyethyl

ether, m.p. 79.0–79.5° u c. (141), 77–78° (143). — C̄ with β-isopropoxyethyl alc. (isopropyl "cellosolve") (1:6413) in pyridine gives (50–60% yield (141)) trityl β-isopropoxyethyl ether, m.p. 71.0–71.5° u c. (141). — C̄ with β-benzyloxyethyl alc. (benzyl "cellosolve") (1:6533) in pyridine gives (50–70% yield (141)) trityl β-benzyloxyethyl ether, m.p. 76–77° u.c. (141). — C̄ with β-phenoxyethyl alc. (phenyl "cellosolve") (1:6518) in pyridine gives (75–85% yield (141)) trityl β-phenoxyethyl ether, m.p. 123.5–124.0 u.c. (141).]

[C̄ with β-(β-methoxyethoxy)ethyl alc. (methyl "carbitol") (1:6458) in pyridine gives (55–60% yield (141)) trityl β-(β-methoxyethoxy)ethyl ether, m.p. 58–59° u.c. (141). — Note that the trityl ethers of β-(β-ethoxyethoxy)ethyl alc. ("carbitol") (1:6470) and of β-(β-n-butoxyethoxy)ethyl alc. (butyl "carbitol") (1:6517) are unreported.]

With various polyhydric alcohols. (For C̄ with carbohydrates see separate section below.)

[C̄ with ethylene glycol (1:6465) in pyridine may according to conditions (141) give either or both of the two possible ethers, viz., ethylene glycol monotrityl ether, m.p. 105–105.5° u c. (141), 104.5–105.5° (144), 102–103° (143), 98–100° (140) (corresp. benzoyl deriv. m.p. 58 5–59 5° (144); corresp. p-nitrobenzoyl deriv., m p. 155–156° (144)), and/or ethylene glycol ditrityl ether, m.p. 190° u.c. (145), 187–188° u.c. (141), 185–186° (140)]

[C̄ with propylene glycol (propanediol-1,2) (1:6455) in pyridine gives (146) propylene glycol ditrityl ether, m.p. 176 5–177.0° u.c. (146).]

[C̄ (2 moles) with diethylene glycol (1:6525) in pyridine gives (60–70% yield (141)) diethylene glycol ditrityl ether, m.p. 157.5–158.0° u.c. (141); note that corresp. diethylene glycol *mono*trityl ether has m.p. 112.5–113.5° u.c. (141).]

[C̄ (2 moles) with triethylene glycol (1:6538) in pyridine gives (45–60% yield (141)) triethylene glycol ditrityl ether, m.p. 142.0–142.5° u.c. (141); note that this prod. is dimorphous, and an unstable form, m.p. 130.5–131.5° u.c., sometimes obtd. can be converted to the stable higher-melting form by htg. at 125° or by grinding in acetone (141).]

[C̄ with glycerol (1:6540) may give mono-, di-, or tritrityl ethers acc. to conditions; glycerol α-monotrityl ether, m.p. 93–94° (147), 92–94° (140), but also sometimes in another form of m.p. 108–110° (147) (148), 109–110° (149); glycerol α,α′-ditrityl ether, m.p. 174–177° (150), 174–176° cor. (151), 170–171° (140); glycerol α,α′,β-*tris*-trityl ether, m.p. 196–197° (147) (150). — Note that the relationships of these three ethers are subtle; e.g., the monoether at 180–190° is converted (147) into the α,α′-diether; the latter in turn at 260° gives (147) the triether.]

[C̄ (4 moles) with pentaerythritol (1:5850) in pyridine gives (145) a tetratrityl ether m.p. above 350°.]

With carbohydrates and their relatives. C̄ has recently been much employed as a tritylating agent for compounds of the carbohydrate group. This use started from the original (erroneous) impression that C̄ etherified hydroxyl groups only if the latter were primary. However, although C̄ does in general react preferentially with such primary hydroxyls, and this reaction has been proposed (155) as a means for the detection of primary alcs. in the presence of secondary and/or tertiary alcohols, yet such primary tritylation is *not* specific. Abundant evidence is already available (156) (157) (158) (159) that secondary hydroxyl groups undergo tritylation. Although the scope of this book cannot be extended to a detailed treatment of the use of C̄ as tritylating agent in the carbohydrate group, yet a few brief citations may be of service as leading references.

With various tetrahydric alcohols. [For behavior of C̄ with *meso*-erythritol (1:5825) and pentaerythritol (1:5850) see (145).]

With various pentahydric alcohols and pentoses. [For behavior of C̄ with adonitol, arabitol, xylitol, fucitol, rhamnitol, and epirhamnitol see (145); with arabinose, ribose, and xylose see (160); with various derivatives of these see (158) (167) (168).]

With various hexahydric alcohols and hexoses. [For behavior of C̄ with mannitol (145) (161), sorbitol (145), dulcitol (162) see indic. refs; with *d*-glucose (163) (164) (165), with *d*-galactose (165), with fructose (160) (166); with various derivs. of these see (159) (169) (152) (170) (171) (172) (173).]

With various disaccharides. [For behavior of C̄ with sucrose (174), maltose (174), turanose (175) see indic. refs.]

With various polysaccharides. [For behavior of C̄ with raffinose (174), glycogen (176), starch (177), cellulose (177), and arabogalactan (178) see indic. refs.]

With thiols (for thiophenols see below). C̄ with mercaptans yields the corresp. trityl thioethers [e g, C̄ with MeSH in dry ether or C_6H_6 gives (179) (180) trityl methyl sulfide [Beil. VI₁-(352)], lfts. from MeOH, m.p. 105° (179); C̄ with EtSH similarly gives (179) (180) trityl ethyl sulfide [Beil. VI₁-(353)], m.p. 125° (179). — C̄ with Na triphenylthiocarbinolate in alc. on htg. gives (95) ditrityl sulfide, m.p. 182° dec. (also obtd. from C̄ + abs. alc. Na_2S) — For tritylation with C̄ of SH groups in mercaptoacetic acid, α-mercaptopropionic acid (thiolactic acid), β-mercaptopropionic acid (thiohydracrylic acid, α-mercaptosuccinic acid (thiomalic acid) see (180)].

With phenols. C̄ with phenols (as with alcohols) gives in general the corresp. trityl ethers; however, with phenols there is a further complication in that [illegible] of the trityl radical of the ether or [illegible]

[illegible] [C̄ with KOC_6H_5 (89) (181) cf. (182) or $NaOC_6H_5$ (139) (182) in dry ether gives (yields: 90% (139), 71% (181), 70% (182)) trityl phenyl ether (α-phenoxytriphenylmethane) [Beil. VI-716, VI₁-(350)], m.p. 103° (89) (165) [illegible] accompanied by some *p*-tritylphenol [illegible] (364)], m.p. 282° (182), 280° (179); note [illegible] may represent as much as 74% yield [illegible] the former by use of "Claisen's alkali" (182), was originally (89) overlooked; note, also, that C̄ with phenol (1:1420) in pyridine at 100° for 3½ hrs. gave 28% yield (165) trityl phenyl ether, while C̄ with phenol at 130–140° for 4 hrs. gave (182) cf. (179) only 1 5% of this product and 98 5% of the isomeric *p*-tritylphenol.]

With the 3 cresols. [C̄ with *o*-cresol (1:1400) in pyridine at 110° for 5–6 hrs (183) (181) (184) or C̄ with sodium *o*-cresolate in dry [illegible] ls: 31–53% (183) [illegible] by as much as 26 [illegible], m p. 186° (185), [illegible] C̄ with sodium *o*-cresolate in excess *o*-cresol [illegible] hrs. (183) or C̄ with *o*-cresol at 180° for 5 hrs. (181) or in pres. of $ZnCl_2$ at 180° for ½ hr. (181) gives (33% yield (183)) 4-trityl-2-methylphenol — Note that this latter cryptophenol was originally (181) [illegible] the structure α- [illegible] since (186) (187) [illegible]

[C̄ with th [illegible] (53% yield (185)) [illegible] expected nuclear tritylation prod., viz , 4 [illegible] the latter has subsequently [illegible] (190), 213° (186)]

[illegible] at 100° for 7 hrs. (181) or 5 hrs. (191) (26) or C̄ with sodium *p*-cresolate in dry ether refluxed 2 hrs. (185) gives (yields: 80% (191), 50–60% (185)) trityl *p*-tolyl ether, the latter being definitely trimorphous and occurring in three forms; viz., m.p. 114° (185), 113–114° (191) (192) (26); m p 95° (193) (194); and m p. 81° (181) (193) (194) (note that the lower-melting forms tend to convert to the 114°

type (194)) accompanied by a trace of a cryptophenol, presumably 2-trityl-4-methylphenol, m.p. 182° (185) (190), also obtd. (64% yield (190)) from C̄ with sodium *p*-cresolate in excess *p*-cresol at 130–140° for 3 hrs.]

With other phenols. [For further examples of nuclear tritylation of phenols by use of C̄ with isochavibetol and isoeugenol see (196) cf. (26); with 2-hydroxynaphthoquinone-1,4 see (197). — *For formn. of di-trityl ethers from* pyrocatechol (1:1520) (140) or from hydroquinone (1:1590) (198) see indic. refs.]

With thiophenols. C̄ with thiophenol on htg. (199) or in C_6H_6 soln. on refluxing ½ hr. (180) (179), or C̄ with $NaSC_6H_5$ in ether at ord. temp. for 18 hrs. (200) (201), gives (yield alm. quant. (199) (200), 96% (180)) trityl phenyl sulfide, m.p. 106.5° (180), 106° (201), 105–106° (199) (200), 105° (179); this prod. on oxidn. with $CrO_3/AcOH$ gives (199) the corresp. sulfoxide, m.p. 163°, but is unaffected by H_2O_2 (199) [for corresp. sulfone, m p. 175–176° (210), see below under reaction of C̄ with salts of organic acids (sodium benzenesulfinate)].

[For corresp. sulfides from C̄ with *o*-thiocresol, *p*-thiocresol, α-thionaphthol, β-thionaphthol, 2,4-dinitrothiophenol see (201).]

With enols or enolates. [For examples of reaction of C̄ with the enol form of diphenylacetaldehyde (202), methyl diphenylacetate (202), or with stilbenediol *bis*-MgI cpd. (203) see indic. refs.]

Behavior of C̄ with Ethers

C̄ with various aliphatic ethers in the pres. of suitable catalysts yields triphenylmethane and an aldehyde [e.g., C̄ with diethyl ether in the pres. of $AlCl_3$ (56) (77), $FeCl_3$ (65), or $ZnCl_2$ (78) gives triphenylmethane and acetaldehyde; although the latter is lost by polymerization the method is standard (77) for prepn. of triphenylmethane (1:7220)].

[Note, however, that with aromatic ethers nuclear tritylation occurs: e.g., C̄ with anisole (1:7445) + $SnCl_4$ at 100–110° for 1 hr. gives (45% yield (204)) 4-tritylanisole, m.p. 200.5° (204)]

Behavior of C̄ with Organic Acids

(For salts of organic acids see below.)

C̄ with AcOH even at 13° (133) (146) cf. (50) is in equilibrium with trityl acetate (see below) + HCl. — C̄ with thiolacetic acid (CH_3COSH) gives trityl thiolacetate [Beil. VI-721, VI_1-(353)], m.p 138° (179). — C̄ with thiolbenzoic acid (C_6H_5COSH) in toluene gives (85% yield (180)) trityl thiolbenzoate [Beil. IX-422, IX_1-(170)], m.p. 187.5–188° (180). — C̄ with free thiocyanic acid in C_6H_6 gives (97% yield (180)) trityl thiocyanate, m.p. 139° (180) (see also below).

Behavior of C̄ with Salts of Organic Acids

C̄ with salts of organic acids normally reacts to yield the corresp. trityl esters.

C̄ with AgOAc in dry ether or C_6H_6 on shaking at room temp. (57) or in C_6H_6 refluxed 2 hrs. (46), or C̄ shaken with NH_4OAc in C_6H_6 at ord. temp. (205), gives trityl acetate, cryst. from AcOEt + lgr., m.p. 87–88° (46) (57). — C̄ with AgOBz in C_6H_6 at 60° for 4 hrs. gives (96) trityl benzoate, m.p. 165–166° (96). — Note that in analogous fashion C̄ might be expected to react with silver salts of *p*-nitrobenzoic and 3,5-dinitrobenzoic acids to give corresp. esters, but these are unreported.

[C̄ with excess dry Ag_2CO_3 in dry C_6H_6 shaken 24 hrs. gives (60–80% yield (106)) (105) ditrityl carbonate, cryst. from xylene, m.p. 209° dec. (106), 205–210° (105); this prod. on htg. in xylene in pres. of Cu pdr. decomposes (106) (105) into CO_2 and ditrityl ether, m p. 237–238° (106) (see also above under C̄ with HgO).]

[C̄ with excess $Hg(CN)_2$ at 150–170° for 1 hr. gives (alm. 100% yield (53)) on extraction

with C_6H_6 (53) (206) (207) trityl cyanide (triphenylacetonitrile) [Beil. IX-714, IX_1-(309)], pr. from AcOH, m.p. 129° (208), 127.5° (53).]

[C̄ with mercury fulminate in dry C_6H_6 under cooling gives (65% yield (208)) trityl cyanide oxide, $(C_6H_5)_3CNO$, ndls. from alc., m.p. 153–154° (208).]

[C̄ with KSCN in dry C_6H_6 shaken at room temp. for 2 days gives (209) trityl thiocyanate [Beil. VI-721], m.p. 137° (209) (see also above under C̄ with organic acids (HSCN)).]

[C̄ with sodium benzenesulfinate in dry ether gives (210) trityl phenyl sulfone [Beil. VI-721], lfts. from ether, m.p. 175–176° (210); note that corresp. sulfoxide (see above under behavior of C̄ with thiophenol) has m.p. 163°. — Similarly, C̄ with sodium p-toluenesulfinate in dry C_6H_6 gives (179) trityl p-tolyl sulfone [Beil. VI_1-(353)], m.p. 173° (179).]

Behavior of C̄ with Organometallic Compounds

This topic cannot be fully expanded within the scope of this book, but the following examples will serve as leading references.

With organo-alkali compounds. [C̄ with Li n-butyl in pet. ether for 9 days gives (26% yield (211)) 1,1,1-triphenylpentane, m.p. 153–154° (211). — C̄ with Li C_6H_5 gives (212) free trityl isolated in form of (20% yield) ditrityl peroxide.]

[C̄ with Na n-butyl or Na trityl in liq. NH_3 + toluene (112) or C̄ with Na trityl in dry ether (108) gives free trityl. — C̄ with Na + tetraphenylethylene as directed gives (213) pentaphenylethyl.]

With RMgX compounds. C̄ with MeMgBr (214) or C̄ with MeMgI (215) gives no gas (216) cf. (217) (218) but couples giving (yields: 95% (214), 70% (215)) 1,1,1-triphenylethane (α-methyltriphenylmethane) [Beil. V-709, V_1-(350)], cryst. from alc., m.p. 94–95° (214) (215), 94.8–95.0° (15); note that this prod. is also obtd. from MeMgBr with trityl acetate (61% yield (219)) or from K trityl with MeI in liq. NH_3 (85–94% yield (220)).

[C̄ with EtMgBr in dry ether reacts rapidly and quant. (221) yielding (215) not only the expected 1,1,1-triphenylpropane [Beil. V-712], m.p. 51° (215), but also (215) triphenylmethane (1:7220) and ethylene.]

[C̄ with n-PrMgBr in dry ether gives (215) not only 1,1,1-triphenylbutane, m.p. 79° (215), but also considerable triphenylmethane (1:7220). — C̄ with iso-PrMgBr in dry ether gives (215) not only 1,1,1-triphenyl-2-methylpropane, b.p. 233–234° at 21 mm. (215), but also much triphenylmethane (1:7220).]

[C̄ with C_6H_5MgBr in dry ether or C_6H_6 gives a small yield (25–30% (222), 10–12% (139), 5–10% (215) (223)) tetraphenylmethane [Beil. V-738, V_1-(371), V_2-(672)], m.p. 281–282° (224) (225), b.p. 431° at 760 mm. (225), but the principal product (yield: 50–77% (222), 47.4% (226)) is 4-benzohydrylbiphenyl (p-phenyltetraphenylmethane) [Beil. V-738, V_2-(672)], m.p. 111° (226), 112–113° (116); for explanation and study of this reaction see (222). — Note that C̄ with C_6H_5MgI behaves differently giving (227) cf. (179) triphenylmethyl and biphenyl (1:7175).]

[C̄ in C_6H_6 with benzyl MgCl in dry ether gives (100% yield (215)) (228) 1,1,1,2-tetraphenylethane [Beil. V-740, V_1-(372), V_2-(674)], m.p. 144° (215), 143.5–143.7° (15). — C̄ with benzohydryl bromide + Mg in dry ether (215) cf. (230) (or better trityl MgBr + benzohydryl bromide (229) cf. (230)) gives (90% yield (229)) pentaphenylethane [Beil. V-755, V_1-(386), V_2-(711)], m.p. in air 166–178° (229), in N_2 182–185° (229). — C̄ with trityl MgCl gives (230) free trityl.]

[For behavior of C̄ with phenylacetylenyl MgBr giving trityl-phenylacetylene or with acetylene-*bis*-MgBr giving di-tritylacetylene (hexaphenylbutyne-2) see (231).]

Behavior of $\bar{C}$ with (Organic) Amines

(For $\bar{C}$ with NH_3, NH_2OH, NH_2NH_2, etc., see above under $\bar{C}$ with inorganic nitrogen compds; for $\bar{C}$ with arylhydrazines see below.)

$\bar{C}$ with Primary Amines

[$\bar{C}$ with $MeNH_2$ in C_6H_6 in pres. of NaOMe gives (125) trityl-*N*-methylamine [Beil. XII-1344, XII_1-(557)], m.p. 73° (125) (236) (corresp. $\bar{B}$.HCl, m.p. 216° (125)).]

With aromatic *prim.* amines. $\bar{C}$ in C_6H_6 with aniline in alc. refluxed 15 min. gives (80% yield (228)) (57) *N*-tritylaniline [Beil. XII-1344, XII_1-(557)], cryst. from alc / ether, m.p. 149–150°, (57), 148–149° (237), 146° (228) [note that this prod. with ½ its wt. $ZnCl_2$ at 160° for 15 min. rearranges (228) to *p*-tritylaniline [Beil. XII-1348], ndls. from toluene or alc., m.p. 256° cor. (225), 249° (228); note also that $\bar{C}$ is claimed to form with aniline an addn. cpd., m.p. 189–190° (34)].

[$\bar{C}$ in C_6H_6 with *o-toluidine* in alc. refluxed 15 min. gives (228) *N*-trityl-*o*-toluidine, m.p. 142.5° (228), 142° (237) (238), 140–142° (57); this prod. with $ZnCl_2$ at 160° for 15 min. rearranges (82% yield (189)) (228) to 4-trityl-2-methylaniline, m.p. 216° (228), 215° (189) (*not* to α-(2-amino)-β,β,β-triphenylethane as originally supposed (228) cf. (189)). — $\bar{C}$ with *m-toluidine* directly has not been studied nor has the other expected product, viz., *N*-trityl-*m*-toluidine, nor its rearr. prod., been reported. — $\bar{C}$ in C_6H_6 with *p-toluidine* in alc. refluxed 15 min. gives (228) *N*-trityl-*p*-toluidine [Beil. XII-1344], m.p. 180° (228), 177–178° (85), 177° (238), 176° (237): this product with $ZnCl_2$ at 190° for 30 min. does *not* (228) rearrange.]

[$\bar{C}$ with *p*-aminobiphenyl (*p*-xenylamine) in C_6H_6 on htg. gives (82% yield (239)) *N*-trityl-*p*-xenylamine, pr. from C_6H_6, m.p. 179.5–180.5° (239); note that this prod. does *not* rearrange.]

$\bar{C}$ with Secondary Amines

With aliphatic *sec.* amines. [$\bar{C}$ with Me_2NH in C_6H_6 gives (65% yield (240)) trityldimethyl-amine, cryst. from abs. alc., m.p. 95–97° (240), 97° (236).]

With aromatic *sec.* amines. [$\bar{C}$ with diphenylamine might first be expected to give *N*-trityl-diphenylamine, ndls. from toluene, m.p. 172° (241), which has actually been prepd. by other means (241) (242) (243); however, $\bar{C}$ with diphenylamine (244) in hot C_6H_6 (243) or pyridine (165) or the above *N*-trityl-diphenylamine with diphenylamine HCl in C_6H_6 or in hot AcOH directly (243) gives the rearr. prod., viz., 4-trityl-diphenylamine (4-anilinotetraphenylmethane), m.p. 242° (243) (244), 240° (165). — For use of these and related prods. as antioxidants see (244) (245). —For analogous behavior of $\bar{C}$ with di-*p*-tolylamine, di-*p*-amylamine, and di-(*p*-dimethylaminophenyl)amine see (243).]

[For behavior of $\bar{C}$ with *N,N*-diphenyl-*p*-phenylenediamine yielding a blue meriquinoid salt, m.p. 182–183°, see (246) (247) (248); with indole and with 2-methylindole giving *N*-trityl derivs. see (196).]

With heterocyclic *sec.* amines. [$\bar{C}$ with piperidine in C_6H_6 yields (179) *N*-tritylpiperidine, ndls. from alc., m.p. 153° (179).]

$\bar{C}$ with Tertiary Amines

With aliphatic *ter*-amines. [$\bar{C}$ with Me_3N in acetonitrile + $CHCl_3$ at room temp. ppts. a prod., m.p. 190–195° dec. (249), of compn. $2(C_6H_5)_3COH.(CH_3)_3$ N.HCl from which extraction with aq. leaves triphenylcarbinol (1:5985), m.p. 161°, or from which extraction with C_6H_6 leaves the trimethylamine HCl. — For analogous behavior of $\bar{C}$ with Et_3N see (249)]

With aromatic *ter*-amines. [$\bar{C}$ with 3 wts. dimethylaniline at 100–115° for 8 hrs. gives (42% yield (250)) 4-trityldimethylaniline (4-dimethylamino-tetraphenylmethane), cryst. from alc., m.p. 204–205° (250), 208° (251).]

With heterocyclic *ter*-amines. [$\bar{C}$ with pyridine does not give a simple quaternary salt; however, $\bar{C}$ with pyridine in nitromethane + $CHCl_3$ (249) or in EtOAc (249), or $\bar{C}$ in dry pyridine with exactly 1 mole H_2O (84) (252) (165), gives a definite prod., cryst. from acetone (249) or $CHCl_3$ (42), m.p. 176° (42), 174° (34) (253) (165), 172–174° (84), 170–175° (249); this prod. is formulated as either $(C_6H_5)_3C.OH.C_5H_5N.HCl$ (249) or as $(C_6H_5)_3CCl.C_5H_5N.H_2O$ (84) (252) (42).]

Behavior of $\bar{C}$ with Arylhydrazines

With monoarylhydrazines. $\bar{C}$ with phenylhydrazine (2 moles) in dry ether at room temp. gives (90% yield (254)) *N*-trityl-*N*-phenylhydrazine [Beil. XV-581, XV_1-(184)], cryst. from boilg. abs. alc., m.p. 136–137° (254), 148° (255). [Note that this prod. is easily oxidized (dehydrogenated), e.g., with nitrous oxides (100% yield (254), 86% (256)) or Br_2/aq. (100% yield (257)) giving tritylazobenzene $(C_6H_5)_3C—N{=}N—C_6H_5$ [Beil. XVI-85], m.p. 113–114° (254), 110° (255), 110–112° (256) (for study of thermal decompn. of this prod. see (258)).]

[$\bar{C}$ with *p*-nitrophenylhydrazine in a large vol. C_6H_6 gives (257) cf. (256) *N*-trityl-*N*-(*p*-nitrophenyl)hydrazine, m.p. 170° (250).]

With diarylhydrazines. [$\bar{C}$ with *N,N*-(*unsym.*)-diphenylhydrazine (2 moles) in C_6H_6 refluxed 20 min. gives (259) *N'*-trityl-*N,N*-diphenylhydrazine, m.p. 136–137° (259). — $\bar{C}$ with *N,N'*-diphenylhydrazine (hydrazobenzene) (2 moles) in dry ether under CO_2 refluxed 16 hrs. gives (259) *N'*-trityl-*N,N*-diphenylhydrazine, m.p. 107° (259) (in this connection recall also that $\bar{C}$ with hydrazobenzene in boilg. C_6H_6 is in part reduced (79) to triphenylmethane).]

Behavior of $\bar{C}$ with Amides

[$\bar{C}$ (2 moles) with urea (1 mole) in dry pyridine at 100° gives (165) cf. (179) *N,N'*-ditritylurea, cryst. from alc. with 2 EtOH not lost on air drying, m.p. 245° (165); note that *N*-tritylurea (prepd. indirectly (124)) has m.p. 234–235° dec. (124). — $\bar{C}$ (1 mole) + thiourea in pyridine at 100° for 1 hr. gives (165) cf. (179) *N*-tritylthiourea, cryst. from C_6H_6, m.p. 222° dec. (165), 217° (179).]

Behavior of $\bar{C}$ with Hydrazides

[$\bar{C}$ with free semicarbazide ($NH_2CONH.NH_2$) in pyridine at 0° gives (88% yield (260)) 1-tritylsemicarbazide, cryst. from abs. alc. with 1 EtOH, m.p. 186–188° dec.; the solvate alc. is lost in vac. at 110° after 6 hrs. and m.p. rises to 190–192° (260).]

[$\bar{C}$ with primary hydrazides (acylhydrazine) in general reacts to give *N*-trityl-*N*-acylhydrazines which upon suitable dehydrogenation give *N*-trityl-*N*-acyl-azo compounds; the topic cannot here be expanded but for many examples see (260) (261).]

- Ⓓ Triphenylmethane (1:7220): lfts. from alc. [From $\bar{C}$ in anhydrous formic acid (1:1005) at 100° for 2 hrs. in 90% yield (4).]
- Ⓓ Triphenylcarbinol (1:5985): cryst. from C_6H_6 or alc., m.p. 161–162°. [From $\bar{C}$ on boilg. with aq.]
- Ⓓ Trityl methyl ether: cryst. from MeOH, m.p. 82–83°. (See text above under behavior of $\bar{C}$ with alcohols.)
- Ⓓ Trityl ethyl ether: cryst. from EtOH, m.p. 83–84°. (See text above under behavior of $\bar{C}$ with alcohols.)

Ⓓ *N*-Tritylphthalimide: tbls. from alc., m.p. 172° (179). [From C̄ with K phthalimide at 200° (179).]

3:3432 CHLOROMALEIC ACID

Cl—C—COOH
‖
H—C—COOH

$C_4H_3O_4Cl$

Beil. II - 752
II_1—
II_2-(646)

M.P. 115°	(1) (2)
114–115°	(3) (4)
[108° after sintering at 95° (5) (6)]	

[*See also chlorofumaric acid* (3:4853).]

Cryst. from AcOH/$CHCl_3$, ether/$CHCl_3$, ether/pet. ether, or ether alone. — Eas. sol. alc, ether, AcOH; spar. sol $CHCl_3$ or C_6H_6; insol. pet. ether.

[For prepn. of $\bar{C}$ from *meso*-α,α'-dichlorosuccinic acid (3:4930) with NaOAc/dil. AcOH on boilg. (5) (1), or from its neutral sodium salt in aq soln. on boilg ½ hr. (4), see indic. refs; from chloromaleic anhydride (3:0280) by hydrolysis with aq. and subsequent evapn. see (4) (5) (6) (7); from 3,5,5,5-tetrachloro-4-ketopenten-2-oic acid-1 ("β-(trichloroacetyl)-β-chloroacrylic acid") [Beil. III-733] on 24 hr. stdg. at room temp. of its soln. in excess 10% aq Na_2CO_3 see (6); from chloromaleonitrile (b.p 185° at 753 mm., 71.0–71.5° at 10 mm., D_4^{20} = 1.2293, n_D^{20} = 1.48944 (9)) by hydrol see (9).]

$\bar{C}$ on htg. at 180° loses H_2O yielding (6) chloromaleic anhydride (3:0280).

$\bar{C}$ although unchanged by conc. HCl at ord. temp. for as long as 10 days (4) is by repeated evapn with conc HCl (7) isomerized to chlorofumaric acid (3:4853).

$\bar{C}$ in aq soln with Zn filings is dehalogenated yielding (4) fumaric acid (1:0895); $\bar{C}$ (as $Na_2\bar{A}$) in aq soln with 1% Na/Hg gives (4) mainly succinic acid (1:0530) accompanied by some fumaric acid (1:0895).

$\bar{C}$ readily reduces aq. $KMnO_4$.

[$\bar{C}$ readily combines with Br_2 if heated in s.t. to 100° (7).]

$\bar{C}$ behaves normally as a dibasic acid: e g, titration with standard dil. aq. alk. gives Neut. Eq 75 3; for study of electrometric titration see (1).

[*Salts:* $KH\bar{A}$, eas. sol. aq (dif. from corresp salt of chlorofumaric acid (3:4853)), e.g., 100 g. of its satd. aq soln at 15° cont. 29.2 g of $KH\bar{A}$ (7); for crystallographic data see (7).

— $NaH\bar{A}.3H_2O$, eas. sol. aq. (7). — $Ag_2\bar{A}$, insol. aq. (7). — $Ba\bar{A}.2H_2O$ (4) (5) (6), spar. sol. aq. — $Ca\bar{A}.4H_2O$ (4). — $Sr\bar{A}.4\frac{1}{2}H_2O$, spar. sol. cold aq. (5). — $Pb\bar{A}$, insol. aq. (4).]

[$\bar{C}$ on stdg. at ord. temp. with slight excess 0.76 N aq. KOH gives chlorine ion only $\frac{1}{40}$ as rapidly (4) as the isomeric chlorofumaric acid (3:4853).]

The acid chloride corresp. to $\bar{C}$, viz., chloromaleyl (di)chloride (3:6158) q.v., has been reported only by indirect means.

—— Dimethyl chloromaleate: oil (see 3:9351).

—— Diethyl chloromaleate: oil (see 3:6697).

Ⓓ Chloromaleanil [N-phenyl-chloromaleimide]: ndls. from boilg. alc., m.p. 170° (8). [From aniline salt of $\bar{C}$ (or of chlorofumaric acid) on htg. for a few minutes at 170–180° (8); note that this prod. on htg. with aniline yields (8) α-anilinosuccinanil [Beil. XXI-554, XXI_1-(432)], yel. cryst. from acetone + C_6H_6, m.p. 232° (8), and that a little of this latter cpd. which may accompany the former is readily removed from it by washing with warm C_6H_6 (8).]

Ⓓ Chloromaleic p-chloroanil [N-(p-chlorophenyl)chloromaleinimide]: pl. from hot alc., m.p. 175° (8). [From p-chloroaniline salt of $\bar{C}$ on htg. for a few minutes at 170–180° (8).]

Ⓓ Chloromaleic p-bromoanil [N-(p-bromophenyl)chloromaleinimide]: microcrystn. powder from boilg. alc., m.p. 190° (8). [From p-bromoaniline salt of $\bar{C}$ on htg. for a few minutes at 170–180° (8).]

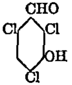
3:3520 2,4,6-TRICHLORO-3-HYDROXYBENZALDEHYDE



$C_7H_3O_2Cl_3$ Beil. VIII-61, $VIII_1$—

M.P. 115.5–116.5° (1)
115–116° (6)
114° (2)
113° (3)

Colorless cryst. from 50% AcOH; $\bar{C}$ seps. with AcOH of crystn. but this immediately effervesces in air. — $\bar{C}$ has pronounced sternutatory props. and on moist skin produces painful blisters (2).

[For prepn. of $\bar{C}$ from *m*-hydroxybenzaldehyde (1:0055) in AcOH with excess Cl_2 see (1) (2).]

[For condens. of $\bar{C}$ with 2,4-dichlorophenol (3:0560) see (4), with 2,4-dihydroxybenzoic acid (1:0843) and use of prod. as dye intermediate see (5).]

$\bar{C}$ in 50% aq. KOH warmed for 4 hrs. at 60–70° gives (89.9% yield (3)) 2,4,6-trichlorophenol (3:1673).

$Na\bar{A}$, pure yel. ndls., spar. sol. aq (2).

$\bar{C}$ in Na_2CO_3 soln. with Me_2SO_4 yields 2,4,6-trichloro-3-methoxybenzaldehyde, ndls. from alc., m.p 76° (2); on very slow oxidn with alk. $KMnO_4$ this prod. yields 2,4,6-trichloro-3-methoxybenzoic acid, m.p. 109° (2)

Ⓓ **2,4,6-Trichloro-3-hydroxybenzaldoxime:** ndls. from dil. alc., m.p. 174° (2), 170° (6). [This with boilg. Ac_2O yields 2,4,6-trichloro-3-acetoxybenzonitrile, lfts. from dil. AcOH, m.p. 82–83° (6).]

Ⓓ **2,4,6-Trichloro-3-hydroxybenzaldehyde *p*-nitrophenylhydrazone:** yel.-or. ndls., m.p. 272–273° dec (2) [From $\bar{C}$ in alc with *p*-nitrophenylhydrazine + 1 drop aq. (2).]

3:3520 (1) Bissell, Kranz (to Nat. Aniline & Chem. Co.), U S 1,776,803, Sept. 30, 1930; *Cent.* **1931**, I 159; *C.A* **24**, 5769 (1930). (2) Hodgson, Beard, *J. Chem. Soc.* **1926**, 148–149, 153. 3:3523 2,3,4,5-TETRACHLOROPHENOL

$C_6H_2OCl_4$ Beil. S.N. 522

M.P. 116–117° (1)
116° (2) (3)

[For prepn. of $\bar{C}$ from 2,3,4,5-tetrachloroaniline [Beil. XII-630, XII_1-(313)] via diazotization and reaction with aq (65% yield) see (1); from 2-amino-3,4,5,6-tetrachlorophenol [Beil. XIII-386] (3) via diazotization and elimination of diazo group with alc. see (3); for formn. of $\bar{C}$ from pentachlorobenzene (3:2290) with $N/2$ MeOH/NaOMe at 180° in s t. for 7½ hrs. as by-prod. of the isomeric 2,3,5,6-tetrachlorophenol (3:3460) see (4).]

$\bar{C}$ in aq. behaves as an acid, K at 25° = 1.1×10^{-7}, and can be titrated with $N/10$ aq. NaOH (1), Neut Eq = 232.

—— **2,3,4,5-Tetrachlorophenol methyl ether (2,3,4,5-tetrachloroanisole):** m.p. 83° (3). [Reported only by indirect means (4).]

—— **2,3,4,5-Tetrachlorophenol ethyl ether (2,3,4,5-tetrachlorophenetole):** unreported.

—— **2,3,4,5-Tetrachlorophenyl acteate:** unreported.

Ⓓ **2,3,4,5-Tetrachlorophenyl benzoate:** m.p. 110° (4) (5). [Note that this prod. depresses m.p. of corresp. benzoate from the isomeric 2,3,4,6-tetrachlorophenol (3:1687) (5).]

—— **2,3,4,5-Tetrachlorophenyl *N*-phenylcarbamate:** unreported.

3:3523 (1) Tiessens, *Rec. trav. chim.* **50**, 115–116, 119 (1931). (2) Tiessens, *Rec. trav. chim.* **48**, 1068 (1929). (3) Bures, Havlinova, *Časopis Československ. Lékárnictva*, **9**, 101–107, 129–134, 153–157 (1929); *Cent.* **1929**, II 1403; *C.A.* **24**, 2998 (1930). (4) Holleman, van der Hoeven, *Rec. trav. chim.* **39**, 748 (1920). 3:3525 4,5-DICHLOROCATECHOL (4,5-Dichloropyrocatechol)

$C_6H_4O_2Cl_2$ Beil. VI - 783
VI₁-(389)
VI₂—

M.P. 116–117° (1)
105–106° (2) (3)
(See text)

Colorless pr. from $CHCl_3 + CS_2$ (1); ndls. from C_6H_6 + pet. ether (2). — $\bar{C}$ is eas. sol. in cold aq. from which it crystallizes as a hemihydrate (1) (it is possible that the m.p. of 105–106° observed by some workers may have been due to formn. of this prod.). — $\bar{C}$ cryst. from AcOH with 1 mole of solvent, viz., $\bar{C}$.AcOH (1).

[For prepn. of $\bar{C}$ from pyrocatechol (1:1520) with SO_2Cl_2 (2 moles) or from 4-chloropyrocatechol (3:2470) with SO_2Cl_2 (1 mole) see (2).]

[$\bar{C}$ with silver oxide in dry ether gives (1) 4,5-dichlorobenzoquinone-1,2 [Beil. VII₁-(338)], m.p. 94°; note, however, that $\bar{C}$ with this prod. forms a corresp. quinhydrone, dec. abt. 85°.]

[$\bar{C}$ with Cl_2 in AcOH gives (1) 3,4,5-trichloropyrocatechol (3:3448) cryst. from aq. as monohydrate, m.p. abt. 106–109° (1), 104–105° (4), 115° (5).]

[$\bar{C}$ with PCl_5 gives (2) 1,2,4,5-tetrachlorobenzene (3:4115).]

$\bar{C}$ with N/10 aq. KOH titrates (1) as a monobasic acid, i.e., Neut. Eq. = 89.5. — $\bar{C}$ with aq. $FeCl_3$ gives blue-green coloration becoming red on addn. of aq. Na_2CO_3 (1).

$\bar{C}$ does *not* (6) condense with xanthydrol (1:5205) in AcOH (dif. from 4-chloropyrocatechol (3:2470)).

—— 4,5-Dichloropyrocatechol diacetate: unreported.

Ⓓ 4,5-Dichloropyrocatechol dibenzoate [Beil. IX₁-(72)]: m.p. 140.0–140.5° (1).

—— 4,5-Dichloropyrocatechol 1-methyl ether (4,5-dichloroguaiacol) [Beil. VII-783]: ndls. from pet. ether, m.p. 71–72° (7). [Prepd. indirectly (7).]

—— 4,5-Dichloropyrocatechol dimethyl ether (4,5-dichloroveratrole) [Beil. VII-783]: ndls. from alc., m.p. 85.5–86 5° (7). [From the preceding monomethyl ether with MeI + aq. KOH (7).]

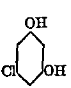
3:3530 5-CHLORORESORCINOL



$C_6H_5O_2Cl$ Beil. VI —
VI₁—
VI₂-(819)

M.P. 117° (1)

$\bar{C}$ cryst. from C_6H_6 in colorless ndls. of monohydrate, m p. 67° (1), which on sublimation in vac. yield anhydrous $\bar{C}$ (1).

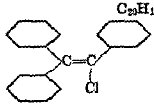
$\bar{C}$ is readily sol. in all usual solvents except lt. pet.; it rapidly absorbs aq. regenerating above monohydrate, m.p. 67° (1).

$\bar{C}$ with $FeCl_3$ gives bluish-purple color; $\bar{C}$ reduces boilg. Fehling soln.

$\bar{C}$ on bromination (no details (1)) yields 5-chloro-2,4-tribromoresorcinol, colorless ndls. from AcOH or dil. alc., m.p. 143° (1).

3:3530 (1) Hodgson, Wignall, *J. Chem. Soc.* **1926**, 2827.

3:3560 1-CHLORO-1,2,2-TRIPHENYL-ETHYLENE ("Chlorotriphenylethylene") $C_{20}H_{15}Cl$ Beil. V - 722, V_1-(355), V_2—



M.P. 117° (1) (2) (3) (4) (5)
116-117° (6)

Colorless cryst. from alc or pet. ether. — Insol aq.; sol. alc. or lt. pet.; freely sol. ether, acetone, benzene, or $CHCl_3$. — [For use of $\bar{C}$ in stimulation of action of estrogenic hormones see (7), for aq. susp. of $\bar{C}$ for medicinal use see (9).]

[For prepn of $\bar{C}$ from 1,1,2-triphenylethanol-1 (benzyl-diphenyl-carbinol) [Beil. VI-721, VI_1-(354)] in AcOH by treatment with Cl_2 at 30–40°, then htg. to b.p. to remove AcOH and effect loss of HCl (87% yield), see (1); from 1,2-dichloro-1,1,2-triphenylethane (1) by htg. just above m p. (115°) (100% yield (1)) or by refluxing 5 hrs. in pyridine (65% yield (1)) see (1); from triphenylethylene [Beil V-722, V_1-(355)] in AcOH with Cl_2 (1), in C_6H_6 with PCl_5 (4), or in CCl_4 with SO_2Cl_2 in pres. of dibenzoyl peroxide (2) see indic. refs.; from ω,ω-diphenylacetophenone (1,1,2-triphenylethanone) (triphenylvinyl alcohol) [Beil. VII-522, VII_1-(291)] (5) (3) or from triphenylacetaldehyde [Beil. VII_1-(292)] (6) with PCl_5 see indic. refs.]

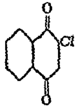
3:3580 2-CHLORONAPHTHO-QUINONE-1,4 (2-Chloro-α-naphthoquinone) $C_{10}H_5O_2Cl$ *Beil. VII - 729*, VII_1—



M.P. 118°	(1)
117°	(2) (3) (4)
116-117°	(5)
116°	(9)
115°	(8)
112° u.c.	(6)
111°	(7)

Yel. ndls with pungent quinone odor from dil. alc. or dil. AcOH. — Volatile with steam. — Eas. sol. alc., C_6H_6; spar. sol. ether.

[For prepn. of $\bar{C}$ from naphthoquinone-1,4 (α-naphthoquinone) (1:9040) by conversion with Cl_2 in AcOH to 2,3-dichloro-1,4-diketo-1,2,3,4-tetrahydronaphthalene ("α-naphtho-

quinone dichloride") [Beil. VII-702] and subsequent elimination of 1 HCl with NaOAc/AcOH see (4) cf. (7); from α-naphthol (1:1500) by conversion with Cl_2 in AcOH to 2,2,4-trichloro-1-keto-1,2-dihydronaphthalene [Beil. VII-387] and subsequent hydrolysis (with rearr.?) in boilg. dil. alc. or dil. AcOH see (5).]

[For prepn. of $\bar{C}$ from 1,3-dichloronaphthalene (3:1310) by oxidn. with CrO_3/AcOH see (8); from 2,4-dichloronaphthol-1 (3:3250) by oxidn. with CrO_3/AcOH or HNO_3/AcOH see (5) (9); from 2-chloro-1,2-diaminonaphthalene (2-chloronaphthylenediamine-1,2) by oxidn. with 2% alk. $KMnO_4$ see (2); from 2-chloronaphthol-1-sulfonic acid-4 by oxidn. with MnO_2 in boilg. 50% H_2SO_4 see (1); from 2,4-dinitronaphthol [Beil. VI-617, VI_1-(308)] by oxidn. with NaOCl in HCl soln. (3) or HCl + $KClO_3$ (10) see indic. refs.; from sodium salt of 4-(p-sulfobenzeneazo)naphthol-1 ("Orange I") [Beil. XVI-275, XVI_1-(296)] by oxidn. with NaOCl in HCl soln. see (3).]

[$\bar{C}$ on reduction might be expected to give 2-chloro-1,4-dihydroxynaphthalene [Beil. VI-975], m.p. 116–117°; note, however, that this reaction has not actually been reported and that this prod. is also obtained by SO_2 reduction of 3-chloronaphthoquinone-1,2 (3:4704). — For study of oxidn.-reductn. potential of $\bar{C}$ see (7).]

[$\bar{C}$ with Cl_2 in AcOH gives (4) (5) 2,3-dichloronaphthoquinone-1,4 (3:4857).]

[$\bar{C}$ in boilg. alc. with aq. NaN_3 splits out NaCl giving (90% yield (11)) 2-azidonaphthoquinone-1,4, long yel. pr. from alc., m.p. 118° dec.]

$\bar{C}$ with aniline on htg. (5) (6) in alc. soln. (8) (9) gives 3-chloro-2-anilino-naphthoquinone-1,4 [Beil. XIV-168, XIV_1-(434)], red ndls., m.p. 207–208° (10), 207° (8), 202–203° (9) (6).

$\bar{C}$ like many other quinones is able to form Diels-Alder type adducts with many conjugated dienes [e.g., $\bar{C}$ with 2,3-dimethylbutadiene-1,3 (1:8050) gives an adduct which with aq. 5% NaOH and a little $Na_2S_2O_4$ at 70° reduces (with loss of halogen) to 2,3-dimethyl-1,4-dihydroanthrahydroquinone which in turn upon oxidn. with air at 0° gives (12) 2,3-dimethylanthraquinone [Beil. VII-815, VII_1-(425)], yel. ndls. from alc. or AcOH, m.p. 210° (13), 209° (14), 208–209° (15), 208° (16), 205–206° (17); note also that this 2,3-dimethylanthraquinone is also obtd. (18) from the initial adduct with pyridine in absence of air, or (18) from $\bar{C}$ + 2,3-dimethylbutadiene-1,3 (1:8050) at 100–105° under press. — For behavior of $\bar{C}$ with 2-methylbutadiene-1,3 (isoprene) (1:8020) and with butadiene-1,3 see (18).]

—— 2-Chloronaphthoquinone-1,4-oxime-4 (2-chloro-4-nitrosonaphthol-1) [Beil. VII-729]: ndls. from alc., m.p. 200° dec. (8). [From $\bar{C}$ with $NH_2OH.HCl$ in alc. on warming (8).]

—— 2-Chloronaphthoquinone-1,4-(p-nitrophenylhydrazone-4) = 4-(p-nitrobenzeneazo)-2-chloronaphthol-1: m.p. 274° dec. (1). [From $\bar{C}$ with p-nitrophenylhydrazine (1); also from 2-chloronaphthol-1 (3:1490) in alk. soln. on coupling with diazotized p-nitroaniline (1).]

3:3580 (2) Hodgson, Elliott,
J. Chem ..., 201, 338 (1927). (4)

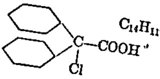
mann, *Ber.* 15, 485, Note 1 (1882).

3:3585 α-CHLORO-DIPHENYL-ACETIC ACID
(Diphenylchloroacetic acid)



$C_{14}H_{11}O_2Cl$ Beil. IX - 674
IX_1-(282)

M.P. 120° dec. (1)
118–119° dec. (2) (3)

[*See also α-chlorodiphenylacetyl chloride* (3:0885).]

Tbls. from C_6H_6/lgr.; very eas sol. lgr.

[For prepn. of $\bar{C}$ from benzilic acid (α-hydroxydiphenylacetic acid) (1:0770) with $POCl_3$ on warming (not boilg) until red color begins to appear (65% yield (3)) (4); with PCl_5 (62 5% yield (1)) or PCl_3 (68% yield (1)) both at room temp ; with $SOCl_2$ directly at room temp. (92% yield (1)) or with $SOCl_2$ (3 moles) in CCl_4 at ord. temp (5) (2) see indic. refs ; note, however, that benzilic acid (1:0770) with PCl_5 (2 moles) at 120–130° (6) or 100° (7) or *excess* PCl_5 (5 moles) in C_6H_6 at room temp. (1) gives instead α-chlorodiphenylacetyl chloride (3:0885), m p. 50°; note also that benzilic acid (1:0770) with large excess (6 moles) $SOCl_2$ refluxed for several days gives (5) α-chlorodiphenylacetic acid anhydride [Beil. IX_1-(228)], m p 129° (5)]

[For prepn. of $\bar{C}$ from *O*-carbomethoxybenzilic acid (2) with $SOCl_2$ see (2); for prepn of $\bar{C}$ from α-chlorodiphenylacetyl chloride (3:0885) by hydrolysis (even in moist air) see (8).]

$\bar{C}$ on reduction with $TiCl_3$ in boilg. AcOH gives (8) diphenylacetic acid (1:0765), m.p. 148°.

$\bar{C}$ (or its sodium salt) htd. under reduced press. at 125° for 10 hrs. gives (80–90% yield (9)) benzilide [Beil. XIX-187, XIX_1-(700)], ndls. from alc., m.p 196° (10), 194° (11) (5), 193° (12), 192–193 5° (9) [the structure of this prod is disputed, but it is either 2,2,5,5-tetraphenyl-3,6-diketodioxane-1,4 or tetraphenyldiglycolic acid anhydride].

$\bar{C}$ with aq. KSH (or NaSH) does *not* (21) give the expected α-mercaptodiphenylacetic acid (diphenylthioglycolic acid) (thiobenzilic acid) [Beil X_1-(154)], but rather (apparently because of alkalinity of the soln) benzilic acid (1·0770).

[$\bar{C}$ with NaOMe (?) gives (13) α-methoxydiphenylacetic acid (benzilic acid *O*-methyl ether) [Beil. X_1-(152)], m.p. 100° (13); note that various compounds prepd by a wide variety of methods but all supposed to have this structure have been reported with m p.'s as follows: 99–100° (14), 102° (15), 106° (16), 107° (17), 111–112° (18), 120–121° (9); note also that the corresp. methyl ester, viz., methyl α-methoxydiphenylacetate, oil, b p 199–200° at 27 mm., has been prepd. (19) from α-bromodiphenylacetate with MeOH.]

[$\bar{C}$ with EtOH/NaOEt gives (8) cf. (13) α-ethoxydiphenylacetyl bromide with MeOH.] tbls. from ether, m.p. 114–115° (20) (8), 114° (13), 113–114° (14); the corresp. ethyl ester, viz., ethyl α-ethoxydiphenylacetate, appears to be unreported]

$\bar{C}$ with Na phenolate might be expected to give α-phenoxydiphenylacetic acid, but neither this reaction nor the expected prod. is reported. — However, $\bar{C}$ with thiophenol in C_6H_6 refluxed 2 hrs evolves HCl and gives (22) α-thiophenoxy-diphenylacetic acid, cryst. from 50% AcOH, m p. 126–128° (22)

[$\bar{C}$ with C_6H_6 + $AlCl_3$ gives normal Friedel-Crafts type reaction giving (25% yield (3)) triphenylacetic acid [Beil. IX-712, IX_1-(309)], m p. 265°.]

$\bar{C}$ with various amines or amino compds splits out HCl giving the corresp. α-aminodiphenylacetic acid derivatives [e.g , $\bar{C}$ with NH_3 gives (13) α-aminodiphenylacetic acid (diphenylglycine), m p. 245° (13); $\bar{C}$ with piperidine gives (13) α-piperidinodiphenylacetic acid, m p. 180° (13); for other cases see (13)].

$\bar{C}$ with benzhydrazide in C_6H_6 splits out HCl and yields (8) α-benzhydrazido-diphenylacetic acid, m.p. 167–168° (8).

$\bar{C}$ with excess $SOCl_2$ on warming does *not* give the expected α-chlorodiphenylacetyl chloride (3:0885), m.p. 50°, but rather (5) α-chlorodiphenylacetic acid anhydride, m.p. 120° (5).

$\bar{C}$ in pyridine on htg. at 100° (23) evolves CO_2 presumably yielding benzohydryl chloride (α-chlorodiphenylmethane) (3:0060) as its quaternary salt with pyridine.

—— Methyl α-chlorodiphenylacetate: oil, b.p. 196° at 16 mm. (4). [From $\bar{C}$ in dioxane soln. with diazomethane (100% yield) (4); note also that this ester with Cu bronze refluxed in C_6H_6 for 5 hrs. then evaporated in air gives (4) the *peroxide*, m.p. 151–152°, of dimethyl tetraphenylsuccinate.]

—— Ethyl α-chlorodiphenylacetate: cryst. from alc., m.p. 43–44° (24) (6), b.p. 185° at 14 mm. (24). [From $\bar{C}$ with EtOH + dry HCl (10) best in pres. of C_6H_6 as directed (90% yield (25)), or from α-chlorodiphenylacetyl chloride (3:0885) with EtOH (6), or from ethyl benzilate (1:2086) with PCl_5 (6).]

—— α-Chlorodiphenylacetamide: m.p. 115° (6), 111–113° (26). [From α-chlorodiphenylacetyl chloride (3:0885) in ether with NH_3 gas (6) (13).]

—— α-Chlorodiphenylacetanilide: m.p. 88°. [See text of α-chlorodiphenylacetyl chloride (3:0885).]

3:3585 (1) Setlur, Nadkarny, *Proc. Indian Acad. Sci.* **12-A**, 268 (1940); *C.A.* **35**, 1398 (1941).

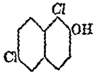
3:3600 1,6-DICHLORONAPHTHOL-2



$C_{10}H_6OCl_2$ Beil. VI — VI_1— VI_2-(604)

M.P. 119.5° (1)

Ndls from hot lgr.

[For prepn from 1-chloronaphthol-2 (3:1700) by actn. of Cl_2 in sunlight see (1).]

$\bar{C}$ on reduction with $FeSO_4$ + NaOH yields (2) 6-chloronaphthol-2 (3:3500), m.p. 115° (2).

3:3600 (1) Ruggli, Knapp, Merz, Zimmermann, *Helv. Chim. Acta* **12**, 1050–1051 (1929). (2) Herzberg, Spengler, Schmidt (to I G), Ger. 431,165, June 30, 1926, *Cent.* **1926**, II 1196.

3:3634 DICHLOROMALEIC ACID

Cl—C—COOH
‖
Cl—C—COOH

$C_4H_2O_4Cl_2$ Beil. II - 753 II_1— II_2—

M.P. 119–120° (1)
118.5–119° (2)
118–119° (3)
116° (4)

[*See also dichloromaleic anhydride* (3:3635) *and dichloromaleyl (di)chloride* (3:6197).]

Ndls. from lgr./ether. — Eas. sol. aq.; sol. alc., AcOH; insol C_6H_6, $CHCl_3$, CS_2. — Note that $\bar{C}$ on htg. very readily loses H_2O and is converted to dichloromaleic anhydride (3:3635); the m.p.'s observed for $\bar{C}$ are probably actually those of its anhydride.

Note also that, although the structure corresp. to $\bar{C}$ should be capable of existing also in the geometrically isomeric *trans* configuration, no such dichlorofumaric acid or its derivatives has ever been reported.

[For prepn. of $\bar{C}$ from furfural (1:0185) in conc. HCl soln. with Cl_2 (30% yield) see (5); from dichloromaleinaldehyde-acid ("mucochloric acid") [Beil. III-727] by oxidn. with fumg. HNO_3 on stdg. at ord. temp. for several days (100% yield (4)) (2) see indic. refs.; from α,β-dichloro-β-(trichloroacetyl)acrylic acid ("perchloro-β-acetylacrylic acid") [Beil. III-733] by hydrolytic cleavage with aq. NaOH (chloroform is also formed) see (3); from hexachlorocyclohexen-1-dione-3,6 [Beil. VII-574] by hydrolytic cleavage with 10% aq. NaOH (trichloroethylene (3:5170) is also formed) see (1); from hexachlorocyclohexen-1-dione-3,5 ("hexachlororesorcinol") (3:3470) (6) or from 2,2,3,4,6,6,6-heptachlorohexen-3-one-5-acid-1 [Beil. III-735, III_1-(255)] (6) with large excess dil. aq. $Ca(OCl)_2$ see indic refs.]

[For formn. of $\bar{C}$ from 3,4-dichlorofuroic acid [Beil. XVIII-282] by oxidn. with boilg. dil. HNO_3 (7) or from 3,4,5-trichlorofuroic acid [Beil. XVIII-283] by oxidn. with hot dil. HNO_3 or cold Br_2/aq. (7) see indic. refs.; from pyrrole with aq. NaOCl (other prods. are also formed) see (8).]

$\bar{C}$ behaves normally as a dibasic acid: e.g., $\bar{C}$ on titration with standard dil. aq. alk. gives Neut. Eq. 92.5 (2).

[Salts: for $Li_2\bar{A}$, $Na_2\bar{A}.H_2O$, $NaH\bar{A}.H_2O$, $K_2\bar{A}.2H_2O$, $K_2\bar{A}.H_2O$, $Cu\bar{A}.H_2O$, $Pb\bar{A}.H_2O$, $Ni\bar{A}.2H_2O$ see (4). — $Ba\bar{A}.2\frac{1}{2}H_2O$ (3). — $Ag_2\bar{A}$, white ndls. which explode on htg. (3) (8) (9).]

—— **Dimethyl dichloromaleate:** oil, b.p. 225° (9). [From dichloromaleic anhydride (3:3635) in MeOH with HCl gas on boilg. (9). — This prod. with aniline at 100° yields (4) dimethyl α,β-dianilinomaleate, cryst. from alc., m.p. 172° (4).]

—— **Diethyl dichloromaleate:** unreported.

—— **Dichloromaleinimide** [Beil. XXI-401]: ndls. from aq., m.p. 179° (10). [From dichloromaleic anhydride (3:3635) with urea on htg. at 110–115° (10).]

—— ***N*-Phenyldichloromaleinimide** *(dichloromaleanil)* [Beil. XXI-402]: *colorless lfts.* from MeOH, m.p. 203°. [Reported only by indirect means.]

[*See also dichloromaleic acid* (3:3634).]

Colorless lfts. very eas. sol. alc., ether, C_6H_6, or CS_2; sublimable.

[For prepn. of $\bar{C}$ from dichloromaleic acid (3:3634) by htg. see (1) (2) (10); for prepn. of $\bar{C}$ from maleic anhydride (1:0625) with Cl_2 at 130° in pres. of Fe (80% yield (7)) or from chlorofumaryl dichloride with Cl_2 in pres. of Fe (8) see indic. refs.; for prepn. of $\bar{C}$ from furoic acid (1:0475) by conv. with MnO_2 + HCl to mucochloric acid, OCH.CCl=CCl.COOH [Beil. III-727] (9), and subsequent treatment with fumg. HNO_3 (4) (9) or from 3,4-dichlorofuran (9) by oxidn. with fumg. HNO_3 (9) see indic. refs.; for formn. of $\bar{C}$ (together with other products) from diethyl tartrate (1:4256) with PCl_5 for 7–8 hrs. at 100° see (6); from either dichloromaleo(di)nitrile (m.p. 58–59°, D_4^{62} = 1.32501, n_D^{62} = 1.48824 (12)) or from dichlorofumaro(di)nitrile (m.p. 60.0–60.5°, D_4^{62} = 1.32543, n_D^{62} = 1.48845 (12)) by hydrol. see (12).]

$\bar{C}$ is itself spar. sol. aq. but slowly dissolves (1) (6) yielding a soln. of dichloromaleic acid (3:3634).

$\bar{C}$ with PCl_5 yields (8) dichloromaleyl dichloride (3:6197).

$\bar{C}$ with 1 mole anthracene (1:7285) htd. for 10 min. at 170° gives 100% yield (4) of anthracene-9,10-*endo*-dichloromaleic anhydride, ndls. from acetonitrile, m.p. 235° (4).

$\bar{C}$ with 1 mole urea htd. to 90–95° for 20 min. yields (11) dichloromaleic acid monoureide [Beil. III-68], m.p 158° dec. (11); this prod. on fusion or the original system htd. at 110–115° yields (11) dichloromaleinimide [Beil. XXI-401], m.p. 179° (11).

$\bar{C}$ on htg. with aniline (9) yields α-chloro-α-anilinomalein-α′-isoanil [Beil. XVII-555], greenish yel. cryst. from alc., m.p. 188.7–190 2° cor. (9), 187° (10).

120–121° (2)

[*See also 3,4-dichlorophthalic acid* (3:4880).]

Tbls. from CCl_4; sol. in C_6H_6, toluene, $CHCl_3$.

[For prepn. of $\bar{C}$ from 3,4-dichlorophthalic acid (3:4880) by protracted htg. at 220° see (2); for formn. of $\bar{C}$ (together with other isomers) from phthalic anhydride (1:0725) with Cl_2 at 240° in pres of Fe or Fe salts (3), from phthalic anhydride or 3-chlorophthalic

anhydride (3:3900) with Cl_2 in fumg. H_2SO_4 in pres. of I_2 (4) (1), see indic. refs.] [For sepn. of $\bar{C}$ from isomeric dichlorophthalic anhydrides by means of salts of corresp. acids see (4) (1) (18); by means of differential hydrolysis with H_2SO_4 (prods. with no α-chlorine such as 4,5-dichlorophthalic anhydride require H_2SO_4 of 98–100% concn.; those with one α-chlorine such as $\bar{C}$ hydrolyze with 56–95% H_2SO_4; those with two α-chlorines such as *3,6-dichloro- or 3,4,5,6-tetrachlorophthalic anhydrides hydrolyze at H_2SO_4 concns. of* less than 50%) see (5).]

$\bar{C}$ dislvd. in abs. alc. yields *one* of the two known acid esters, viz., 3,4-dichloro-2-carbethoxybenzoic acid, pr. from dil. alc., m.p. 164° (6); see also under 3,4-dichlorophthalic acid (3:4880).

[$\bar{C}$ with PCl_5 htd. in s.t. at 200° for 6 hrs. gives exclusively (6) *pseudo*-3,4-dichlorophthaloyl dichloride (3,3,6,7-tetrachlorophthalide), ndls. from C_6H_6, m.p. 133° (6) (this prod. shaken *with abs. alc. susp. of $CaCO_3$ for 10 hrs. yields (6)* 6,7-dichloro-3,3-diethoxyphthalide, pr. from pet. ether., m.p. 79° (6), which depresses m.p. of normal diethyl 3,4-dichlorophthalate, m.p. 80° (6) to 60°).]

$\bar{C}$ with 1 mole $NH_2OH.HCl + Na_2CO_3$ in aq. as directed (2) yields 3,4-dichlorophthalylhydroxylamine (*N*-hydroxy-3,4-dichlorophthalimide) [Beil. XXI-504], ndls. from MeOH, m.p. 218–219° (2), 216–219° (7) (this prod. with boilg. aq. Na_2CO_3 yields (2) (7) a mixt. of 3,4-dichloro-2-aminobenzoic acid (3,4-dichloroanthranilic acid) [Beil. XIV-367, XIV_1-*(549)] and 5,6-dichloro-2-aminobenzoic acid (5,6-dichloroanthranilic acid* [Beil. XIV-368]).

[$\bar{C}$ with steam passed over cat. at 380–420° loses CO_2 presumably yielding (8) 2,3-dichlorobenzoic acid (3:4650) and/or 3,4-dichlorobenzoic acid (3:4925).]

[$\bar{C}$ with hydroquinone (1:1590) + H_3BO_3 htd. at 190° and afterward treated with hot conc. H_2SO_4 (9), or $\bar{C}$ with $AlCl_3$ + NaCl htd. at 200–220° for 45 min. (10), or $\bar{C}$ with *p*-chlorophenol (3:0475) htd. with fumg. $H_2SO_4 + H_3BO_3$ (11), gives 5,6-dichloro-1,4-dihydroxyanthraquinone *(5,6-dichloroquinizarin) [Beil. $VIII_1$-(715)], red. ndls. from* AcOH, m.p. 239° (10), 208° (9) (diacetate, m.p. 170° (10), 140° (9)).]

[For study of behavior of $\bar{C}$ with *o*-chlorotoluene + $AlCl_3$ see (12); for use of $\bar{C}$ with dibenzanthrone derivs. in prepn. of vat dyes see (13); for reactn. with *p*-cresol see (16).]

$\bar{C}$ on fusion with urea yields (14) 3,4-dichlorophthalimide, m.p. 348–351° (14) (for use in prepn. of pigments of phthalocyanine type see (14) (15)).

$\bar{C}$ (1 pt.) dislvd. in 5 pts. boilg. AcOH and treated with 1 pt. aniline gives on cooling *97% yield 3,4-dichlorophthalanil [Beil. XXI_1-(391)], cryst. from AcOH, m.p. 181–181.5°* cor. (1), ndls. from alc., m.p. 179–180° (17) [note, however, that on protracted htg. with excess aniline one of the two nuclear halogens also reacts, e.g., $\bar{C}$ (1 pt.) boiled with 3 pts. aniline for 10 hrs. gives 4-chloro-3-anilinophthalanil, cryst. from alc., m.p. 159.5–160° cor. (1); note also that under certain conditions both halogens can be removed, e.g., 3,4-dichlorophthalanil (above) on refluxing 6 hrs. with aniline + anhydrous Na_2CO_3 + Cu gives (10% yield (17)) 3-anilinophthalanil, or.-yel. pr., m.p. 144.5–145° (17).]

$\bar{C}$ on saponification with standard alk. (Sap. Eq. = 108.5), followed by acidification, yields 3,4-dichlorophthalic acid (3:4880) q.v.

Ndls. from dil. alc. or from $CHCl_3$. — Very eas. sol. org. solv. — Sublimes in ndls. — Volatile with steam but less so than 2-chloronaphthol-1 (3:1490) (use in sepn. from latter (6)).

[For prepn. of C̄ from *bis*-(4-chloronaphthyl-1) carbonate (itself obtd. from *bis*-(α-naphthyl) carbonate in AcOH with Cl_2 in pres. of $SbCl_3$ (5)) by hydrolysis with alc. KOH see (5); from 4-chloronaphthyl-1 *p*-toluenesulfonate (itself obtd. from α-naphthyl *p*-toluenesulfonate in CCl_4 with Cl_2 + cat. (7)) by hydrolysis see (7); from α-naphthol (1:1500) with SO_2Cl_2 in $CHCl_3$ as directed (yields: 20–60% (1), 42% (6), 27–33% (8)) (26) (the isomeric 2-chloronaphthol-1 (3:1490) is also formed) see indic. refs.; from 1,4-dichloronaphthalene (3:1655) by htg. with MeOH/KOH in copper-lined autoclave 20 hrs. at 190–200° see (9); from 4-chloronaphthol-1-sulfonic acid-8 (10) (3) by hydrolysis (10) or reductive cleavage with Na/Hg (3) of the $-SO_3H$ group see indic. refs.; from 4-chloro-1-hydroxynaphthoic acid-2 [Beil. X_1-(146)] by htg. in naphthalene or nitrobenzene in pres. of aniline (yield: 81–89%) see (2); from 4-chloronaphthyl-1 MgBr in ether by oxidn. with dry O_2 see (4).]

C̄ with Cl_2 in AcOH yields (4) 2,4-dichloronaphthol-1 (3:3250), m.p. 106° (4); C̄ with 1 mole Br_2 in AcOH gives alm. quant. yield (11) 2-bromo-4-chloronaphthol-1; ndls., m.p. 96° (11).

[C̄ with 0.5 mole SCl_2 in $CHCl_3$ gives (79% yield (12)) *bis*-(4-chloro-1-hydroxynaphthyl-2) sulfide, colorless ndls. from hot alc., m.p. 172° dec. (12); for reactn. of C̄ with 2-hydroxynaphthalene-1-sulfenyl bromide (13) (14), or with SCl_2 + β-naphthol (15), see indic. refs.]

[C̄ undergoes many condensations with various types of cpds., e.g., for condensation of C̄ with formaldehyde (16) (17), with 2,6-*bis*-(hydroxymethyl)-4-methylphenol (18), and use of prods. as mothproofing cpds. see indic. refs.; for condensation of C̄ with naphthalene-2,3-dicarboxylic acid anhydride [Beil. $XVII_1$-(266)] see (19); for condensation of C̄ with malic acid (1:0450) or with ethyl acetoacetate (1:1710) or with ethyl methylacetoacetate (1:1712) using H_2SO_4 or P_2O_5 yielding naphthapyrone derivs. see (8); for condens. of C̄ with 2,3-dichloronaphthoquinone-1,4 (3:4857) for use in prepn. of vat dyes see (21).]

[C̄ with maleic anhydride (1:0625) + $AlCl_3$ + NaCl htd. ½ hr. at 210–220° gives (12% yield (20)) 10-chloro-1-hydroxyanthraquinone-4,9, dark red ndls. from C_6H_6, m.p. 205–206°; similarly C̄ with citraconic anhydride (1:1135) yields (20) both 10-chloro-1-hydroxy-2-methyl- and 10-chloro-1-hydroxy-3-methylanthraquinone-4,9.]

[$\bar{C}$ with 2,4-dinitrotoluene forms a mol. cpd., m.p. 65° (22); $\bar{C}$ with 2,4-dinitroanisole forms a mol. cpd. (22); for use of these as fungicides see (22); for use of $\bar{C}$ as disinfectant see (23).]

$\bar{C}$ with PkOH in $CHCl_3$ (5) forms an unstable mol. cpd., $\bar{C}$.PkOH, or. ndls., m.p. 171° (5), 170–171° (4) (1).

$\bar{C}$ with $FeCl_3$ or $Ca(OCl)_2$ in neutral soln. gives blue ppt. (5) (4).

$\bar{C}$ in alc. (10 pts.) treated with conc. HCl (5 pts.) and then with $NaNO_2$ (0.4 pt.) yields (2) 4-chloronaphthoquinone-1,2-oxime-2 [Beil. VII$_1$-(385)], purified via the beautifully crystg. dif. sol. red sodium salt, from which HCl ppts. the free oxime, pale yel. ndls, m.p. 157° (2).

Ⓓ **4-Chloro-1-naphthyl acetate:** cryst. from lgr., m.p. 44° (4) (26). [From $\bar{C}$ with AcCl (2).] [For Fries rearr. of this acetate to 4-chloro-1-hydroxy-2-naphthyl methyl ketone see (24).]

—— **4-Chloro-1-naphthyl benzoate:** ndls. from alc., m.p. 100–101° (25). [Reported only by indirect means (25).]

3:3750 2,6-DICHLOROBENZOQUINONE-1,4
(*m*-Dichlorobenzoquinone)

$C_6H_2O_2Cl_2$ Beil. VII - 633
VII$_1$-(347)

M.P.	121° cor.	(1)
	121°	(2)
	120.5°	(3)
	120°	(4) (5) (6) (9) (14) (17)
	120–121°	(7) (8)
	119°	(12)

[*See also* 2,6-*dichlorohydroquinone* (3:4600).]

Yellow cryst. from C_6H_6 or lgr.; yellow pr. from alc. or AcOH. — $\bar{C}$ is somewhat sol. boilg. aq. or cold alc.; eas. sol. hot alc.; sol. $CHCl_3$. — Sublimes far below m.p.; volatile

with steam. — $\bar{C}$ turns skin reddish brown. [For study of photochem. decompn. of alc. soln. see (43).]

[For prepn. of $\bar{C}$ from 2,6-dichlorohydroquinone (3:4600) with CrO_3 (7) or with excess aq. $FeCl_3$ soln. on *warming* (9) see indic. *refs.*; from 2,4,6-trichlorophenol (3:1673) on oxidn. with CrO_3 in AcOH at 30–40° (yields: 60% (3), 27% (10)) (2), with cold fumg. HNO_3 (25% yield (11)) (6), with mixt. of fumg. HNO_3 + conc. H_2SO_4 (12), with PbO_2 in AcOH or in C_6H_6 (10) or in alc. with HNO_2 (13) (14) cf. (10), see indic. refs. (note that in addn. to $\bar{C}$ the crude oxidn. prod. contains also 2-*chloro*-6-(2',4',6'-*trichlorophenoxy*)-benzoquinone-1,4, m.p. 134–135° (10), and 2,6-*bis*-(2',4',6'-trichlorophenoxy)benzoquinone-1,4, m.p. 245° (10), which resemble $\bar{C}$ in appearance, composition, and behavior); from 2,6-dichloro-4-fluorophenol (8) or its dimethyl ether (8) or from 2,6-dichloro-4-bromophenol (11) with ice-cold HNO_3 (D = 1.5) see indic. *refs.*; *from* 2,6-dichloro-4-nitrophenol [Beil. VI-241, VI$_1$-(122)] on htg. above its m.p. (125°) (15) or in small amt. with mixt. of fumg. HNO_3 + fumg. H_2SO_4 at ord. temp. (16); from 2,6-dichloro-4-aminophenol [Beil. XIII-512, XIII$_1$-(183)] by *oxidn. with* $K_2Cr_2O_7$ + H_2SO_4 *(90% yield (1)) (17) see indic. refs.*; *from* 3,5-dichloro-4-aminophenol [Beil. XIII-513] similarly see (18); *from* 2,6-dichloro-*p*-phenylenediamine [Beil. XIII-118, XIII$_1$-(37)] by oxidn. with dichromate see (19) (10); from 2,6-dichloro-4-bromophenol bromide (4) or from "2,4,6-trichlorophenol bromide" (2,4,6-trichloro-6-bromocyclohexadiene-1,4-one-3) [Beil. VII-145] (5) with cold fumg. HNO_3 see *indic. refs.*; *from* 2,6-dichlorobenzoquinone-1,4-(2,4-dinitroanil)-4 [Beil. XII-754] on hydrolysis with dil. H_2SO_4 in s.t. at 200° see (20).]

[For study of bactericidal value of $\bar{C}$ see (21); for use as vulcanization accelerator see (22); for condensation with β-naphthylamine and use of prods. as intermediates in prepn. of *sulfur dyes see* (23); *for condensation with various amines to yield corresp. mono- and* diarylaminoquinones see (24); for condensation with various aminophenols and use of prods. in prepn. of oxazine dyes see (25); for condensation of $\bar{C}$ with o-aminoaryl mercaptans and use in prepn. of vat dyes see (26); for reactn. with $Na_2S_2O_3$ + AcOH in prepn. of sulfur *dyes see* (40).]

$\bar{C}$ on reductn. with aq. SO_2 gives (80% yield (3)) (27) (1) 2,6-dichlorohydroquinone (3:4600) (note, however, that $\bar{C}$ in dil. aq. NaOH under N_2 with SO_2 is in part reduced to 2,6-dichlorohydroquinone (3:4600) and in part sulfonated to mono- and disulfonic acids of $\bar{C}$ (28)). — [For studies of the oxidn.-reductn. potential of system $\bar{C}$ + 2,6-dichlorohydroquinone see (3) (29) (30) (42).] — [$\bar{C}$ forms with 2,6-dichlorohydroquinone the corresp. quinhydrone, brown prismatic ndls., m.p. 135° (31), but does so less readily than the benzoquinone-1,4/hydroquinone system (3); *note that this same quinhydrone is obtd.* (36) from $\bar{C}$ + ord. hydroquinone (36).]

[$\bar{C}$ in $CHCl_3$ at low temp. does not react with Cl_2 but at ord. temps. gives (22) tetrachlorobenzoquinone-1,4 (chloranil) (3:4978). — $\bar{C}$ in AcOH at 15–20° gives (11) with 2 *moles* Br_2 2,6-*dichloro*-3,5-*dibromobenzoquinone*-1,4 [Beil. VII-642], m.p. 291° (11), accompanied by a little 2,5-dichloro-3,6-dibromobenzoquinone-1,4 [Beil. VII-642], m.p. 292° (11); but $\bar{C}$ in boilg. AcOH with 2 moles Br_2 gives exclusively the latter (11) cf. (19) (33).]

[$\bar{C}$ with conc. HCl gives on boilg. (34) both 2,3,5-trichlorobenzoquinone-1,4 (3:4072) and 2,3,5,6-tetrachlorobenzoquinone-1,4 (chloranil) (3:4978).]

[$\bar{C}$ in cold alc. treated dropwise with 10% alc. KOH gives first a green soln. turning to brownish red and pptg. in poor yield (2) a potassium salt of 2-chloro-3,6-dihydroxybenzoquinone-1,4 [Beil. VIII-378]; $\bar{C}$ *in satd. alc. soln. at* 50–60° with conc. NH_4OH gives a purple soln. grad. turning brownish red and pptg. (20–25% yield (2)) 2-chloro-3,6-dihydroxybenzoquinone-1,4-diimide [Beil. VIII-379], bronze-colored lfts. from AcOH, subliming at 258–260° without melting.]

[$\bar{C}$ (1 pt.) in alc. (15–20 pts.) + conc. HCl (0.3–0.4 pts.) *treated with* aniline (0.25 pt.)

yields mainly (35) 2,6-dichloro-3-anilinobenzoquinone-1,4 [Beil. XIV-137], blue ndls. or lfts., m.p. 154° (35), and 2,6-dichlorohydroquinone (3:4600) accompanied by small amts. of 2-chloro-3,6-dianilinobenzoquinone-1,4 (see below); C̃ in either alc. or AcOH with excess *aniline yields* (35) *2-chloro-3,6-dianilinobenzoquinone-1,4* [Beil. XIV-143], brown lfts. from AcOH, m.p. 262° (35), and 2,6-dichlorohydroquinone (3:4600).] — [Note that C̃ with sulfanilic acid behaves similarly: e g., C̃ with 2 moles sulfanilic acid in aq. (best in pres. of NaOAc) yields (37) 2-chloro-3,6-*bis*-(*p*-sulfoanilino)benzoquinone-1,4 together with 2,6-dichlorohydroquinone (3:4600); in aq. alc., however, 2,6-dichloro-3-(*p*-sulfoanilino)benzoquinone is also formed (37).]

[C̃ with $NH_2OH.HCl$ in alc. yields (38) 2,6-dichlorobenzoquinone-1,4-monoxime-4, pale yel. lfts. from dil. alc., m.p. 140° (38), which with cold conc. HNO_3 oxidizes to 2,6-dichloro-4-nitrophenol [Beil. VI-241], colorless ndls. from aq., lfts. from AcOH, tbls. from ether, *m.p. 125° dec.; note that no dioxime can be formed.*]

[C̃ with semicarbazide HCl in cold dil. alc. gives (39) 2,6-dichlorobenzoquinone-1,4-*semicarbazone-4, in red or yel. forms acc. to conditions, but both of m.p. 218° dec. (39)*; note that no *bis*-semicarbazone can be formed.]

[C̃ with 20% soln. of triphenylphosphine in $CHCl_3$ gives an orange-red, red, or brown color (41) (also shown by trichlorobenzoquinone and by chloranil); for other limitations and details see (41).]

3:3780 **4-CHLORO-3-HYDROXYBENZALDEHYDE** 
$C_7H_5O_2Cl$ Beil. S.N. 746

M.P. 121° (1) (2)

Colorless ndls. (1).

[For prepn. of C̃ from *m*-hydroxybenzaldehyde (1:0055) via 4-nitro-3-hydroxybenzaldehyde, reduction to amino cpd., and use of appropriate diazo reactn. see (1).]

C̃ in 50% AcOH mononitrated as specified (2) gives mainly 4-chloro-2-nitro-3-hydroxybenzaldehyde, spar. sol. in hot $CHCl_3$, colorless pr. from AcOH, m.p. 175° (2) (3). [Note that this statement takes account of a very important correction (3).] [This 4-chloro-2 nitro-3-hydroxybenzaldehyde yields the following derivs.: *p*-nitrophenylhydrazone, deep maroon ndls. from hot AcOH, m.p. 275–276° dec.; semicarbazone, lt. or. ndls. from alc., m p. 265–266° dec. (2)]

C̃ in aq. contg $NaHCO_3$ treated with $(CH_3)_2SO_4$ yields (1) 4-chloro-3-methoxybenzaldehyde, m.p. 52° (1). [This prod. depresses m.p. of corresp. methyl ether of the isomeric 2-chloro-3-hydroxybenzaldehyde (3:4085), m p. 56–57° (1); on keeping it acquires a beautiful silver-gray color (1); it yields an oxime, colorless ndls., m.p. 98–99°, and a *p*-nitrophenylhydrazone, old-gold ndls., m.p. 251° (1).]

Ⓓ **4-Chloro-3-hydroxybenzaldoxime:** colorless ndls. of hydrate, dec. 106–110° from dil. alc.; anhydrous oxime, m.p. 126° (1).

—— **4-Chloro-3-hydroxybenzaldehyde phenylhydrazone:** unrecorded.

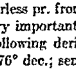
Ⓓ **4-Chloro-3-hydroxybenzaldehyde *p*-nitrophenylhydrazone:** violet-red ndls. from dil. alc , m.p 226–227° (1).

—— **4-Chloro-3-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone:** unrecorded.

Ⓓ **4-Chloro-3-hydroxybenzaldehyde semicarbazone:** pale yel. ndls., m p. 238–239° (1).

3:3780 (1) Hodgson, Beard, *J. Chem. Soc.* **1926**, 150–154. (2) Hodgson, Beard, *J. Chem. Soc.* **1926**, 2033–2034. (3) Hodgson, Beard, *J. Chem. Soc.* **1927**, 2377–2378.

3:3810 7-CHLORONAPHTHOL-1



$C_{10}H_7OCl$ Beil. VI - 612, VI_1—, VI_2—

M.P. 123° (1)

Ndls. from aq or CS_2; spar. sol. aq. — C̃ has odor suggesting that of iodoform.

[For prepn. of C̃ from γ-(*p*-chlorophenyl)paraconic acid [Beil. XVIII-421] by distn. see (1).]

C̃ dis. in aq alk. from which it is repptd. by CO_2; the alk. soln. of C̃ couples with diazonium salts yielding azo dyestuffs (1).

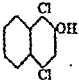
C̃ with aq $FeCl_3$ gives a yellowish white ppt. which on stdg. assumes a pronounced violet color (1)

C̃ (1 mole) with PkOH (1 mole) in $CHCl_3$ yields an addn. cpd., C̃.PkOH, or.-red. ndls. from hot $CHCl_3$, m.p 139° (1).

—— **7-Chloro-1-naphthyl acetate:** oil.

3:3810 (1) Erdmann, Kirchhoff, *Ann.* **247**, 374–375 (1888).

3:3840 1,4-DICHLORONAPHTHOL-2



$C_{10}H_6OCl_2$ Beil. VI - 650, VI_1—, VI_2—

M.P. 123–124° (1)
122–123° (2)
121° (3)

Ndls. from lgr ; eas sol alc., ether, or AcOH.

[For prepn. of C̃ from 1,1-dichloro-2-keto-1,2-dihydronaphthalene, m.p. 54° (2), 48–50°

(3) (itself prepd. from naphthol-2 (1:1540) in AcOH + NaOAc soln. with Cl_2 (2) (3)), by shaking with satd. soln. of HCl gas in AcOH for 2–3 min. (2) (3) see indic. refs.; from 1,1,3,4-tetrachloro-2-keto-1,2,3,4-tetrahydronaphthalene [Beil. VII-371] by partial reduction with $SnCl_2$ in AcOH (poor yield) see (1); from 1-chloronaphthol-2 (3:1700) with SO_2Cl_2 at ord. temp. (4) (note that this prepn. undoubtedly involves intermediate formn. of 1,1-dichloro-2-keto-1,2-dihydronaphthalene (above) (2)) see indic. refs.; from 1,4,5-trichloronaphthol-2 [Beil. VI-650] by partial reduction with Na/Hg see (4).]

[C̄ in AcOH with Cl_2 gives (1) 1,1,4-trichloro-2-keto-1,2-dihydronaphthalene [Beil. VII-386], m.p. 86–87°, together with other oily by-products.]

C̄ with $SnCl_2$/AcOH/HCl in s.t. at 100° for 8 hrs. gives (72% yield (2)) (3) 4-chloronaphthol-2 (3:3045), m.p. 103–104°.

C̄ in AcOH mixed with conc. HNO_3 ($D = 1.42$) and cautiously warmed until the liq. shows intense red color, then poured into aq., yields (1) 4-chloro-3-nitronaphthoquinone-1,2 [Beil. VII-724], red ndls. from AcOH, m.p. 184° (1).

C̄ with aq. alc. Na_2SO_3 boiled 72 hrs. gives in poor yield (2) 4-chloronaphthol-2-sulfonic acid-1, cryst. from aq. with ½ H_2O (not lost at 100° in vac.); note that this prod. on hydrolysis with H_2SO_4 gives (91% *yield* (2)) *4-chloronaphthol-2 (3:3045), m.p. 103–104°.*

Ⓓ **1,4-Dichloro-2-naphthyl acetate:** m.p. 90–91° (1). [From C̄ with AcCl (1).]

3:3840 (1) [illegible] (2) Burton, *J. Chem. Soc.* **1945**, 280–283. [illegible] (1930). (4) Armstrong, Rossiter, *Chem.* [illegible]

3:3860 3,3′-DICHLOROBENZOPHENONE $C_{13}H_8OCl_2$ Beil. S.N. 652

(Di-(*m*-chlorophenyl) ketone)

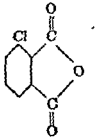
M.P. 123.8–124.9° (1) B.P. 160–166° at 2 mm. (1)

[For prepn. of C̄ from *m*-chlorobromobenzene [Beil. V-209, V_1-(115), V_2-(161)] (2) via conversion to *m*-chlorophenyl MgBr (cf. (3)) and reaction with *m*-chlorobenzonitrile [Beil. IX-339] (4), followed by hydrolysis (77% *yield*), see (1).]

Ⓓ **3,3′-Dichlorobenzophenone 2,4-dinitrophenylhydrazone:** m.p. 235–238° (1).

3:3860 (1) Haller, Bartlett, Drake, Newmann, Cristol, et al., *J. Am. Chem. Soc.* **67**, 1600–1602 (1945). (2) Hartwell, *Org. Syntheses* **24**, 22–24 (Note 5) (1944). (3) Hein, Retter, *Ber.* **71**, 1968 (1938). (4) Korczynski, Fandrich, *Compt. rend.* **183**, 421–423 (1926); *Cent.* **1926**, II 1853; *C.A.* **21**, 77 (1927).

3:3900 3-CHLOROPHTHALIC ANHYDRIDE



$C_8H_3O_3Cl$ Beil. XVII - 482 $XVII_1$—

M.P. 126° (1)
124.5–125.5° (2)
123° (3)
122° (4) (5)

[*See also 3-chlorophthalic acid* (3:4820).]

[For prepn. of C̄ from 3-chlorophthalic acid (3:4820) by *distn.* see *(4) (2)*; from 3-nitrophthalic anhydride [Beil. XVII-486, $XVII_1$-(256)] by htg. with PCl_5 in s.t. 6 hrs. at 175° (5) or 9 hrs. at 220° (60% yield (1)) or with Cl_2 at 240° (6) see indic. refs.; from phthalic anhydride (1:0725) with Cl_2 at 240° in pres. of Fe or Fe salts see (7).]

[C̄ with Cl_2 in fumg. H_2SO_4 in pres. of I_2 gives (8) a mixt. contg. 3 pts. 3,6-dichlorophthalic anhydride (3:4860), m.p. 194° cor., and 1 pt. 3,4-dichlorophthalic anhydride (3:3695), m.p. 120–121°, b.p. 329°.]

[The neutral dimethyl and diethyl esters corresp. to C̄ are unreported; ethyl hydrogen 3-chlorophthalate has m.p. *118–119° (3).*]

[C̄ with PCl_5 (3) or with $SOCl_2$ + $ZnCl_2$ in s.t. at 200–240° (9) yields 3-chlorophthaloyl (di)chloride, b.p. 169–171° at 16 mm. (3).]

C̄ with urea on fusion at 170° gives (3) 3-chlorophthalimide, cryst. from AcOH, m.p. 233° (3), 236° (15) — C̄ with 1 mole aniline htd. at 200–220° until no more steam is evolved (14) or C̄ with 1 mole aniline in boilg. AcOH (14) gives quant. yield 3-chlorophthalanil (*N*-phenyl-3-chlorophthalimide), pale cream-colored ndls. from AcOH, m.p. 189–190° (14); C̄ similarly treated with *p*-toluidine gives (80–90% yield (14)) *N*-(*p*-tolyl)-3-chlorophthalimide, colorless ndls. from AcOH, m.p. 160.5° (14).

[C̄ with pyrocatechol (1:1520) + $AlCl_3$ + NaCl htd. at 130–138° gives (10) an intermediate prod. (presumably 3-chloro-2-(*o,m*-dihydroxybenzoyl)benzoic acid), yel. cryst. from AcOH, m.p. 187° (10), which with conc. H_2SO_4 yields (10) 8-chloro-1,2-dihydroxyanthraquinone (5-chlorohystazarin), yel. cryst. from pyridine, m.p. 187° (diacetate, m.p. 193° (10)). — C̄ with hydroquinone (1:1590) + $AlCl_3$ + NaCl htd. at 200–220° for 40–50 min. yields (11) 8-chloro-1,4-dihydroxyanthraquinone (5-chloroquinizarin), red cryst. from xylene, m.p. 213° (diacetate, m.p. 205°, dimethyl ether, m.p. 208° (11)).]

[C̄ with C_6H_6 + $AlCl_3$ yields (12) 6-(3?)-chloro-2-(benzoyl)benzoic acid, m.p. 233.5°, which with conc. H_2SO_4 for 4 hrs. at 95° gives (59% yield (12)) 1-chloroanthraquinone (3:4180), m.p. 162° (12) — C̄ with *p*-xylene + $AlCl_3$ gives (81% yield (13)) 6-(3?)-chloro-2-(2,5-dimethylbenzoyl)benzoic acid, pr. from AcOH, m.p. 215°, which on warming with 9 pts. fumg. H_2SO_4 (10% SO_3) gives (96% yield (13)) 1-chloro-5,8-dimethylanthraquinone, yel. ndls. from AcOH, m.p. 186°.]

C̄ on boilg. with dil. HCl (1) or C̄ on saponification with standard alk. (Sap. Eq. = 91.3) followed by acidifn. gives 3-chlorophthalic acid (3:4820) q.v.

3:3956 *o*-CHLOROPHENYLPROPIOLIC ACID $C_9H_5O_2Cl$ Beil. S.N. 950

M.P. 131–132° (1) (2)
131° (3)

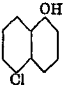
Cryst. from 50% AcOH or C_6H_6.

[For prepn. of C̄ from *o*-chlorobenzaldehyde (3:6410) by conversion through *o*-chlorocinnamic acid to ethyl *o*-chlorocinnamate, thence by addn. of Br_2 to give ethyl β-(*o*-chlorophenyl)-α,β-dibromopropionate, followed by elimination of 2 HBr and saponification (or vice versa) with alc. KOH, and final acidification (68% yield (1)) (2) cf. (3), see indic. refs.]

C̄ suspended in aq., treated with $NaHCO_3$ + $CuCl_2$, and steam-distilled (1) or C̄ with $Cu(OAc)_2$ (2) loses CO_2 giving (66% yield) *o*-chlorophenylacetylene (3:9497).

3:3956 (1) Bergmann, Bondi, *Ber.* 66, 282–283 (1933). (2) Otto, *J. Am. Chem. Soc.* 56, 1393–1394 (1934). (3) Wilson, Wenzke, *J. Am. Chem. Soc.* 57, 1265–1267 (1935).

3:3960 5-CHLORONAPHTHOL-1



$C_{10}H_7OCl$ Beil. VI - 612
VI₁—
VI₂—

M.P. 131.5° (1)

Ndls. from aq., lfts. from CS_2; spar. sol. aq. — C̄ has characteristic odor.

[For prepn. of C̄ from γ-(2-chlorophenyl)paraconic acid [Beil. XVIII-421] on rapid distn. see (1).]

[For condensation of C̄ with subst. isatin chlorides in prepn. of indigoid dyes see (2).]

C̄ dis. in aq. alk. and this soln. couples (1) with diazonium salts yielding azo dyestuffs

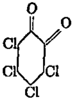
C̄ with aq. $FeCl_3$ gives a yellowish-white ppt. unchanged on stdg.; C̄ with $Ca(OCl)_2$ soln. gives a pale violet ppt. (1).

C̄ (1 mole) in $CHCl_3$ on mixing with PkOH (1 mole) in $CHCl_3$ gives (1) ppt. of addn. cpd., C̄.PkOH, orange ndls. from hot $CHCl_3$, m.p. 160° (1).

Ⓓ **5-Chloro-1-naphthyl acetate:** lfts. from alc., m.p. 53° (1). [From C̄ on protracted boilg. with AcCl (1).]

3:3960 (1) Erdmann, Kirchhoff, *Ann.* **247**, 372–374 (1888). (2) I.G., Brit. 318,107, Oct. 23, 1929; *Cent.* **1930**, I 1383.

3:3965 TETRACHLOROBENZO-QUINONE-1,2
(Tetrachloro-*o*-quinone)



$C_6O_2Cl_4$ Beil. VII - 602
VII₁-(338)

M.P. 133° (1)
131–132° (2)
130° (4) (7)
129–130° (3)
129° (11)

[*See also tetrachloropyrocatechol* (3:4875).]

Red cryst. pdr. (1), cryst. from dil. AcOH (2).

[For prepn. of C̄ from tetrachloropyrocatechol (3:1520) by oxidn. with fumg. HNO_3 in AcOH (81% yield (1)) (2) (3) (4) (5) (6) see indic. refs.; from pyrocatechol (1:1520) (2) (3) or pyrocatecholsulfonic acid (7) with Cl_2 in AcOH see indic. refs.; from tetrachloropyrocatechol monomethyl ether (tetrachloroguaiacol) (8) or from tetrachloropyrocatechol dimethyl ether (tetrachloroveratrole) (8) by oxidn. with HNO_3 see indic. refs.]

[C̄ adds 1 mole Cl_2 yielding (9) hexachlorocyclohexene-3-dione-1,2 [Beil. VII-575] q.v. which on reduction with $SnCl_2$ in AcOH (3) gives tetrachloropyrocatechol *(3:4875).*]

[C̄ with PCl_5 (2 moles) htd. in s.t. at 200–210° for ½ hr. gives (10) hexachlorobenzene (3:4939) and other products.]

[For complex behavior of C̄ on htg. with aq., with cold alcs., or with aniline see Beil. VII-602, VII₁-(338).]

C̄ forms addn. cpds. with many hydrocarbons [e.g., C̄ with benzene gives C̄.$3C_6H_6$, m.p. 37–42° (11); C̄ with toluene gives C̄.C_7H_8, m.p. 45–50° (11); C̄ with hexamethylbenzene (1:7265) gives C̄.$C_{12}H_{18}$, greenish black ndls. from AcOH, m.p. 140–143° (11).]

C̄ with equiv. tetrachloropyrocatechol (3:4875) in least possible hot $CHCl_3$ gives on

cooling the corresp. quinhydrone (6). — [For study of oxidn.-reductn. potential of system C̄/tetrachloropyrocatechol see (4) (5).]

[*See also* 2,3,5-*trichlorobenzoquinone*-1,4 (3:4672).]

Colorless shining pr. from aq. rapidly losing their luster in air (3); transparent pr. with 1 mole AcOH from AcOH but solvated AcOH readily lost in air (5).

C̄ at 15° is sol. in 160 pts. aq. (6); C̄ is spar. sol. cold aq. but eas. sol. hot aq. in which it first melts to an oil (3); C̄ is eas. sol alc. or ether.

C̄ readily sublimes in lfts. (4); for study of sublimation press. see (7).

[For study of heat of formn. of C̄ see (8); for studies of heat of combustion of C̄ see (5) (9).]

[For detn. of chlorine in C̄ by hydrogenation at elevated temp. see (10); for patent on use of C̄ as vulcanization accelerator see (11).]

PREPARATION OF C̄

From trichlorobenzoquinone. [For prepn. of C̄ from 2,3,5-trichlorobenzoquinone-1,4 (3:4672) by reduction with aq. SO_2 (3) (4) (6) (12) in ether (1), or from " benzoquinone tetrachloride " (2,3,5,6-tetrachlorocyclohexanedione-1,4) [Beil. VII-557] with aq. SO_2 (13), see indic. refs.]

From other sources. [For formn. of C̄ (together with other products) from 2,5-dichlorobenzoquinone-1,4 (3:4470) or from 2,6-dichlorobenzoquinone-1,4 (3:3750) with boilg. conc. HCl see (14); from C_6H_6 with $KClO_3 + H_2SO_4$ see (16).]

CHEMICAL BEHAVIOR OF C̄

Reduction. [C̄ with Na/Hg in acid soln. is hardly affected and does *not* (3) give hydroquinone; however, for anal. of C̄ by quant. detn. of chlorine with H_2 at elev. temp. see (10).]

Oxidation. C̄ on oxidn., e.g., with CrO_3 at 0° (5), conc. HNO_3 (4) (3), $AgNO_3$ (4), or $FeCl_3$ (4), gives 2,3,5-trichlorobenzoquinone-1,4 (3:4672); note, however, that with insufficient oxidizing agent the corresp. quinhydrone (see below) may separate.

[For study of oxidn.-reductn. potential of system C̄ + 2,3,5-trichlorobenzoquinone-1,4 (3:4672) see (2) (17) (18).]

C̄ (1 mole) with 2,3,5-trichlorobenzoquinone-1,4 (3:4672) (1 mole) in $CHCl_3$ soln. gives on evapn. (2) (19) the corresp. quinhydrone, green-black cryst., m.p. 114–115° (2), 103° (19).

[Note also that C̄ in aq. KOH exposed to air first turns green, then red, and finally brown (4), and this soln. on stdg. or boilg. in air gradually separates the corresp. potassium salt of chloranilic acid (3:4970) (3).]

Other reactions of C̄. [C̄ with PCl_5 (2 moles) on htg. gives (3) a mixture of pentachlorobenzene (3:2290) and hexachlorobenzene (3:4939).]

3:4095 2,4-DICHLOROPHENOXYACETIC ACID $C_8H_6O_3Cl_2$ Beil. S.N. 522

M.P. 140–141° (1)
138° (2)

White odorless cryst. from C_6H_6; alm. insol. aq. — Neut. Eq. = 221.0.

[For prepn. of C̄ from 2,4-dichlorophenol (3:0560) with chloroacetic acid (3:1370) in aq. NaOH (87% yield) see (1).]

[For general survey of C̄ as plant hormone see *(1) (3) cf. (4); for use of* solns. of C̄ in polyethylene glycols for regulating growth of plants see (5); for use of C̄ as weed killer see (6).]

3:4095 (1) ... –991 (1943). (2) Pokorny, *J. Am. Chem. Soc.* **63**, 1768 (... *Contrib. Boyce Thompson Inst.* **12**, 321–343 (1942); *C.A* ... r, Shalvia, *Botan. Gaz.* **104**, 281–287 (1942); *C.A.* **37**, 1 ... *Botan. Gaz.* **105**, 474–483 (1944); *C.A.* **38**, 4654 (1944). (6, ... (1944).

:4102 *m*-CHLOROPHENYLPROPIOLIC ACID $C_9H_5O_2Cl$ Beil. S.N. 950

M.P. 140–141° (1)

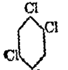
Cryst. from AcOH.

[For prepn. of Č from *m*-chlorobenzaldehyde (3:6475) by conversion through *m*-chlorocinnamic acid to ethyl *m*-chlorocinnamate, thence by addn. of Br_2 to give ethyl β-(*m*-chlorophenyl)-α,β-dibromopropionate, followed by elimination of 2 HBr and saponification (or vice versa) with alc. KOH, and final acidification (yield not stated), see (1).]

Č with $Cu(OAc)_2$ loses CO_2 yielding (1) *m*-chlorophenylacetylene (3:9500) (cf. also under *o*-chlorophenylpropiolic acid (3:3956)).

3:4102 (1) Otto, *J. Am. Chem. Soc* 56, 1393–1394 (1934).

3:4115 1,2,4,5-TETRACHLOROBENZENE $C_6H_2Cl_4$ Beil. V - 205
V₁-(113)
V₂-(157)



M.P.	141°	(1)	B.P. 243–246° cor.	(9)
	140–141°	(2)	240°	(5)
	139.6–139.9°	(3)	236°	(7)
	139.5–140.5°	(4)		
	139°	(5) (6) (24)		
	138°	(7) (8) (13) (14)		
	137–138°	(9) (10)		
	137.5°	(11)		
	137°	(12) (23)		

Ndls. from ether; cryst. from CCl_4, CS_2, C_6H_6 + EtOH, or C_6H_6 (for studies on crystallographic props. see (2) (8) (5) (15)). — Insol. cold and spar. sol. hot alc; fairly sol cold ether, C_6H_6, $CHCl_3$, or CS_2 — Č has penetrating and disagreeable odor. — Sublimes easily.

[For prepn of Č from 2,4,5-trichloroaniline [Beil. XII-627] (9) or from 2,5-dichloro-*p*-phenylenediamine [Beil XIII-118] (16) via diazotization and use of Cu_2Cl_2 reactn. (64% yield (16)) see indic refs; from *p*-dichlorobenzene (3:0980) with S_2Cl_2 + $AlCl_3$ in SO_2Cl_2 (67% yield (1)) (17) or from *o*-dichlorobenzene (3:6055) with Cl_2 + cat. (18) see indic. refs]

[For formn of Č from C_6H_6 with Cl_2 in pres. of I_2 (5), Fe (44% yield (13)), or $AlCl_3$ (19), or Cu (20), or from chlorobenzene with Cl_2 + Cu (20), or from *o*-dichlorobenzene (3:6055) with Cl_2 + cat (18) or Al/Hg (21), or from *m*-dichlorobenzene (3:5960) with Cl_2 + Al/Hg (21) or $AlCl_3$ (4), or from *p*-dichlorobenzene with Cl_2 in pres. of Fe (39% yield (13)), see indic refs, from dry C_6H_6 with anhyd. $AuCl_3$ (22) or on electrol in aq. HCl/AcOH soln see (23); from lower chloro derivs. of C_6H_6 with $FeCl_3$ see (7); from 2,4,5-trichlorotoluene (3.2100) with Cl_2 see (24); from benzaldehyde (1:0195) by htg. with $SbCl_5$ see (11)]

[For formn of Č from 2,5-dichloro-4-nitroaniline on diazotization and treatment with Cu_2Cl_2 see (25) (14) (note abnormal replacement of nitro group); from nitrobenzene with SO_2Cl_2 + N_2O_4 see (10), from resorcinol 4,6-*bis*-(sulfonyl chloride) or hydroquinone 2,5-

bis-(sulfonyl chloride) with PCl_5 in s.t. at 180° see (12) (26); from 4,6-dichlorobenzene 1,3-*bis*-(sulfonyl chloride) (27) or from 1,3-*bis*-(methylmercapto)benzene-4,6-*bis*-(sulfonyl chloride) (28) with $SOCl_2$ at 170–200° see indic. refs.; from 2,5-dichlorobenzene-1,4-*bis*-(sulfonyl chloride) with PCl_5 in s.t. 4 hrs. at 180° see (6); from 2,3,5,6-tetrachloro-*N*-nitroacetanilide (39) by refluxing in toluene or xylene (other products are also formed) see (39).]

[For behavior of C̄ with liq. Cl_2 yielding addn. products see (29); for behavior with NH_3 at elevated temps. see (30); C̄ with S_2Cl_2 + $AlCl_3$ + SO_2Cl_2 yields (17) hexachlorobenzene (3:4930).]

[C̄ htd. with NaOMe as directed yields according to conditions (13) (31) (32) (38) 2,4,5-trichlorophenol (3:1620) or its methyl ether.]

C̄ on mononitration, e.g., on boilg. with 5 pts. HNO_3 (D = 1.52) for ½ hr. (3) (13) (34), yields 1,2,4,5-tetrachloro-3-nitrobenzene [Beil. V-247], m.p. 99–100° (33) (35), 99° (34) (13), 98° (9), some tetrachlorobenzoquinone (chloranil) (3:4978) (insol. in pet. ether) also being formed (9) (34) (13) (33). [For studies on chem. of this mononitro cpd. see (36).]

C̄ on dinitration by boilg. 5–6 hrs. with mixt. of 10 pts. HNO_3 (D = 1.52) + 10 pts. fumg. H_2SO_4 (25% SO_3) gives (71% yield (33)) 1,2,4,5-tetrachloro-3,6-dinitrobenzene, cryst. from C_6H_6 by addn. of alc., m.p. 227–228° (33), 232–233° (35).

C̄ with 4 pts. chlorosulfonic acid refluxed for hr. gives (78% yield (37)) hexachlorobenzene (3:4930), m.p. 218–219° u.c. (37).

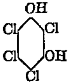
3:4135 TETRACHLORORESORCINOL



$C_6H_2O_2Cl_4$ Beil. VI - 820
VI_1—
VI_2-(819)

M.P. 141° (1)
140° (2)

Long colorless ndls. from hot aq. — Faintly pleasant phenolic odor. [New comml. rod (1942) in U.S.A.] — Eas. sol. alc., ether, AcOH, C_6H_6; fairly eas. sol. hot aq.; spar. ol. cold aq.

[For prepn. from "hexachlororesorcinol" (3:3470) by reduction with $SnCl_2$ in AcOH ee (1).]

C̄ is sol. in aq. alk. (2). — C̄ in aq. soln. gives with $FeCl_3$ a blue color (2).

C̄ in AcOH on treatment with Cl_2 yields "hexachlororesorcinol" (3:3470), m.p. 115°.

Ⓓ Tetrachlororesorcinol diacetate: m.p. 145° (1), 144° (2). [Note that m.p. of this deriv. is close to that of C̄ and should be tested by method of mixed m.p.'s.]

:4135 (1) Zincke, Fuchs, *Ber.* **25**, 2689–2690 (1892). (2) Fries, Hartmann, *Ber.* **54**, 199 (1921).

3:4140 2,4-DICHLORO-3-HYDROXYBENZ-ALDEHYDE  $C_7H_4O_2Cl_2$ Beil. S.N. 745

M.P. 141° (1)

Colorless cryst. from AcOH. C̄ has pronounced sternutatory props. and blisters moist skin. — [Note that the m.p. of a mixt. of C̄ with isomeric 2,6-dichloro-3-hydroxybenzaldehyde (3:4160), m.p. 140°, is depressed to 111° (1).]

[For prepn. of C̄ from 4-chloro-3-hydroxybenzaldehyde (3:3780) in AcOH with Cl_2 at room temp. (100% yield) see (1).]

C̄ (1 pt.) in AcOH (4 pts.) on nitration at 65° with 1 pt. conc. HNO_3 (D = 1.42) yields (2) 2,4-dichloro-3-hydroxy-6-nitrobenzaldehyde (2), colorless ndls. from its deep yellow soln. in AcOH or from hot aq., m.p. 107° (2) (p-nitrophenylhydrazone, or. ndls. from AcOH, m.p. 279–280° (2), semicarbazone monohydrate, yel. ndls. from dil. alc., softens 140–150° (2))

C̄ dislvd. in boilg. 10% NaOH (2 moles) and treated with Me_2SO_4 (1.3 moles) yields (1) 2,4-dichloro-3-methoxybenzaldehyde, m.p. 82° (1) (p-nitrophenylhydrazone, old-gold ndls., m.p. 258–260° (1)), which on oxidn. yields 2,4-dichloro-3-methoxybenzoic acid, colorless ndls., m.p. 163° (1).

Ⓓ 2,4-Dichloro-3-hydroxybenzaldoxime: fine colorless ndls. from alc., m.p. 188° (1).

Ⓓ 2,4-Dichloro-3-hydroxybenzaldehyde *p*-nitrophenylhydrazone: or.-red ndls., m.p. 277–278° dec. (1)

3:4140 (1) Hodgson, Beard, *J. Chem. Soc.* **1926**, 147–155. (2) Hodgson, Beard, *J. Chem. Soc.* **1926**, 2030–2036.

3:4150 *o*-CHLOROBENZOIC ACID  $C_7H_5O_2Cl$ Beil. IX - 334, IX_1-(138)

M.P.	**142°**	(1) (2) (3)	**139.9°**	(15)

Cryst. from hot aq., C_6H_6, dioxane/C_6H_6, or alc. — $\bar{C}$ is spar. sol. cold aq.; e g., $\bar{C}$ is sol. at 0° in 881 pts. aq. (27); at 25°, 100 ml. satd. aq. soln. conts. 0.213 g $\bar{C}$ (21) (= 0.0136 mole per liter (21) (28)) — $\bar{C}$ is eas. sol. hot aq., alc., ether (26). — At 14–16°C 100 ml. satd. soln. of $\bar{C}$ in acetone conts. 28.4 g. $\bar{C}$, in ether 17 g. $\bar{C}$, in EtOAc 13.2 g. $\bar{C}$, in 75% AcOH 6.2 g. $\bar{C}$; in C_6H_6 0.9 g. $\bar{C}$; in CCl_4 0.6 g. $\bar{C}$; in CS_2 0.5 g. $\bar{C}$; in lgr. 0.07 g. $\bar{C}$ (10). — For study of soly. of $\bar{C}$ in acetone (4), C_6H_6 (4) (29), heptane (29), chlorobenzene (3:7903) (30), o-chlorotoluene (3:8245) (30), or m-chlorotoluene (3:8275) (30) see indic. refs.

For study of distribution at 25° of $\bar{C}$ between aq. + toluene (31), aq. + xylene (32), or aq. + $CHCl_3$ (31) (32) (for use of $CHCl_3$ in sepn. of $\bar{C}$ from aq. suspension of 3-chlorophthalic acid (3:4820) (33)) see indic. refs.; for adsorption of $\bar{C}$ on charcoal from its solns. in EtOH (34), acetone (4), C_6H_6 (4), or aq. (35) see indic. refs.; for soly. of $\bar{C}$ in aq. solns. of various salts (including Na$\bar{A}$) see (28) (21).

$\bar{C}$ can be sublimed in vac. (12). — $\bar{C}$ is but very slightly volatile with steam (for details see (11)). — For crystallographic data see (36) (37). — For purification of $\bar{C}$ (by use of decolorizing carbon on soln. of $\bar{C}$ in aq. Na_2CO_3 followed by repptn. with 6 N HCl) see (38).

Binary systems contg. $\bar{C}$: for f.p./compn. data on system $\bar{C}$ + H_2O see (39); for f.p./compn. data and diagram on system $\bar{C}$ + BzOH (1:0715), eutectic, m.p. 91.1°, contg. about 41 wt. % $\bar{C}$, see (10) (41); for f.p./compn. data on systems $\bar{C}$ + o-toluic acid (1:0690) (20) or $\bar{C}$ + o-hydroxybenzoic acid (salicylic acid) (1:0780) (20) see indic. refs.

For f.p./compn. data and diagrams on systems $\bar{C}$ + m-chlorobenzoic acid (3:4392) (eutectic, m.p. 110.7°, contg. 52–53 mole % $\bar{C}$ (6) (40) (10) (15)) see indic. refs.; on system $\bar{C}$ + p-chlorobenzoic acid (3:4940) (eutectic, m.p. 132°, contg abt. 86 mole % $\bar{C}$) see (10) (15).

For f.p./compn. data and diagrams on systems $\bar{C}$ + o-bromobenzoic acid (41), $\bar{C}$ + o-iodobenzoic acid (42), $\bar{C}$ + o-nitrobenzoic acid (43), $\bar{C}$ + m-nitrobenzoic acid (43) see indic. refs.

Ternary systems contg. $\bar{C}$. [For influence of addn. of benzoic acid (6) or of p-chlorobenzoic acid (3:4940) (40) to the eutectic of $\bar{C}$ with m-chlorobenzoic acid (3:4392) see indic. refs.; for influence of addn. of $\bar{C}$ to the eutectic of benzoic acid with m-chlorobenzoic acid see (40); for data on system $\bar{C}$ + m-chlorobenzoic acid (3:4392) + p-chlorobenzoic acid (3:4940), eutectic, m.p. 104.9°, contg. respectively 48.3, 44.0, and 7.7 mole % of the three isomers, see (15).]

Miscellaneous. [For study of fate of $\bar{C}$ in animal organism see (44) (45); note that contrary to earlier (45) results with dogs and rabbits conjugation with glycine to yield the expected N-(o-chlorobenzoyl)glycine (o-chlorohippuric acid) [Beil. IX-336], m.p. 176° (45), does (44) occur. — For study of use of $\bar{C}$ (or its salts) as preservatives see (46); for detectn. of $\bar{C}$ in foods see (179). — For use of $\bar{C}$ as vulcanization regulator see (47) (48).]

Preparation. [For prepn. of $\bar{C}$ from o-chlorotoluene (3:8245) by oxidn. with boilg. aq. $KMnO_4$ (yields: 90% (14), 74–78% (18), 68–71% (24)) (49) (13), with nitrosulfonic acid (from fumg. HNO_3 + dry SO_2) at 100° (50), with air in the pres. of various catalysts (51) (52) (53), or in aq. alk. at 260° under press. (54), see indic. refs.; for formn. of $\bar{C}$ from o-chlorophenyl benzyl ketone by auto-oxidn. in light and air see (56); for formn. of $\bar{C}$ from o-chlorobenzaldehyde (3:6410) by oxidn. with CrO_3 (57), with alk. $KMnO_4$ (58), or by auto-oxidn. in Ac_2O (59) see indic. refs.]

[For prepn. of $\bar{C}$ from o-aminobenzoic acid (anthranilic acid) [Beil. XIV-312, XIV_1-(529)] via diazotization and use of Cu_2Cl_2 (yields: 90% (24), 87% (178)) (preferably under CO_2 (60)), or CuH (60% yield (61)), or Cu (62) see indic. refs.]

[For prepn. of $\bar{C}$ from o-chlorobenzonitrile [Beil. IX-336] by hydrolysis with H_2SO_4 (14), with dil. HCl in s t. at 150° (63), or boilg. KOH (14) see indic. refs.; from o-chlorobenzoyl chloride (3:6640) by hydrolysis with aq. (91) or aq. alk.; from o-chlorobenzotri-

chloride (3:6880) by hydrolysis (64) (65), e.g., with aq. in s.t. at 150° (27) or by boilg. conc. HNO_3 (65) see indic. refs.; from *o*-chlorobenzal (di)chloride (3:6625) with CrO_3 (57) or with boilg. aq. for 20 hrs. followed by oxidn. with $KMnO_4$ (75% yield (7)); from a mixt. of *o*-chlorobenzotrichloride + *o*-chlorobenzal (di)chloride by hydrol. with 70% H_2SO_4 or 80% AcOH or 5% NaOH at 90–100° in stream of air to effect immediate oxidn. (67); from *o*-chlorobenzoyl-*o*-chlorotriphenylmethane by hydrolytic cleavage with 20% MeOH/KOH 5 hrs. at b.p. (8); from *o*-chlorophenylnitrolic acid by hydrolysis with boilg. aq. (19) see indic. refs.]

[For formn. of $\bar{C}$ (together with other prods.) from benzoic acid (1:0715) with $KClO_3$ + HCl (68), with NaOCl (6) (69), see indic. refs.]

[For formn. of $\bar{C}$ from *o*-sulfobenzoic acid imide (saccharin) [Beil. XXVII-168, $XXVII_1$-(266)] with $KClO_3$ + HCl see (9); from 3-chlorophthalic acid (3:4820) by cat. monodecarboxylation see (70); from *o*-nitrotoluene [Beil. V-318, V_1-(158), V_2-(243)] (71), from sodium *o*-toluenesulfonate [Beil. XI-83, XI_1-(22)] (72), or from *o*-toluenesulfonyl chloride [Beil. XI-86, XI_1-(23)] (71) with $SOCl_2$ in s.t. at elevated temp. followed by treatment with aq. see indic. refs.]

Chemical behavior. [$\bar{C}$ (as $Na\bar{A}$) on reduction with Na/Hg (27) (25) (73) or $\bar{C}$ (as $K\bar{A}$) on fusion with sodium formate (74) cf. (75) is dehalogenated yielding benzoic acid (1:0715) (for study of reduction of $\bar{C}$ with H_2 + Ni in aq. alk. at ord. temp. see (76)). — $\bar{C}$ on electrolytic reduction in alc. H_2SO_4 yields (77) *o*-chlorobenzyl alc. [Beil. VI-444, VI_1-(222)], ndls. from aq. alc., m.p. 72° (77).]

$\bar{C}$ behaves normally as a monobasic acid: e.g., $\bar{C}$ on titration with standard dil. aq. alk. gives Neut. Eq. 156.5; ionization const. at 25° is 13.2×10^{-4} (78) (79) cf. (80) (81) (21) (1). — [For study of acid strength of $\bar{C}$ in various alcohols (82) (83) (84) (5) (85) (86) (22) or in acetonitrile (87) see indic. refs. — For solubility of $\bar{C}$ in aq. solns. of various salts incl. $Na\bar{A}$ see (28) (21). — For sepn. of $\bar{C}$ from *p*-chlorobenzoic acid (3:4940) by use of difference in their acidic strength see (88). — For use of $\bar{C}$ as standard in alkalimetry (89) and in iodimetry (90) see indic. refs.]

Salts of inorg. bases. [$NH_4\bar{A}$ (91) (92) (note that this salt with benzotrichloride (3:6880) in pres. of suitable cat. yields (93) *o*-chlorobenzonitrile). — Hydroxylamine salt: m.p. 104.5° (94). — $Na\bar{A}$ (use as preservative) (46). — $K\bar{A}.\frac{1}{2}H_2O$ (91) (forms liq. cryst. on fusion (95)). — $Ag\bar{A}$, scales from boilg. aq. (25) (100) (note that this salt with I_2 in C_6H_6 under reflux does *not* (96) yield phenyl *o*-chlorobenzoate, m.p. 37°, and thus differs from corresp. salt of *m*-chlorobenzoic acid (3:4392)). — $Ca\bar{A}_2.H_2O$ (26) (97), much more sol. aq. than corresp. salts of *m*-chlorobenzoic acid (3:4392) or *p*-chlorobenzoic acid (3:4940) (97); insol. either cold or hot alc. (98); on dry distn. gives (18% yield (99)) xanthone (1:7275), m.p. 174°. — $Ba\bar{A}_2.3H_2O$ from spont. evapn. of aq. soln. (98) (9). — $Ba\bar{A}_2$ from hot conc. aq. soln. (25) (26) (use in sepn. of $\bar{C}$ from isomers (40)); spar. sol. aq. (100). — Note that $Pb\bar{A}_2$ (25) (100) and $Cu\bar{A}_2$ (25) (100) are spar. sol. aq., while salts of Ca, Sr, Mg, Zn, Fe, Mn, Co, Ni, and Cd are sol. (100). — For sepn. of $\bar{C}$ from BzOH (1:0715) by use of Cu salts see (6).]

Salts of organic bases. $\bar{C}$ with equiv. amt. benzylamine in boilg. EtOAc followed by evapn. of solvent yields (101) benzylammonium *o*-chlorobenzoate, m.p. 148.4–149.4° u.c., 150.5–151.5° cor., Neut. Eq. 263.6 (note that the m.p. of this salt is but very slightly dif. from that of corresp. salt of *m*-chlorobenzoic acid (3:4392)). — $\bar{C}$ similarly treated with α-phenylethylamine yields (101) α-phenylethylammonium *o*-chlorobenzoate, m.p. 128.4–129.4° u.c., 130.9–131.9° cor., Neut. Eq. 277.6 (note that m.p. of this salt, although better separated from those of the isomeric acids than the preceding case, is very close to those of the corresp. salts of *m*-methoxybenzoic acid, *p*-methoxybenzoic acid, and *o*-nitrobenzoic acid).

$\bar{C}$ (1 mole) in alc. mixed with codeine (1 mole), m.p. 155°, htd. several minutes, solvent evapd. and resulting sirup recrystd. from aq. yields (102) codeine *o*-chlorobenzoate, $C_{18}H_{21}O_3N.\bar{C}$, m.p. 134° on "Maquenne block"; note that this value although close to that of corresp. prod. from *o*-bromobenzoic acid is widely different from that of corresp. salts of either *m*-chlorobenzoic acid (3:4392) or *p*-chlorobenzoic acid (3:4940) which are 96° and 162° respectively. — $\bar{C}$ (1 mole) in alc. (or $CHCl_3$) with strychnine (1 mole) in alc, boiled for a few minutes, then cooled, yields (103) strychnine *o*-chlorobenzoate, $C_{21}H_{22}O_2N_2.\bar{C}$, m.p. 170° u.c. on "Maquenne block"; note that this melting point is somewhat lower than that (185°) for the corresp. salt of *m*-chlorobenzoic acid (3:4392) and widely different from that (251°) of the corresp. salt of *p*-chlorobenzoic acid (3:4940).

[For optical data on cinchonine salt see (104); for salt (m.p. 108–110°) with phenylmercuric hydroxide see (105).]

$\bar{C}$ with alcohols gives by conventional processes the corresp. esters; for details on methyl *o*-chlorobenzoate (3:6695) and ethyl *o*-chlorobenzoate (3:6800) see these compds. — [For study of rate of esterification of $\bar{C}$ with MeOH (106) (111) (17) (112), with EtOH (2) (17) (113), or with cyclohexanol (1:6415) (107) see indic. refs.]

$\bar{C}$ with P_2O_5 in toluene boiled for 4 hrs. (108), or $\bar{C}$ (109) or its sodium salt (110) refluxed with oxalyl (di)chloride (3:5060) in C_6H_6, yields *o*-chlorobenzoic acid anhydride, ndls. from lt. pet. (108) or alc. (109), m.p. 79.6° (108), 78–79° (109); note that $\bar{C}$ (2 moles) with oxalyl (di)bromide refluxed in C_6H_6 similarly gives good yields (110) of the above anhydride, but that $Na\bar{A}$ with oxalyl (di)bromide can also be used (110) to give *o*-chlorobenzoyl bromide, b.p. 143–145° at 37 mm. (110).

$\bar{C}$ with PCl_5 (114) (45) (115), or with $PCl_3 + ZnCl_2$ (114), or with $SOCl_2$ (114) (45) (116) (117), or with $SOCl_2$ + pyridine (118), or with *o*-chlorobenzotrichloride (3:6880) + $ZnCl_2$ (119) yields *o*-chlorobenzoyl chloride (3:6640) q.v. for data on yields.

$\bar{C}$ with KOH or NaOH on fusion (128) (27) (25), or $\bar{C}$ with aq. piperidine in pres. of Cu powder in s.t. at 160° for 4 hrs. (121), or $\bar{C}$ with aq. piperidine + Na_2CO_3 + amyl alc. + Cu powder refluxed 6 hrs. (124), or $\bar{C}$ (as $K\bar{A}$) with aq. NaOAc + $Cu(OAc)_2$ in s t. at 140–150° for 9–10 hrs. (126), or $\bar{C}$ with aq. $Ca(OH)_2$ + Cu cpds. at 160–170° under press. (122) gives (83% yield (126)) *o*-hydroxybenzoic acid (salicylic acid) (1:0780), accompanied in some cases (120) by substantial amounts of *m*-hydroxybenzoic acid (1:0825). — For use of alk. fusion as means of detect. of $\bar{C}$ in wine see (123). — Note that $\bar{C}$ with aq. KOH (even in pres. of copper) (124), or $\bar{C}$ with aq. $Ba(OH)_2$ in s.t. at 190–200° (125), does not yield salicylic acid or any chloride ion.

Reaction of $\bar{C}$ with phenols. $\bar{C}$ on suitable treatment condenses with phenols yielding *o*-aryloxybenzoic acids: e g, $\bar{C}$ (as $K\bar{A}$) with Na phenolate and Cu powder at 180–190° for 5 min. (127) (128), or $\bar{C}$ (as $K\bar{A}$) with phenol + Cu powder or Cu salts (129) (130), or $\bar{C}$ (as $K\bar{A}$) with anhydrous KOAc/NaOAc + Cu powder at 245–255° for 5 hrs. (126) gives (90% yield (127)) *o*-phenoxybenzoic acid [Beil. X-65, X_1-(28)], lfts. from dil. alc., m.p. 113°; note that this prod. with conc. H_2SO_4 on gentle warming loses H_2O and ring-closes in quant. yield (131) to xanthone (1:7275), m.p. 174°. — [For analogous condensations of $\bar{C}$ with *o*-cresol (1:1400) (127) (128) (60), *m*-cresol (1:1730) (127), *p*-cresol (1:1410) (127) (128), α-naphthol (1:1500) (132), β-naphthol (1:1540) (127) (128), *o*-chlorophenol (3:5980) (133), *m*-chlorophenol (3:0255) (133), *p*-chlorophenol (3:0495) (133), *m*-nitrophenol (133), *p*-nitrophenol (133), including conv. to the corresp. xanthones, see indic. refs.; many other analogous cases are known but cannot be included here.

Reaction of $\bar{C}$ with amines. $\bar{C}$ (or its salts) with primary or secondary aliphatic or aromatic amines in the pres. of K_2CO_3 and Cu powder on htg. condenses with elimination of HCl (or its equivalent) to yield products of type *o*-HOOC—C_6H_4—NHR; these products by ring closure through elimination of water yield in turn the corresponding acridones; the

reaction has been executed for countless cases of which only a few of the more important examples can be cited here; for the most comprehensive single survey see (134).

$\bar{C}$ (as K$\bar{A}$) htd. with aq. aniline + Cu powder (134) (135), Cu salts (135), or $\bar{C}$ htd. with aniline + Cu powder (136) or Cr powder (137), or $\bar{C}$ htd. with aniline + anhydrous K_2CO_3 + CuO (134) (38) gives (yields: 97% (134), 82–93% (38), 87% (137)) *N*-phenylanthranilic acid (diphenylamine-*o*-carboxylic acid) [Beil XIV-327, XIV$_1$-(533)], cryst. from alc., m.p. 182–183° rap. htg (38); this prod. with conc H_2SO_4 at 100° loses aq and ring-closes *(yields: 91–96% (38)) (138) (139) to acridone [Beil XXI-335, XXI$_1$-(312)], sublimable* yel. ndls., m p. 354° cor.

[For details on analogous reaction of $\bar{C}$ with *o*-toluidine (134) (135) (136) (140), *m*-toluidine (134) (141), *p*-toluidine (134) (135), α-naphthylamine (134) (135), β-naphthylamine (134) (135), *o*-aminophenol (134), *o*-anisidine (134), *m*-anisidine (134) (141), *p*-anisidine (142), *o*-aminobenzoic acid (134), *m*-aminobenzoic acid (134), *p*-aminobenzoic acid (134), *p*-phenylenediamine (134), *p*-aminodimethylaniline (124), see indic. refs.; scores of other examples cannot be cited here.]

Substitution of nucleus of $\bar{C}$. — [$\bar{C}$ in fumg. H_2SO_4 or chlorosulfonic acid + a little sulfur treated with Br_2 (1 mole) at 60–70° gives (70–75% yield (143)) 5-bromo-2-chlorobenzoic acid [Beil. IX-355], ndls , m.p. 165–167° (143).]

$\bar{C}$ on mononitration under various conditions, e g., $\bar{C}$ (2 wt pts) dislvd. in conc. H_2SO_4 (15 wt. pts) and treated below 50° with a mixt. of HNO_3 (D = 1 5) (1 wt. pt.) in conc. H_2SO_4 (2.5 wt pts) (144) gives mainly (yields: 78.5% (144), 35% (145), 32–38% (146)) (147) (148) (14) (149) 2-chloro-5-nitrobenzoic acid [Beil. IX-403], ndls. from aq., m.p. 165° (149) (14) (172), 164–165° (144) (145), 164° (146) (148), accompanied by a small amt. 2-chloro-3-nitrobenzoic acid [Beil IX-402], m p. 185° (148), 181° (150). — [Note that both the other nitro-2-chlorobenzoic acids are known, viz, 2-chloro-4-nitrobenzoic acid [Beil. IX-404], ndls. from aq , m.p. 140° (151), 139–140° (152), and 2-chloro-6-nitrobenzoic acid, m.p 161° (151), but are prepd. by other methods.]

$\bar{C}$ on direct dinitration, e.g., with conc. H_2SO_4 + KNO_3 at 100° (153) (154) or at 130° (155) or $\bar{C}$ with conc. H_2SO_4 + fumg. HNO_3 at 130–140° (156), gives (94% yield (155)) 2-chloro-3,5-dinitrobenzoic acid [Beil. IX-415], ndls from aq., m.p. 199–200° (153) (154), 199° (156), 198 5° cor. (155) (for use of this prod in detection of $\bar{C}$ see (180)); this prod. is also obtd. by further nitration of 2-chloro-3-nitrobenzoic acid (above) with conc. H_2SO_4 + KNO_3 at 170° (157) — [Note that of the 5 other isomeric dinitro-2-chlorobenzoic acids which are possible only one is known, viz., 2-chloro-4,5-dinitrobenzoic acid, m.p. 165° cor. (158), obtd. from 2-chloro-4-nitrobenzoic acid (above) by further nitration with fumg. HNO_3 + conc. H_2SO_4 (80% yield (158)).]

—— **Methyl *o*-chlorobenzoate**: oil, b.p. 234°. (See 3:6695.)

—— **Ethyl *o*-chlorobenzoate**: oil, b.p. 243°. (See 3:6800)

Ⓓ ***p*-Nitrobenzyl *o*-chlorobenzoate**: m.p. 106° (159). [From $\bar{C}$ (as Na$\bar{A}$) with *p*-nitrobenzyl bromide (m.p. 99°) in boilg. dil. alc. (159); note that the m.p. of this ester is almost identical with that (107°) of the corresp. prod. from *m*-chlorobenzoic acid (3·4392).]

Ⓓ **Phenacyl *o*-chlorobenzoate**: m.p. 85.5° (160), 83° (23). [From $\bar{C}$ (as Na$\bar{A}$) with phenacyl bromide (m.p. 50°) in boilg. alc. (97% yield (23)).] — [Note that the m.p. of this prod. is only slightly lower than that (87.6°) of the corresp. prod. similarly obtd from *p*-chlorobenzoic acid (3:4940).]

—— ***p*-Chlorophenacyl *o*-chlorobenzoate**: unreported.

Ⓓ ***p*-Bromophenacyl *o*-chlorobenzoate**: m.p. 107.0° cor. (161), 106° (23) (162). [From $\bar{C}$ (as Na$\bar{A}$) with *p*-bromophenacyl bromide (m.p. 109°) in boilg. alc. (80% yield (23)).]

—— *p*-Iodophenacyl *o*-chlorobenzoate: unreported.

Ⓓ *p*-Phenylphenacyl *o*-chlorobenzoate: m.p. 123° (163). [From C̄ (as NaĀ) with *p*-phenylphenacyl bromide (m.p. 126°) in boilg. alc. (163).]

—— *S*-Benzylthiuronium *o*-chlorobenzoate: unreported.

Ⓓ *S*-(*p*-Chlorobenzyl)thiuronium *o*-chlorobenzoate: cryst. from dioxane, m.p. 159° cor. (164). [From C̄ (as NaĀ or KĀ) in aq. with 1 equiv. of *S*-(*p*-chlorobenzyl)-thiuronium chloride, m.p. 197° (10% in alc.) (164); note that the m p. of this prod is closely adjacent to that (m.p. 157° cor.) of the corresp. salt of *m*-chlorobenzoic acid (3:4392).]

Ⓓ *S*-(*p*-Bromobenzyl)thiuronium *o*-chlorobenzoate: m.p. 168° cor. (165). [From C̄ (as KĀ or NaĀ) in aq. with 1 equiv. of *S*-(*p*-bromobenzyl)thiuronium bromide (m p. 213°) in alc. (165); note that m.p. of this prod. is only slightly higher than that (163° cor.) for the corresp. prod. from *p*-chlorobenzoic acid (3:4940).]

Ⓓ *o*-Chlorobenzamide: cryst. from alc. or alc./ether, m.p. 142.4° cor. (166), 142° (167), 141° (14), 140.5° (91), 139° (25). [From C̄ by refluxing with AcOH + $(NH_4)_2CO_3$ (37–39% yield (167)), from *o*-chlorobenzoyl chloride (3:6640) with conc. aq. NH_4OH (166) (14) (91) (25), or from ethyl *o*-chlorobenzoate (3:6800) with conc. aq. NH_4OH (25).] — [Note that *o*-chlorobenzamide on htg. with $AlCl_3.NaCl$ (large excess) gives (93% yield (168)) *o*-chlorobenzonitrile [Beil. IX-336], m.p. 43–44° (168), 42–43° (169), b.p. 232° (169).]

Ⓓ *o*-Chlorobenzhydrazide: ndls. from alc., m.p. 117–118° (170), 109–110° (171). [From ethyl *o*-chlorobenzoate (3:6800) q.v. with hydrazine hydrate (170) (171); for use as reagt. for identification of aldehydes and ketones see (170).]

—— *N*-(*o*-Chlorobenzoyl) *N*-phenylhydrazide: unreported.

Ⓓ *o*-Chlorobenzanilide: ndls. from alc. or pet. ether; m.p. 114° (172) (173) (174), 117–118° (175) (176). — [From *o*-chlorobenzoyl chloride (3:6640) with excess aniline (25) (172) in pres of a tertiary amine (80% yield (174)); also from oxime of *o*-chlorobenzophenone (3:0715) by Beckmann rearr. (175) (173) (176).] — [Note that this prod must not be confused with benz-*o*-chloroanilide, m.p. 99–100°.]

Ⓓ *o*-Chlorobenz-*p*-toluidide: cryst. from dil. alc., m.p. 131° (177). [From *o*-chlorobenzoyl chloride (3:6640) with *p*-toluidine (177).]

—— *o*-Chlorobenz-α-naphthalide: unreported.

—— *o*-Chlorobenz-β-naphthalide: unreported.

138–139°	(11)			

[*See also cis*-1,2-*dichloro*-1,2-*diphenylethylene* (3:1380).]

Colorless tbls. from alc.; $\bar{C}$ is much less sol. in alc. than its *cis* isomer (3:1380); 100 pts. abs. alc. at 24.4° dis. 0.71 pt. $\bar{C}$, but soly. of $\bar{C}$ is diminished by pres. of its stereoisomer (10). — $\bar{C}$ (like its isomer) is very sol. ether.

Note that $\bar{C}$ (the higher-melting tolane dichloride) has now been shown (4) to have the *trans* configuration, many earlier reports to the contrary notwithstanding.

Note also that $\bar{C}$ with 1,1,2,2-tetrachloro-1,2-diphenylethane (tolane tetrachloride) (3:4496) gives an isomorphous mixt. (2), formerly erroneously regarded as an individual cpd. designated as "ditolane hexachloride."

PREPARATION OF $\bar{C}$

Note that in all processes (below) for prepn. of $\bar{C}$ more or less of the lower-melting (*cis*) stereoisomer is always formed.

FROM DINUCLEAR INITIAL MATERIALS

From diphenylacetylene (tolane). [For prepn. of $\bar{C}$ from tolane [Beil. V-656, V_1-(319), V_2-(568)] with Cl_2 in $CHCl_3$ see (7).]

From *trans*-1,2-diphenylethylene (stilbene). [For prepn. of $\bar{C}$ from stilbene (1:7250) with PCl_5 (2 moles) in $POCl_3$ at 170° see (12).]

From 1,1,2,2-tetrachloro-1,2-diphenylethane (tolane tetrachloride). [For prepn. of $\bar{C}$ from tolane tetrachloride (3:4496) by removal of two adjacent chlorine atoms by use of Zn dust in EtOH (1) (6) (7) (10), Zn dust in AmOH (6), Fe powder in boilg. AcOH (14) (6) (note that in this method ratio of $\bar{C}$ to lower m.p. stereomer is 1:5 (6)), or by use of excess conc. (2 *N*) MeMgCl (11), or with H_2 + hydrazine hydrate in MeOH/KOH at b.p. for 1½ hrs. (3) see indic. refs.]

From benzoin. [For formn. of $\bar{C}$ from benzoin (1:5210) with PCl_5 at 0° (much benzoyl-phenyl-dichloromethane("chlorobenzil") [Beil. VII-436, VII_1-(234)] also being formed) see (20).]

FROM MONONUCLEAR INITIAL MATERIALS

From benzotrichloride. [For prepn. of $\bar{C}$ from benzotrichloride (3:6540) with Cu powder (yield of total mixed stereoisomers 68% (15), 23 5% (16) (17)), by action of excess conc. (2 *N*) MeMgCl (yield total mixed stereoisomers 22% (11)), by action of hydrazine hydrate + Pd in MeOH/KOH (35% yield (3)), or for formn. of $\bar{C}$ (together with other products) by pyrolysis over hot Pt (18) see indic. refs.]

From benzal (di)chloride. [For formn. of $\bar{C}$ (together with other prods.) from benzal (di)chloride (3:6327) by pyrolysis over hot Pt see (18).]

FROM MISCELLANEOUS SOURCES

[For formn. of $\bar{C}$ from CaC_2 with satd. soln. of Cl_2 in C_6H_6 see (13); from benzoyl-phenyl-diazomethane (azibenzil) [Beil. VII_1-(395), XXIV-208] with oxalyl (di)chloride (3:5060) in C_6H_6 (38.5% yield $\bar{C}$) see (9); from 1,1,2-trichloro-1,2-diphenylethane [Beil. V-601] by elimination of HCl with alc. KOH see (19); for formn. of $\bar{C}$ from its lower-melting stereoisomer (3:1380) by distn. (about 32% conversion to $\bar{C}$ (10)) (12) (6) see indic. refs.]

CHEMICAL BEHAVIOR OF $\bar{C}$

$\bar{C}$ on htg is partially transformed (6) (12) to the lower-melting isomer (3:1380); on distn. conversion is about 68% (10).

Reduction of $\bar{C}$. $\bar{C}$ with conc. HI and red P in s.t. at 170° for 20 hrs. gives (16) (20) bibenzyl (1:7149), m.p. 52°.

Elimination of 2 chlorine atoms. $\bar{C}$ with Na/Hg in alc. (1) (16), or $\bar{C}$ with Zn dust in boilg. alc. (7) (10), or $\bar{C}$ with alc. KOH in s.t. at 180° (12) gives diphenylacetylene (tolane) [Beil. V-656, V_1-(319), V_2-(568)], m.p. 60°.

Addn. of halogens. $\bar{C}$ with Cl_2 in C_6H_6 soln. yields (13) 1,1,2,2-tetrachloro-1,2-diphenylethane (tolane tetrachloride) (3:4496). — $\bar{C}$ does *not* (12) add Br_2, and the expected prod. 1,2-dibromo-1,2-dichloro-1,2-diphenylethane is unreported from any other source.

Nitration of $\bar{C}$. The nitration of $\bar{C}$ has never been studied, and neither mono nor dinitro derivs. are reported from any other source.

[For use as antioxidant and gum inhibitor in cracked gasoline see (10); in aq. petroleum emulsion as insecticidal oil spray see (11)]

C̄ with $FeCl_3$ gives a greenish black quinhydrone (1).

C̄ in AcOH with excess Br_2 yields (6) 4,5-dibromo-2,3-dichlorohydroquinone, golden-yel lfts from lgr , m p 294° (6).

C̄ reduces $NH_4OH/AgNO_3$ and Fehling's soln. (1); C̄ on oxidn. with MnO_2 + dil. H_2SO_4 (1) (4) (5) or with CrO_3/AcOH (7) gives (yields: 88% (4), 60% (1)) 2,3-dichlorobenzoquinone (3:2885) q.v [For study of oxidn -reductn. potential of C̄ see (4)]

- Ⓓ **2,3-Dichlorohydroquinone diacetate:** colorless ndls. from dil. alc., m.p. 121° (6) (2). [From C̄ + Ac_2O (6), or from p-benzoquinone dichloride (see above) with Ac_2O + H_2SO_4, (2)]
- Ⓓ **2,3-Dichlorohydroquinone dibenzoate:** colorless cryst. from CS_2 or pet. ether, m p. 173-174° (1). [From C̄ in dil. aq alk. with BzCl (1).]
- Ⓓ **2,3-Dichlorohydroquinone dimethyl ether:** pinkish white ndls. from dil. alc., m p. 124° (6). [From C̄ in dil. alk with Me_2SO_4 (6)] [Note that corresp. deriv. of 2,5-dichlorohydroquinone (3:4690) has m.p. 125-127° but that a mixt. of the two derivs. is depressed to m p. 97° (6)]

3:4220 (1) ...

601 (1930).

(11) Yates (to Shell Development Co.), U.S. 1,778,240, Oct. 14, 1930; *Cent.* **1931**, I 2799; *C.A.* **24**, 5928 (1930).

3:4260 *o*-CHLOROPHENOXYACETIC ACID $C_8H_7O_3Cl$ Beil. VI — VI_1— VI_2-(172)

M.P. 147.2–147.7° cor. (4)
145–146° (1) (2) (3) **Neut. Eq. 186.5**

Wh. ndls. (from hot aq.). [For prepn. from *o*-chlorophenol (3:5980) by htg. with chloroacetic ac. (3:1370) and aq. alk. see (1) (2) (3).]

C̄ refluxed with 1½ pts. thionyl chloride for 1½ hrs. gives (90% yield (1)) *o*-chlorophenoxyacetyl chloride, b.p. 136° at 12 mm., m.p. 18 4° (1).

The methyl ester (b p. 186–188°) and the ethyl ester, ndls. (from alc.), m.p. 32°, have been prepd. from the acid chloride (1) (5)

o-Chlorophenoxyacetamide: from the acid chloride by treatment with excess $(NH_4)_2CO_3$; ndls. readily sol. in hot aq., alc., or C_6H_6, m.p. 149.5° (1).

o-Chlorophenoxyacetanilide: from the acid chloride by action of aniline (2 moles) in C_6H_6; ndls (from alc.), m.p. 121° (1).

Colorless lfts. from alc ; eas. sol. ether, acetone, AcOH, $CHCl_3$, CS_2 — [For f.p./compn. data on systems C̄ + benzophenone (1:5150) and C̄ + diphenylamine see (12).]

[For prepn. of C̄ from *p*-chlorobenzoic acid (3·4940) + chlorobenzene (3:7903) + $AlCl_3$ (82% yield (1)) or from *p*-chlorobenzoyl chloride (3:6550) + chlorobenzene (3:7903) + $AlCl_3$ in CS_2 *in direct sunlight* (yields: 90% (17), 75–80% (2), 36% (9)) (37) (some isomeric 2,4′-dichlorobenzophenone (3:1565) also being formed) *see indic. refs.*; from chlorobenzene (3:7903) + $AlCl_3$ + CO_2 at 80–150° and 10 atm. press. (*p*-chlorobenzoic acid is main prod.) see (18); from *p*-chlorophenyl MgCl + CO_2 (together with *p*-chlorobenzoic acid) see (8).]

[For prepn. of C̄ from dichloro-*bis*-(*p*-chlorophenyl)methane (4,4′-dichlorobenzophenone

dichloride) (see below) by hydrolysis with boilg. dil. alc. (14) or conc. H_2SO_4 (14) (15) (6) (19) see indic. refs.; from tetra-(*p*-chlorophenyl)ethylene glycol (see below) on fusion or on boilg. with AcOH see (20); from 4,4′-dibromobenzophenone with PCl_5 at 150° see (21); from 4,4′-dichloro-3-nitrobenzophenone (see below) via reduction to amine, diazotization, and treatment with $SnCl_2$ + NaOH see (2).]

[For formn. of $\bar{C}$ by oxidation with CrO_3/AcOH of 4,4′-dichlorobenzilic acid (2), of *bis*-(*p*-chlorophenyl)methane (7), of *tris*-(*p*-chlorophenyl)methane (16), of 1,1,4,4-tetra-(*p*-chlorophenyl)butyne-2 (91% yield (4)), or of 1,1,4,4-tetra-(*p*-chlorophenyl)butatriene-1,2,3 (94% yield (5)) see indic. refs.; from oxidn. of β,β-di-(*p*-chlorophenyl) [illegible] with aq. $KMnO_4$ see (10); from [illegible] (*p*,*p*′-dichlorobenzohydryl)pinacolone [illegible] (*p*-chlorophenyl)propiophenone by oxidn. with aq. $KMnO_4$ in NaOH + pyridine soln. see (13); from *bis*-(*p*-chlorophenyl)methyleneacetophenone with $KMnO_4$ in acetone (71% yield) see (3).]

[For formn. of $\bar{C}$ from 1,1-di-(*p*-chlorophenyl)ethane (3:0995) (39), from 1-chloro-2,2-*bis*-(*p*-chlorophenyl)ethylene (3:1430) (84% yield (40)), or from 1,1-dichloro-2,2-*bis*-(*p*-chlorophenyl)ethylene (3:2438) (40), all by oxidn. with CrO_3/AcOH, see indic. refs.]

[$\bar{C}$ on reduction with 3% Na/Hg in 90% alc. (20), with Al/Hg in 80% alc (6) (11), with Zn dust + AcOH on boilg. (20), with Zn dust + alc. KOH (20) or NaOH (23), or simply with boilg alc. KOH (24) gives (yields: 100% (23), 96% (6) (11)) di-(*p*-chlorophenyl)carbinol (4,4′-dichlorobenzhydrol) [Beil. VI-680, VI_1-(327)], cryst. from alc, m.p. 94° (20), 93° (24), 91.5° (23), 89–90° (6) (11) (corresp. 3,5-dinitrobenzoate, m.p. 174–176° (41)); note that in some cases this main prod. is accompanied by tetra-(*p*-chlorophenyl)ethylene glycol (see below). — $\bar{C}$ on reduction with Zn dust + AcOH + dil. H_2SO_4 (25), or in alc. in bright sunlight for 5 days (20) cf. (26), gives (85% yield (20)) tetra-(*p*-chlorophenyl)ethylene glycol [Beil. VI-1058, VI_1-(523)], m.p. 180° (6) (11), 175° (20) (accompanied by smaller amts. of other prods.).]

[$\bar{C}$ with sodium phenylacetylene in dry ether gives (57% yield (3)) *bis*-(*p*-chlorophenyl)-ethynyl-carbinol, m.p. 163–164° (3); $\bar{C}$ with diphenylmethyl sodium gives (27) *bis*-(*p*-chlorophenyl)-diphenylmethyl-carbinol, m.p. 183–184° (27); $\bar{C}$ with MeMgI in dry ether gives (39) (19) not only some *bis*-(*p*-chlorophenyl)-methyl-carbinol, m.p. 67.0–68.5° (39), but also (68% yield (19)), by loss of H_2O, *unsym.*-di-(*p*-chlorophenyl)ethylene, m.p. 91° (3:2475); $\bar{C}$ with β-(diphenylvinyl)MgBr gives (12% yield (28)) 1,1-di-(*p*-chlorophenyl)-3,3-diphenylpropen-2-ol-1, m.p. 85°, which on htg. at 130–150° loses H_2O yielding 1,1-di-(*p*-chlorophenyl)-3,3-diphenylpropadiene-1,2, m.p. 93–95° (28); $\bar{C}$ with ethyl bromoacetate + Zn in C_6H_6 gives (30% yield (28) ethyl β,β-di-(*p*-chlorophenyl)-β-hydroxypropionate, m.p. 102° (28).]

[$\bar{C}$ with PCl_5 at 150° gives (17) (15) (29) dichloro-di-(*p*-chlorophenyl)methane (4,4′-dichlorobenzophenone dichloride), m.p. 52–53° (15), 52.5° (17).]

[$\bar{C}$ on fusion with NaOH yields (7) chlorobenzene (3:7903) + *p*-chlorobenzoic acid (3:4940). — $\bar{C}$ with 10% aq. NaOH in pres. of Cu 5 hrs. at 190° under press. yields (30) 4,4′-dihydroxybenzophenone [Beil. VIII-317, $VIII_1$-(641)], m.p. 214° (30).]

[$\bar{C}$ with hydrazine hydrate in isopropyl alc. in s.t. at 150–160° for 7 hrs. gives (56% yield (42)) 4,4′-dichlorobenzophenone hydrazone, m.p. 91–93°, which on Wolff-Kishner reduction gives (21% yield (42)) 4,4′-dichlorodiphenylmethane (3:1057).]

[$\bar{C}$ with aq. NH_4OH in pres. of CuO + NH_4NO_3 + $KClO_3$ under press. at 180° (1) cf. (31) gives (92% yield (1)) 4,4′-diaminobenzophenone [Beil. XIV-88, XIV_1-(391)], m.p. 245–246° (1), 242.5° (31); some half reactn. prod., viz., 4-amino-4′-chlorobenzophenone, m.p. 185° (1), is also formed. — For similar reactn. of $\bar{C}$ with diethylamine leading to 4-chloro-4′-diethylaminobenzophenone see (32). — For reactn. of $\bar{C}$ with *N*-methyl-α-

phenylindole and use in prepn. of dyes see (33); with ethylbutyl-*m*-toluidine see (34); with aminoanthraquinone derivs. see (35) (36).]

[C̄ on nitration with 10 wt. pts. fumg. HNO_3 (D = 1.47) in cold (37) or with 5 pts. abs. HNO_3 at 0° (2) gives (81% yield (37)) 4,4′-dichloro-3,3′-dinitrobenzophenone, cryst. from AcOH, m p. 132.5° (2), 132–133° (38), 120° (37); C̄ on trinitration at 130° with 1.8 wt. pts. conc. H_2SO_4 contg. 2 pts. KNO_3 gives (37) 4,4′-dichloro-3,3′,5-trinitrobenzophenone, cryst. from AcOH, m.p. 140° (37); C̄ on tetranitration with 10 pts. fumg. H_2SO_4 + 1 pt. KNO_3 at 150° gives (37) 4,4′-dichloro-3,3′,5,5′-tetranitrobenzophenone, cryst. from AcOH, m.p. 202° (37).] [A *mono*-nitrated C̄, viz., 4,4′-dichloro-3-nitrobenzophenone. ndls. from alc , m.p. 87° (2), 88–89° (38) has been obtd. indirectly.]

Ⓓ **4,4′-Dichlorobenzophenone oxime:** ndls. from alc., m.p. 136–136.5° (1), 136° (7), 135° (8) (9), 134° (5). [From C̄ with excess NH_2OH in alc. at 100° (9)] [This prod. by Beckmann rearr. with conc. H_2SO_4 yields *p*-chlorobenz-*p*-chloroanilide, m.p. 213–213.5° (1).]

—— **4,4′-Dichlorobenzophenone phenylhydrazone:** not reported.

—— **4,4′-Dichlorobenzophenone *p*-nitrophenylhydrazone:** not reported.

—— **4,4′-Dichlorobenzophenone 2,4-dinitrophenylhydrazone:** m.p. 238–240° (40).

3:4280 2-CHLORO-4-HYDROXYBENZ-ALDEHYDE $C_7H_5O_2Cl$ Beil. VIII - 81
$VIII_1$—

M.P. 147–148° (1)
146.5° (2)

Colorless ndls. from AcOH (1) or aq. (2). — Volatile with steam but much less so than the isomeric 4-chloro-2-hydroxybenzaldehyde (3:0960) (1).

[For prepn. of C̄ from *m*-chlorophenol (3:0255) via Reimer-Tiemann reactn. see (1); via anhyd. HCN + $AlCl_3$ + C_6H_6 (50% yield) see (2); for prepn. (alm. 100% yield (1)) from 2-chloro-4-nitrotoluene via 2-chloro-4-aminotoluene and subsequent diazo reactn. see (1).]

C̄ does not reduce $NH_4OH/AgNO_3$ or Fehling soln. (1).

C̄ with aq. $FeCl_3$ gives only a slight ppt. [dif. from 4-chloro-2-hydroxybenzaldehyde (3:0960)]; the copper and chromium salts are lighter green in color than those from that isomer (1).

C̄ on mononitration as specified (3) yields 5-nitro-2-chloro-4-hydroxybenzaldehyde, vol. with steam, colorless ndls. from alc., m.p. 125° (3). [This product yields a phenylhydrazone, silky dark purple ndls. from alc., m.p. 166° sl. dec.; a *p*-nitrophenylhydrazone, deep or. ndls. from AcOH, m.p. 266° dec.; and a semicarbazone, light or. ndls. from dil. AcOH, m.p. 266° dec. (3).]

C̄ on dinitration as specified (3) yields 3,5-dinitro-2-chloro-4-hydroxybenzaldehyde, not volatile with steam, pale yel. massive pr. from aq., m.p. 93° (3). [This product yields a phenylhydrazone, br.-purple ndls. from alc., m.p. 210° dec.; a *p*-nitrophenylhydrazone, red-br. ndls. from dil. AcOH, m p. 267° dec ; and a semicarbazone, lt. br. ndls. from dil. AcOH, m.p. 192° dec. (3).]

Ⓓ **2-Chloro-4-hydroxybenzaldoxime:** cryst. from alc., m.p. 194° (2).
—— **2-Chloro-4-hydroxybenzaldehyde phenylhydrazone:** unrecorded.
Ⓓ **2-Chloro-4-hydroxybenzaldehyde *p*-nitrophenylhydrazone:** dark red pl. from alc. or vermilion red cryst. from AcOH, m.p. 288° dec. (1).
—— **2-Chloro-4-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone:** unrecorded.
Ⓓ **2-Chloro-4-hydroxybenzaldehyde semicarbazone:** yel. cryst. from alc., m p. 214° (1).
Ⓓ **2-Chloro-4-acetoxybenzaldehyde:** colorless ndls. from dil. AcOH, m.p. 51.5° (1).
Ⓓ **2-Chloro-4-benzoxybenzaldehyde:** colorless ndls. from alc., m p. 96.5° (1). [Note that this Ⓓ does not give good distinction from isomeric 4-chloro-2-hydroxybenzaldehyde (3:0960) whose corresponding benzoate has m.p. 98.5° (1).]

315° (15) (17)

Colorless cryst. from toluene + lt. pet. (2), from 50% AcOH (14), or from alc. (11).

[For prepn. of C̄ from 4,4′-diaminobiphenyl (benzidine) [Beil. XIII-214, $XIII_1$-(58)] via tetrazotization and use of Cu powder (9), Cu_2Cl_2 (3), or $HgCl_2$ complex (82% yield (10)), see indic. refs.; from biphenyl (1:7175) in AcOH with Cl_2 (41% yield (2)) (convenient for prepn. small amts C̄) see (2); from 4,4′-dinitrobiphenyl with $SOCl_2$ in s t. for 10 hrs. at 200–210° see (7); from *p*-chloroiodobenzene [Beil. V-221, V_1-(119)] with Cu powder at 200–250° (82% yield) see (15).]

[For formn. of C̄ from chlorobenzene (3:7903) by pyrolysis see (16) (12) (for discussion of formn during mfg. of phenol from chlorobenzene see (19)); from biphenyl (1:7175) with Cl_2 in pres. of $SbCl_5$ (17) or I_2 (13) see indic. refs ; from 4,4′-dihydroxybiphenyl (1:1640) with PCl_5 see (13); from 4,4′-dichlorobiphenyl-3,3′-dicarboxylic acid on htg. see (18); from 4,4′-dichloro-3,3′-diaminobiphenyl via tetrazotization and htg. with alc. see (14), from decompn. of *bis*-(*p*-chlorobenzoyl) peroxide on htg see (6).]

[For manuf. of C̄ or mixts of dichlorobiphenyls contg. C̄ from biphenyl with Cl_2 see (20) (21) (22) (23); for use as insecticide see (24).]

[C̄ htd. under press. with conc. aq NH_4OH in pres of Cu_2Cl_2 and $Ca(OH)_2$ gives (99.5% yield (25)) 4,4′-diaminobiphenyl (benzidine); C̄ with aq. over Cu + silica gel at 525–600° gives (26) 4,4′-dihydroxybiphenyl (1:1640).]

C̄ on mononitration in 15 pts AcOH with 10 pts. HNO_3 (D = 1.46) at 100° for ½ hr. (2), or in nitrobenzene soln. with HNO_3 (D = 1.52) as directed (2), gives alm. quant. yield of 4,4′-dichloro-2-nitrobiphenyl, cryst. from alc or CCl_4, m.p. 102° (2) (27). [This prod. does *not* react with piperidine (27).]

C̄ on dinitration by soln in 7½ pts HNO_3 (D = 1 52) in an ice bath gives (2) mixt. contg. 81.3% 4,4′-dichloro-2,3′-dinitrobiphenyl and 18.7% 4,4′-dichloro-2,2′-dinitrobiphenyl By recryst. from AcOH 4,4′-dichloro-2,3′-dinitrobiphenyl is obtd. in ndls., m p. 141–142° (2), 140° (28), which on warming with piperidine for a few seconds yields (28) 4-chloro-4′-piperidino-2,3′-dinitrobiphenyl, or. ndls from alc., m p. 132° (28) (note that the principal dinitration prod. of C̄ is the 2,3′-dinitro-C̄ and *not* the 2,2′-isomer as formerly (29) supposed). — From the mother liq. of the above dinitration may be obtd. (2) the true 4,4′-dichloro-2,2′-dinitrobiphenyl, m.p. 138–139° (2); this does not react with piperidine.

C̄ on trinitration with 10 pts HNO_3 (D = 1.52) for 2 hrs. at 100° gives (2) (30) 4,4′-dichloro-2,3′,5′-trinitrobiphenyl, ndls. from AcOH, m.p. 166–167° (2), 164–165° (30); this prod warmed with piperidine gives 4-chloro-4′-piperidino-2,3′,5′-trinitrobiphenyl, crimson pr. from AcOH, m p. 182° (2).

C̄ on oxidn. with CrO_3 in AcOH yields (13) *p*-chlorobenzoic acid (3:4940), m p. 237° (13).

3:4315 6,7-DICHLORONAPHTHOL-1  $C_{10}H_6OCl_2$ **Beil. VI-613**
VI_1—
VI_2—

M.P. 151° (1) (2)
149–150° (3)

Cryst. from $CHCl_3$ (3).

[For prepn. from β-(3,4-dichlorobenzal)propionic ac. [Beil. IX-614] by distn. see (1) (2) (3); C̄ is sepd. from the smaller proportion of 7,8-dichloronaphthol-1 (3:2635) by the greater soly. of the latter in lgr. (3).]

C̄ on oxidn. with $K_2Cr_2O_7$ + dil. H_2SO_4 yields (3) 4,5-dichlorophthalic ac. (3:4890), which during m.p. detn. is converted to 4,5-dichlorophthalic anhydride (3:4830), m.p. 184–185° (3).

C̄ in alk. soln. coupled with diazotized naphthionic acid (1-aminonaphthalenesulfonic acid-4) gives a deep red-bluish color which upon acidification becomes dark yellow (3). [Dif. from 7,8-dichloronaphthol-1 (3:2635) q.v.]

Ⓓ **6,7-Dichloro-1-naphthyl acetate:** ndls. from dil. alc., or compact pr. from $CHCl_3$ lgr., m.p. 102–103° (3).

3:4325 3,3-DICHLORO-2,2-DIMETHYLBUTANE  $C_6H_{12}Cl_2$ **Beil. I-150**
I_1—
I_2-(113)

M.P. 151–152° (1)

Colorless cryst. subliming readily even at ord. temp.

[For prepn of C̄ from *ter*-butyl methyl ketone (pinacolone) (1:5425) with PCl_5 at 0–5° (1) (2) (3) (4) (5) (6) (7) (9) see indic. refs. Note that C̄ (by loss of HCl) is always accompanied by more or less 3-chloro-2,2-dimethylbutene-3 (3:7340) and other prods.]

C̄ on htg. with phenol + KOAc yields (8) 3-chloro-2,2-dimethylbutene-3 (3:7340).

C̄ on htg. at 150–230° with powdered KOH (moistened with alc.) gives (65% yield (6)) (9) (2) *ter*-butylacetylene [Beil. I-256], b.p. 37.8° at 760 mm., $D_0^{20} = 0.6683$, $n_\alpha^{20} = 1.37257$ (6); note that use of NaOH instead of KOH gives by loss of 1 HCl only 3-chloro-2,2-dimethylbutene-3 (3:7340) and no *ter*-butylacetylene (9).

3:4330 2-CHLORONAPHTHOIC ACID-1  $C_{11}H_7O_2Cl$ Beil. IX-651
IX₁—

M.P. 152–153° (1)
151–152° (2)
151° (4)

Cryst. from C_6H_6 (2). — Sol. in 1000 pts. aq. at 20° or in 126 pts. aq at 100°; eas. sol. alc., ether (1).

[For prepn of C̄ from 2-hydroxynaphthoic acid-1 [Beil. X-328, X_1-(144)] with PCl_5 (3 moles) in s.t. at 180–190° for 8 hrs. followed by treatment with aq. see (1) (2); from 1-chloroformylnaphthyl-2-phosphoric acid dichloride [Beil. X-329] with PCl_5 (2 moles) in s.t. at 180–190° followed by treatment with aq see (1) (2); from 2-chloro-1-(chloromethyl)-naphthalene (4) by oxidn. with dil HNO_3 for 15 days see (4).]

C̄ in aq. susp. with 2% Na/Hg yields (1) α-naphthoic acid (1:0785), m.p. 160° (1).

C̄ does not esterify upon treatment in MeOH with HCl gas (3).

Salts: $CaĀ_2.2H_2O$; sol. in 150 pts. cold aq or 75 pts. hot aq.; loses water of hydration completely at 180° (1).

Ⓓ Methyl 2-chloro-1-naphthoate: pr. from alc. + toluene, m.p. 50° (1) (2), b.p. 176–180° at 18.5 mm. (2). [From AgĀ with MeI in s.t at 100° (1) or from C̄ with ethereal diazomethane (2).] [This ester is very resistant to hydrolysis (1) (2).]

—— Ethyl 2-chloro-1-naphthoate: unreported.

—— *p*-Bromophenacyl 2-chloro-1-naphthoate: unreported.

M.P. 156.7–157.2° cor. (6)
155–156° (1) (4) (5)
151° (2) (3)

Pr. (from hot aq.). — Spar sol. cold aq.

[For prepn from *p*-chlorophenol (3:0475) by htg. with chloroacetic ac. (3:1370) and aq. alk. see (1) (4) (5) (6).]

C̄ htd. with conc. HCl in s t. at 150° yields *p*-chlorophenol (3:0475) (3)

C̄ refluxed with 1½ pts. thionyl chloride for 1½ hrs. gives (90% yield) *p*-chlorophenoxyacetyl chloride, b.p. 142° at 17 mm, m p. 18.8° (1).

The methyl ester (b p. 177–180°) and the ethyl ester, ndls. (from alc.), m p. 49°, have been prepared from the acid chloride (1)

***p*-Chlorophenoxyacetamide:** from the acid chloride by treatment with excess $(NH_4)_2CO_3$; ndls. from alc., m.p. 133° (1).

p-Chlorophenoxyacetanilide: from the acid chloride by action of aniline (2 moles) in C_6H_6; ndls. (from alc.), m.p. 125° (1).

3:4375 (1) Minton, Stephen, *J. Chem. Soc.* **121**, 1599–1601 (1922). (2) Michael, *Am. Chem. J.* **9**, 216 (1887). (3) Peratoner, *Gazz. chim. ital.* **28**, I 239 (1898). (4) Behaghel, *J. prakt. Chem.* **114**, 297–298 (1926). (5) Koelsch, *J. Am. Chem. Soc.* **53**, 304–305 (1931). (6) Hayes, Branch, *J. Am. Chem. Soc.* **65**, 1555–1564 (1943).

3:4390 4-CHLOROPHTHALIC ACID

$C_8H_5O_4Cl$ Beil. IX - 816
IX_1-(366)

M.P. **157°** (1)
156° (2)
151° (3)
150–150.5° (4)
150° in s.t. (5)
148° u.c. (6)

[*See also 4-chlorophthalic anhydride* (3:2725).]

Ndls. from alc.; cryst. from C_6H_6 or CCl_4. — Eas. sol. aq., alc., ether, or AcOH.

[For prepn. of $\bar{C}$ from 4-chlorophthalic anhydride (3:2725) by warming with aq. or from dimethyl 4-chlorophthalate (3) or diethyl 4-chlorophthalate (5) by hydrol. with alk. see indic. refs.; from neutral sodium phthalate in aq. alk. on treatment with Cl_2 see (3) (7) (8) (9) (10); from 4-chloro-2-methylbenzoic acid (3:4700) (11) (12), from 5-chloro-2-methylbenzoic acid (3:4670) (11), from 4-chloro-2-methylacetophenone [Beil. VII-306] (2), or from 7-chloro-1,2,3,4-tetrahydronaphthalene (1) by oxidn. with alk. $KMnO_4$ see indic. refs.; from 6-chloroindanone-1 [Beil. VII-361] on evapn. with hot 25% HNO_3 see (4); from 1,6-dichloronaphthalene (3:0810) (13), 2,6-dichloronaphthalene (3:4040) (14) (6), 2,7-dichloronaphthalene (3:3445) (14), 6-chloronaphthol-2 (3:3500) (6), or 4-chloro-2-methylbenzoic acid (above) (12) on oxidn. with dil. HNO_3 in s t. as directed see indic. refs.; from the trichloride of 4-sulfophthalic acid [Beil. XI-407] with PCl_5 in s.t. at 220° followed by KOH hydrolysis of the 4-chlorophthalyl (di)chloride see (15); from 4-sulfophthalic anhydride (16) by htg. with HCl + $NaClO_3$ see (16).]

$\bar{C}$ on htg. above m.p. gives 4-chlorophthalic anhydride (3:2725).

[$\bar{C}$ on fusion with KOH (11) or with NaOH at 165–175° (10) gives (100% yield (10)) 4-hydroxyphthalic acid [Beil. X-499, X_1-(255)], m.p. 204–205°, with conv. to corresp. anhydride, m p. 171° (note that this same prod. is also obtd. from the isomeric 3-chlorophthalic acid (3:4820)).]

[$\bar{C}$ htd. under press. at 350° with aq. + cat. loses CO_2 presumably yielding (17) *m*-chlorobenzoic acid (3:4392) and/or *p*-chlorobenzoic acid (3:4940).]

[$\bar{C}$ with NH_3 gas + cat. as directed (18) yields 4-chlorophthalonitrile, m.p. 130–132° (19).]

[For use of $\bar{C}$ as softener for cellulose derivatives see (20); for reaction of $\bar{C}$ with naphthalene + $AlCl_3$ yielding intermediates for vat dyes see (21).]

$\bar{C}$ on htg. with resorcinol + few drops conc. H_2SO_4, then dissolving in alk., gives fluorescein reactn. (2). — $\bar{C}$ is unstable toward $KMnO_4$ (2).

Salts. *Ba$\bar{A}$, Ca$\bar{A}$, dif. sol. aq.; Ba$\bar{A}$.$H_2\bar{A}$, spar. sol. even in hot aq. (11) (for table of* heavy metal salts see (22)).

Esters. Dimethyl 4-chlorophthalate; from $Ag_2\bar{A}$ with MeI (15), from 4-chlorophthalyl (di)chloride (above) with MeOH (15), or from $\bar{C}$ in MeOH with HCl gas (3); ndls. from

lgr., m.p. 38° (3), 37° (15), b.p. 186–187° at 32 mm. (3); diethyl 4-chlorophthalate; from C̄ in alc. with HCl gas (15) or from diethyl 4-aminophthalate via diazotization and use of Cu_2Cl_2 reactn. (70% yield (5)), b.p. 300–305° (15), 185–190° at 25 mm. (5), 173–174° at 16 mm. (1).

	154.8°	(10)		

Pr. from hot aq., 30% AcOH or C_6H_6. — C̄ is spar. sol. cold aq., e g., 1 pt. C̄ is sol. at 0° in 2840 pts. aq (23); 100 ml. satd. aq. soln. at 25° conts. 0.0385 g. C̄ (60). — C̄ is eas. sol. hot aq, alc., ether. — At 14–16° C 100 ml. of satd. soln. of C̄ in ether conts. 14 g. C̄; in C_6H_6, 0 66 g. C̄; in CS_2, 0 62 g. C̄; in CCl_4, 0.08 g. C̄ (8). — For study of soly. of C̄ in C_6H_6 or *n*-heptane see (11); in chlorobenzene (3:7903), in *o*-chlorotoluene (3:8245), or in *m*-chlorotoluene (3:8275) see (10); in acetone or C_6H_6 see (6); for soly. of C̄ in aq. solns. of various salts including NaĀ see (60). — For distribution coefficients of C̄ at 25° between aq. + toluene or between aq. and $CHCl_3$ see (102).

C̄ can be sublimed under reduced press. (24) (14). — C̄ is but very slightly volatile with steam (for details see (12)). — For study of adsorption of C̄ by charcoal from acetone or C_6H_6 soln. see (6).

Binary systems contg. C̄: [For f.p./compn. data on system C̄ + H_2O see (25). — For f.p./compn data and diagram of system C̄ + benzoic acid (1:0715) (eutectic, m.p. 96 0° (20), 95.4° (27) (8), contg. 36 wt. % C̄ (27) (20) (8) (28)) see indic. refs. — For f.p./compn. data on systems C̄ + *m*-toluic acid (1:0705) (26), C̄ + *m*-hydroxybenzoic acid (1:0825) (26), see indic. refs.]

[For f.p./compn. data on system $\bar{C}$ + *o*-chlorobenzoic acid (3:4150) (eutectic, m.p. 110.7°, contg. 47–48 mole % $\bar{C}$ (20) (27) (8) (19)) see indic. refs.; on system $\bar{C}$ + *p*-chlorobenzoic acid (3:3940) (eutectic, m.p. 140.9°, contg. 80 mole % $\bar{C}$ (8) (19) cf. (104)) see indic. refs.; on system $\bar{C}$ + 2,5-dichlorobenzoic acid (3:4340) (eutectic, m.p. 119.7°, contg. 51–58 mole % $\bar{C}$) see (13).]

[For f.p./compn. data on systems $\bar{C}$ + *o*-bromobenzoic acid (28), $\bar{C}$ + *m*-bromobenzoic acid (28), $\bar{C}$ + *p*-bromobenzoic acid (28), *m*-iodobenzoic acid (29), *o*-nitrobenzoic acid (30), *m*-nitrobenzoic acid (30) see indic. refs.]

Ternary systems contg. $\bar{C}$: [For influence of addn. of benzoic acid (20) or of *p*-chlorobenzoic acid (3:4940) (27) to eutectic of $\bar{C}$ with *o*-chlorobenzoic acid (3:4150) see indic. refs. — For influence of addn. of *o*-chlorobenzoic acid (3:4150) to eutectic of $\bar{C}$ with benzoic acid (1:0715) see (27); for data on system $\bar{C}$ + *o*-chlorobenzoic acid (3:4150) + *p*-chlorobenzoic acid (3:4940) see (19).]

Miscellaneous. [For study of fate of $\bar{C}$ in animal organism see (31) cf. (102) (note that although from man $\bar{C}$ is excreted (34) as *N*-(*m*-chlorobenzoyl)glycine (*m*-chlorohippuric acid) [Beil. IX-339], m.p. 143–144° (31), yet from dog and rabbit no evidence for this conjugation product has been found (31). — For study of use of $\bar{C}$ as a preservative see (32). — For use of $\bar{C}$ as vulcanization regulator see (33).]

Preparation. [For prepn. of $\bar{C}$ from benzoic acid (1:0715) by chlorination with Cl_2 (38) in pres. of $FeCl_3$ (70% yield (8)), with $KClO_3$ + conc. HCl (35) (36) (37) (38), with aqua regia at 100° (yield 32% (39)) (7), with $SbCl_5$ (35) (40) (84), with MnO_2 + conc. HCl in s.t. at 150° (41), with NaOCl soln. (20) (42), or with $Ca(OCl)_2$ soln. (42) (35) (38) see indic. refs. (note that in all these cases numerous other chlorination products are also formed); from cinnamic acid (1:0735) by chlorination and oxidn. with $Ca(OCl)_2$ soln. see (35) (38).]

[For prepn. of $\bar{C}$ by oxidn. of *m*-chlorotoluene (3:8275) with $K_2Cr_2O_7$ + H_2SO_4 (43), with 5% aq. $KMnO_4$ (75% yield (4)) (8), with dil. HNO_3 in s.t. at 130–140° for 8 hrs. (47), or in aq. alk. at 260° under press. with air (44) see indic. refs.; from 3-chlorobiphenyl (3:8940) or from 3,3′-dichlorobiphenyl (3:0180) by oxidn. with CrO_3/AcOH in pres. of V_2O_5 see (45); from *m*-chlorobenzaldehyde (3:6475) by oxidn. with alk. $KMnO_4$ see (3).]

[For prepn. of $\bar{C}$ from *m*-chlorobenzal (di)chloride (3:6710) by hydrolysis with aq followed by $KMnO_4$ oxidn. (7% yield (2)) or from its mixt. with *m*-chlorobenzotrichloride (3:6845) by hydrolysis with 70% H_2SO_4 or 80% AcOH or 5% NaOH at 90–100° in stream of air to effect immediate oxidn. (46) see indic. refs.]

[For prepn. of $\bar{C}$ from *m*-chlorobenzonitrile [Beil. IX-339], m.p. 40.5° (48), by hydrolysis with conc. H_2SO_4 (3), from *N*-(*m*-chlorobenzoyl)glycine (*m*-chlorohippuric acid) by hydrolysis with HCl (35) (36), see indic. refs.]

[For prepn. of $\bar{C}$ from *m*-aminobenzoic acid [Beil. XIV-383, XIV_1-(558)] via dizaotization and use of Cu_2Cl_2 reactn. (74% yield (101)) (3) (4) (49); from *m*,*m*′-diazoaminobenzoic acid (diazoaminobenzene-3,3′-dicarboxylic acid) [Beil. XVI-727] with warm conc. HCl (50) see indic. refs.]

[For formn. of $\bar{C}$ from *m*-chloro-iodobenzene [Beil. V-220, V_2-(167)] by reaction with *n*-butyllithium in ether followed by carbonation with CO_2 (41.5% yield (51)); from *p*-chloronitrobenzene [Beil. V-243, V_1-(129), V_2-(182)] with alc. KCN in s t. at 200° (52); from 3-chlorophthalic acid (3:4820) or 4-chlorophthalic acid (3:4390) by cat. partial decarboxylation (53); from 3-chlorophthalic acid by mercuration and treatment with HCl (99) see indic. refs.]

Chemical behavior. [$\bar{C}$ (as Na$\bar{A}$) on reduction in boilg. aq. soln. with Na/Hg yields (36) (54) benzoic acid (1:0715) (for study of reduction of $\bar{C}$ with H_2 + Ni in aq. alk. at ord. temp. see (55)); $\bar{C}$ on *electrolytic reduction in alc./H_2SO_4 yields* (56) *m*-chlorobenzyl

alcohol [Beil. VI-444], oil, b.p. 234° (56); note that $\bar{C}$ with Ni/Al alloy (Raney nickel) in aq. alk. soln. at 90° gives (100% yield (106)) benzoic acid (1:0715), m.p. 121°.]

$\bar{C}$ behaves normally as a monobasic acid: e g., $\bar{C}$ on titration with standard dil. aq. alk. gives Neut. Eq. 156.5; ionization const. at 25° is 1.55×10^{-4} (57), $1.53–1.59 \times 10^{-4}$ (58), 1.506×10^{-4} (59) cf. (1) (60). — [For study of acid strength of $\bar{C}$ in MeOH, EtOH, and various other alcs. see (61) (62) (63) (16) (64) (65) (17).]

Salts of inorganic bases. [$NH_4\bar{A}$, m.p. 203–204° dec. (39), lfts. from acetone/pet. ether (39), powder from abs alc (66). — Hydroxylamine salt, ndls. from xylene, m.p. 144° (72), 145–146° dec. (39). — $Na\bar{A}$ (67), $K\bar{A}$ (67) both behave as liquid cryst. on fusion. — $Ag\bar{A}$, insol. aq. (68) (note that this salt (1 mole) with I_2 (2 equiv.) in dry C_6H_6 refluxed 15–18 hrs. yields (69) phenyl *m*-chlorobenzoate, m.p. 53°, + CO_2 + AgI). — $Ca\bar{A}_2.3H_2O$, sol. at 12° in 82 6 pts. aq. (68) (35). — $Ba\bar{A}_2.4H_2O$, eas. sol. aq. or alc. (for use in sepn. of $\bar{C}$ from *o*-chlorobenzoic acid (3:4150) and *p*-chlorobenzoic acid (3:4940) see (27)). — $Cd\bar{A}_2.2H_2O$ (71).]

Salts of organic bases. E.g., $\bar{C}$ with equiv. amt. benzylamine in boilg. EtOAc followed by evapn. of solvent yields (73) benzylammonium·*m*-chlorobenzoate, m.p. 146.8–147.4° u c., 149 2–149 8° cor. (73), Neut. Eq. 263.6 (note that the m.p. of this salt is only very slightly lower than that of the corresp. salt from *o*-chlorobenzoic acid (3:4150)). — $\bar{C}$ similarly treated with α-phenylethylamine yields (73) α-phenylethylammonium *m*-chlorobenzoate, m.p 142 0–142 6° u c., 144 7–145.3° cor. (73), Neut. Eq 277.6 (note that the m.p. of this salt, although better separated from those of the isomeric acids than the preceding case, is very close to that for the corresp. deriv. of cinnamic acid (1:0735)).

$\bar{C}$ (1 mole) in alc. mixed with codeine (1 mole), m.p. 155°, in alc htd. several minutes, solvent evaporated, and resulting syrup recrystallized from aq. yields (74) codeine *m*-chlorobenzoate, $C_{18}H_{21}O_3N.\bar{C}$, m.p 96° on "Maquenne block"; note that this m.p. although very close to that (99°) of corresp. salt from *m*-bromobenzoic acid is widely different from the corresp. salts of *o*-chlorobenzoic acid (3:4150) and *p*-chlorobenzoic acid (3:4940), which are 134° and 162° respectively. — $\bar{C}$ (1 mole) in alc. (or $CHCl_3$) with strychnine (1 mole) in alc. boiled for a few minutes then cooled yields (75) strychnine *m*-chlorobenzoate, $C_{21}H_{22}O_2N_2.\bar{C}$, m.p 185° u c. on "Maquenne block"; note that this m.p. is somewhat higher than that (170°) of the corresp. salt from *o*-chlorobenzoic acid (3:4150) and widely different from that (251°) of the corresp. salt of *p*-chlorobenzoic acid (3:4940).

$\bar{C}$ with alcohols gives by conventional procedures the corresp. esters; for details on methyl *m*-chlorobenzoate (3:6670) and on ethyl *m*-chlorobenzoate (3:6770) see these compds. — [For study of rate of esterification of $\bar{C}$ with MeOH (76) or with cyclohexanol (77) see indic. refs.]

$\bar{C}$ with P_2O_5 in toluene boiled for 4 hrs. (78) or $\bar{C}$ with oxalyl (di)chloride (3:5060) refluxed in C_6H_6 (79) cf. (80) yields *m*-chlorobenzoic acid anhydride, pl. from C_6H_6 or toluene, ndls. from lt. pet. or alc , m p. 95.5° (78), 95° (79) (note that $\bar{C}$ (2 moles) with oxalyl (di)bromide refluxed in C_6H_6 similarly gives good yields (80) of the above anhydride but $Na\bar{A}$ with oxalyl dibromide can also be used (80) to prepare *m*-chlorobenzoyl bromide, oil, b p. 143–147° at 40 mm. (80)).

$\bar{C}$ with PCl_5 (31) (68) (3) or with $SOCl_2$ (81) (82) or with $SOCl_2$ + pyridine (83) gives (76% yield (31)) *m*-chlorobenzoyl chloride (3:6590), b p. 225°.

[$\bar{C}$ with HN_3 in conc. H_2SO_4 in trichloroethylene (3:5170) soln. at 40° gives (75% yield (107)) *m*-chloroaniline]

$\bar{C}$ fused with KOH, subsequently acidified, yields (84) *m*-hydroxybenzoic acid (1:0825).

$\bar{C}$ on nitration with boilg. fumg. HNO_3 for 10 min. (70) or with abs. HNO_3 at 0° or −30° (3) (21) (85) gives a mixt. of two isomeric nitro-*m*-chlorobenzoic acids; this mixt. consists mainly (92–93% (86) cf. (21)) of 3-chloro-6-nitrobenzoic acid [Beil. IX-401],

cryst. from HNO_3 (D = 1.1) (24), ether, C_6H_6, or aq., m.p. 139° (85), 137–138° (70), 136° (3), 135–136° (24), accompanied by a little (7–8% (86)) cf. (24) 3-chloro-2-nitrobenzoic acid [Beil. IX-400], ndls. or tbls. from hot aq., m.p. 235° (70) (85), 233–234° (3) (for details on sepn. of these two isomers see (3) (70) (24) (85)). — Note that the other two possible nitro-m-chlorobenzoic acids are known but are not found in the product from nitration of C̄; they are 3-chloro-4-nitrobenzoic acid [Beil IX-404], m.p. 185–186°, and 3-chloro-5-nitrobenzoic acid [Beil. IX-403, IX_1-(165)], m.p. 147°. — [Note also that *no* dinitro-3-chlorobenzoic acids have ever been reported.]

—— **Methyl m-chlorobenzoate:** b.p. 231°, m.p. 21°. (See 3:6670.)

—— **Ethyl m-chlorobenzoate:** b.p. 245°. (See 3:6770.)

Ⓓ **p-Nitrobenzyl m-chlorobenzoate:** m.p. 107.2° u.c. (87). [From C̄ (as NaĀ) with p-nitrobenzyl bromide (m.p. 99°) in boilg. dil. alc. (87); note that m.p. of this ester is almost identical with that (106° (88)) of the corresp. ester of o-chlorobenzoic acid (3:4150).]

Ⓓ **Phenacyl m-chlorobenzoate:** m.p. 118° (89), 116.4° (21). [From C̄ (as NaĀ) with phenacyl bromide (m.p. 50°) in boilg. alc. (98% yield (21)).]

—— **p-Chlorophenacyl m-chlorobenzoate:** unreported.

Ⓓ **p-Bromophenacyl m-chlorobenzoate:** m.p. 117.2° (21), 116° (90). [From C̄ (as NaĀ) with p-bromophenacyl bromide (m.p. 109°) in boilg. alc. (21).]

—— **p-Iodophenacyl m-chlorobenzoate:** unreported.

Ⓓ **p-Phenylphenacyl m-chlorobenzoate:** m.p. 154° u.c. (91). [From C̄ (as NaĀ) with p-phenylphenacyl bromide (m.p. 126°) in boilg. alc. (91); note that the m.p. of this deriv. is only slightly lower than that (160° u c. (91)) of the corresp. ester of p-chlorobenzoic acid (3:4940); note also that, since this ester has almost the same m.p. as the original C̄, care must be taken to show that the supposed ester is insol. in aq. Na_2CO_3 (dif. and sepn. from C̄); note finally that the m.p. of a mixt. of C̄ with this ester is depressed to 130–132° (91).]

Ⓓ **S-Benzylthiuronium m-chlorobenzoate:** cryst. from alc., m.p. 155° cor. (92). [From NaĀ or KĀ in dil. alc. with slight excess S-benzylthiuronium chloride soln. (15% in hot alc.) (92).]

Ⓓ **S-(p-Chlorobenzyl)thiuronium m-chlorobenzoate:** cryst from dioxane, m.p. 157° cor. (93). [From NaĀ or KĀ in aq. with 1 equiv. of S-(p-chlorobenzyl)thiuronium chloride, m.p. 197° (10% in alc.) (93); note that the m.p. of this prod. is closely adjacent to that (m.p. 159° cor. (93)) of the corresp. salt of o-chlorobenzoic acid (3:4150), and is also almost identical with that of the original C̄.]

Ⓓ **S-(p-Bromobenzyl)thiuronium m-chlorobenzoate:** m.p. 150° cor. (94). [From NaĀ or KĀ in aq. with 1 equiv. of S-(p-bromobenzyl)thiuronium bromide, m.p. 213°, in alc. (94).]

Ⓓ **m-Chlorobenzamide:** cryst. from hot aq. or alc., m p. 135° (100), 134 5° cor. (3), 134° u.c. (95), 132–133° (70). [From o-chlorobenzoyl chloride (3:6590) with conc. aq. NH_4OH (68) (70) or from C̄ by refluxing with AcOH + $(NH_4)_2CO_3$ (46–50% yield (100)); note that this amide gives on fusion with HgO a mercuric deriv., m.p. 245° u c. (95).]

Ⓓ **m-Chlorobenzhydrazide:** ndls. from aq. or alc , m.p. 158° (96), 157–158° (97). [From ethyl m-chlorobenzoate (3:6770) with hydrazine hydrate in abs. alc. on 8-hr. reflux. (yield: 97% (96), 87% (97)).] — [For use of m-chlorobenzhydrazide as general reagt. for identification of aldehydes and ketones see (97).]

—— **N'-(m-Chlorobenzoyl)-N-phenylhydrazide:** unreported.

—— *m*-Chlorobenzanilide: cryst. from alc., m.p. 122–125° (98). [Prepn. reported but only by indirect means (98).] — [Note that the isomeric benz-*m*-chloroanilide [Beil. XII-605] has m.p. 118°.]

—— *m*-Chlorobenzo-*p*-toluidide: unreported.

—— *m*-Chlorobenzo-α-naphthalide: unreported.

—— *m*-Chlorobenzo-β-naphthalide: unreported.

3:4395 2-CHLORO-3-HYDROXYBENZOIC ACID 
$C_7H_5O_3Cl$ **Beil. X - 142 X_1—**

M.P. 157.5–158.5° (1)
156.5–157.5° (1)
156–157° (2) (5)
156° (3)
155.0–155.5° u.c. (10)

Colorless lfts. from aq. or C_6H_6. [Ioniz. const. at 25° = 1.40×10^{-3} (5).]

[For prepn. of $\bar{C}$ from 2-chloro-3-hydroxybenzaldehyde (3:4085) with 5–6 pts. 50% KOH at 60–70° (Cannizzaro reactn.) (96% yield) see (3); from ethyl 2-chloro-3-hydroxybenzoate (see below) by hydrolysis with 35% KOH see (1) (2) cf. (4); for formn. from *m*-hydroxybenzoic acid (1:0825) with Cl_2 in MeOH (6) (44% yield (10)) or AcOH (1) (together with some of the isomeric 6-chloro-3-hydroxybenzoic acid (3:4720)) see indic. refs; for prepn. of $\bar{C}$ from 2-amino-3-hydroxybenzoic acid (1) via diazotization and use of Cu_2Cl_2 reactn. see (1).]

Salts: Ag$\bar{A}$, cryst. ppt. (2).

$\bar{C}$ in aq. soln. gives with $FeCl_3$ a violet-red color.

[$\bar{C}$ with formalin (1:0145) + conc. HCl + HCl gas at room temp. gives (87% yield (10)) 7-chloro-6-hydroxyphthalide, m.p. 290° cor. (10).]

—— **Methyl 2-chloro-3-hydroxybenzoate**: pr. with 1 H_2O from dil. alc., m.p. 70–71° (2); anhydrous form, m.p. 62–65° (2). [From $\bar{C}$ in MeOH with H_2SO_4 (2).] — [This ester with MeI + MeOH/KOH in s.t. at 130° for several hours gives methyl 2-chloro-3-methoxybenzoate, anhydrous ndls. from dil. alc., m.p. 41–42° (2).]

—— **Ethyl 2-chloro-3-hydroxybenzoate**: white ndls. with 1 H_2O from dil. alc., m.p. 58° (2); above m.p. loses aq. giving viscous oil (2). [From ethyl *m*-hydroxybenzoate (1:1471) with SO_2Cl_2 (together with the isomeric ethyl 6-chloro-3-hydroxybenzoate (2) (4)).] — [This anhydrous ester with AcCl yields ethyl 2-chloro-3-acetoxybenzoate, ndls. from dil. alc., m.p. 48–49° (2).]

—— **2-Chloro-3-methoxybenzoic acid**: colorless ndls. from aq., m.p. 161.5° (7), 160° (8) (9). [Prepd. indirectly from 2-chloro-3-methoxybenzaldehyde by oxidn. with $KMnO_4$ (7) (8).]

—— 2-Chloro-3-acetoxybenzoic acid: cryst. from aq. or C_6H_6, m.p. 152.5–153° u.c. (10). [From Č + Ac_2O + K_2CO_3 (10)]

3:4395 (1) Beyer, *Rec. trav. chim.* **40**, 626–628 (1921). (2) Mazzara, *Gazz. chim ital.* **29**, I 380–383 (1899). (3) Lock, *Monatsh.* **55**, 310–311 (1930). 3:4400 3,5-DICHLORO-4-HYDROXYBENZALDEHYDE

$C_7H_4O_2Cl_2$ Beil. VIII - 81 VIII₁—

M.P. 158–159° cor. (1)
156° (2) (3)

Colorless odorless ndls. from dil alc or from $CHCl_3$, fairly eas. sol. alc., ether, AcOH; more dif. sol C_6H_6, lgr., $CHCl_3$

[For prepn. of Č from *p*-hydroxybenzaldehyde (1:0060) in 5 pts. AcOH at 100° (2) (4) or in $CHCl_3$ with cooling (1) with Cl_2 see indic refs.; from corresp. methyl ether (3,5-dichloro-4-methoxybenzaldehyde) with boilg. conc HI see (3)]

Č in *N* KOH with H_2O_2 yields (4) 2,6-dichlorohydroquinone (3:4600).

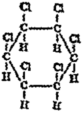
[The methyl ether of Č (see above) has been obtd. indirectly (3) from *p*-methoxybenzaldehyde (*p*-anisaldehyde) (1.0240) by chlorination with large excess (9 moles) SO_2Cl_2; bright red cryst from alc., m p 61 5° (3); on oxidn. with CrO_3 this prod. gives (80% yield (3)) 3,5-dichloro-*p*-methoxybenzoic acid [Beil. X-177], m p 202.0–202.5° (3)]

Ⓓ 3,5-Dichloro-4-hydroxybenzaldoxime: colorless ndls from dil. alc., m p. 185° (2). [From Č in moderately conc NaOH (3 moles) with $NH_2OH.HCl$ (1½ moles), subsequently acidified with AcOH (2).] — [This oxime on boilg. with Ac_2O for 2 hrs. yields (2) 3,5-dichloro-4-acetoxybenzonitrile, colorless cryst. from dil. alc., m.p. 93° (2).]

Ⓓ 3,5-Dichloro-4-hydroxybenzaldehyde semicarbazone: greenish yel. ndls. from AcOH, m.p. 236–237° cor. dec. (1) [From Č in hot AcOH (50 pts.) by addn. of conc aq. soln. of semicarbazide hydrochloride, followed by ½ hr. htg. (1)]

3:4400 (1) Biltz, *Ber* **37**, 4033–4034 (1904). (2) von Auwers, Reis, *Ber.* **29**, 2356–2358 (1896). (3) Durrans, *J. Chem. Soc.* **123**, 1426 (1923). (4) Dakin, *Am. Chem. J.* **42**, 490–491 (1909).

3:4410 *cis*-1,2,3,4,5,6-HEXACHLOROCYCLOHEXANE (α-Benzenehexachloride)



$C_6H_6Cl_6$ Beil. V - 23 V₁-(8) V₂-(11)

M.P. 158.2° (1)
158° (2)
157° cor. (3) (21)

[*See also β-benzenehexachloride* (3:4990).]

Nine stereoisomeric configurations of benzenehexachloride are possible (cf. (1)) and four are known; Č (contrary to earlier opinion (5)) is now thought (but not unequivocally proved) to have the *cis* configuration; the β-isomer has been shown to have the *trans* configuration; the configurations of the γ-isomer, m.p. 112–113° (2), and the δ-isomer, m p. 129–132° (2), are unknown.

C̄ cryst. from 80% AcOH (3) or from alc. — C̄ is volatile with steam (dif. and separation from β-isomer). — C̄ is insol. aq. but sol. in 22.8 pts. $CHCl_3$ at 15.25°; in 15 4 pts. C_6H_6 at 18 25° (5). — C̄ forms with the β-isomer a eutectic (m.p. 155.5°) contg. 79.7% C̄ (2).

[For manuf. of ordinary benzenehexachloride (mixt. of stereoisomers) from C_6H_6 (1:7400) + Cl_2 in pres. of light (6) (7) (8), X-radiation (9), or conc. H_2SO_4 (10) see indic. refs.; for study of prepn. of C̄ (together with other stereoisomers) from C_6H_6 with Cl_2 in pres. of 1% aq. *NaOH see (3) (2) (28), in gas phase (11) (12), in pres. of ethylene in the dark (13)*, in pres. of NCl_3 in the dark (14) or in light (15), in pres. of light (16) (17) (18) (19) (20).] [For use of C̄ as insecticide see (27); note, however, that insecticidal props. are thought to be due to γ-isomer (29).]

C̄ on htg. above its m.p. loses HCl and yields (3) (21) 1,2,4-trichlorobenzene (3:6420).

C̄ on htg. with aq in s.t. at 200° (19), on boilg. with MeOH/KOH (2), EtOH/KOH (2) (3) (19) (20) (22), alc. KCN (19), or pyridine (2), or on htg. with quinoline at 105–110° (2) yields mainly 1,2,4-trichlorobenzene (3:6420) together with other prods.; e.g, C̄ on boilg. with excess 10% alc KOH for ½ hr. (2) or C̄ boiled with 10 pts. pyridine for 1 hr. (2) gives (yield: 75–86% (2)) 1,2,4-trichlorobenzene (3:6420).

C̄ reacts very vigorously with boilg. aniline (19), but the prods. have not been detd.

[C̄ stood in s.t. with 3 pts. liq. Cl_2 for 11 days yields (23) α-nonachlorocyclohexane, cryst. *from alc, m.p. 95–96° (23) (24).]*

C̄ in alc. boiled with Zn dust yields (25) benzene (1:7400).

C̄ is very inert to most other reagents: e.g., C̄ can be recrystallized unchanged from fumg. HNO_3 (3), is unattacked by fumg H_2SO_4 (19), is unattacked by CrO_3 (3), is only slightly affected by aq. $KMnO_4$ even on boilg. (3), and is unaffected by conc. aq. NH_4OH (3), boilg. alc. $AgNO_3$ (3), or AgOAc (26).

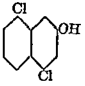
3:4420 *4,8-DICHLORONAPHTHOL-2*



$C_{10}H_6OCl_2$ Beil. VI — VI_1— VI_2-(604)

M.P. 158–159° (1).

Colorless ndls. from alc. — sol. in NaOH.

[For prepn. from 4,8-dichloronaphthylamine-2 via diazo reaction see (1).]

[For use in prepn. of azo dyestuffs see (2).]

C̄ on suitable methylation yields methyl ether, viz., methyl 2,4-dichloro-β-naphthyl ether, colorless ndls., m.p. 93° (1).

3:4420 (1) Friedländer, Karamessinis, Schenk, *Ber.* **55**, 48–49 (1922). (2) Herzberg, Wunderlich (to I.G.), Ger. 459,989, May 18, 1928; *Cent.* **1928**, II 395.

3:4430 2-CHLORO-4-HYDROXYBENZOIC ACID

$C_7H_5O_3Cl$ Beil. S.N. 1069

M.P. 159° (1)

Colorless ndls. from aq.

[For prepn. of C̄ from 2-chloro-4-methoxybenzoic acid (see below) by cleavage with conc. HI (D = 1.7) see (1).]

[The corresp. methyl ether, viz., 2-chloro-4-methoxybenzoic acid (2-chloro-*p*-anisic acid), m.p. 208° (2) (3), has been obtd. indirectly from 2-chloro-4-methoxybenzaldehyde [Beil. VIII-81] (2) or from 2-chloro-4-methoxytoluene [Beil. VI-402] (3) by $KMnO_4$ oxidn. (2) (3).]

3:4430 (1) Hodgson, Jenkinson, *J. Chem. Soc.* **1927**, 1742. (2) Tiemann, *Ber.* **24**, 712 (1891). (3) Ullmann, Wagner, *Ann.* **355**, 368 (1907).

3:4435 3-CHLORO-2-METHYLBENZOIC ACID

$C_8H_7O_2Cl$ Beil. IX - 467
IX_1—

M.P. 159° (1)
156° (2)
154° (3)

Colorless ndls. from alc.; eas. sol. alc.

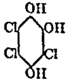
[For prepn. of C̄ from 3-chloro-2-methylbenzonitrile, m.p. 19° (1), by refluxing with 20% aq. KOH for 5 hrs. (98% yield) see (1); from 3-chloro-1,2-dimethylbenzene (3:8645) on oxdn. with boilg. dil. HNO_3 (D = 1.20) see (3); from 2-methylbenzoic acid (*o*-toluic acid) (1:0690) in $CHCl_3$ in pres. of Fe with Cl_2 (4) or in AcOH with Cl_2 (2) see indic. refs.]

Salts: $Ca\bar{A}_2.2H_2O$, spar. sol. hot aq. (3).

C̄ on oxdn. with $KMnO_4$ gives (3) 3-chlorophthalic acid (3:4820).

3:4435 (1) Noelting, *Ber.* **37**, 1025–1026 (1904). (2) Claus, Bayer, *Ann.* **274**, 310–311 (1893). (3) Krüger, *Ber.* **18**, 1758 (1885). (4) Claus, Stapelberg, *Ann.* **274**, 311 (1893).

3:4444 3,5,6-TRICHLORO-2-HYDROXYHYDROQUINONE



$C_6H_3O_3Cl_3$ Beil. VI - 1089
VI_1—
VI_2-(1072)

M.P. 160° (1)

Ndls. from C_6H_6 — C̄ cryst. from C_6H_6 or AcOH in solvated form. C̄ is eas. sol. alc., ether; spar. sol. pet. ether.

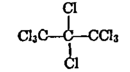
[For prepn. of $\bar{C}$ from 3,5,6-trichloro-2-hydroxybenzoquinone-1,4 [Beil. VIII-238] by reduction with aq. SO_2 see (1).]

$\bar{C}$ dis. in aq. yielding colorless soln. which on htg. develops violet color; $\bar{C}$ with aq. alk. gives deep green color changing to brown (1).

—— 3,5,6-Trichloro-2-hydroxyhydroquinone trimethyl ether: unreported.
—— 3,5,6-Trichloro-2-hydroxyhydroquinone triethyl ether: unreported.
—— 3,5,6-Trichloro-2-hydroxyhydroquinone triacetate: ndls. from lgr./C_6H_6, m.p. 171° (1). [From $\bar{C}$ with Ac_2O + NaOAc on htg. (1).]

3:4444 (1) Zincke, Schaum, *Ber.* **27**, 557–558 (1894).

3:4450 OCTACHLOROPROPANE (Perchloropropane)



C_3Cl_8 Beil. I - 108, I_1- (35), I_2—

M.P. 160°? (1) B.P. 268–269° at 734 mm. (1)

White extraordinarily pliable (2) crystals, difficult to filter with suction (because of their high vapor pressure (3)) and best purified by fractional distn. (3) or slow sublimation in vac. (2). — Very sol. in alc., ether, or lgr. (1).

[For prepn. of $\bar{C}$ (100% yield (3)) from 1,1,1,2,2,3,3-heptachloropropane (3:0200) by conversion with MeOH/KOH by loss of HCl to 1,1,1,2,3,3-hexachloropropene-2 (3:6370) and subsequent treatment with Cl_2 below 50° in sunlight see (3) (2).] [For formn. from 1,2,3-trichloropropane (3:5840) or from isobutyl chloride (3:7135) with excess ICl_3 at 200° see (1).]

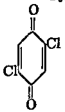
$\bar{C}$ on htg. at 300° (1) or on htg. with $AlCl_3$ (2) splits quantitatively (2) into CCl_4 (3:5100) + tetrachloroethylene (3:5460).

[For fluorination of $\bar{C}$ see (3) (4); for use of $\bar{C}$ + Zn for production of smoke see (5) (6).]

3:4450 (1) Krafft, Merz, *Ber.* **8**, 1296–1302 (1875). (2) Prins, *J. prakt. Chem.* (2) **89**, 416–417 (1914). (3) Henne, Ladd, *J. Am. Chem. Soc.* **60**, 2494 (19[illegible] (4) [illegible] Brit. 378,324, Aug. 11, 1932; French 730,370, Aug. 11, 19[illegible] (1933). (5) Métivier, *Chimie & industrie*, Spec. No. 179 [illegible] (6) Métivier, French 649,853, Dec. 28, 1928; *Cent.* **1931**, I [illegible]

3:4470 2,5-DICHLOROBENZOQUINONE-1,4 (*p*-Dichlorobenzoquinone)

$C_6H_2O_2Cl_2$ Beil. VII - 632, VII_1-(346)



M.P.	**161–162°**	(1)
	160.4–161.4°	(2)
	161° u.c.	(3)
	161°	(4) (17) (28)
	159°	(5) (10)
	158.5°	(6)
	158–161°	(7)

[*See also* 2,5-*dichlorohydroquinone* (3:4690).]

Dark yellow cryst. from alc. or C_6H_6; insol. aq.; alm. insol. cold dil. alc., eas. sol. boilg. abs. alc.; fairly eas. sol. ether or $CHCl_3$. — Volatile with steam; sublimes in vacuum.

[For prepn. of $\bar{C}$ from 2,5-dichlorohydroquinone (3:4690) by oxidn. with $K_2Cr_2O_7$ or

$Na_2Cr_2O_7$ + dil. H_2SO_4 (2) (4) (6) (8) (9) or with conc. HNO_3 at ord. temp (5) see indic. refs.; from 2,5-dichlorohydroquinone dimethyl ether with fumg. HNO_3 in the cold see (1); from 2-chlorobenzoquinone-1,4 (3:1100) via conversion with HCl to 2,5-dichlorohydroquinone (3:4690) and subsequent oxidn. of latter see (5) (17); from 2,5-dichloroaniline [Beil. XII-625, XII_1-(311)] with CrO_3 (5) or from 2,5-dichloro-p-phenylenediamine [Beil. XIII-118] with CrO_3 (10) or $K_2Cr_2O_7$ + dil. H_2SO_4 (28) see indic. refs.; for formn. of $\bar{C}$ from benzoquinone-1,4 (1:9025) in CCl_4 with ICl on gentle warmg. see (3); from benzene with ClO_2 see (11), from copper salt of quinic acid [Beil. X-535, X_1-(270)] by oxidn. with MnO_2 + NaCl + H_2SO_4 see (12).]

[For study of oxidn.-reductn. potential of system $\bar{C}$ + 2,5-dichlorohydroquinone (3:4690) see (6) (13) (14).] — [For use as vulcanization accelerator see (15); for use in prepn of curhodol dyes see (16), for study of bactericidal actn. see (18).]

[$\bar{C}$ is sol in conc. H_2SO_4 with greenish-yellow color, in dimethylaniline with deep blue color (19), $\bar{C}$ is sol in dil. aq alk. with brown color and decomposition (11) (12).]

[$\bar{C}$ with KCN in 85% MeOH gives (20) a ruby-red soln. with red fluorescence; $\bar{C}$ with diphenylketene in ether + pet. eth. gives a compound, m p. 180–192° dec. (21).]

$\bar{C}$ in aq reduces with SO_2 (12) to 2,5-dichlorohydroquinone (3:4690) q.v. (note that the intermediate quinhydrone, dark violet pr. or greenish-black ndls. with 2 H_2O (12), crystal water lost over H_2SO_4 or on warming giving yellow anhydrous form, m.p. 140–145° (22), is known), however, $\bar{C}$ in dil. aq. NaOH (under N_2) treated with SO_2 is in part reduced to 2,5-dichlorohydroquinone (3:4690) and in part sulfonated to mono- and disulfonic acids of $\bar{C}$ (23).

[$\bar{C}$ in $CHCl_3$ at low temps. does not react with Cl_2; at ord. temps , however, yields tetrachlorobenzoquinone-1,4 (chloranil) (3:4978) (24). — $\bar{C}$ in AcOH at 70–80° with 2 moles Br_2 *gives (alm quant. yield (4)) (25) (9) 2,5-dichloro-3,6-dibromobenzoquinone-1,4 [Beil. VII-642]*, golden-brown tbls. from C_6H_6, m p. 292° (4).]

[$\bar{C}$ with conc HCl gives on boilg. (5) 2,3,5-trichlorobenzoquinone-1,4 (3:4672), but some tetrachlorobenzoquinone (chloranil) (3:4978) is also formed.]

$\bar{C}$ (1 pt) in Ac_2O (5 pts.) + AcOH (5 pts.) loses color on boilg. with Zn dust (1) and yields (by reductive acylation) 2,5-dichlorohydroquinone diacetate, cryst. from alc., m p. 141° (1)

$\bar{C}$ (1 pt.) in hot AcOH (40 pts) + conc. HCl (0.4–0.5 pt) treated with aniline (0.4–0.5 pt) yields mainly (26) 2,5-dichloro-3-anilinobenzoquinone-1,4 [Beil XIV-137], blue lfts., m.p 180° (26), and 2,5-dichlorohydroquinone (3:4690) accompanied by small amts. of 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 (see below); $\bar{C}$ htd. with excess aniline yields (26) 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 [Beil XIV-144], *yel.-br. tbls. from* C_6H_6, m p 290° (26), and 2,5-dichlorohydroquinone (3:4690).

[$\bar{C}$ in C_6H_6 + alc. warmed with slightly more than 1 mole $NH_2OH.HCl$ yields (8) (27) 2,5-dichlorobenzoquinone-1,4 monoxime (2,5-dichloro-4-nitrosophenol) [Beil. VII-633], pale yel. cryst from C_6H_6, m p 155–160° (8) (purified by conv. with Ac_2O + NaOAc to its acetate, yel pr from C_6H_6, m p. 149° (8), and subsequent hydrolysis with NaOH). — $\bar{C}$ in alc. with excess $NH_2OH.HCl$ yields (27) 2,5-dichlorobenzoquinone-1,4 dioxime, grayish yel. cryst. from C_6H_6. m.p not stated (27).]

[*See also* 2-*chloroanthraquinone* (3:4922).]

Yellow ndls. from C_6H_6, toluene, or alc.; eas. sol. C_6H_6, toluene, AcOH, nitrobenzene, or AmOH on htg.; spar. sol. alc. or lgr.

[For f.p./compn. data and diagram of system $\bar{C}$ + 2-chloroanthraquinone (3:4922) (eutectic, m.p. 143.9–144.2°, contg. about 25% $\bar{C}$) see (14).]

[For use in coloring oils, fats, and waxes see (19); $\bar{C}$ is very widely used as intermed. in prepn. of many dyestuffs, but no general summary can be given here although selected examples occur in the following text.]

[For prepn. of $\bar{C}$ from potassium salt of anthraquinonesulfonic acid-1 [Beil. XI-335, XI_1-(81)] by htg with strong HCl + $NaClO_3$ (yields: 97–98% (3), 95% (4)) at 100° (3) (4) (10) (6) (8) (for use of this method in detn. of mixt. of anthraquinone-α- and β-sulfonic acids or their salts by f.p./compn. curve of resultant mixt. of $\bar{C}$ + 2-chloroanthraquinone (3:4922) see (4)) or by actn of Cl_2 at 100° (20) see indic. refs.; from anthraquinonesulfonic acid-1 (9) or its Na salt (15) in dil. HCl on exposure to light see indic. refs.; from anthraquinonecarboxylic acid-1 with HCl + $KClO_3$ in s.t. at 200° for 12 hrs. see (22); from Na salt of anthracenesulfonic acid-1 [Beil. XI-194, XI_1-(44)] with HCl + $NaClO_3$ at 100° see (21); from 1-chloroanthraquinonesulfonic acid-5 by electrolysis of alk. soln. see (23); from K salt of anthraquinonesulfonic acid-1 (see above) (24) or from anthraquinonesulfonyl chloride-1 (5) by htg. in s.t. with $SOCl_2$, or from 1-anthraquinonylarsinic acid by 10 hrs. reflux with $SOCl_2$ (67), see indic. refs.]

[For prepn. of $\bar{C}$ from 2-benzoyl-3- (or 6)-chlorobenzoic acid by ring closure with conc. H_2SO_4 see (7) (25).]

[For prepn. of $\bar{C}$ from 1-aminoanthraquinone (see below) via diazotization and use of Cu_2Cl_2 reactn. see (26); from 1-nitroanthraquinone [Beil. VII-791, VII_1-(415)] with Cl_2 in trichlorobenzene soln. at 160–165° see (27); from 1-hydroxyanthraquinone [Beil. VIII-338, $VIII_1$-(650)] with PCl_5 in boilg. nitrobenzene see (28).]

[C̄ on htg. with conc. H_2SO_4 at 200–205° for 9 hrs. rearr. (29) to 2-chloroanthraquinone (3:4922).]

[C̄ on reductn. with Zn dust + conc. aq. NH_4OH under reflux yields (30) 1-chloroanthracene [Beil. V_1-(324)], colorless lfts. from AcOH, m.p. 81–82° (2), 79° (30). — C̄ on reductn. with hydrazine hydrate in MeOH/KOH at 10 atm. and 135° for 1½ hrs. in pres. of Pd/$CaCO_3$ followed by access of air to the prod. gives (87% yield (31)) anthraquinone (1:9095). — C̄ on reductn. with Al powder + conc. H_2SO_4 (32) (33) (6) (34) yields 1-chloroanthrone-9, yel. ndls from $CHCl_3$ + lt. pet., m.p. 118° (32), 114° (6); C̄ on reductn. with Sn + HCl in AcOH contg. $PtCl_4$, however, gives the isomeric 4-chloroanthrone-9, yel. ndls. from $CHCl_3$ + lt. pet., m.p. 118° (32) (note that although these two isomeric chloroanthrones have the same m.p. yet each depresses the m.p. of the other (32) and the earlier prod. of m.p 106° (33) may have been a mixture). — For studies of oxidn.-reductn. potential of C̄ see (12) (17).]

[C̄ with MeOH/KOH at 80° yields (35) 1-methoxyanthraquinone [Beil. VIII-[illegible], $VIII_1$-(651)], m.p. 169 5° — C̄ with 2-hydroxyanthraquinone + NaOAc + Cu powder in boilg. nitrobenzene gives (36) 1,2'-dianthraquinonyl ether [Beil VIII-34[illegible], but m.p. [illegible] not reported. — C̄ with K xanthate + Cu powder boiled for 24 hrs. in AmOH or C̄ with alk. trithiocarbonate in boilg. nitrobenzene (4[illegible]) gives (64% yield (37)) di-(1-anthraquinonyl) sulfide, red pr. from pyridine, m.p. [illegible] (37) (for disulfide see below). — C̄ with thiosalicylic acid (2-mercaptobenzoic acid) + solid KOH htd. in AmOH at 1[illegible]° for [illegible] hrs. gives (96% yield (38)) *S*-(1-anthraquinonyl)-thiosalicylic acid [Beil. [illegible]], [illegible] tbls. from alc., m p. 261° cor. (38); this prod. on htg. with PCl_5 in nitrobenzene gives (98% yield (38)) 3,4-phthalylthioxanthone [Beil. $XVII_1$-(290)], or.-red lfts., m.p. 340° cor. (38).]

[C̄ with NaOH + glycerol htd. at [illegible]° is claimed (39) to yield anthraquinone (1:9095). — C̄ on boilg. with [illegible] + Na_2S_2 (42) yields 1-mercaptoanthraquinone [Beil. [illegible]] [illegible] AcOH, m p. 187° (41); this prod. on oxidn. by air [illegible] (4[illegible]) readily yields di-(1,1'-dianthraquinonyl) di-sulfide, m p. 359° (45), also obtd. from C̄ with Na_2S + S in boilg. alc. (40) (43) (4[illegible]) from C̄ + K thiobenzoate in boilg. AmOH (80% yield (4[illegible])). — C̄ with K_2Se in [illegible] at 80° gives (47) 1-selenomercaptoanthraquinone, or.-red lfts. from AcOH, m.p. [illegible]; also di-(1-anthraquinonyl) diselenide.]

[C̄ with conc. aq. NH_4OH in pres. of Cu salts under press. at elevated temp. [illegible] (50) (57) in alm. quant. yield 1-aminoanthraquinone [Beil. XIV-177, [illegible]] [illegible] ndls., m.p. 242°. — Countless other analogous combinations of C̄ with prim. [illegible] amines cannot be included here; however, note that C̄ with 1-aminoanthraquinone [illegible] + NaOAc + $CuCl_2$ htd. in nitrobenzene yields (52) cf. (51) di-(1-anthraquinonyl)amine [Beil. XIV-180, [illegible]], the prototype of a large group of dyes and dye intermediates (for amplification of this topic see [illegible]). — C̄ with hydrazine hydrate + [illegible] for ½ hr. gives ([illegible] yield ([illegible])) 1-hydrazinoanthraquinone [Beil. [illegible]] [illegible] lfts. from xylene, m.p. [illegible] cor. (54). — For reactn. of C̄ with $NH_2OH.HCl$ [illegible] see (1).]

[For condens. of C̄ with [illegible]-aminoazobenzene (54) or with [illegible] prods. as dyes [illegible] in pres. of [illegible] for prepn. of dyestuffs see (55).]

[C̄ with Cu [illegible] at [illegible] or in boilg. nitrobenzene [illegible] *bis*-1,1'-[illegible] [Beil. VII-[illegible], VII_1-(4[illegible])] [illegible] m.p. 4[illegible] [illegible] quin[illegible] (56); note however [illegible] (51% yield [illegible] (5[illegible])). — C̄ with [illegible] [illegible] 9,10-diphenyl[illegible]

185° (57), 180–182° (58); a mixt. of this prod. with corresp. prod. (m.p. 193°) from 2-chloroanthraquinone (3:4922) has m.p. 152–160° (58).]

[For formn. of addn. cpds. of C̄ with $SbCl_5$ in $CHCl_3$ see (16) (18); for formn. of 1-anthraquinonylpyridinium chloride from C̄ + $AlCl_3$ in pyridine see (59).]

[C̄ on mononitration by soln. in 10 wt. pts. conc. H_2SO_4 and addn. of HNO_3/H_2SO_4 as directed (61) (62) gives (30% yield (61)) 1-chloro-4-nitroanthraquinone [Beil. VII-792, VII_1-(415)], cryst. from AcOH, m.p. 260–261° (63), 259° (61); note that 1-chloro-2-nitroanthraquinone (prepared by indirect means) has m.p. 257–258° (63). — For study of kinetics of nitration of C̄ see (64).]

[C̄ on monosulfonation, e.g., with fumg. H_2SO_4 (20% SO_3) at 160° for 4 hrs. (65) (66), yields a mixt. of about equal parts of two monosulfonic acids eas. separable via their sodium salts; viz., 1-chloroanthraquinonesulfonic acid-6 (Na salt *less* sol. boilg. aq., corresp. sulfonyl chloride, pale yel. pr. from lgr., m.p. 207–208° dec.) and 1-chloroanthraquinonesulfonic acid-7 (Na salt *more* sol. boilg. aq., corresp. sulfonyl chloride, lemon-yel. pl. from C_6H_6, m.p. 200–201° dec.); the m.p. of mixts. of the two sulfonyl chlorides is depressed below 180° (65). — *C̄ on sulfonation in the pres. of Hg salts but otherwise as above yields*, however, a different result as the principal prod. is 1-chloroanthraquinonesulfonic acid-5 (corresp. sulfonyl chloride, yel. pl. from toluene, m p. 243–244° dec. (65) (66)), accompanied by 1-chloroanthraquinonedisulfonic acid-4,5.

3:4485 2,3,5-TRICHLOROBENZOIC ACID $C_7H_3O_2Cl_3$ Beil. IX - 345 IX_1—

M.P. 163° (1)
162° (2) (3)

Ndls. from hot aq. (2). — Not volatile with steam. — Very spar. sol. cold aq. but sol. in org solv.

[For prepn. of Č from 2,3,5-trichlorotoluene (3:0610) by oxidn with 20% HNO_3 in s.t. at 140° see (2); from 2,3,5-trichlorobenzaldehyde (3:1060) by oxidn. with $KMnO_4$ see (3), for prepn. from corresp nitrile by hydrolysis see (1).]

Č on soln. in warm fumg HNO_3 readily yields a mononitro cpd, 2,3,5-trichloro-*x*-nitrobenzoic acid, cryst from alc, m p. 158° (1).

Č with excess PCl_5 yields (1) 2,3,5-trichlorobenzoyl chloride, cryst. from EtOAc, m.p. 36° (1).

—— *Methyl 2,3,5-trichlorobenzoate:* unrecorded.
—— **Ethyl 2,3,5-trichlorobenzoate:** oil. [From Č + alc. + HCl (1).]
Ⓓ **2,3,5-Trichlorobenzamide:** from 2,3,5-trichlorobenzoyl chloride + $(NH_4)_2CO_3$; ndls. from dil. AcOH, m.p 204-205° (1).
—— **2,3,5-Trichlorobenzanilide:** unrecorded.

3:4485 (1) Matthews, *J. Chem. Soc.* **79,** 43-49 (1901). (2) Cohen, Dakin, *J. Chem. Soc.* **81,** 1331 (1902). (3) Hodgson, Beard, *J. Chem. Soc.* **1927,** 2382.

3:4492 5-CHLORONAPHTHOQUINONE-1,4 $C_{10}H_5O_2Cl$ Beil. S.N. 674

M.P. 163° (1)

Yellow ndls. from alc or lgr. — Sublimes undecomposed. — Fairly eas. sol. AcOH or lgr.; moderately sol alc.; spar. sol. aq.

[For prepn. of Č from 5-chloro-1,4-diaminonaphthalene (5-chloronaphthylenediamine-1,2) by oxidn of its hydrochloride with $FeCl_3$ see (1).]

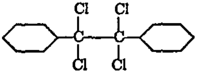
[Č with aniline (no details) gives (1) 2(3?)-anilino-5-chloronapthoquinone-1,4, red

bronzy ndls. from AcOH, m.p. 219° (1); note also that C̄ with aniline boiled for 1 hr. gives (1) a halogen-free cpd., dark violet cryst. from alc., m.p. 140°, but its structure has not been determined.]

3:4492 (1) Fries, Köhler, *Ber.* **57**, 504–505 (1924).

3:4496 1,1,2,2-TETRACHLORO-1,2-DIPHENYLETHANE ($\alpha,\alpha,\alpha',\alpha'$-Tetrachlorobibenzyl; tolane tetrachloride)

$C_{14}H_{10}Cl_4$ Beil. V - 601; V_1-(282); V_2-(507)



M.P. 163°	(1) (2) (3)
162–163°	(4)
162°	(5) (6)
161–162°	(7)
161.5°	(8)
161°	(9)

Colorless cryst. from AcOH, pet. ether, C_6H_6, or toluene. — Eas. sol. boilg. C_6H_6; moderately sol. hot but spar. sol. cold pet. ether; spar. sol. alc. or ether.

C̄ with *trans*-tolane dichloride (3:4210) forms an isomorphous mixt. (8) formerly erroneously regarded as an individual cpd. designated as "ditolane hexachloride."

PREPARATION OF C̄

From Dinuclear Initial Materials

[For prepn. of C̄ from benzil (1:9015) with excess PCl_5 (32% yield (10)) in s.t. at 200° for 6–7 hrs. (5), or from *ms*-dichlorodesoxybenzoin ("chlorobenzil") [Beil. VII-436, VII_1-(234)] with PCl_5 in s.t. at 200° (11) in $POCl_3$ [illegible] refs.; from diphenylacetylene (tolane) [Beil. V-65 [illegible] (13) or from either *cis*-(3:1380) or *trans*-(3:4210) [illegible] refs.]

From Mononuclear Initial Materials

From benzotrichloride. [For prepn. of C̄ from benzotrichloride (3:6540) by reduction in alc. with H_2 + colloidal Pd (75% yield (4)) or H_2 + $Pd/BaCO_3$ (14) in alc.-alkali, or by htg. with Cu powder at 100° (6) or in C_6H_6 under reflux for 4 hrs. (30–36% yield (5)) (1) cf. (10), see indic. refs.; for formn. of C̄ from benzotrichloride (3:6540) with excess dilute (0.2 *N*) MeMgCl in ether (7), with EtMgBr (3) or C_6H_5MgBr (3), or by pyrolysis over hot Pt (15), or by htg. with Ni in atm. of CO_2 (16) see indic. refs.]

CHEMICAL BEHAVIOR OF C̄

[C̄ on reduction with conc. HI + P (1) or with H_2 in alc.-alk. + $Pd/CaCO_3$ (14) gives bibenzyl (1:7149), m.p. 52°.]

[C̄ on removal of two adjacent chlorine atoms with Fe powder in boilg. AcOH (12) cf. (5), with Cu powder at 160° (6), with excess conc. (2 *N*) MeMgCl in ether refluxed 4 hrs. (7), with H_2 + hydrazine hydrate in MeOH/KOH 1½ hrs. at b.p. (17), or with Zn dust in boilg. alc. (18) (5) (2) (10) gives either or both *trans*- (3:4210) and *cis*- (3:1380) tolane dichlorides; note that use of insufficient Zn gives (8) cf. (5) (10) the *cis*-tolane dichloride (3:1380) + an isomorphous mixt. of C̄ + *trans*-tolane dichloride (3:4210).]

[C̄ with Na/Hg in alc. gives (11) diphenylacetylene (tolane) (see ref. above), some stilbene (1:7250) and bibenzyl (1:7149) also being formed (2). C̄ on htg. with Zn dust gives (2) stilbene (1:7250).]

[C̄ is very resistant to hydrolysis and is unattacked by H_2O, alc., or AcOH in s.t. at 200° (2); note, however, that C̄ with AcOH in s.t. at 230–250° or with H_2SO_4 at 165° is claimed (2) to give benzil (1:9015).]

[C̄ is very resistant to action of boilg. HNO_3 (2); note, however, that *p,p'*-dinitrotolane dichloride, m.p. 264–265° dec., has been prepd. indirectly (19) (from *p*-nitrobenzal(di)-chloride with acetone + KOH).]

[C̄ with anhydrous HF at 100° yields (20) 1,2-difluoro-1,2-diphenylethylene, m.p. 122–123° (20); however, C̄ with HF in pres. of HgO gives (20) 1,2-dichloro-1,2-difluoro-1,2-diphenylethane, m.p. 128–130° (20).]

CHAPTER XI

DIVISION A. SOLIDS

(3:4500–3:4900)

3:4500 2,3,6-TRICHLOROBENZOIC ACID  $C_7H_3O_2Cl_3$ Beil. IX - 345 IX_1—

M.P. 163–164° (1)
163–165° (2)

Cryst. from aq. (1).
[For prepn. of C̄ from 2,3,6-trichlorotoluene (3:0625) by oxidn. with HNO_3 see (1) (2).]
No further data on this compd. are recorded.

3:4500 (1) Cohen, Dakin, *J. Chem. Soc.* **81**, 1332 (1902). (2) Feldman, Kopeliowitsch, *Arch. Pharm.* **273**, 491 (1935).

3:4520 2,3-DICHLORO-2,3-DIMETHYL-BUTANE (Tetramethylethylene dichloride)  $C_6H_{12}Cl_2$ Beil. I - 152 I_1— I_2—

M.P.	**164°**	(1)
	160°	(2)
	159–160°	(3)
	159°	(4)

Colorless cryst. (from alc. (1)) with camphoraceous odor. — Readily sublimes in open tubes on htg.; eas. sol. alc. ether.

[For prepn. of C̄ from tetramethylethylene glycol (pinacol) (1:5805) with fumg. HCl (4) or with PCl_5 (5) see (4) (5); for formn. from 2,3-dimethylbutane (di-isopropyl) (1:8515) with Cl_2 in pres. of I_2 see (4) (6).]

C̄ with alc. KOH in s.t. at 130–140° gives (4) mainly 2,3-dimethylbutadiene-1,3 (1:8050), b.p. 68.7° (accompanied by unsatd. ethers, b.p. 136–146°) (4). [For study of behavior of C̄ with aq. alc. NaOH see (3).]

3:4520 (1) Kahovec, Wagner, *Z. physik. Chem.* **B-47**, 53 (1940). (2) Schorlemmer, *Ann.* **144**, 186–187 (1867). (3) Tishchenko, *J. Gen. Chem.* (*U.S.S.R.*) **9**, 1380–1388 (1939); *C.A.* **34**, 1611 (1940). (4) Kondakow, *J. prakt. Chem.* (2) **62**, 169–174 (1900). (5) Couturier, *Ann. chim.* (6) **26**, 443–444 (1892). (6) Silva, *Ber.* **6**, 36 (1873).

3:4545 2,4,6-TRICHLOROBENZOIC ACID  $C_7H_3O_2Cl_3$ Beil. IX - 345 IX_1—

M.P.	**164°**	(1)	**M.P.** (*contd.*)	**160–161°**	(3)
	162°	(2)		**160°**	(4) (5)

Long ndls. from hot aq. (4); cryst. from C_6H_6 + pet. eth. — Eas. sol. alc., ether, or $CHCl_3$ (5).

[For prepn. of $\bar{C}$ from 2,4,6-trichloroaniline [Beil. XII-627] via conversion by diazo reactn. to 2,4,6-trichlorobenzonitrile, m.p. 77.5° (1), 75° (6), thence to 2,4,6-trichlorobenzamide (see below) and hydrolysis of latter see (1) (4) (5) (2) (12); for prepn. of $\bar{C}$ from 2,4,6-trichlorotoluene (3:0380) by oxdn. with HNO_3 see (3).]

$\bar{C}$ on soln. in 5 pts conc. HNO_3 yields (1) 2,4,6-trichloro-3-nitrobenzoic acid [Beil. IX-405], cryst. from $CHCl_3$, m p. 160.2° (1)

$\bar{C}$ with PCl_5 (5) (73% yield (2)) or with $SOCl_2$ + pyridine (7) gives 2,4,6-trichlorobenzoyl chloride, b.p 272° (5), 107–107.5° at 6 mm. (2), 120.1–120.4° at 3 mm (7). — This acid chloride is very stable to aq (5) and is alleged to give no ester with MeOH (5). [Note, however, that with EtOH reactn. is 99% complete in 1 min. (7).] [For study of reactn. of 2,4,6-trichlorobenzoyl chloride with MeMgCl (8) or MeMgBr (12) giving (50% yield (2)) di-(2,4,6-trichlorobenzoyl)methane, m p. 160–161°, see (8), with MeMgBr giving 2,4,6-trichloroacetophenone, m p 51° (8) (14), see (8); with C_6H_6 + $AlCl_3$ yielding 2,4,6-trichlorobenzophenone, m p. 103.5°, see (9).]

—— Methyl 2,4,6-trichlorobenzoate: unrecorded. [$\bar{C}$ + MeOH + HCl yields no ester (4) (10).]

—— Ethyl 2,4,6-trichlorobenzoate: unrecorded. [$\bar{C}$ + EtOH + HCl yields no ester (5).]

Ⓓ 2,4,6-Trichlorobenzamide: m.p. 181° (1), 177° (6). [This amide has not been recorded as prepd. from the acid chloride + NH_3; it has been obtd. only by partial hydrolysis (11) (6) (1) of 2,4,6-trichlorobenzonitrile (see above).] [The amide itself is only slowly hydrolyzed to $\bar{C}$ by 75% H_2SO_4 at 160° (6), but for conversion to $\bar{C}$ via HNO_2 see (11) (1) (2).]

Ⓓ 2,4,6-Trichlorobenzanilide: from 2,4,6-trichlorobenzoyl chloride + aniline (12), ndls., m.p 197° (12).

3:4545 (1) Montagne, *Rec. trav. chim.* **21**, 383–388 (1902). (2) Fuson, Bertetti, Ross, *J. Am. Chem Soc* **54**, 4381–4382 (1932). (3) Cohen, Dakin, *J Chem. Soc* **81**, 1336 (1902). (11) Sudborough, *J. Chem Soc.* **67**, 602 (1895). (12) Chapman, *J. Chem. Soc.* **1927**, 1749. (13) Fuson, Van Campen, Wolf, *J. Am. Chem. Soc.* **60**, 2269–2270 (1938). (14) Lock, Böck, *Ber.* **70**, 925 (1937).

3:4560 2,4-DICHLOROBENZOIC ACID $C_7H_4O_2Cl_2$ Beil. IX - 342 IX_1-(141)

M.P.	164.3°	(1)	M.P. (*contd.*)	161°	(7)
	164°	(2) (3) (4)		159–160°	(8)
	163–164°	(5)		158°	(9)
	161.5–162.5°	(6)		156–158°	(10)
	161–162°	(20)			

Cryst. from aq., alc. (3), C_6H_6 or C_6H_6 + lgr. — Sublimes undecomposed in ndls. (9) or lfts. (10) — Eas. sol in boilg aq. or org solv. (10).

[For prepn. of $\bar{C}$ from 2,4-dichlorotoluene (3:6290) by oxidn with dil. HNO_3 at 140° (9) (7) (8) or with $KMnO_4$ (70% yield (1)) or by electrolytic oxidn. (65% yield (3)) see indic. refs.; from 2,4-dichlorobenzaldehyde (3:1800) via Cannizzaro reactn. see (5); from 2,4-dichloroaniline [Beil. VII-621] via conversion to and hydrolysis of 2,4-dichlorobenzoni-

trile see (4) (5); from 2,4-dichlorobenzotrichloride with 95% H_2SO_4 see (5) (11) (12); for still other misc. methods see Beil. IX-342 + IX_1-(141).]

$\bar{C}$ warmed at 100° with a mixt. of fumg. HNO_3 (D = 1.52) + conc. H_2SO_4 as directed (13) yields 2,4-dichloro-3,5-dinitrobenzoic acid, pr. from dilute alc., m.p. 210–211° (13), together with a trace of 2,4-dichloro-1,3-dinitrobenzene, m.p. 103°, insol. in Na_2CO_3. [A mononitrated $\bar{C}$, viz., 2,4-dichloro-5-nitrobenzoic acid, cryst. from 30% AcOH, m.p. 161–163° (11), 162° (18), and 2,4-dichloro-6-nitrobenzoic acid, cryst. from C_6H_6, m.p. 189–190° (19), have been prepd. indirectly.]

$\bar{C}$ with PCl_5 (14) or $SOCl_2$ (15) (3) yields 2,4-dichlorobenzoyl chloride, b.p. 150° at 3–4 mm. (14), 152–155° at 30 mm. (16), 91.9–92.5° at 1 mm. (15). [For conv. of this acid chloride to 2,4,2′,4′-tetrachlorodibenzoyl peroxide see (3).]

—— Methyl 2,4-dichlorobenzoate: oil, b.p. 132° at 15 mm., D_{20}^{20} = 1.572 (21). [From $\bar{C}$ by conv. to $Na\bar{A}$ and htg. with MeI in MeOH for 20 hrs. (73% yield (21))].

—— Ethyl 2,4-dichlorobenzoate: constants unrecorded. [For study of rate of hydrolysis see (17).]

—— 2,4-Dichlorobenzamide: unrecorded.

—— 2,4-Dichlorobenzanilide: unrecorded.

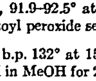
3:4580 3,5-DICHLOROPHTHALIC ACID $C_8H_4O_4Cl_2$ Beil. IX - 817 IX_1—



M.P. 164° (1)
164° dec. (2)

[*See also 3,5-dichlorophthalic anhydride* (3:2375).]

Colorless ndls. or tbls. from aq. HCl; readily sol. in cold alc., ether, or acetone, but spar. sol. in C_6H_6 or $CHCl_3$ even on boilg.

[For prepn. of $\bar{C}$ from 3,5-dichlorophthalic anhydride (3:2375) on boilg. with aq. see (1) (2); from aq. soln. of $NH_4H\bar{A}$ by passing in HCl gas see (1) (2); from 3,5-dichloro-1,2-dimethylbenzene [Beil. V-364] (itself obtd. in good yield from dimethyldihydroresorcinol ("methone") (1:0768) with PCl_5 in $CHCl_3$ (2) (3)) by oxidn. with dil. HNO_3 in s.t. at 190–200° see (2).]

Salts. $NH_4H\bar{A}$, spar. sol. aq., eas. prepd. by mixing aq. solns. of $(NH_4)_2\bar{A}$ + $\bar{C}$; $Ag_2\bar{A}$, white curdy ppt. from warm aq. soln. of $(NH_4)_2\bar{A}$ by addn. of aq. $AgNO_3$.

Esters. Dimethyl 3-chlorophthalate and methyl hydrogen 3-chlorophthalate are unreported: diethyl 3-chlorophthalate (from $Ag_2\bar{A}$ with EtI in dry ether) is oil, b.p. 312–313° at 760 mm. (2); ethyl hydrogen phthalate is unreported.

C̄ on htg. alone (1) or with AcCl (2) yields 3,5-dichlorophthalic anhydride (3:2375), m.p. 89°.

PREPARATION OF C̄

From 2,3,5-trichlorohydroquinone. [For prepn. of C̄ from 2,3,4-trichlorohydroquinone (3:4052) by oxidn., e.g., with CrO_3 at 0° (10), conc. HNO_3 (14) (5) see indic. refs.]

From phenol or chlorinated phenols. [For prepn. of C̄ from phenol (1:1420) via sulfonation followed by oxidn. with $KClO_3$ + HCl see (3) (15) cf. (22), note that by this method both C̄ and 2,3,5,6-tetrachlorobenzoquinone-1,4 ("chloranil") (3:4978) are produced; for sepn. of C̄ from latter see (5) (16).]

[For prepn. of C̄ from 2,3,5-trichlorophenol (3:1340) or from 2,3,6-trichlorophenol (3:1160) with fumg. HNO_3 on protracted htg. (17), or from 2,4,6-trichlorophenol (3:1673) with mixt. of conc. HNO_3 + conc. HCl boiled for a few minutes (2), or from 2,3,4,6-tetrachlorophenol (3:1687) by oxidn. with 5 wt. pts. fumg. HNO_3 (70% yield (1)), see indic. refs.]

From amines, aminophenols, etc. [For formn. of C̄ from aniline during electrolytic oxidn. in HCl soln. see (18); from *p*-aminophenol hydrochloride with $Ca(OCl)_2$ soln. see (19); from 2,3,5-trichloro-4-aminophenol hydrochloride by action of Br_2 (20) or NaOBr

(30); from benzal *p*-anisidine or benzal *p*-phenetidine by treatment with *ter*-AmOCl (3:9287) followed by subsequent oxidn. with $K_2Cr_2O_7/H_2SO_4$ see (4).]

From various derivs. of C̄ by hydrolysis. [For formn. of C̄ from various imide derivs. of C̄ by acid hydrolysis, e.g., from the corresp. *N*-(*p*-chlorophenyl)imide [Beil. XII-611] (21), *N*-(2,4,6-trichlorophenyl)imide [Beil. XII-628] (22) (7), or *N*-(2,4-dinitrophenyl)-imide [Beil. XII-754] (23), see indic. refs.]

From miscellaneous sources. [For formn. of C̄ from C_6H_6 (1:7400) by oxidn. with CrO_2Cl_2/AcOH (24), from copper salt of quinic acid [Beil. X-535, X_1-(270)] by oxidn. with MnO_2/NaCl/H_2SO_4 (14), or from benzoquinone-1,4 (1:9025) with Cl_2 (25) see indic. refs.]

CHEMICAL BEHAVIOR OF C̄

Reduction. C̄ with aq. SO_2 (5) (14) (15) (16), or C̄ in ether soln. with aq. SO_2 (1) reduces to 2,3,5-trichlorohydroquinone (3:4052). [Note that this reaction is used (16) to separate C̄ from 2,3,5,6-tetrachlorobenzoquinone-1,4 ("chloranil") (3:4978) since the latter is but slowly reduced by aq. SO_2.] [For studies of oxidn.-reduction potential of system C̄ + 2,3,5-trichlorohydroquinone (3:4052) see (6) (26) (27).]

Oxidation. C̄ with strong HNO_3 on digestion is degraded with formn. of *trichloronitromethane ("chloropicrin") + CO_2 (15).*

Chlorination. [C̄ with Cl_2 reacts only very slowly; however, C̄ with Cl_2 + I_2 + aq. (15), or C̄ with Cl_2 + HCl (28), gives 2,3,5,6-tetrachloro-benzoquinone-1,4 ("chloranil") (3:4978).]

Reaction with HCl. C̄ with conc. HCl on protracted boilg. (29) (3), or C̄ with fumg. HCl in s.t. at 130° (30), gives 2,3,5,6-tetrachlorohydroquinone (3:4941).

Behavior of C with other inorganic reactants. *With aq. alkali.* [C̄ with dil. aq. KOH turns green and then dis. to a red-brown soln. from which upon acidification is pptd. (5) 2,5-dichloro-3,6-dihyroxybenzoquinone-1,4 ("chloroanilic acid") (3:4970).]

With aq. K_2SO_3. [C̄ dis. in warm aq. K_2SO_3 or $KHSO_3$ and on cooling ppts. (31) the potassium salt of 2,3,5-trichlorohydroquinonesulfonic acid-6 [Beil. XI-300]; the mother liquor conts. a cpd. which on boilg. with KOH gives (31) the salt of 2,5-dihydroxybenzoquinone-1,4-disulfonic acid-3,6 [Beil. XI-353].]

With NH_3. [C̄ with alc. NH_3 reacts vigorously yielding (3) a dark soln. from which can be obtd. in small amt. 3,6-dichloro-2,5-diaminobenzoquinone-1,4 ("chloranilamide") [Beil. XIV-144].]

With PCl_5. [C̄ with PCl_5 + $POCl_3$ in s.t. at 180–200° gives (5) hexachlorobenzene (3:4949).]

Behavior of C with organic reactants. *With phenol.* C̄ with K phenolate (2 moles) at 100° for 20 min. gives (32) 3-chloro-2,5-diphenoxybenzoquinone-1,4, or. tbls. from alc., m.p. 169–170° (32).

With 2,3,5-trichlorohydroquinone. C̄ (1 mole) with 2,3,5-trichlorohydroquinone (1 mole) (3:4052) in $CHCl_3$ soln. gives on evapn. (6) (33) the corresp. quinhydrone, green-black cryst., m.p. 114–115° (6), 103° (33).

With acetyl chloride. C̄ with AcCl in s t. at 160–180° gives (5) 2,3,5,6-tetrachlorohydroquinone diacetate (cf. 3:4941).

With aniline. [C̄ (1 mole) with aniline hydrochloride (1 mole) in AcOH on boilg. and subsequent partial evapn. (34) cf. (35) gives (66.5% yield (34)) 2,3,5-trichloro-6-anilinobenzoquinone-1,4 [Beil XIV-137], blue lfts. from hot alc., but without def. m p. (35).—C̄ with aniline (excess) in alc. (30) (35) or AcOH (35) gives, however, 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 [Beil. XIV-144, XIV_1-(421)], yel.-brown metallic lfts. from C_6H_6, m.p. 290° (35), 285–290° (30).]

With triphenylphosphine. $\bar{C}$ with 20% soln. of $(C_6H_5)_3P$ in $CHCl_3$ gives (36) wine-red color; note, however, that a very similar behavior is shown by 2,3,5,6-tetrachlorobenzoquinone-1,4 ("chloranil").

	166°	(7)

Colorless ndls. from aq. alc., dil. AcOH or C_6H_6; eas. sol. hot aq.; eas. volatile with steam.

[For prepn. of $\bar{C}$ from 4-chloro-1,2-dimethylbenzene (3:8675) by oxidn. with boilg. dil. HNO_3 (D = 1.20) (7) or with 20 pts. dil. HNO_3 (D = 1.10) in s.t. at 160° for 5–6 hrs. (8) (by this method $\bar{C}$ is always accompanied by the isomeric 5-chloro-2-methylbenzoic acid (3:4670) separable by its less sol. calcium salt (1) (8) (7)) see indic. refs.; from 4-chloro-2-methylbenzaldehyde [Beil. VII-296] by air oxidn. see (4); from chloromethyl 4-chloro-2-methylphenyl ketone (*4-chloro-2-methylphenacyl chloride*) [Beil. VII-306] by oxidn. with $KMnO_4$ see (2); from β-chloroethyl 4-chloro-2-methylphenyl ketone (5) by oxidn. at 100° with mixt. of equal pts. conc. HNO_3 and aq. see (5); from 4-chloro-2-methylbiphenyl (3) by oxidn. with CrO_3/AcOH (8% yield) see (3); from 1-methyl-1-(trichloromethyl)cyclohexadiene-2,5-one-4 [Beil. VII-149] by treatment with PCl_5 giving 4-chloro-2-methylbenzotrichloride, followed by alk. hydrolysis of the latter, see (9); from 4-chloro-2-methylbenzonitrile, m.p. 67° (1) (10), by boilg. for 16 hrs. with 8% aq. KOH see (1) (10).]

$\bar{C}$ on oxidn. with alk. $KMnO_4$ (7) or with 10–20 pts. dil. HNO_3 ($D = 1.13$) in s.t. at 180–200° for 5 hrs. (1) yields 4-chlorophthalic acid (3:4390).

$\bar{C}$ fused with KOH yields (7) 4-hydroxy-2-methylbenzoic acid [Beil. X-215], m.p. 172–173° (7).

Salts. $NH_4\bar{A}$, eas. sol. aq.; $K\bar{A}.H_2O$, very eas. sol. aq.; $Ca\bar{A}_2.3H_2O$ more sol. in aq. than corresp. salt of 5-chloro-2-methylbenzoic acid (3:4670); $Ba\bar{A}_2.4H_2O$, more eas. sol. aq. than calcium salt (for details see (1)).

—— Methyl 4-chloro-2-methylbenzoate: unrecorded.

—— Ethyl 4-chloro-2-methylbenzoate: oil, b.p. 258° (1), $D_4^{20} = 1.1626$ (10), $n_{He}^{20} = 1.52705$ (10) [From $\bar{C}$ in EtOH with HCl gas (1) or from the amide (see below) with ethyl nitrite in s.t. at 140° for 4–5 hrs. (1).]

—— 4-Chloro-2-methylbenzamide: colorless ndls. from hot aq., from alc. or ether, m.p. 183° (1). [Obtd. indirectly by partial sapon. of corresp. nitrile (above) (1).]

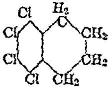
3:4703 5,6,7,8-TETRACHLORO-1,2,3,4-TETRAHYDRONAPHTHALENE (5,6,7,8-Tetrachlorotetralin)



$C_{10}H_8Cl_4$ Beil. V — V_1— V_2-(386)

M.P. 172° (1)
174° (2)

B.P. 180° at 26 mm. (1)

[*See also naphthalene tetrachloride* (3:4750).]

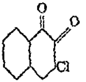
Cryst. from AcOH.

[For prepn. of $\bar{C}$ from 1,2,3,4-tetrahydronaphthalene (tetralin) (1:7550) with Cl_2 in pres. of I_2 (15% yield (2)) at 15° in diffuse daylight see (1) (2); for formn. in small amt. from tetralin during prepn. of 7-chloro-1,2,3,4-tetrahydronaphthalene (β-chlorotetralin) with Cl_2 in pres. of I_2 at 10° see (1).]

$\bar{C}$ with $2Br_2$ in boilg. CS_2 yields (1) 1,2-dibromo-5,6,7,8-tetrachloronaphthalene [Beil. V_2-(388)], m.p. 142° (1), which with alc. (?) NaOEt gives (alm. quant. yield (1)) 1,2,3,4-tetrachloronaphthalene [Beil. V_2-(446)], m.p. 198°

3:4703 (1) von Braun, *Ber* **56**, 2337 (1923). (2) Wynne, *J. Chem. Soc.* **1946**, 61.

3:4704 3-CHLORONAPHTHOQUINONE-1,2 (3-Chloro-β-naphthoquinone)



$C_{10}H_5O_2Cl$ Beil. VII-720 VII_1—

M.P. 172° (1) (2) (3)

Red ndls. from $CHCl_3$. — Sol. hot alc., AcOH, C_6H_6, $CHCl_3$.

[For prepn. of $\bar{C}$ from β-naphthol (1:1540) by conversion with Cl_2 in AcOH (2) to 1,1,3,4-tetrachloro-2-keto-1,2,3,4-tetrahydronaphthalene [Beil. VII-371] (lfts. of monohydrate from aq., m.p. 90–91°; anhydrous lfts. or ndls. from hot lgr., m.p. 101–103°)

followed by treatment with aq. Na_2CO_3 (2) (3) (overall yield of C̄ is 50% (4)). — For prepn. of C̄ from naphthoquinone-1,2 (1:9002) with Cl_2 in AcOH (1) (5), or from 1,3-dichloronaphthol-2 (3:1090) by oxidn. with conc. HNO_3 in AcOH (3), see indic. refs.]

C̄ on reduction with SO_2 in AcOH gives (1) 3-chloro-1,2-dihydroxynaphthalene [Beil. VI-975], colorless ndls., m.p. 116–117° (1).

[C̄ on oxidn. with aq. $Ca(OCl)_2$ undergoes rupture of the quinoid ring and a subsequent series of changes (5) resulting in formation of (phthalidyl-3)-dichloroacetic acid [Beil. XVIII-419], tbls. of monohydrate from aq., anhydrous ndls. from C_6H_6, m.p. 157°, accompanied by some 2,2-dichloroindandione-1,3 [Beil. VII-696, VII_1-(375)], m.p. 124–125°.]

[C̄ although insol. in aq. Na_2CO_3 gradually dissolves in dil. aq. alkali with conversion (1) to 3-chloro-2-hydroxy-naphthoquinone-1,4 (3-chloro-4-hydroxynaphthoquinone-1,2) [Beil. VIII-304], yel. ndls. from alc., m.p. 215°.]

[C̄ with alc. NH_3 on htg. gives (1) 3-chloro-2-hydroxynaphthoquinone-1,4-imine-4 (3-chloro-4-aminonaphthoquinone-1,2) [Beil. VIII-305], m.p. abt. 260°.]

[C̄ with alc. aniline on htg. similarly gives (1) 3-chloro-2-hydroxynaphthoquinone-1,4-anil-4 (3-chloro-4-anilino-naphthoquinone-1,2) [Beil. XII-225], yel. ndls. from AcOH, m.p. 253°.]

C̄ with 2,3,-dimethylbutadiene-1,3 (1:8050) in spec. purified $CHCl_3$ in s.t. at 100° in dark for 1 hr. readily forms (70% yield (4)) a Diels-Alder type adduct $C_{16}H_{15}O_2Cl$, lemon-yel. ndls. from ether/pet. ether, m.p. 87–88°; this adduct is unstable even at 10° and in alc. or ether soln. on shaking with air loses HCl and is oxidized (by loss of 2 hydrogen atoms) giving (87% yield (4)) 2,3,-dimethylphenanthraquinone, m.p. 237–238° u.c., 242–243° cor. (4). — For study of reaction of C̄ with excess 2,3-dimethylbutadiene-1,3 (1:8050) giving 36% yield of a halogen-free prod. of m.p. 135° see (6).

—— **3-Chloronaphthoquinone-1,2-oxime-1 (3-chloro-1-nitrosonaphthol-2)** [Beil. VII-721]: yel.-red ndls. from hot alc., m.p. 167–168° dec. (7). [Prepd. indirectly.]

3:4704 (1) Zincke, *Ber.* **19**, 2497 (1886). (2) Zincke, Kegel, *Ber.* **21**, 3550–3552 (1888). (3) Zincke, Kegel, *Ber.* **21**, 3380, 3386 (1888). (4) Fieser, Dunn, *J. Am. Chem. 172°	(5) (6) (7) (8) (9) (22) (27)	167–168°	(17) (18) (19)

Colorless ndls. from aq. or alc.; sol. in 1100 pts. aq. at 20° and in 80 pts. aq. at 100° (17); eas. sol. alc., ether, C_6H_6, $CHCl_3$, AcOH; spar. sol. lgr. — Volatile with steam (12). — Shows sternutatory props.

[For prepn. of C̄ from *p*-chlorophenol (3:0475) in CCl_4 with aq. NaOH (very small yield (15)) in pres. of Cu (19) or in CCl_4 with alc. KOH in s.t. at 140° for 5–6 hrs. (17) see indic. refs.; from dry sodium *p*-chlorophenolate with CO_2 at 140–150° under press. see (12) (20); from salicylic acid (1:0780) with Cl_2 in CS_2 (65% yield (38)) (3), in MeOH (21) or EtOH (22) (much 3,5-dichlorosalicylic acid (3:4035) also being formed), in AcOH (85%

yield (4)) or in nitrobenzene at 50–60° (23), or with $C_6H_5ICl_2$ in suitable solvents (89% yield (2)), or by htg. with $SbCl_5$ (14), or with HCl + 30% H_2O_2 (56–66% yield (6)), see indic. refs.; from mono K salicylate in aq. with Cl_2 (24) or from di-potassium salicylate with KOCl (1) (much 3,5-dichlorosalicylic acid (3:4935) being also formed) see indic. refs.]

[For prepn. of $\bar{C}$ from 5-chloro-2-aminobenzoic acid (5-chloroanthranilic acid) [Beil. XIV-365] with nitrous acid at 50° see (11); from 5-amino-2-hydroxybenzoic acid (5-aminosalicylic acid) [Beil. XIV-579, XIV_1-(650)] via diazotization and use of Cu_2Cl_2 reactn. (62–71% yield (16)) (25) see indic. refs.; from 5-chloro-2-hydroxybenzonitrile [Beil. X-104] by hydrolysis with H_2SO_4 see (13); from ethyl 5-chloro-2-hydroxybenzoate (see below) by hydrolysis with KOH see (7) (25), from 5-chloro-2-methoxybenzoic acid (see below) by cleavage with conc. HI see (10); from chloral-5-chlorosalicylamide (see below) by hydrolysis with 10% NaOH see (26); from 5-chlorosalicylin by oxidn. with $K_2Cr_2O_7$ + H_2SO_4 (18) or with $KMnO_4$ followed by acid hydrolysis (9) see indic. refs ; from 6-chloro-2,3-dimethylchromone (27), 6-chloro-2,3-diphenylchromone (28), or 7-chloro-1,2,3,4-tetrahydroxanthone (5) by alk. hydrol. see indic. refs.]

[For use of various esters of $\bar{C}$ as mothproofing agents (29), as insecticides (30), or as plasticizers (31) (32) see indic. refs.; for studies of bactericidal power of $\bar{C}$ see (33) (34); for study of fate of $\bar{C}$ in animal body see (35)]

[$\bar{C}$ on electrolytic reduction in aq. alc. H_2SO_4 yields (36) 5-chloro-2-hydroxybenzyl alcohol [Beil. VI-893], m.p. 93° (36); $\bar{C}$ on reductn. with Na/Hg as directed (16) yields 5-chloro-2-hydroxybenzaldehyde (3:2800).]

[$\bar{C}$ with PCl_5 (37) in lgr. (38) yields 4-chloro-2-chloroformylphenylphosphoryl dichloride, $Cl.CO.C_6H_3Cl.O\text{-}P(O)Cl_2$ [Beil. X-103], oil, b.p. 183–184° at 13 mm. (38); $\bar{C}$ with PCl_3 yields (38) 4-chloro-2-chloroformylphenyl metaphosphite, $Cl.CO.C_6H_3Cl.O\text{-}P{:}O$ [Beil. X-103], m.p. abt. 55–57°, b.p. 155–156° at 14 mm. (38).]

[$\bar{C}$ with $ClSO_3H$ at 50–70° yields (39) 3-chlorosulfonyl-5-chloro-2-hydroxybenzoic acid [Beil. XI_1-(106)], pr. from AcOH, m.p. 206–207° (39).]

[$\bar{C}$ with HNO_3 + conc. H_2SO_4 at 0° (23), or $\bar{C}$ on warming with fumg. HNO_3 (22), or $\bar{C}$ in AcOH treated with 5 pts. fumg. HNO_3 in AcOH (40), yields 5-chloro-3-nitrosalicylic acid [Beil. X-120], pale yel. ndls , m.p. 162–163° (22); note that by loss of CO_2 and further nitration 4-chloro-2,6-dinitrophenol [Beil. VI-260, VI_1-(128)], yel. ndls. from aq., m.p. 80° (22), is also formed.]

[$\bar{C}$ in alc. with I_2 + HgO gives (41) 5-chloro-x-iodo-salicylic acid, colorless ndls. from hot dil. alc , m.p. 224° sl. dec. (41); $\bar{C}$ in alk. with I_2/KI yields (25) by loss of CO_2 and further iodination 4-chloro-2,6-diiodophenol [Beil. VI_1-(112)], yellowish ndls. from alc., m.p. 108° (25) (ethyl ether, m.p. 69°, acetate, m.p. 127.5° (25)).]

$\bar{C}$ in aq. soln. gives with $FeCl_3$ a violet coloration.

Salts. $Li\bar{A}, 2H_2O$ (8); $Na\bar{A}$ (8) (12), $K\bar{A}$ (8) all eas. sol. aq ; $Ca\bar{A}_2.3H_2O$ (14), $Ba\bar{A}_2\,3H_2O$ (11) (12) (14) (17) (18) see indic. refs.; $Pb\bar{A}_2$ (11), $Ag\bar{A}$ (12) (18), insol. aq.

Ⓓ **Methyl 5-chloro-2-hydroxybenzoate** (methyl 5-chlorosalicylate): ndls. from alc., m.p. 50° (1), 48° (7) (12), b p. 249° sl. dec. (12). [From $\bar{C}$ in MeOH with HCl gas (12), or from $Ag\bar{A}$ with MeI (1): also from methyl salicylate (1:1750) by chlorination with methyl *N,N*-dichlorocarbamate in AcOH (44).]

—— **Ethyl 5-chloro-2-hydroxybenzoate** (ethyl 5-chlorosalicylate): ndls. from alc , m.p. 25° (7). [From ethyl salicylate (1:1755) with SO_2Cl_2 (7).]

Ⓓ **5-Chloro-2-methoxybenzoic acid**: ndls. from aq., m.p. 82° (42), 81–82° (10), 80–81° (4). [Obtd. indirectly from 2-methoxybenzoic acid (1:0685) in AcOH with Cl_2 (4), or from 5-chloro-2-methoxybenzonitrile by alk. hydrolysis (43).]

Ⓓ **5-Chloro-2-ethoxybenzoic acid:** lfts. from dil. alc., m.p. 118° (7).

Ⓓ **5-Chloro-2-acetoxybenzoic acid:** cryst. from C_6H_6, m.p. 149° (8), 148° (42), 142° (25). [From $\bar{C}$ with AcCl (42).]

Ⓓ **5-Chloro-2-hydroxybenzamide:** lfts. from alc. or C_6H_6, m.p. 226–227° (26) (13), 223.5–224° (7), 222–223° (8). [From methyl or ethyl 5-chlorosalicylates (above) with alc. NH_3 (7).] [This amide with chloral (3:5210) gives on warming (26) chloral-5-chloro-2-hydroxybenzamide, ndls. from C_6H_6, m.p. 148–149° dec. (26).]

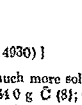
3:4711 *d,l*-α,α′-DICHLOROSUCCINIC ACID (*allo*-Dichlorosuccinic acid; isodichlorosuccinic acid)



$C_4H_4O_4Cl_2$ Beil. II - 619 II_1-(267) II_2-(557)

M.P.	*175° u.c.*	(1) (2) (3) (4) (12)
	174–175° dec.	(5) (6)
	173°	(7) (8)
	170–172° cor., dec.	(9)
	170° dec.	(10)

[*See also meso-α,α′-dichlorosuccinic acid* (3.4930)]

Cryst. from ether + pet ether. — $\bar{C}$ is much more sol. aq. than its *meso* stereoisomer; e.g., 100 cc. satd aq. soln. of $\bar{C}$ at 0° conts 54 0 g $\bar{C}$ (8); $\bar{C}$ is eas. sol. ether, less so in ...

[*For prepn. of $\bar{C}$ from disodium salt of fumaric acid* (1:0895) with ... in dark or diffuse daylight at 5° (yields: 75% (7) ... (note that as a side reactn some addn. o ... 10% (9) chloromalic acid, and that under some (ca ... the reactn. yields as much as 80% (9) of the *meso* stereoisomer (3.4... from maleic anhydride (1:0625) in CCl_4 by addn. of Cl_2 *in sunlight followed by hydrolysis* see (12) (9); from *d,l*-α,α′-diaminosuccinic acid [Beil. IV-487, IV_2-(901)] in aq. HCl soln with NOCl see (2); *from benzoquinone*

dichloride [Beil. VII-573] (13) or toluquinone dichloride [Beil. VII-576] (13) by oxidn. with aq. $KMnO_4$ (or $BaMnO_4$) at 0° see (3); from *d,l*-α,α′-dichlorosuccinyl (di)chloride (3:0395) by aq. hydrolysis see (14)]

C̄ behaves as a normal dibasic acid: titration with standard dil. aq. alk. gives Neut. Eq. 93.5. — For study of acid strength ($K_1 = 372.0 \times 10^{-4}$ at 16°; $K_2 = 18.0 \times 10^{-4}$ at 16.7° (8) cf. (15); for study of conductivity see (4).

[Salts (of metals): $(NH_4)_2\bar{A}.2H_2O$ (10), $K_2\bar{A}.H_2O$ (6), $KH\bar{A}.2H_2O$ (6), $CaA.2\frac{1}{2}H_2O$ (10), $Ba\bar{A}.7H_2O$ (10), $Cu\bar{A}.2\frac{1}{2}H_2O$ (10), all eas. sol. aq.; $Sr\bar{A}.7H_2O$ (10), sol. in 15 pts. aq.; $Pb\bar{A}.3H_2O$ (10) spar. sol. aq.]

C̄ on boilg. with aq. (12) or with aq. KOH (7) (6) or aq. acid (6) loses 1 HCl yielding chlorofumaric acid (3:4853); for study of rate at 25° see (7) (16).

[$K_2\bar{A}$ in aq. soln. maintained at neutrality at 100° yields mainly (6) *d,l*-tartaric acid (1:0550)]

C̄ with PCl_5 (2 moles) gives (100% yield (14)) *d,l*-α,α′-dichlorosuccinyl (di)chloride (3:0395), m p. 39°.

Ⓓ Dimethyl *d,l*-α,α′-dichlorosuccinate: m.p. 43° (see 3:0485).

—— Diethyl *d,l*-α,α′-dichlorosuccinate: oil (see 3:9578).

—— Acid salt of C̄ with *d,l*-α-phenylethylamine: pr. from aq., m.p. 149–150°, rap. htg. (6); satd. aq. soln. at 25° conts. 18.67 g./liter (6). [For details of resolution of C̄ with opt. act. α-phenylethylamine see (6) (1); note incidentally that, although m p. of C̄ is 175°, the m.p. of each of the opt. act. stereoisomeric forms is lower, viz., 166–167° dec. (6), 168° (1).]

1). (5) [illegible]
03–304 [illegible]
Brass, [illegible]

$\bar{C}$ with alc. KOH on boilg yields (2) (16) (17) [illegible] lene (3:1310), m p. 61–62°, accompanied by [illegible] 68°, and a little 2,3-dichloronaphthalene (3:[illegible] 38°, supposed by the earlier workers to have been [illegible] (19) to consist of a mixt. (possible mol cpd.) of [illegible] naphthalene.

$\bar{C}$ on oxidn. with 8.7 wt. pts. conc HNO_3 (D = 1.4[illegible]) at [illegible] (20) 2,3-dichloronaphthoquinone-1,4 (3:4857), m p. [illegible] HNO_3 also yields (21) (13) (presumably by further oxidn. of [illegible] acid (1·0820) and oxalic acid (1:0115).

$\bar{C}$ on oxidn. with CrO_3/AcOH yields (20) 2,4-dichloronaphth[illegible] 107° (20).

[$\bar{C}$ with moist silver oxide in s t. at 200° yields (19) (9) a [illegible] 2,3-dichloronaphthalene (3·3665), and other prods. (9).]

[$\bar{C}$ on nitration with HNO_3 (D = 1.5) at not above 20 [illegible], followed by [illegible] with $MeOH/Na_2CO_3$ or $MeOH/NaHCO_3$ in C_6H_6 at [illegible] with $MeOH/NH_3$ ord. temp (23), yields 5,8-dichloro-1-nitronaphthalene [Beil. [illegible] 2).]

[For conversion of $\bar{C}$ to artificial resins by htg. with metal halides such as [illegible]), or by htg with naphthalene + a surface cat. such as fuller's earth (25), see [illegible]

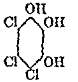
3:4782 4,5,6-TRICHLOROPYROGALLOL



$C_6H_3O_3Cl_3$ **Beil. VI-1084**
VI₁—
VI₂—

M.P. about	**185°** dec.	(1)
	177° u.c. dec.	(2)
	175°	(3)

Ndls. with 3 H_2O, m.p. 75° (1) from alc. or C_6H_6 (2); this trihydrate in vac. over H_2SO_4 loses 2 H_2O, the final H_2O at 110° (2). — C̄ is spar. sol. in cold aq., C_6H_6, $CHCl_3$, CCl_4, or CS_2; eas. sol. alc., ether, or hot aq.

[For prepn. of C̄ from pyrogallol (1,2,3-trihydroxybenzene) (1:1555) in 60% AcOH with Cl_2 (2), or with SO_2Cl_2 in dry ether (3), see indic. refs.]

[For prepn. of C̄ from "leucogallol" [Beil. VI-1078] or "mairogallol" [Beil. VI-1078] by reduction with Zn dust + dil. H_2SO_4 see (1); from gallic acid (1:0875) in $CHCl_3$ with Cl_2 see (4).]

[C̄ in CCl_4 or $CHCl_3$ prev. satd. with Cl_2 gives (2) "leucogallol."]

C̄ in ether soln. with aq. $Ba(OH)_2$ gives deep blue coloration; with aq. Na_2SO_3 a fugitive red coloration (2).

C̄ with aq. $FeCl_3$ gives (4) a blue coloration.

C̄ with conc. HNO_3 is oxidized and decomposed (2); C̄ dis. in cold conc. H_2SO_4 without evoln. of gas but on warming decomposes (2).

C̄ reduces $NH_4OH/AgNO_3$ (1).

—— 4,5,6-Trichloropyrogallol trimethyl ether: cryst. from alc., m.p. 54° (5). [Prepd. indirectly (5).]

... 125° (4), 122° (1).

3:4810 2,3,4-TRICHLOROBENZOIC ACID

$C_7H_3O_2Cl_3$ Beil. IX-345; IX_1—

M.P. 186–187° (1)

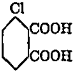
Ndls. from hot aq. (1). — C̄ does *not* melt under boiling water (1).

[For prepn. from 2,3,4-trichlorotoluene (3:0425) by oxidn. with HNO_3 in s.t. at 150° see (1); from 2,3,4-trichlorobenzaldehyde (3:2445) by oxidn. with $KMnO_4$ see (2).] [The latter product was probably impure (1).]

No further data on C̄ are recorded.

3:4810 (1) Cohen, Dakin, *J. Chem. Soc.* **81**, 1328 (1902). (2) Seelig, *Ann.* **237**, 150 (1887).

3:4820 3-CHLOROPHTHALIC ACID



$C_8H_5O_4Cl$ Beil. IX-816; IX_1-(360)

M.P. **186–187°** (1)
185–187° (2)
186° (3)
184° (4) (5)

[*See also 3-chlorophthalic anhydride* (3:3900).]

Ndls from aq.; eas. sol. alc.; eas. sol. ether (use in sepn. from phthalic acid (1:0820) (6). — 100 pts. aq. at 14° dis. 2.16 pts. C̄ (5). — [For sepn. of C̄ from o-chlorobenzoic acid (3:4150) by use of $CHCl_3$ see (7).]

[For prepn. of C̄ from 3-chlorophthalic anhydride (3:3900) by hydrolysis with boilg. dil. HCl see (3) (6); from 1,5-dichloronaphthalene (3:3200) by oxidn. with CrO_3/AcOH see (5); from 5-chloro-1,2,3,4-tetrahydronaphthalene [Beil. V_1-(237)] (1) by oxidn. with $KMnO_4$ see (1); from 3-chloro-2-methylbenzoic acid (3:4435) by oxidn. with $KMnO_4$ see (8).]

C̄ on htg above its m p yields (5) (8) 3-chlorophthalic anhydride (3:3900).

[C̄ on KOH fusion yields (8) (note rearrangement.) 4-hydroxyphthalic acid [Beil. X-499, X_1-(255)], m p. 204–205°, with conv. to corresp. anhydride, m.p 171°.]

[C̄ with steam passed over cat. at 350° loses CO_2 presumably yielding (9) o-chlorobenzoic acid (3:4150) and/or m-chlorobenzoic acid (3:4392).]

[C̄ htd. with $Hg(OAc)_2$ in AcOH as directed (2) gives *anhydro*-2-hydroxymercuri-3-chlorobenzoic acid which on htg with aq HCl yields m-chlorobenzoic acid (3·4392)]

Salts. $Ag_2\bar{A}$, ndls. from hot aq. (5); $Ba\bar{A}$, eas sol. cold aq, but spar. sol. hot aq., on protracted boilg. with aq gives monohydrate which is insol cold aq. (8).

Esters. The neutral dimethyl and diethyl esters of C̄ are unreported; of the various possible acid esters only ethyl hydrogen 3-chlorophthalate, m p. 118–119° (1), has been reported.

[*See also 4,5-dichlorophthalic acid* (3:4890).]

Tbls. or pr. from hot toluene or from CCl_4; spar. sol. cold but eas. sol. hot C_6H_6 or toluene; very little sol in CCl_4

[For prepn. of C̄ from 4,5-dichlorophthalic acid (3:4890) by htg at 200° (4) or by htg. with AcCl (2) see indic. refs.; for formn. of C̄ (together with other isomers) from phthalic anhydride (1:0725) with Cl_2 in pres. of Fe or Fe salts at 160–260° (5), or from phthalic anhydride (1:0725) or 3-chlorophthalic anhydride (3:3900) with Cl_2 in fumg. H_2SO_4 in pres. of I_2 (4) (1), see indic. refs.; for formn. of C̄ from aq solns. of alk. salts of phthalic acid (1:0820) with Cl_2 see (2) (6) (7).]

[For sepn. of C̄ from isomeric dichlorophthalic anhydrides by means of salts of corresp.

acids, etc., see (4) (8) (1); by means of differential hydrolysis with H_2SO_4 (prods. with no α chlorine such as C̄ require H_2SO_4 of 98–100% concn., those with 1 α chlorine such as 3,4-dichlorophthalic anhydride hydrolyze with 56–95% H_2SO_4, those with 2 α chlorine atoms such as 3,6-dichloro- or 3,4,5,6-tetrachlorophthalic anhydrides hydrolyze at H_2SO_4 concns. of less than 50%) see (9).]

C̄ dislvd. in abs. alc. yields (4) ethyl hydrogen 4,5-dichlorophthalate, ndls. from $CHCl_3$, m.p. 133–134° (4).

[C̄ with 1 mole $NH_2OH.HCl$ + Na_2CO_3 in aq. soln. as directed (4) yields 4,5-dichlorophthaloylhydroxylamine (*N*-hydroxy-4,5-dichlorophthalimide) [Beil. XXI-504], pr. from MeOH, m.p. 195–197° dec. (4); this prod. on warming with aq. Na_2CO_3 gives 100% yield 4,5-dichloro-2-aminobenzoic acid (4,5-dichloroanthranilic acid) [Beil. XIV-368, XIV_1-(549)], m.p. 213–214° (4).]

[C̄ with steam passed over cat. at 380–420° loses CO_2 presumably yielding (10) 3,4-dichlorobenzoic acid (3:4925).]

C̄ with benzene + $AlCl_3$ (12) or in acetylene tetrachloride (11) gives (98% yield (12)) 4,5-dichloro-2-(*o*-benzoyl)benzoic acid [Beil. X_1-(357)], cryst. from C_6H_6 (12) or toluene (11), m.p. 209° (12), 208° (11), which on htg with 20 pts. conc. H_2SO_4 at 160° for 1 hr. gives (92% yield (12)) (11) 2,3-dichloroanthraquinone [Beil. VII-788, VII_1-(413)], yellowish ndls. from AcOH, m.p. 267° cor. (12), 265° (11). — [C̄ with *o*-xylene + $AlCl_3$ in acetylene tetrachloride gives (80% yield (11)) 4,5-dichloro-2-(3′,4′-dimethylbenzoyl)benzoic acid, cryst. from cyclohexane, m.p. 184° (11), which with 10 pts. conc. H_2SO_4 at 100° gives (45% yield (11)) 6,7-dichloro-2,3-dimethylanthraquinone, cryst. from xylene, m.p. 305° (11). — C̄ with *o*-dichlorobenzene (3:6055) + $AlCl_3$ 4 hrs. at 100° gives (80% yield (11)) 3,4-dichloro-2-(3′,4′-dichlorobenzoyl)benzoic acid, cryst. from C_6H_6, m.p. 183°, which with 12 pts. conc. H_2SO_4 6 hrs. at 100° gives mainly 2,3,6,7-tetrachloroanthraquinone, cryst. from *o*-dichlorobenzene, m.p. 348° (11). — For analogous reactns. of C̄ with naphthalene (13), pyrene (14), or *o*-chlorotoluene (15) see indic. refs.]

[C̄ with hydroquinone (1:1590) + H_3BO_3 htd. at 190° and afterward treated with hot conc. H_2SO_4 at 150–165° (16), or C̄ with $AlCl_3$ + NaCl htd. at 200–220° (17), or C̄ with *p*-chlorophenol (3:0475) htd. with fumg. H_2SO_4 + H_3BO_3 (18) gives (yield: 80% (17), 15% (16)) 6,7-dichloro-1,4-dihydroxyanthraquinone (6,7-dichloroquinizarin) [Beil. VIII-452, $VIII_1$-(716)], red-br. cryst. from xylene, m.p. 295.5° (17), 288° (16), (diacetate, m.p. 125° (16), dimethyl ether, m.p. 168 5° (17)).]

[For use of C̄ in prepn. of pigments of the copper phthalocyanine type see (19).]

C̄ with $(NH_4)_2CO_3$ htd at 250° for ½ hr. (20) yields 4,5-dichlorophthalimide, pl. from alc., m.p. 221° (20) (note that behavior of C̄ with conc aq. NH_4OH is different yielding (4) 4,5-dichlorophthalamic acid (not specifically characterized) which with alk. NaOCl gives 4,5-dichloro-2-aminobenzoic acid (above)). — [For behavior of C̄ with hydrazine hydrate in AcOH yielding corresp. cyclohydrazide see (21).]

C̄ (1 pt.) in boilg. AcOH (6 pts.) treated with aniline (1 pt.) gives (82% yield (1)) 4,5-dichlorophthalanil (*N*-phenyl-4,5-dichlorophthalimide) [Beil. XXI_1-(301)], cryst. from AcOH, m.p. 212.5–213° cor. (1).

C̄ on saponification with standard alkali (Sap. Eq. = 108 5), followed by acidification, yields 4,5-dichlorophthalic acid (3:4890) q.v

White cryst. with camphoraceous odor which readily sublime without melting. — Cryst. from alc, ether, $CHCl_3$ or CS_2. — Č is trimorphous: below about 46° cryst. Č is orthorhombic, in range 46–71° cryst Č is triclinic; about 71° cryst Č is cubic at these transition temps volume alterations occur which have sometimes (5) been mistaken for m p.'s. — [For details on trimorphism and these transitions see (19) (8) (20) (21) (25) (26); for influence of high press. see (22) — For crystallographic data see (20) (23) (24); for X-ray crystallog. data see (27) (28)]

Č is almost abs. insol aq and vice versa at ord temp. (29); for patents on drying of Č see (30) (31) — [For studies of vap press of Č at various temps see (13) (4) (7) (32). — For prevention of "caking" of cryst Č by addn of 1–10% paraformaldehyde see (33)]

Cryoscopic const of Č, i.e, f p. lowering per mole solute in 100 g Č, is 5 6° (34). [For thermal anal. of binary systems of Č with naphthalene (1:7200) (8) (34), with phenanthrene (1:7240) (34), or with anthracene (1:7285) (34) see indic. refs]

USES OF Č

Č finds many uses in industry, some based on its physical characteristics and some on its chem. behavior — [E g, for use of Č as solvent for prepn. of solid solns. of I_2 for use in place of usual tincture see (35); for use of Č as means for temporary marking of cloth removable at will by heat (sublimation) see (36)]

[For use of $\bar{C}$ as addition agent to CCl_4 fire extinguishers see (37); as component of certain types of explosives (e.g., 75% nitrostarch + 20% $\bar{C}$ + 5% $NaNO_3$) see (38); for use of $\bar{C}$ as mothproofing agent see (39) (40) (41) (42); for use of $\bar{C}$ as insecticide and/or fungicide see (43) (44); for use of $\bar{C}$ together with CS_2 (45) or rotenone (46) as insecticides see indic. refs.]

$\bar{C}$ is an important component of "HC" smoke candles or grenades used for the production of screening clouds or smokes; a mixture of $\bar{C}$ with powdered metal (usually Zn) once started undergoes vigorous decomposition yielding $ZnCl_2$ + C; other materials are usually added to ignite the mixture and to modify the character of the resultant smoke; for further details see (47) (48) (49). — [For use of this type of reactn. in prepn. of activated carbon see (153)]

PHYSIOLOGICAL ASPECTS OF $\bar{C}$

[For studies of toxicity of $\bar{C}$ and its ability to penetrate skin see (50) (51) (52) cf. (160); for studies of $\bar{C}$ as anthelmintic see (53) (54); for study of antiseptic power of $\bar{C}$ see (55).]

DETERMINATION OF $\bar{C}$

For detn. of $\bar{C}$ by reactn. with Na + ethanolamine in dioxane followed by detn. of resultant chloride ion see (161).

PREPARATION (OR FORMATION) OF $\bar{C}$

$\bar{C}$ is a by-product of the tech. prepn. of CCl_4 (5:5100) from CS_2 + Cl_2 (56), of prepn. of $CHCl_3$ (3:5050) and of CH_2Cl_2 (3:5020) (57), and is found (12) (together with other by-products) in the high-boilg. fractn. ("Tri-Nachlauf") from the prepn. of trichloroethylene (3:5170) from acetylene tetrachloride (3:5750). — For quick prepn. of $\bar{C}$ from CCl_4 (3:5100) refluxed with Al powder (80% yield (14)) or with Al/Hg (65% yield (58)) cf. (96) see indic. refs.; for prepn. of $\bar{C}$ from ethylene with Cl_2 over activated carbon at 300–350° (90% yield) see (59). — For many other methods of preparation, manufacture, or formation see below.

From various polychloroethanes. *From 1,2-dichloroethane (ethylene dichloride) (3:5130).* [For prepn. of $\bar{C}$ from ethylene dichloride in vapor phase with Cl_2 + cat. (60) (61) or with Cl_2 under press. (62) see indic. refs.; note that ethylene dichloride in liq phase with Cl_2 gives mainly (61) 1,1,2-trichloroethane (3:5085). — Note also that 1,2-dibromoethane (ethylene dibromide) refluxed with $AlCl_3$ while treated with Cl_2 (63) gives $\bar{C}$.]

From 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). [For formn. of $\bar{C}$ together with other prods. from acetylene tetrachloride over pumice at 700° (64), or with anhydr. $FeCl_3$ on htg. in s.t. (65), or with Cl_2 (66) in u.v. light at 50–60° (67) or X-radiation (68), or with Cl_2 over activated carbon at 300–400° (69) (70) or at 60–70° (71), or with Cl_2 in pres. of $AlCl_3$ at 20–100° (71) or at 120° under reflux (80% yield (72)), or with Cl_2 in pres. of Fe at 20–80° (71), or with Cl_2 in CCl_4 soln. (73), or even with aq. bleaching powder (71), see indic. refs. — (Note also that acetylene tetra*bromide* with $AlCl_3$ + Cl_2 under reflux yields (63) $\bar{C}$).]

From pentachloroethane (3:5880). [For formn. of $\bar{C}$ together with other prods. from pentachloroethane with dry Cl_2 + AlCl... or with ... carbon at 300–400° (70), or with Cl_2 in u.v. ... exce... 10 hrs. (16), see indic. refs. — (Note also that ... SbC... for 2 hrs. gives (75) $\bar{C}$.)]

From various ... *...ene (3:5170).* [For formn. of $\bar{C}$ ... over

pumice at 700° (64), or with anhydrous $FeCl_3$ on htg. in s.t. (65), or with Cl_2 over act. carbon at 60–70° (98% yield (70)), see indic. refs.]

From tetrachloroethylene (3:5460). [For prepn. and/or formn. of $\bar{C}$ from tetrachloroethylene with Cl_2 (162) (76) (77) in direct sunlight (78) cf. (79) (80) (106) or in pres. of suitable cat. in dark at 80–100° (81), or in CCl_4 soln. at 22° (82) cf. (73) or in vapor phase at 40° and low press. in light and absence of oxygen (33) see indic. refs. (note that tetrachloroethylene (3:5460) with Cl_2 + light in presence of O_2 undergoes photo-oxidation to trichloroacetyl chloride (3:5420)). — For formn. of $\bar{C}$ from tetrachloroethylene with SO_2Cl_2 in pres. of dibenzoyl peroxide (84), or in small amt. with dibenzoyl peroxide alone (85), or with chlorine monoxide in CCl_4 at −20° (86), see indic. refs.] See also below under formn. of $\bar{C}$ from acetylene.

From dichloroacetylene (3:5010). [For formn. of $\bar{C}$ from dichloroacetylene with Cl_2 in CCl_4 soln. see (2).]

From various polychloromethanes. *From trichloromethane (chloroform) (3:5050).* [For formn. of $\bar{C}$ together with other prods. from $CHCl_3$ by pyrolysis at 425° (87), in electric arc (6), by actn. of radium radiation (88), or by actn. of NCl_3 in sunlight (89) see indic. refs.]

From carbon tetrachloride (3:5100). [For formn. of $\bar{C}$ together with other prods. from CCl_4 by pyrolysis at 600–1500° (90) cf. (91) (76), by actn. of electric arc (6), dark elec. discharge (92), or radium radiation (88), with hydrogen at 600–650° (93), or with hydrogen over reduced Ni at 270° (94), or from CCl_4 in nitrogen over GeO_2 at 500–865° (95), see indic. refs.]

[For prepn. of $\bar{C}$ from CCl_4 (3:5100) by refluxing with Al powder (80% yield (14)), Al/Hg (65% yield (58)), or Al + $AlCl_3$ (96), or by htg. with Cu powder in s.t. at 120° (97), amorphous As in s.t. at 160° (98), or molecular Ag in s.t. at 200° (99), see indic. refs.]

From various hydrocarbons. *From methane.* [For formn. of $\bar{C}$ together with other prods. from CH_4 + Cl_2 in silent elec. discharge see (100).]

From ethane. [For formn. of $\bar{C}$ together with other prods. from ethane with Cl_2 in pres. of activated carbon or other cat. at elev. temp. see (101) (102) (103).]

From ethylene. [For formn. of $\bar{C}$ together with other prods. from ethylene with Cl_2 over act. carbon at 120–125° (104) or at 300–350° (90% yield (59)) cf. (101) (105).]

From acetylene. [For formn. of $\bar{C}$ together with other prods. from acetylene with Cl_2 at 650–1000° as directed (106) or at 700–950° as directed (107), with Cl_2 in an inert gas such as N_2 or HCl over act. carbon at elev. temp. (108), or with S_2Cl_2 in pres. of 1–2% reduced iron (109) (110) see indic. refs. — (Note that by this mode of procedure acetylene tetrachloride (see this heading above) is a probable intermediate.)]

From miscellaneous sources. $\bar{C}$ has been observed as one of the products of decomposition of many different types of compounds contg. the $-CCl_3$ group [For example, for formn. of $\bar{C}$ (together with other prods.) from iodotrichloromethane on distn. (111), from bromotrichloromethane in ultraviolet light (112), from trichloroacetyl chloride (3:5420) at 600° (113), from trichloroacetyl bromide in s.t. at 400° (113), from trichloroacetyl iodide on distn. at ord. press. (113), from nitrosotrichloromethane with O_2 at 120° (114), or from nitrotrichloromethane (chloropicrin) with HCl gas over pumice at 400° (1) see indic. refs. — For formn. of $\bar{C}$ together with other prods. from trichloroacetaldehyde (chloral) (3:5210) with Cl_2, Br_2, or I_2 in pres. of $AlCl_3$ (115), from trichloroacetic acid (3:1150) by pyrolysis over ThO_2, kaolin, or carbon (116), from K trichloroacetate by electrolysis of its soln. in aq. KOAc (15), from ferric trichloroacetate in aq. soln. in light (117) (118) (119), from pentachlorodimethyl ether on htg. with aq. (120), or from trichloromethyl benzoate on htg. (121) see indic. refs.]

The formn. of $\bar{C}$ has also been observed in connection with certain acid chlorides [e.g.,

for formn. of $\bar{C}$ from acetyl chloride (3:7065) with excess PCl_5 in s.t. at 180° (122), from pentachloropropionyl chloride (3:0470) with $AlCl_3$ on warming (123), from dichloromaleyl (di)chloride (3:6197) with PCl_5 at 230° for 6 hrs. (124), or from pentachloroethyl chloroformate with $AlCl_3$ at 100° (125) see indic. refs.]

[For formn. of $\bar{C}$ from various alkanes with $SbCl_5 + I_2$ (126), from a mixt. of dichloropropanes or from hexachlorobutadiene (3:6425) with Cl_2 at 400° and 30 atm. (127), from an electric arc between carbon electrodes in Cl_2 (128), from n-propyl chloride (3:7040) or isobutyl chloride (3:7135) with excess ICl_3 in s.t. at 200° (129), from CaC_2 with gaseous or liq. Cl_2 at 20° under press. (10), from various iodochlorides of ethylene on warming (9), from lignin on boilg with $SbCl_5 + I_2$ (130), from humic acid with $KClO_3 + HCl$ (131), from β,β'-dichlorodiethyl sulfide ("mustard gas") with dry Cl_2 at 100° (132), or from $\alpha,\alpha,\beta,\beta,\beta,\beta'$-hexachlorodiethyl sulfide or $\alpha,\alpha,\beta,\beta,\beta,\alpha',\beta'$-heptachlorodiethyl sulfide with Cl_2 in cold (133) see indic. refs.]

CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis. [$\bar{C}$ passed over porcelain in hot tube gives (78) tetrachloroethylene (3:5460); $\bar{C}$ (in stream of air) pyrolyzed at 550–600° gives (57) tetrachloroethylene (3:5460) + CCl_4 (3:5100) in conversions of substantially 100%. — Note also that $\bar{C}$ with $SbCl_5$ above 450° yields almost exclusively (126) CCl_4 (3:5100).]

Reduction. $\bar{C}$ with granulated Zn in boilg. alc. (134), with Zn + dil. H_2SO_4 at room temp. for several days (100% yield (135)) (136) (76), with Zn + aq. above 80° (137), with H_2 over Ni at 270° (138), or with alc. KSH (139) loses 2 chlorine atoms giving tetrachloroethylene (3:5460) [for other, less direct conversions of $\bar{C}$ to tetrachloroethylene see latter under preparation; also below.)]

Oxidation. $\bar{C}$ is oxidized only with considerable difficulty [e g., for behavior of $\bar{C}$ over hot CuO see (140); for detn. of chlorine in $\bar{C}$ by cat. oxidn. over Fe_2O_3 (low results) see (141); $\bar{C}$ with CrO_3/H_2SO_4 is incompletely oxidized (142); $\bar{C}$ with SO_3 in s.t. at 150° (143) cf. (144) yields trichloroacetyl chloride + $S_2O_5Cl_2$.]

Partial replacement of chlorine by fluorine. [$\bar{C}$ with F_2 gas over Cu gauze cat. at 125° (145), or with SbF_3Cl_2 htd. under press. (146) (147) (148), or with $SbF_3 + Cl_2 + SbCl_3$ as directed (149) yields 1,1,2,2-tetrachloro-1,2-difluoromethane, m.p. 24–25°, b.p. 92°, accompanied by numerous other partially fluorinated prods.]

Behavior with alkalies. [$\bar{C}$ with solid KOH in s.t. at 210–220° for several days yields (150) KCl + potassium oxalate; $\bar{C}$ with alc. KOH in s.t. at 100° for a week yields (151) the same prods. accompanied by ethylene and hydrogen; $\bar{C}$ with $N/10$ abs EtOH/NaOH at 25° (17), with alc.-free NaOEt in ether under press. htd. to 140° (152), yields tetrachloroethylene (3:5460) (for study of kinetics see (17)).]

Behavior with metals. [$\bar{C}$ with alk. or alk.-earth metals is (like many other polychloro compounds) subject to explosion by mechanical shock; for study of sensitivity of $\bar{C}$ with Li, Na, K, Mg, Ca, Sr, Ba, Al, or Tl see (154). — $\bar{C}$ with "molecular" Ag at 280° loses 2 atoms of chlorine yielding (99) tetrachloroethylene (3:5460).]

Behavior with organometallic compounds. [For behavior of $\bar{C}$ with RMgX compds. see (155) (166); $\bar{C}$ does not (11) react with Hg di-(p-tolyl).]

Behavior with NH_3 or organic bases. [$\bar{C}$ with NH_3 at 700–800° gives up its halogen quant. (157) yielding NH_4Cl. — $\bar{C}$ with excess phenylhydrazine in xylene soln. on stdg or on warming is reduced to tetrachloroethylene (3:5460), HCl, C_6H_6, and N_2 also being formed (158) (note that analogous reactns. are also shown by 1,1,2,2-tetrachloroethane (3:5750) and by pentachloroethane (3:5880)). — For kinetics of reactn. of $\bar{C}$ with pyridine or piperidine see (159).]

3:4840 3,5-DICHLOROBENZOIC ACID $C_7H_4O_2Cl_2$ Beil. IX - 344 IX$_1$-(141)

M.P. 188° (1) (2) (3) (4) (5)
184–185° (6)
182.5–183° (7) (11)
182–182.5° (8)

Ndls from alc. — Sublimes (10). — Very eas. sol. alc., spar. sol. aq. or lgr.

[For prepn from 3,5-dichlorotoluene (3:6310) by oxidn. with dil. HNO_3 at 150–170° see (8) (7); from 3,5-dichlorobenzaldehyde (3:1475) by oxidn with $KMnO_4$ (74% yield) see (3); from 3,5-dichlorobiphenyl (3:0360) by oxidn with CrO_3 + AcOH see (9): for prepn. from *3,5-diaminobenzoic ac.* via diazo reactn. see (1), from *4-amino-3,5-dichlorobenzoic ac.* via diazo reactn. see (2); from 3,5-dichloroaniline via conv. to acid hydrolysis of the nitrile see (10), for prepn. from 5-nitro-3-sulfobenzoic acid via PCl_5 and subsequent boilg. with alk. see (11).]

C̄ added to 8 pts. fumg. HNO_3 (D = 1.48), stood 2–3 hrs. at 70°, cooled, ppts. 75% yield 2-nitro-3,5-dichlorobenzoic ac., ndls. from dil. alc., m p 194° cor. (5). [This prod. depresses m.p. of C̄ (5).]

C̄ with PCl_5 yields (12) 3,5-dichlorobenzoyl chloride, b.p. 135–137° at 25 mm. (12).

—— **Methyl 3,5-dichlorobenzoate**: m p. 58° (13).
—— **Ethyl 3,5-dichlorobenzoate**: m.p. unrecorded. [For study of velocity of hydrolysis see (14).]
—— **3,5-Dichlorobenzamide**: unrecorded.
—— **3,5-Dichlorobenzanilide**: ndls. from dil. alc., m.p. 148° (15).

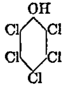
3:4850 PENTACHLOROPHENOL



C_6HOCl_5 — Beil. VI - 194; VI_1-(104); VI_2-(182)

M.P. 190.2° (1)	**B.P. 309–310° at 754.3 mm. sl. dec. (7)**
190–191° (2) (3) (4)	**195° at 16 mm. (3)**
189° (5)	
186–187° (8) (9) (10) (15)	

Cryst. from alc. as monohydrate, C̄.H_2O, m.p 174°; anhydrous ndls. from C_6H_6; sublimes in long ndls. — Very insol. aq. (17), very eas. sol. alc, ether; mod. sol. C_6H_6; spar. sol. cold lgr.; for quant data on solubility in 15 solvents at 7 temps. from 0° to 60° see (1) (17). — Odor pronounced only on htg ; dust of C̄ causes sneezing. — Slightly volatile with steam.

[For general review see (1), for use as wood preservative see (17) (19); for studies on toxicity see (20) (21); for fate of C̄ in organism see (22).]

[For prepn see Beil. VI-194, VI_1-(104); for comml. prepn. from hexachlorobenzene (3:4939) + NaOH + MeOH see (12) cf. (23); from chlorination of phenol or polychlorophenols in pres. of $AlCl_3$ see (13), from "hexachlorophenol" (3:3180) by reduction with SO_2 in alc. see (18).]

C̄ is acidic and in alc. soln titrates quant. using thymol-blue (Neut. Eq. = 266 5) (1). [For dissoc. const. see (2).] — C̄ is insol. in NH_4OH (1) but slowly dis. in cold Na_2CO_3 soln. (8) — C̄ in alk. soln. does not couple with diazonium salts. [For spectrophotometric detn. see (11).]

Salts. See Beil. VI-194. NaĀ, ndls. (from acetone + lgr.), spar. sol. aq. (3), NaĀ H_2O, loses aq. at 110°, sol. aq., alc., ether. [For comml. application as preservative see (1) (14).] — AgĀ, yel. ppt. turning orange on drying. — Heavy metal salts insol. aq. and often colored (1).

C̄ in alk. shaken with $(CH_3)_2SO_4$ (6), or C̄ treated with diazomethane (6), or C̄ htd. in MeOH with CH_3I + KOH (15), yields its methyl ether, pentachloroanisole, ndls. from alc., m.p. 108° (6), 106 5° (6).

Ⓓ Pentachlorophenyl acetate: from C̄ on htg with Ac_2O + NaOAc (15) or from C̄ in CS_2 + AcCl + $AlCl_3$ (16); ndls. from alc., m.p. 149.5–150 5° (16), 147–148° (15). [This prod. is very resistant to saponification (16).]

Ⓓ Pentachlorophenyl benzoate: from $\bar{C}$ + BzCl by warming in pyridine (3); ndls. from alc., m p. 164–165° (3), 150–160° (15), 159° (10). [Very resistant to saponification (16).]

3:4853 CHLOROFUMARIC ACID

Cl—C—COOH
‖
HOOC—C—H

$C_4H_3O_4Cl$ Beil. II - 744
II_1-(302)
II_2-(640)

M.P.	193°	(1)
	192°	(2) (3) (4)
	191.5–192.5° cor.	(5)
	191.5°	(6)
	191–192°	(22)
	191°	(8) (10) (19)
	190–191°	(7) (12)
	189°	(11)
	188–189°	(14)

[*See also chloromaleic acid* (3 3432).]

Tbls from AcOH — $\bar{C}$ is very eas. sol. aq, alc. or ether; spar. sol. C_6H_6 or lgr. — $\bar{C}$ sublimes without forming anhydride

[For prepn of $\bar{C}$ from chloromaleic acid (3:3432) by repeated evapn. with conc. HCl see (5) (2); from *d,l-α,α'*-dichlorosuccinic acid (3:4711) on boilg. with aq (7), or with aq. KOH (8) (9) or aq acid (9) see indic refs; from *meso-α,α'*-dichlorosuccinic acid (3:4930) with aq KOH at 0° see (7) (8) (9) (note that from this source action of acid yields (9) both $\bar{C}$ and chloromaleic acid (3:3432)), from diethyl *d,l-α,α'*-dichlorosuccinate (3:9578) on hydrolysis with boilg 30% H_2SO_4 see (1); from diethyl chlorofumarate (3:6864) by evapn. with 1:1 HCl see (6); from chlorofumaro(di)nitrile (b p 172° at 74 mm., 64.0–64 2° at 10 mm., D_4^{20} = 1 2499, n_D^{20} = 1 49571 (22)), by hydrol. see (22).]

[For formn of $\bar{C}$ from diethyl oxaloacetate [Beil. III-782, III_1-(273), III_2-(479)] by actn. of PCl_5 followed by alc KOH see (11); from acetylenedicarboxylic acid [Beil. II-801, II_1-(317), II_2-(670)] with conc. HCl on stdg. 10 days at room temp. see (12) cf. (13); from 3-chlorofuroic acid [Beil XVIII-282] on oxidn with dil HNO_3 or from 3,5-dichlorofuroic acid [Beil. XVIII-283] or 4,5-dichlorofuroic acid [Beil. XVIII-283] on oxidn. with Br_2/aq. see (14).]

$\bar{C}$ on gentle boilg. largely decomposes into CO + CO_2 + HCl (5); but $\bar{C}$ on vigorous boilg. splits off aq. and isomerizes (or vice versa) yielding (5) chloromaleic anhydride (3:0280). — $\bar{C}$ with P_2O_5 (6) (15), or with $POCl_3$ (16) or with AcCl (5), gives on distn. chloromaleic anhydride (3:0280). — $\bar{C}$ (1 mole) with chlorofumaryl (di)chloride (3:6105) (1 mole) at 125° for 1 hr. also yields (17) chloromaleic anhydride (3:0280).

[$\bar{C}$ (as $K_2\bar{A}$) in aq. soln. with Na/Hg is dehalogenated and reduced yielding (18) succinic acid *(1:0530).*]

$\bar{C}$ readily reduces aq. $KMnO_4$.

[$\bar{C}$ in aq. soln. on protracted treatment with Cl_2 gives (19) β,β,β-trichloro-α,α-dihydroxypropionic acid ("trichloropyruvic acid hydrate") [Beil. III-623, III_1-(408)], ndls. from $CHCl_3$, m.p. 102° (19). — $\bar{C}$ does *not* (5) add Br_2 even at 100° (dif. from chloromaleic acid (3:3432)).]

$\bar{C}$ behaves normally as a dibasic acid: e.g., titration with standard dil. aq. alk. gives Neut. Eq. 75.3; for study of electrometric titration see (2).

[Salts. $(NH_4)_2\bar{A}$, cas. sol. aq. (5), but spar. sol. MeOH, EtOH, and insol. in ether, acetone, AcOEt, $CHCl_3$, or C_6H_6 (20) see indic. refs. — $KH\bar{A}$, much less sol. than corresp. prod. from chloromaleic acid, e.g., 100 g. of its satd. soln. at 15° conts. 3.843 g. $KH\bar{A}$ (5). — $Ag_2\bar{A}$ (10) (12). — $Ba\bar{A}.3H_2O$, fairly sol. aq. (10). — $Pb\bar{A}.2H_2O$ (13).]

[$\bar{C}$ on stdg. at ord. temp. with slight excess 0.76 N aq. KOH gives chlorine ion about 40 times as fast (12) as the isomeric chloromaleic acid (3:3432).]

The acid (di)chloride corresp. to $\bar{C}$, viz., chlorofumaryl (di)chloride (3:6105), has been reported only by indirect means.

—— Dimethyl chlorofumarate: oil (see 3:6582).

—— Diethyl chlorofumarate: oil (see 3:6864).

Ⓓ *bis*-(*p*-Nitrobenzyl) chlorofumarate: m.p. 138.5° (21). [From $Na_2\bar{A}$ with *p*-nitrobenzyl bromide in 63% alc. refluxed 2 hrs. (21).]

—— Chloromaleanil [*N*-phenyl-chloromaleinimide]: ndls. from boilg. alc., m.p. 170° (17). [From aniline salt of $\bar{C}$ on htg. for a few minutes at 170°–180°; note that during the process isomerization occurs and therefore that the prod. is the same as similarly obtd. from chloromaleic acid (3:3432) q.v.]

Ⓓ Chlorofumaro-*bis*-(*p*-chloroanilide): pale yel. ndls. from alc., m.p. 223° (17). [From chlorofumaryl (di)chloride (3:6105) with *p*-chloroaniline (4 moles) in dry ether; note that crude prod. is also accompanied by a little *N*-(*p*-chlorophenyl)-chloromaleinimide, m.p. 175° (17).]

Ⓓ Chlorofumaro-*bis*-(*p*-bromoanilide): faintly yel. ndls. from boilg. alc., m.p. 236° (17). [From chlorofumaryl (di)chloride (3:6105) with *p*-bromoaniline (4 moles) in dry ether; note that crude prod. is also accompanied by a little *N*-(*p*-bromophenyl)-chloromaleinimide, m.p. 190° (17).]

Colorless ndls. from alc., AcOH, C_6H_6, toluene, or lgr. — Spar. sol. hot alc., eas. sol. hot toluene. — Sublimes.

PREPARATION OF $\bar{C}$

From Binuclear Initial Materials

From stilbene (*trans*-1,2-diphenylethylene). [For prepn. of $\bar{C}$ from 1,2-diphenylethylene (stilbene) (1:7250) with Cl_2 in $CHCl_3$ (8) (16), with Cl_2 in ether in sunlight (17) (some "β"-stilbene dichloride (3:2570) is also formed), with Cl_2 in ethane soln. (note low temp.) *in sunlight (gives 34 4% yield* $\bar{C}$ + *48.7% yield diastereomer (3:2570)* (15)) see indic. refs.; with PCl_5 (2 moles) in $CHCl_3$ soln. (6) or with PCl_5 in $POCl_3$ in s.t. at 170° (2) see indic. refs.; with SO_2Cl_2 in presence of peroxides at room temp. (yield of crude mixt. is 100%; sepn. of isomers gives 45% $\bar{C}$ + 33% diastereomer (3:2570) (7)), with nitryl chloride ($ClNO_2$) in ether (57% yield (18)), see indic. refs.]

From isostilbene (*cis*-1,2-diphenylethylene). [For prepn. of $\bar{C}$ from isostilbene with PCl_5 in C_6H_6 stood 2 days at room temp. see (6).]

From bibenzyl. [For formn. of $\bar{C}$ from bibenzyl (1:7149) with chromyl chloride (CrO_2Cl_2) in CS_2 (other prods. are also formed) see (19).]

From α,α'-dibromobibenzyl (stilbene dibromide). [For formn. of $\bar{C}$ from the higher-melting *diastereomer* (*m* p. 236°) of stilbene dibromide [Beil. V-602, V_1-(282), V_2-(508)] with $SnCl_4$ in C_6H_6 on refluxing ½ hr. (5) (note that at ord. temp. replacement is only

partial and yields (5) only stilbene chlorobromide, m.p. 225°) or with $HgCl_2$ in acetone/$CHCl_3$ refluxed 11 hrs. (poor yield (11)) see indic. refs.]

From α,α'-dihydroxybibenzyl .

From meso-hydrobenzoin. [For prepn. of $\bar{C}$ from *meso*-hydrobenzoin [Beil. VI-1003, VI_1-(490)] with PCl_5 (2 moles) (20) cf. (15) (yield 43% $\bar{C}$ + 22% diastereomer (3:2570) (8) (16)), with PCl_3 (8) (16), or with $SOCl_2$ in C_6H_6 + pyridine (100% yield (10)) (13) see indic. refs.]

From d,l-hydrobenzoin (isohydrobenzoin). [For prepn. of $\bar{C}$ from isohydrobenzoin [Beil. VI-1004, VI_1-(490)] with PCl_5 (27–32% $\bar{C}$ + much resin (8)) (16) (20) or with PCl_3 (8) (16) see indic. refs.; note, also, that *l*-isohydrobenzoin with PCl_5 in $CHCl_3$ refluxed 2 hrs. gives (45% yield (1)) $\bar{C}$.]

From α-chloro-α'-hydroxybibenzyl. [For formn. of $\bar{C}$ from α-chloro-α'-hydroxybibenzyl (m.p. 77°, corresp. *p*-nitrobenzoate, m.p. 103–104° (3)) with $SOCl_2$ in $CHCl_3$ see (3); note that by this method $\bar{C}$ is formed exclusively.]

From α-amino-α'-hydroxybibenzyl. [For prepn. of $\bar{C}$ from *d,l*-α-amino-α'-hydroxybibenzyl with PCl_5 (42% yield (21)) or with NOCl (1) see indic. refs.; note also that *d*-α-amino-α'-hydroxybibenzyl in HCl with NOCl gives (1) 13% $\bar{C}$ + 24% of *l*-"β"-stilbene dichloride (3:2570) while *l*-α-amino-α'-hydroxybibenzyl in HCl with NOCl gives (1) 14% $\bar{C}$ + 17% *d*-"β"-stilbene dichloride (3:2570).]

From Mononuclear Initial Materials

From benzal (di)chloride. [For formn. of $\bar{C}$ from benzal (di)chloride (3:6327) by bimolecular reduction with H_2 + Pd in alc. soln. (22), or with H_2 + hydrazine hydrate in MeOH/KOH (20% yield (12)), or with excess conc. (2 molar) MeMgI in ether refluxed 2 hrs. (22% yield (14)), or with excess C_6H_5MgBr similarly (14), or by action of Ni on htg. in CO_2 (23), see indic. refs.]

From benzotrichloride. [For formn. of $\bar{C}$ from benzotrichloride (3:6540) by actn. of Ni on htg. in atm. of CO_2 see (23).]

From Miscellaneous Initial Materials

[For formn. of $\bar{C}$ from diphenylacetaldehyde [Beil. VII-438, VII_1-(234)] with PCl_5 in C_6H_6 under reflux 2 hrs. (41% yield) see (3).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Action of heat. $\bar{C}$ on repeated htg. above its m.p. is partially isomerized to its diastereoisomer (3:2570) as a result of which the m.p. of the sample gradually falls to about 160° but not lower (8) (16).

Reduction. $\bar{C}$ with Zn dust + AcOH gives good yields (24) of *trans*-1,2-diphenylethylene (stilbene) (1:7250), m.p. 124°.

Hydrolysis. [No study of the direct hydrolysis of $\bar{C}$ appears to be recorded. — However, $\bar{C}$ with AgOAc in boilg. AcOH gives an ester which upon hydrolysis gives (60% yield (8) (16)) almost exclusively *d,l*-hydrobenzoin (isohydrobenzoin), accompanied by a little

hydrobenzoin; with AgOBz, however, much more of the latter results; however, see also below.]

Other reactions. C̄ with alc. KOH on warming under reflux (20) or in an autoclave at 180° (2) splits out 2 HCl yielding diphenylacetylene (tolane) [Beil. V-656, V_1-(319), V_2-(568)], m p 60°. — C̄ with pyridine in s.t. at 200° for 8 hrs. does *not* (17) split out HCl (dif. from the "β" stereoisomer (3·2570) q v.)

[C̄ with LiI in alc. refluxed 2 hrs. is little affected but in s.t. at 200° for 3 hrs. gives (11) (presumably via halogen interchange and subsequent loss of I_2) a little *trans*-1,2-diphenylethylene (stilbene) (1:7250). — C̄ with NaI in alc. is unchanged even at 150° in s.t.; using AcOH as solvent, however, in s t. at 210° stilbene (1:7250) is formed (11). — C̄ does not (11) react with alc. NaBr.]

[C̄ with AgOAc (2 moles + 25% excess) in AcOH at 100° for 9 hrs. gives (25) mixts. of hydrobenzoin diacetate, m.p. 133–134°, and isohydrobenzoin diacetate, m.p. 114–116° (for m.p./compn. diagram of this pair see (25) (26)).]

	186°	(12)

Golden yellow ndls. from AcOH (contg. a little CrO_3 (2)) or from alc. — Sublimes (use in purification (12)). — Insol. aq. (1 in 10,000,000 (13)), spar. sol. cold alc AcOH, CCl_4, ethyleneglycol ethyl ether, gasoline, cottonseed oil, castor oil, "Nujol" (13); quite sol. (4% (13)) in xylene or *o*-dichlorobenzene (3:6055); fairly sol. in ether, C_6H_6, acetone, or dioxane (13).

[For use of $\bar{C}$ as agricultural and textile fungicide see impt. review article (13) cf. (37).]

[For prepn. of $\bar{C}$ from naphthoquinone-1,4 (1:9040) in AcOH with Cl_2 in pres. of I_2 (yields: 90% (14), 80% (8)), from 2-chloronaphthoquinone-1,4 [Beil. VII-729] in AcOH with Cl_2 (15) (16), from naphthoquinone-1,4-*N*-chloromonimide [Beil. VII-726] in AcOH with 8–10 pts. conc. HCl on warming (70% yield (11)) see indic. refs.; from naphthol-1 (1:1500) with HCl + $KClO_3$ (6) or after preliminary sulfonation to naphthol-1-sulfonic acid-4 (Neville-Winther acid) followed by HCl + $KClO_3$ (yields: 83% crude (4), 47% (2), 40–47% (12)) (17) (18), from 4-nitrosonaphthol-1 (naphthoquinone-1,4-monoxime) [Beil. VII-727, VII_1-(386)] in ether with HCl gas (3), from 4-aminonaphthol-1 in AcOH with Cl_2 (17), from 2,3-dichloronaphthol-1 (3:2935) in AcOH with CrO_3 (19), or from 2,4-dinitrophenol (Martius Yellow) [Beil. VI-617, VI_1-(308)] with HCl + $KClO_3$ (24% yield (2)) (10) see indic. refs.]

[For formn. of $\bar{C}$ from 1,4-dihydroxynaphthalene-3-pyridinium chloride (itself from naphthoquinone-1,4 (1:9040) + pyridine in MeOH + HCl) with $SOCl_2$ under reflux see (7); from naphthalene (1:7200) in AcOH with CrO_2Cl_2 see (20); from 1,2,3,4-tetrachloronaphthalene [Beil. V-546, V_2-(446)] in AcOH with CrO_3 or with conc. HNO_3 in s.t. at 110° see (9); from naphthalene tetrachloride-1,2,3,4 (3:4750) with conc. HNO_3 see (1): from 2,2,3,4,4,-pentachloro-1-oxo-naphthalene tetrahydride [Beil. VII-370] with dil. alc. or dil. AcOH in s.t. at 120–130° see (15).]

[$\bar{C}$ on reduction by shaking ether soln. with aq. $SnCl_2$ (21), or with Sn + HCl (part of halogen is lost (10)), or by refluxing with HI + white P (10) gives 2,3-dichloro-1,4-dihydroxynaphthalene [Beil. VI-979], colorless scales from alc., m.p. 135° (21), 135–140° (10); note that $\bar{C}$ is reduced by SO_2 + aq. only in s.t. at 130–140° (10). — Note that $\bar{C}$ with aq. K_2SO_3 or aq. $KHSO_3$ soln. replaces both chlorine atoms giving (10) K salt of 4-hydroxy-2,3-disulfonaphthyl-1 sulfuric acid [Beil. XI-304].]

$\bar{C}$ on oxidn. with boilg. HNO_3 (D = 1.35) slowly yields (10) phthalic acid (1:0820).— $\bar{C}$ with aqua regia htd. in s.t. yields (22) phthalic (or nitrophthalic) acid accompanied by some trichloronaphthoquinone-1,4 [*Beil. VII-730*], *yel. ndls.*, m.p. 250°.

$\bar{C}$ with equal wt MnO_2 + 4 8 wts conc. HCl in s.t. at 230° for 10 hrs. (11) cf. (17) yields 2,2,3,3-tetrachloro-1,4-dioxonaphthalene tetrahydride-1,2,3,4 [Beil. VII-702], colorless pr. from ether, m.p 117° (11).

$\bar{C}$ with PCl_5 (2 moles) dislvd. in $POCl_3$ htd. in s.t. at 180–200° (10), or at 200–250° for 4–5 *hrs* (22) (*with slow rise of temp. to avoid explosion*), *yields* 1,2,3,4,5-pentachloronaphthalene [Beil. V-546], colorless ndls. from alc , m p 168 5° (10) (22).

[$\bar{C}$ with large excess MeMgI in ether gives (45% yield (23)) (by replacement of 1 atom of chlorine and usual reactn. of the two carbonyl groups) 1,2,4-trimethyl-1,4-dihydroxy-3-chloro-1,4-dihydronaphthalene, cryst. from ether by pptn with pet. ether, m.p. 115–117° (23); with certain other RMgX cpds , however, *both* chlorine atoms are replaced, e g., $\bar{C}$ with large excess C_6H_5MgBr in ether gives (34% yield (23)) 1,2,3,4-tetraphenyl-1,4-dihydroxy-1,4-dihydronaphthalene, cryst. from C_6H_6 + alc , m.p. 241.5° (23); with still other RMgX cpds. *neither halogen is affected and only the carbonyl groups react*; e g , $\bar{C}$ with large excess α-$C_{10}H_7MgBr$ in ether gives (75% yield (23)) 1,4-di-α-naphthyl-1,4-dihydroxy-2,3-dichloro-1,4-dihydronaphthalene, m.p. 261° dec. (23).]

[$\bar{C}$ with 2 pts. Cu powder htd. in nitrobenzene or at 240° as directed (24) gives 3% yield triphthaloylbenzene (1,2,3,4-diphthaloylanthraquinone). — $\bar{C}$ with HBr in nitrobenzene htd in pres. of $CuCl_2$ yields (25) 2-bromo-3-chloronaphthoquinone-1,4, m p. 206–207° (25)]

[$\bar{C}$ with 2,3-dimethylbutadiene-1,3 (1:8050) in pres. of excess 5% alc KOH and a little sodium hydrosulfite boiled 2 hrs. and then oxidized with air gives (26) 2,3-dimethylanthraquinone [Beil. VII-815, VII_1-(425)], *yel. ndls from alc., m.p. 205–206°.*]

$\bar{C}$ with boilg alc. KOH hydrolyzes 1 chlorine yielding on acidification (10) 3-chloro-2-hydroxynaphthoquinone-1,4 [Beil. VIII-304], yel ndls. from alc., m.p. 215°; note that $\bar{C}$ with NaOAc htd in alc. yields (27) the corresp acetate, viz., 3-chloro-2-acetoxynaphthoquinone-1,4, yel. ndls from hot alc., m.p. 98° (27). — [For reactn. of $\bar{C}$ with Na_2S or with H_2S leading to bimolecular condensation with formn. of dibenzothianthrene diquinone or its derivs. see (28) (8).]

$\bar{C}$ with phenol (2 moles) + dry K_2CO_3 (i.e , K phenolate) htd. for 1 hr. at 100° gives (96% *yield* (2)) *2,3-diphenoxynaphthoquinone-1,4, or.-yel. ndls. from xylene,* m.p. 205° (2) — [For reactn of $\bar{C}$ with pyrocatechol (1:1520) in pres. of diethylaniline (2), with pyrogallol (1 1555) in pres of pyridine (29), or with various anthrols and pyridine in *prepn. of vat dyes (30) see indic. refs*]

$\bar{C}$ in nitrobenzene treated with NH_3 gas or $\bar{C}$ in boilg. alc. treated dropwise with conc. NH_4OH (27) gives (probably by 1,4-addition and subsequent loss of 1 HCl (31)) (80% yield (2)) 3-chloro-2-aminonaphthoquinone-1,4, yel -br. ndls. from AcOH, m.p. 193° (2) (corresp acetyl deriv., m p. 219° (27)). — Similarly, $\bar{C}$ with aniline (2 moles) in hot alc. gives (87% *yield* (12)) (32) *3-chloro-2-anilinonaphthoquinone-1,4* [*Beil. XIV-168*, XIV_1-(434)], copper-red ndls , m p 202° (32). — [For corresp. reactn. of $\bar{C}$ with many other aliphatic or arom amines see (33), with β-naphthylamine see (34), with p-phenylenediamine (or its monoacetyl deriv) see (12); with p-chloroaniline see (27); note that some amines, e g , o-nitroaniline, 2-aminoanthraquinone, and 3-chloro-2-aminonaphthoquinone do *not* undergo this reactn. (27) — For reactn. of $\bar{C}$ with pyridine see (2).]

$\bar{C}$ on nitration, e g , with 4 vol/pts red fumg HNO_3 (D = 1.52) + 2½ vol/pts. pure conc. H_2SO_4 at 100° for 6 hrs. (35) cf (36), gives (40–45% yield (35)) 5-nitro-2,3-dichloronaphthoquinone-1,4, pale yel. cryst. from $CHCl_3$ (35), AcOH (36), or alc. (36), m p. 175° (35) (36); this prod. with aniline (2 moles) in hot alc. yields (35) 3-chloro-2-anilino-5 (8)-nitronaphthoquinone-1,4, lfts. from nitrobenzene, m p. 273° (35).

B.P. **339°** (3)

[*See also* 3,6-*dichlorophthalic acid* (3:4870).]

Long colorless ndls. — Sublimes.

[For prepn. of C̄ from 3,6-dichlorophthalic acid (3:4870) by htg. at 130–140° (2) (3) (4), at 160° (8), at 180–190° (5), by distn. under diminished press. (9), or by htg. in a current of dry air at 40° (?) (10) see indic. refs.: from ethyl hydrogen 3,6-dichlorophthalate by htg. at 200–220° see (2) (5): for formn. of C̄ (together with other isomers) from phthalic anhydride (1:0725) with Cl_2 in pres. of Fe or Fe salts at 160–260° (11) or with Cl_2 in fumg H_2SO_4 (12) in pres. of I_2 (3), or from 3-chlorophthalic anhydride (3:3900) with Cl_2 in fumg. H_2SO_4 in pres. of I_2 (3), see indic. refs.]

[For sepn. of C̄ from isomeric dichlorophthalic anhydrides by means of salts of corresp. acids, etc., see (3) (13) (1); by means of differential hydrolysis with H_2SO_4 (prods. with no α-chlorine such as 4,5-dichlorophthalic anhydride require H_2SO_4 of 98–100% concn., those with 1 α-chlorine such as 3,4-dichlorophthalic anhydride hydrolyze with 56–95% H_2SO_4, those with 2 α-chlorine atoms such as C̄ or 3,4,5,6-tetrachlorophthalic anhydride hydrolyze at H_2SO_4 concns. of less than 50%) see (14).]

C̄ dislvd. in abs. EtOH yields the acid ester, viz., ethyl hydrogen 3,6-dichlorophthalate,

cryst. from CCl_4, m p 130–131° (3), 128–130° (2), 128–129° (5); note that this ester when dislvd. in EtOH and satd with HCl gas, then warmed, does *not* convert to the neutral ester readily, and that even with 15 pts. EtOH and 7 hr. htg. only 16% diethyl 3,6-dichlorophthalate is formed (2)

[C̄ with 1 mole PCl_5 htd in s t. at 160° for 6–7 hrs. (8) or at 200° for 6 hrs. (15) yields *pseudo*-3,6-dichlorophthaloyl dichloride (3,3,4,7-tetrachlorophthalide), cryst. from C_6H_6, m p. 122° (15), this prod upon htg above its m.p , or upon solution in inert solvents, or very rapidly upon treatment of such solns. with decolorizing carbon, or slowly even in solid condition, isomerizes to *sym*-3,6-dichlorophthaloyl dichloride, colorless pr., m.p. 31° (15), from low-boilg pet ether (in which the *pseudo*-chloride is spar. sol.). — With MeOH the *pseudo* chloride yields the *pseudo* dimethyl ester (4,7-dichloro-3,3-dimethoxyphthalide, m p 134° (15); the neutral dimethyl 3,6-dichlorophthalate (corresp to the *sym.*-chloride) has m p 82° (15)] — [C̄ with 2 moles PCl_5 htd in s t several hrs at 200° is claimed (8) to yield a prod $C_8H_2OCl_6$, ndls. from alc , m p 117° (8)]

[C̄ with 1 mole $NH_2OH\,HCl$ + Na_2CO_3 in aq. as directed (3) for 3,4-dichlorophthalic anhydride (3:4880) yields 3,6-dichlorophthalylhydroxylamine (*N*-hydroxy-3,6-dichlorophthalimide) [Beil. XXI-504], ndls from MeOH, m p. 253–258° (3); the conv. of this prod. with boilg aq Na_2CO_3 to 3,6-dichloroanthranilic acid (analogous to the corresp. process with its isomers) has not been reported (see, however, under the imide below).]

[C̄ with steam passed over cat. at 380–420° loses CO_2 presumably yielding (16) 2,5-dichlorobenzoic acid (3 4340).]

C̄ with $AlCl_3$ + C_6H_6 yields (8) (17) 3,6-dichloro-2-benzoylbenzoic acid [Beil. X-750, X_1-(357)], ndls from C_6H_6 (17) or dil alc (8), m.p. 168.5° (18), cor (17), 159° (8); this prod. on ring closure by htg. with conc H_2SO_4 (2) (17) (18) (19) yields 1,4-dichloroanthraquinone [Beil. VII_1-(411)], yel. ndls. from AcOH, m p. 187 5–188° (20), 187 5° cor. (17), 187.5° (18), 186° (19). — [For corresp. reactns of C̄ + $AlCl_3$ with chlorobenzene (22), with toluene (21), with *o*-chlorotoluene (3:8245) (23), with *p*-chlorotoluene (3:8287) (24), with fluorene (25), with acenaphthene (26), with pyrene (27), or with β-methylbenzanthrone (28) see indic refs.]

[C̄ with hydroquinone (1:1590) + H_3BO_3 htd. at 190° and afterward treated with hot conc. H_2SO_4 (29), or htd. with $AlCl_3$ + NaCl at 200–220° for 20 min (30), gives (yield: 30% (29), 84% (30)) 5,8-dichloro-1,4-dihydroxyanthraquinone (5,8-dichloroquinizarin) [Beil $VIII_1$-(715)], cryst from xylene (30) or AcOH (29), m p 275 5° (30), 266° (29) (diacetate, m p 180° (30), 170° (29))] — [For reactn of C̄ with $AlCl_3$ + *o*-cresol (31), with *o*-cresol methyl ether (31) (19), or with *p*-cresol (7) see indic refs.; for reactn. of C̄ with α-naphthol + H_3BO_3 see (9)]

[C̄ in fumg H_2SO_4 treated with Br_2 yields (33) (34) 3,6-dichloro-4,5-dibromophthalic anhydride, colorless ndls. from AcOH, m p 269–270° (34), 261° (33). — C̄ in fumg H_2SO_4 (50% SO_3) htd with I_2 as directed (32) gives (97% yield) 3,6-dichloro-4,5-di-iodophthalic anhydride, yel pr from AcOH, m p. 258°–258 5° cor. (32)]

[For condens of C̄ with substituted *m*-aminophenols in prepn. of phthalein dyestuffs see (35); for use of C̄ in prepn. of pigments of phthalocyanine type see (36) (37); for use of C̄ as plasticizer for cellulose esters see (38).]

Fused C̄ treated with dry NH_3 gas (39) or with urea (37) yields 3,6-dichlorophthalimide [Beil. XXI-504], ndls from alc., m p 242° (39) [This prod on ring opening and Hofmann degradation with aq alk NaOCl (3) or NaOBr (39) gives 3,6-dichloroanthranilic acid [Beil. XIV-367], ndls from aq or AcOH, m p 153° cf. (3). — [For behavior of C̄ with hydrazine hydrate yielding acc. to conditions *N*-amino-3,6-dichlorophthalimide, *N*-(3,6-dichlorophthalimido)-3,6-dichlorophthalimide, or 3,6-dichlorocyclophthalhydrazide see (40)]

$\bar{C}$ (1 pt.) dislvd. in 5 pts. boilg. AcOH and treated with 1 pt. aniline gives on cooling (82% yield (1)) 3,6-dichlorophthalanil [Beil. XXI_1-(391)], pale yel. lfts., or ndls. from AcOH, m.p. 201° (10), 197–198° cor. (1), 194° (41), 191° (39). [Note, however, that on protracted htg. with excess aniline first one and then the other nuclear halogen also reacts yielding, respectively, 3-anilino-6-chlorophthalanil, unstable form, m p. 141° cor. (1), stable form., m.p. 160–160.5° cor. (1), and 3,6-dianilinophthalanil, m.p. 197° (41).]

$\bar{C}$ on saponification with standard alk. (Sap. Eq. = 108 5), followed by acidification, yields 3,6-dichlorophthalic acid (3:4870) q.v.

3:4870 3,6-DICHLOROPHTHALIC ACID  $C_8H_4O_4Cl_2$ **Beil. IX-817** **IX_1—**

M.P. See text.

[*See also 3,6-dichlorophthalic anhydride* (3:4860).]

Tbls. from aq.; eas. sol. hot aq. in which it readily gives supersatd. solns.; eas. sol. alc., ether.

$\bar{C}$ on htg. begins to lose aq. even at 100° with formn. of 3,6-dichlorophthalic anhydride (3:4860) cf. (1); this change proceeds with increasing speed as the temperature increases; for this reason no definite m.p. of $\bar{C}$ is recorded and the m.p. observed is actually that of the anhydride.

[For prepn. of $\bar{C}$ from 3,6-dichlorophthalic anhydride by hydrolysis see the anhydride

(3:4860); from ethyl hydrogen 3,6-dichlorophthalate by htg. at 200° to convert to the anhydride and hydrolysis of the latter see (1); from 1,4-dichloronaphthalene (3:1655) by boilg. with HNO_3 (D = 1.3) see (2); from 1,4,5-trichloronaphthalene (3:4005) by htg. with HNO_3 in s.t. see (3); from "α-tetrachloronaphthalene" [Beil. V-546] by oxidn with HNO_3 see (4); from 1,4-dichloronaphthalene tetrachloride (1,2,3,4,5,8-hexachlorotetralin) [Beil. V-493] by boilg. with conc. HNO_3 (D = 1.42) see (5) (6); from 5,8-dichloronaphthylamine-2 [Beil. XII-1310] on oxidn. with dil. HNO_3 in s t. at 180–200° see (7).]

[For sepn of $\bar{C}$ from mixts. with the isomeric 3,4- (3:4880) and 4,5- (3:4890) dichlorophthalic acids see (8) (9).] [For use of $\bar{C}$ as softener and/or plasticizer for cellulose derivs. see (10).]

Salts. $NH_4H\bar{A}$, $NaH\bar{A}$, $KH\bar{A}$, as well as $(NH_4)_2\bar{A}$, $Na_2\bar{A}$, and $K_2\bar{A}$, are all eas. sol. aq. (8); $Ag_2\bar{A}$, insol. aq. (8) (12); $Ca\bar{A}$, $4H_2O$ (5) (12), spar. sol. aq. and pptd. by $CaCl_2$ from hot dil. aq. solns. of $(NH_4)_2\bar{A}$ (8) (12); $Ba\bar{A}$, H_2O, spar. sol. aq. (5) (12); $Zn\bar{A}$, eas. sol. aq. (characteristic dif. from 3,4- and 4,5-dichlorophthalic acids and used in sepn. of $\bar{C}$ (8)).

Esters. Dimethyl 3,6-dichlorophthalate, m p 82° (11) (from $Ag_2\bar{A}$ with MeI (11)); methyl hydrogen 3,6-dichlorophthalate, unreported; diethyl 3,6-dichlorophthalate, cryst. from 50% alc., m p 60° (12) (13) (from $Ag_2\bar{A}$ on htg. with EtI in s.t. at 100° (12) (13), or in very small yield from ethyl hydrogen 3,6-dichlorophthalate with EtOH (1) (14)); ethyl hydrogen 3,6-dichlorophthalate, cryst. from CCl_4, m p. 130–131° (8), 128–130° (1), 128–129° (15) (from 3,6-dichlorophthalic anhydride (3:4860) with EtOH).

[For studies of ionization consts. of first (16) and second (16) (17) acid groups see indic. refs.]

194° (2)
193–194° (3)

[*See also tetrachlorobenzoquinone*-1,2 (3:3965).]

Colorless anhydrous cryst from hot dil. alc (1), lgr. (1) or C_6H_6 (2); $\bar{C}$ from dil. AcOH seps. as monohydrate which over $CaCl_2$ loses half of its water and above 70–80° all of its aq (3) (4); $\bar{C}$ from AcOH seps. as a cpd., $\bar{C}$.AcOH, m.p. 123–124° (4), which can be recrystd. unchanged from lgr. but in air or more rapidly over alk. loses its cryst. AcOH; the above cpd. on soln in alc and pptn. with much aq. yields a trihydrate, $\bar{C}.3H_2O$, m p. 94°, which can be recrystd unchanged from aq , alc., or acetone but which from C_6H_6 or lgr seps. $\bar{C}$ in anhydrous form (4)

[For prepn. of $\bar{C}$ from pyrocatechol (1:1520) with Cl_2 in AcOH (5) (2) (13) or with ICl

(3) see indic. refs.; from hexachlorocyclohexene-3-dione-1,2 [Beil. VII-575] by reductn. with $SnCl_2$ in AcOH see (1).]

$\bar{C}$ with std. alk. (using phenolphthalein) titrates sharply as a monohydric phenol (4) (6), i.e., Neut. Eq. 248; similarly titration of the cpd. $\bar{C}$.AcOH (above) gives Neut. Eq. 154 (4).

$\bar{C}$ on oxidn. with fumg. HNO_3 in AcOH gives (81% yield (13)) (1) (5) (7) (8) tetrachloro-*o*-benzoquinone-1,2 (3:3965). — For study of oxidn.-reductn. potential of system: $\bar{C}$ + tetrachlorobenzoquinone-1,2 see (7) (8). — $\bar{C}$ with equiv. tetrachlorobenzoquinone-1,2 (3:3965) in least possible hot $CHCl_3$ gives on cooling the corresp. quinhydrone (14). — [For other complex prods. obtd. from $\bar{C}$ by action of conc. HNO_3 or N_2O_4 (9), HNO_3 + H_2SO_4 (10), or $NaNO_2$ in AcOH (2) see indic. refs.]

Ⓓ Tetrachloropyrocatechol diacetate: ndls. from AcOH, m.p. 190° (1). [From $\bar{C}$ with Ac_2O (1).]

—— Tetrachloropyrocatechol monomethyl ether (tetrachloroguaiacol) [Beil. VI-784]: ndls. from hot aq., m.p. 185–186° (11). [Reported only by indirect means (11).]

—— Tetrachloropyrocatechol dimethyl ether (tetrachloroveratrole) [Beil. VI-784]: ndls. from alc., m.p. 88° (11) (12). [Reported only by indirect means (11) (12).]

3:4880 3,4-DICHLOROPHTHALIC ACID  $C_8H_4O_4Cl_2$ Beil. IX-817 IX_1—

M.P. abt. 195° rap. htg. (1)

[*See also* 3,4-*dichlorophthalic anhydride* (3:3695).]

Rectangular tbls. from aq.; eas sol. aq , ether — $\bar{C}$ can only with difficulty be separated from 4,5-dichlorophthalic acid (3:4890) by crystn. (1).

[For prepn. from 3,4-dichlorophthalic anhydride (3:3695) on boilg. with aq. see (1); from *N*-(hydroxy)-3,4-dichlorophthalimide (see under 3,4-dichlorophthalic anhydride) by hydrolysis with hot 10% HCl see (1).]

[For sepn. of $\bar{C}$ from mixts. with the isomeric 3,6- (3:4870) and 4,5- (3:4890) dichlorophthalic acids see (1) (2).]

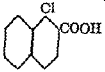
Salts. $NaH\bar{A}$, $Ag_2\bar{A}$, $Cu\bar{A}$, $Ca\bar{A}$, $Ba\bar{A}$, $Zn\bar{A}$ all spar. sol. aq. (1).

Esters. Methyl hydrogen 3,4-dichlorophthalate and dimethyl 3,4-dichlorophthalate *are both unreported: both possible ethyl hydrogen 3,4-dichlorophthalates* are known, viz., ethyl 2-carboxy-3,4-dichlorophthalate (from $\bar{C}$ + abs. EtOH + few drops conc. H_2SO_4 refluxed 6 hrs. (3)), ndls. from dil. alc., m p. 184° (3); and 3,4-dichloro-2-carbethoxybenzoic acid (from diethyl 3,4-dichlorophthalate by partial KOH saponification or from the anhydride with abs. EtOH (3)), pr. from dil. alc , m p. 164° (3): diethyl 3,4-dichlorophthalate (from $Ag_2\bar{A}$), m.p. 80° (3). [For the *pseudo* diethyl ester of $\bar{C}$ see under 3,4-dichlorophthalic anhydride (3:3695).]

$\bar{C}$ on protracted htg. at 220° loses aq yielding 3,4-dichlorophthalic anhydride (3:3695) q.v.

3:4880 (1) Villiger, *Ber.* 42, 3538–3539, 3541–3542 (1909). (2) Hodgson, *J. Soc Dyers Colourists* 49, 215 (1933). (3) Kirpal, Galuschka, Lassak, *Ber.* 68, 1333–1334 (1935).

3:4885 1-CHLORONAPHTHOIC ACID-2 $C_{11}H_7O_2Cl$ Beil. IX - 661
IX_1—



M.P. 196° (1) (2)
195° (3)

Ndls. from C_6H_6 (1) (2) or from 50% AcOH (3). — Volatile without decompn. (1).

[For prepn of $\bar{C}$ from 2-(1-chloronaphthyl)carbinol (2) by oxidn. see (2); from 1-chloro-2-(trichloromethyl)naphthalene [Beil. V-568] by hydrolysis in boilg AcOH contg a little aq see (1), from 1-chloro-2-naphthonitrile (see below) by hydrolysis with $AcOH/H_2SO_4$/aq. mixt. see (4), from methyl 1-chloro-2-naphthoate (see below) by hydrolysis with boilg. *15% alc KOH (46% yield) see (3).*]

$\bar{C}$ with 2% Na/Hg in aq. reduces (1) to β-naphthoic acid (1:0800), m p 184° (1).

[The direct conv. of $\bar{C}$ to 1-chloro-2-naphthoyl chloride is not actually reported; however, this acid chloride, m p 59–60 5° (6), b p 226° at 150 mm. (6), b.p. 199–200° at 11.2 mm (5), has been obtained (5) (3) (6) from 1-hydroxy-2-naphthoic acid [Beil. X-331, X_1-(145)] with PCl_5 (*yield 60 7% (5)*) (2).]

Salts. $Ag\bar{A}$, white flocks spar sol aq., $Ca\bar{A}_2.2H_2O$, cryst from aq. (1).

—— Methyl 1-chloro-2-naphthoate: ndls. from alc, m.p. 50° (2), cryst from pet. eth. + acetone, m p 44–48° (5), b.p 189–193° at 17 5 mm (3), 186 5–189° (but press. not given) (5). [From $\bar{C}$ in MeOH with HCl gas (2) *or from the acid chloride (above)* in boilg MeOH (5) (3).] [This ester with Cu bronze + a trace of I_2 at 290° yields (5) dimethyl 1,1′-binaphthyl-2,2′-dicarboxylate.]

—— Ethyl 1-chloro-2-naphthoate: unreported.

—— 1-Chloro-2-naphthonitrile: colorless ndls. from MeOH but m.p not stated (4), *b.p. 183–184° at 11 mm (4). [From 1-chloro-2-naphthylamine [Beil XII-1308,* XII_1-(542)] by diazotization and reactn. with $KCu(CN)_2$ (4).]

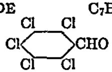
3:4892 PENTACHLOROBENZALDEHYDE C_7HOCl_5 Beil. VII — VII_1-(134)



M.P. 202.5° (1) (2)
197–199° (3)

Colorless ndls. from C_6H_6/alc.; eas. sol. hot C_6H_6 or CS_2; spar. sol. alc., ether, lgr.

[For prepn. of $\bar{C}$ from pentachlorobenzal (di)chloride (3:3590) by hydrolysis with conc. H_2SO_4 at 60–100° or fumg. H_2SO_4 at 40–50° (90% yield (2)) (3) see indic. refs.; from pentachlorobenzaldehyde diethylacetal (see below) by acid hydrolysis see (1).]

$\bar{C}$ with aq. alk. $KMnO_4$ refluxed 7 hrs. oxidizes to (90% yield (1)) pentachlorobenzoic acid (3:4910).

$\bar{C}$ in C_6H_6 shaken with satd. aq. $NaHSO_3$ soln. gives (1) the corresp. $NaHSO_3$ cpd.

$\bar{C}$ with aq. 50% KOH at 100° for 5 hrs. suffers hydrolytic cleavage giving (88% yield (2)) pentachlorobenzene (3:2290) and potassium formate.

$\bar{C}$ with EtOH + dry HCl gas gives (60% yield (1)) pentachlorobenzaldehyde diethylacetal, colorless cryst. from pet. ether, m.p. 45°.

[For use of $\bar{C}$ on prepn. of dyes of the triphenylmethane series see (4).]

$\bar{C}$ reacts normally with RMgX reagents [e.g., $\bar{C}$ with MeMgBr gives (49% yield (1)) methyl-pentachlorophenyl-carbinol, colorless cryst. from alc., m.p. 126° (1); $\bar{C}$ with C_6H_5-MgBr gives (1) phenyl-pentachlorophenyl-carbinol (pentachlorobenzohydrol), cryst. from C_6H_6, m.p. 117°.]

$\bar{C}$ with anhydrous NaOAc + Ac_2O (Perkin synthesis) at 170–180° for 60 hrs. gives (30% yield (1)) 2,3,4,5,6-pentachlorocinnamic acid, cryst. from C_6H_6, m.p. 233° cor. (1).

C̃ with aniline at 100° condenses giving (1) pentachlorobenzaldehyde anil, greenish ndls. from C_6H_6/alc., m.p. 187.5° cor. (1).

Ⓓ Pentachlorobenzaldoxime: colorless ndls. from C_6H_6, m.p. 201° cor. (1). [From C̃ with $NH_2OH \cdot HCl$ + Na_2CO_3 in dil alc. on stdg. few days (1).]

Ⓓ Pentachlorobenzaldehyde phenylhydrazone: citron-yel. ndls. from alc., m.p. 152.5° cor. (1) [From C̃ in hot satd C_6H_6 soln with 1 mole phenylhydrazine (1).]

—— Pentachlorobenzaldehyde *p*-nitrophenylhydrazone: unreported.

—— Pentachlorobenzaldehyde 2,4-dinitrophenylhydrazone: unreported.

—— Pentachlorobenzaldehyde semicarbazone: unreported.

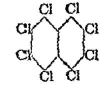
3:4893 OCTACHLORONAPHTHALENE (Perchloronaphthalene)



$C_{10}Cl_8$ Beil. V - 547, V_1—, V_2-(446)

M.P.		B.P.	
203° (1) u.c.	(8)	440–442° at 754 mm., dec.	(2)
202° u.c.	(7)	258–260° at 2.5 mm.	(2)
200°	(6)	246–250° at 0.5 mm.	(2)
197.5–198° cor.	(2)		
197.3–198° cor.	(3)		

Ndls. from CCl_4 + C_6H_6 (2); fairly eas. sol. C_6H_6, lgr., $CHCl_3$; spar. sol. alc. or AcOH.

[For prepn. of C̃ from naphthalene (1:7200) with Cl_2 in pres. of 1% Fe powder + 0.1% I_2 first at 100° then at 150° for 10–12 hrs (90% yield (2)) or with Cl_2 in pres. of $SbCl_5$ (1) (4) cf (2) see indic refs. (for extensive study of merits of many catalysts see (5)).]

[For prepn. of C̃ from mixt. of 2-hydroxynaphthalene-1,5-*bis*-(sulfonyl chloride) and 2-hydroxynaphthalene-1,6-*bis*-(sulfonyl chloride) (from β-naphthol with $ClSO_3H$) with PCl_5 in s.t. see (6), from 1-hydroxynaphthalene-*tris*-(sulfonyl chloride) with PCl_5 in s.t. at 250° see (7); from 1-amino-3,6,8-*tris*-(sulfonyl chloride) with 3–4 pts. PCl_5 in s.t. at 200–225° for 7 hrs. (40% yield) see (2).]

[For prepn. of C̃ from 2,5,6,7,8-pentachloronaphthoquinone-1,4 (Beil. VII-731) with PCl_5 in s.t. at 250° for 6 hrs. see (8); from hexachloronaphthoquinone-1,4 (see below) with PCl_5 see (3).]

[For study of action of C̃ (from insulation material on electric wiring) in production of acne see (9); for prepn. of aq. dispersions of C̃ see (10); for use of C̃ as insecticide see (11); for use of C̃ in prepn. of a red mordant dyestuff (by actn. of fumg. H_2SO_4) see (12).]

[C̃ with H_2 passed through a red-hot tube (4) or C̃ with Na + EtOH (2) gives naphthalene (1:7200) together with other prods.]

C̃ on oxidn. with 10 pts. fumg. HNO_3 (D = 1.52) in s.t. at 90° gives in good yield (2) (3) hexachloronaphthoquinone-1,4, m.p. 222.5° cor., b.p. 412–415° at 758 mm. dec., 265–267° at 14 mm., accompanied by some tetrachlorophthalic acid (3:4946).

[C̃ on htg. with $SbCl_5$ + ICl in s.t. at 350° (1) breaks down yielding (2) cf. (1) carbon tetrachloride (3:5100), hexachloroethane (3:4835), hexachlorobenzene (3:4939), and other prods.; under certain conditions (not specified in abstracts) C̃ can be broken down to decachloroindane (perchlorohydrindene) [Beil. V-487], m.p. 138° cor. (2).]

[$\bar{C}$ with pyridine + CuO + hydrazine hydrate yields (13) a hexachloronaphthalene ndls. from chlorobenzene, m p. 202–204° (13) (note that m.p. is close to that of $\bar{C}$).]

$\bar{C}$ is stable toward 3% aq. KOH or NaOH for 12 hrs. in cold or even 2 hrs. boilg.; $\bar{C}$ is stable to cold 3% alc. KOH or NaOH for 24 hrs., but on htg. for 2 hrs. splits off some 25–30% chlorine and in part resinifies (2).

Ⓟ *Color test with $SbCl_5$ in CCl_4: $\bar{C}$ with $SbCl_5$ in CCl_4 gives stable cherry-red color* (2). [This response is not given by carbon tetrachloride (3:5100), hexachloroethane (3:4835), hexachlorobenzene (3:4939), or decachloroindane (2).]

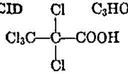
3:4895 PENTACHLOROPROPIONIC ACID



$C_3HO_2Cl_5$ Beil. II — II_1-(112) II_2-(228)

M.P. 200–215° (see text (1)).

Colorless cryst. from CCl_4. — Eas sol cold aq.

[For prepn. of $\bar{C}$ from trichloroacrylic acid (3:1840) with Cl_2 in CCl_4 soln. in sunlight (yield not reported) see (1)]

$\bar{C}$ in aq. soln. behaves as a strong acid; on titration it gives a good Neut. Eq., calcd. 246.5; found 245.8 (1).

$\bar{C}$ is very unstable: e.g., $\bar{C}$ in aq. soln. on warming dec. (1) (with loss of HCl and CO_2) into tetrachloroethylene (3:5460); presumably this same decompn. occurs on process of taking its m.p., and the value given above refers to rapid htg. on Hg bath.

Salts. The salts of $\bar{C}$ can be obtd. by neutralization with metal hydroxide of a cold satd. aq soln. of $\bar{C}$ followed by evapn. to dryness at low temp.; aq. solns. of the salts are also unstable and rapidly decompose yielding metal chloride + CO_2 + tetrachloroethylene (3:5460) (1). [For studies of influence of light on decompn. of these salts see (2) (3) cf. (4).]

[For study of behavior of $\bar{C}$ with H_2 + colloidal Pd see (5).]

Acid chloride. Pentachloropropionyl chloride (3:0470) has been obtd. indirectly, i.e , from trichloroacryloyl chloride with Cl_2 in sunlight (6); colorless cryst., m.p 42°.

Long colorless ndls. from dil. alc.; spar. sol. hot aq ; eas. sol. cold alc.

[For prepn. of C̄ from 2-chloro-4-isopropyl-methylbenzene (2-chloro-p-cymene) (3:8775) by oxidn. with dil. HNO_3 (7) of D = 1 24 for 8–14 days (2) or htd. 6 hrs. with 5 pts. HNO_3 (D = 1.39) + 5 pts. aq. (4) see indic. refs ; from 3-chloro-1,4-dimethylbenzene (2-chloro-p-xylene) (3.8600) by oxidn with nitrosulfonic acid + fumg. HNO_3 see (1) (5); from 3-chloro-4-methylacetophenone (8) by oxidn. with alk. $KMnO_4$ see (8); from 3-chloro-4-methylbenzaldehyde (5) with 50% KOH (Cannizzaro reactn.) see (5); from 3-chloro-4-methylbenzonitrile, m.p. 48–48.5° u c. (3), 45–46° (6), by protracted boilg with aq. KOH see (3), from 3-chloro-4-methylbenzamide (see below) on hydrolysis with 25% aq. NaOH see (6).]

Salts. *KĀ.1½H₂O*, eas sol. aq. (9); $Ca\bar{A}_2.3H_2O$, $Ba\bar{A}_2.4H_2O$ (7).

C̄ on fusion with KOH yields (7) (2) 3-hydroxy-4-methylbenzoic acid [Beil. X-237].

[C̄ on mononitration (9) yields a mixt. of three mononitro derivs containing 60–70% *3-chloro-4-methyl-6-nitrobenzoic acid* [Beil IX-503], *ndls. from alc., m.p. 184–185°* (9), 20–30% 3-chloro-4-methyl-5-nitrobenzoic acid [Beil. IX-503], ndls. from aq., m.p. 159° u c. (9), and 5–10% 3-chloro-4-methyl-2-nitrobenzoic acid [Beil IX-503], lfts from aq., m.p. 211° (9).]

—— **Ethyl 3-chloro-4-methylbenzoate:** oil, b p. 129–130° at 9 mm., $D_4^{19.2}$ = 1.1658, $n_{He}^{19.2}$ = 1.52531 (10). [Note that for the b.p. 149–150° formerly reported (3) no pressure is given.]

—— **3-Chloro-4-methylbenzamide:** lfts. from aq., alc., or aq. alc., m p. 173–175° (6). [From partial hydrolysis of 3-chloro-4-methylbenzonitrile (above) with aq. alk. (3) (6), further hydrolysis yields (6) C̄.]

3:4910 PENTACHLOROBENZOIC ACID $C_7HO_2Cl_5$ Beil. IX - 347
IX_1-(142)

M.P. 208° cor. (1)
201° (2)
200° (3)
199–200° u.c. (4)
199.5° (5)

Ndls. or pr.; sublimes in vac. with slight decomposition (6). Very sol. toluene or alc. (5). — Best recrystd. from toluene + lt. pet. ether (5). — Can be recrystd. from C_6H_6 or dil. AcOH (6). — From alc. C̄ (despite its high m.p.) first separates as an oil (5).

[For prepn. of C̄ from pentachlorotoluene (3:4937) with conc. HNO_3 + Hg see (5); from pentachlorobenzaldehyde (3:4892) with $KMnO_4$ (90% yield) see (1); from *asym.*-tetrachlorophthalyl chloride + Cl_2 via conversion to and subsequent hydrolysis of pentachlorobenzoyl chloride (3:2295) see (3); from 2,3- (3:4650) or 3,4-dichlorobenzoic acid (3:4925) + MnO_2 + fumg. HCl at 180–200° see (4).]

Pentachlorobenzoyl chloride (3:2295), colorless lfts. from alc., m.p. 87° (3), has been prepd. indirectly (see above), but the reaction (if any) of either PCl_5 or $SOCl_2$ on C̄ has never been reported. Upon hydrolysis with alc. KOH the acid chloride yields C̄ (3).

—— Methyl pentachlorobenzoate: pr. from MeOH, m.p. 97° (3). [Prepared from pentachlorobenzoyl chloride + MeOH by 30 hrs. reflux. (3).]

—— Ethyl pentachlorobenzoate: unrecorded.

—— Pentachlorobenzamide: unrecorded.

—— Pentachlorobenzanilide: unrecorded.

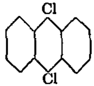
3:4916 9,10-DICHLOROANTHRACENE (*meso*-Dichloroanthracene)



$C_{14}H_8Cl_2$ Beil. V - 664 V_1-(324) V_2-(575)

M.P.	**210°**	(1)
	209–210°	(2) (3)
	209°	(4) (5) (6) (7) (8) (9) (10) (23)
	208–209°	(11) (12)

Yellow ndls. from CCl_4 or C_6H_6 or by sublimation; spar. sol. alc. or ether, eas. sol. C_6H_6.

[For prepn. of $\bar{C}$ from anthracene (1:7285) with Cl_2 in *o*-dichlorobenzene (5) (30) polychlorobenzenes of b.p. 140–170° (4), nitrobenzene (4) (5), or in acetylene tetrachloride (5) (yields: 93–94% (4), 87–88% (5)) see indic. refs. (note that numerous attempts to use this reactn. are given in earlier literature (3) (13) (14) (15) (16) (17) (18) (19) (20) but none is well adapted for pure $\bar{C}$ owing to simultaneous formn. of more highly chlorinated cpds.); from anthracene with SO_2Cl_2 in CCl_4 (7) (11) or in xylene (11) at ord. temp. (yields alm. quant. (7) (11)) see indic. refs. (note, however, that the results are sometimes influenced by the source of anthracene used (11)); for formn. of $\bar{C}$ from anthracene (1:7285) with Cl_2-aq. (21), with S_2Cl_2 (10), or with NOCl in s.t. at 150° or at room temp. in sunlight (22) see indic. refs.; for formn. of $\bar{C}$ from anthracene present in crude phenanthrene during *treatment of latter in* CS_2 *with* Cl_2 see (12).]

[For prepn. of $\bar{C}$ from anthrone (9-hydroxyanthracene) [Beil. VII-473, VII_1-(256)] with 2 wt. pts. PCl_5 in C_6H_6 or without solv. at 100° for 16 hrs. see (2); for formn. of $\bar{C}$ from 9,9,10,10-tetrachloro-9,10-dihydroanthracene (9,10-dichloroanthracene dichloride-9,10) [Beil. V-641, V_1-(309)] by actn. of Zn dust, Cu powder, or phenylhydrazine (3) or on boilg. with anthrone (above) in xylene (6) see indic. refs.; for formn. of $\bar{C}$ from 1,2,3,4-tetrachloro-9,10-dichloroanthracene by htg. with hydrazine hydrate + Cu powder in pyridine (23), or from 9-benzylanthracene with $SOCl_2$ in $CHCl_3$ (24), see indic. refs.; from α-[9,10-dichloroanthracene tetrabromide-1,2,3,4] (see below) by treatment with Zn dust in AcOH or with Cu powder in C_6H_6 see (3).]

[$\bar{C}$ with Cl_2 in *cold* $CHCl_3$ or acetylene tetrachloride gives (17) 9,9,10,10-tetrachloro-9,10-dihydroanthracene (see above); $\bar{C}$ with Cl_2 in C_6H_6 at 60° yields (17) 2,3,9,10-tetrachloro-2,3-dihydroanthracene; $\bar{C}$ in warm $CHCl_3$ or cold C_6H_6 gives (17) a mixt. of these prods.: the end prod. of chlorination of $\bar{C}$ in C_6H_6 at 20° appears (16) (3) to be 1,2,3,4,9,10-hexachloro-1,2,3,4-tetrahydroanthracene [Beil. V-611, V_1-(287)], m.p. 205–207° (3). — $\bar{C}$ with SO_2Cl_2 in nitrobenzene at *100°* yields (25) *2,9,10-trichloroanthracene.*]

$\bar{C}$ adds 2 moles Br_2 giving according to conditions one or the other of two isomeric addn. compds.; i.e., $\bar{C}$ moistened with $CHCl_3$ and treated with 2 Br_2 yields (3) (8) α-[9,10-dichloroanthracene-1,2,3,4-tetrabromide], colorless hexag. pr. from C_6H_6, m.p. 141–142° (3), while $\bar{C}$ with Br_2 vapor gives (3) β-[9,10-dichloroanthracene-1,2,3,4-tetrabromide], ndls. from C_6H_6 (less sol. than α-isomer), m.p. 178–179° (3), 178° (16) (8), 166° (15); both α- and β-isomers with alc. KOH lose 2 HBr (the α- more rapidly than the β-) yielding (3) (8) 2,3-dibromo-9,10-dichloroanthracene, yel. ndls., m.p. 255–256° (3), 251–252° (15) (16) (8).

[$\bar{C}$ in $CHCl_3$ treated with NO_2 gas gives (26) 9,10-dichloro-9,10-dinitro-9,10-dihydroanthracene (very unstable white cryst. on strong cooling) which in boilg. $CHCl_3$ yields anthraquinone (1:9095). — $\bar{C}$ with conc. HNO_3 ($D = 1.43$) in AcOH at 15–18° yields (27) 9,10-dichloro-9-hydroxy-10-nitro-9,10-dihydroanthracene [Beil. VII_1-(258)].]

[$\bar{C}$ with fumg. H_2SO_4 (20% SO_3) in nitrobenzene at 12–15° (4) (5) cf. (28) (30) or in benzenesulfonyl chloride below 50° (28), or $\bar{C}$ with $ClSO_3H$ in $CHCl_3$ or H_2SO_4 at 30° (29),

yields 9,10-dichloroanthracenesulfonic acid-2 [Beil. XI$_1$-(44)], cryst. with 2½ H_2O from alc., m.p. 158–159° (4), losing aq. in vac. at 140° to anhydrous acid, m.p. 212° cor. dec. (4) (corresp. sulfonyl chloride, m.p. 221–225° dec., corresp. sulfonamide, m.p. 279°, corresp. sulfonanilide, m.p. 247.8° cor. (4)).] — [For disulfonation of C̄ see (33).]

C̄ is unaffected (13) by boilg. alc. KOH. — [For behavior of C̄ with *pyridine* see (31). — For reactn of C̄ with NaSH in alc. yielding anthranol, anthrone, dianthrone, and other prods. see (32). — For use of C̄ in prepn. of sulfur dyes see (34).]

C̄ on oxidation yields (18) anthraquinone (1:9095).

C̄ like many other anthracene derivs. adds to suitable unsatd. linkages (35) (36) (37) in Diels-Alder fashion: e.g., C̄ with maleic anhydride (1:0625) in nitrobenzene, boiled for 15 min., gives on cooling (50% yield (35)) adduct, colorless pr. from xylene, m.p. 258–259°, from chlorobenzene, m.p. 253° (36); *in this adduct the halogen is stable toward boilg. alc.* KOH (38) (39), but the adduct with $AlCl_3$ in C_6H_6 refluxed 10 min. yields (35) *9,10-diphenylanthracene* [Beil. V-747, V$_1$-(377)], cryst. from toluene, m.p. 248° (35). — C̄ with β-chloropropionic acid (3:0460) (used as source of acrylic acid (1:1020) by loss of HCl) boiled for 8 hrs. in *o*-dichlorobenzene yields an adduct, cryst. from anisole, m.p. 245° (38); the halogen of this adduct is stable toward hydrolysis and is not removed by boilg. with 10% alc. KOH for 40 min. (38) — C̄ does *not* (38) form an adduct with cinnamic acid.

3:4920 3,4,5-TRICHLOROBENZOIC ACID $C_7H_3O_2Cl_3$ Beil. IX - 346
IX$_1$—

M.P. 210–210.5° (1)
203° (2)

Ndls. from aq. alc. — Sublimes in long ndls. — Somewhat volatile with steam. — Eas.

sol. cold alc., ether, acetone; mod. sol. C_6H_6, $CHCl_3$; spar. sol. CS_2, pet. eth.; alm. insol. cold aq.

[For prepn. of $\bar{C}$ from 3,4,5-trichlorobenzaldehyde (3:2440) by oxidn. with alk. $KMnO_4$ see (1); from 3,5-dinitro-4-aminobenzoic acid (chrysanisic acid) [Beil. XIV-445] with fumg. HCl at 200° see (2); for formn. (together with other products) from benzotrichloride (3:6540) + Cl_2 see (3).]

[For study of $Ag\bar{A}$, $Ca\bar{A}_2.6H_2O$, $Ba\bar{A}_2.4H_2O$ see (2).]

The direct nitration of $\bar{C}$ has not been recorded. [However, 3,4,5-trichloro-2-nitrobenzoic acid, ndls. from alc., m.p. 181–181.5° (1), and 3,4,5-trichloro-2,6-dinitrobenzoic acid, m.p. 219–221.5° (1), have both been prepared from the corresponding aldehydes.]

$\bar{C}$ with PCl_5 yields (2) 3,4,5-trichlorobenzoyl chloride, m.p. 36° (2).

—— Methyl 3,4,5-trichlorobenzoate: unrecorded.
—— Ethyl 3,4,5-trichlorobenzoate: from $\bar{C}$ + alc. + HCl (2), ndls., m.p. 86° (2).
Ⓓ 3,4,5-Trichlorobenzamide: from 3,4,5-trichlorobenzoyl chloride + conc. aq. NH_4OH at 100° (2); ndls. from C_6H_6, m.p. 176° (2).
—— 3,4,5-Trichlorobenzanilide: unrecorded.

[*See also* 1-*chloroanthraquinone* (3:4480).]

Pale yel. ndls. from C_6H_6, chlorobenzene, or toluene; eas. sol. boilg. C_6H_6, toluene, or AcOH; spar. sol. boilg. alc. — Sublimes in vac.

[For f.p./compn. data and diagram of system $\bar{C}$ + 1-chloroanthraquinone (3:4480) (eutectic, m.p. 143.9–144.2°, contg. about 75% $\bar{C}$) see (5).]

[For use of $\bar{C}$ in coloring oils, fats, and waxes see (19); $\bar{C}$ is widely used as intermediate in prepn. of many dyestuffs, but no general summary can be given here although selected examples occur in the following text.]

[For prepn. of $\bar{C}$ from anthraquinonesulfonic acid-2 [Beil. XI-337, XI₁-(83)] or its Na salt with 25% HCl + $NaClO_3$ at 100° (11) (20) (for use of this method in detn. of mixt. of anthraquinone-α- and β-sulfonic acids or their salts by f.p./compn. curve of resultant mixt. of 1-chloroanthraquinone (3:4480) + $\bar{C}$ see (5)) see indic. refs.; from sodium anthraquinone-2-sulfonate in dil. HCl on exposure to light see (9), from anthraquinonesulfonic acid-2 on boilg. with dil. H_2SO_4 + NaCl + $NaClO_3$ see (21); from anthracenesulfonic

acid-2 [Beil. XI-194, XI_1-(44)] with HCl + $NaClO_3$ at 100° see (22); from anthraquinonesulfonic acid-2 or its Na salt (23) or from anthraquinonesulfonyl chloride-2 (24) with $SOCl_2$ in s.t. at 200–230° see indic. refs.]

[For prepn. of C̄ from *o*-(4-chlorobenzoyl)benzoic acid [Beil. X-750, X_1-(356)] by ring closure with conc. H_2SO_4 at 160–170° (25) (16) (26) (27) (28) (4) (29) (34) (49) in pres. of $AlCl_3$ (30) see indic. refs (for study of influence of conditions see espec. (27) (4) (31)); from *o*-(3-chlorobenzoyl)benzoic acid (32) or from 2-benzoyl-4-chlorobenzoic acid [Beil. X-750, X_1-(356)] (33) by similar ring closure with H_2SO_4 see indic. refs.; from 4-chloro-2-benzoyl-benzoyl chloride on htg. see (33).]

[For prepn. of C̄ from 2-chlorobutadiene-1,3 (chloroprene) (3:7080) + naphthoquinone-1,4 (1:9040) in C_6H_6 see (6); from *α*-chlorocrotonaldehyde (3:8117) + naphthoquinone-1,4 (1:9040) in C_6H_6 with piperidine see (74), from 2-aminoanthraquinone (see below) via diazotization and rapid htg. of diazonium chloride at 150° see (8); from 2-chloroanthraquinonecarboxylic acid-4 by htg. at 286–290° (7) or from 2-chloroanthraquinonecarboxylic acid-5 by htg in s.t. at 310–320° or by distn. of its Ba salt with BaO see (17) of (15); from 2,9,10-trichloro-9-hydroxy-10-nitro-9,10-dihydroanthracene [Beil. VII_1-(258)] in C_6H_6, nitrobenzene, or AcOH by htg at 90–95° see (35); from 2,9,10-trichloroanthracene [Beil. V_1-(325)] (36) or from 2-chloroanthrone-9 (or 10) (12) by oxidn. with CrO_3 see indic. refs.]

[For prepn. of C̄ from 1-chloroanthraquinone (3:4480) by htg. with conc. H_2SO_4 at 200–205° for 9 hrs. see (37).]

[C̄ on reductn. with Zn dust + conc. aq. NH_4OH under reflux yields (18) (37) 2-chloroanthracene [Beil. V_1-(324)], m.p. 217° (37), 215° (18). — C̄ on reductn. with hydrazine hydrate in MeOH/KOH at 10 atm. and 135° for 1½ hrs. in pres. of $Pd/CaCO_3$ cat. yields (38) *bis*-(2,2′-anthraquinonyl) [Beil. VII_1-(495)], m.p. 387–388°. — C̄ on reductn. with Al powder + conc. H_2SO_4 (40) or with Sn + HCl (39) yields a mixt. of 3-chloroanthrone-9, m.p. 156° (38) (corresp. acetate, m.p. 146° (41) (42)), and 2-chloroanthrone-9, m.p. 155° (41) (corresp. acetate, m.p. 143° (41)); this mixt. of chloroanthrones can be sepd. by acetylation with Ac_2O + pyridine and fractional crystn. of the resultant acetates (42). — For use of this reductn. method in prepn. of vat dyes see (43). — For study of oxidn/reductn. potential of C̄ see (13).]

[C̄ with MeOH/KOH in s.t. at 130° yields (44) 2-methoxyanthraquinone [Beil VIII-343, $VIII_1$-(655)], m.p. 196°. — C̄ with 2-hydroxyanthraquinone + NaOAc + Cu powder htd. at 250–260° for 12 hrs. gives (66% yield (45)) di-(2-anthraquinonyl) ether, pale yel. ndls. from pyridine, m.p. 324° (45). — C̄ with K xanthate + Cu powder boiled for 16 hrs. in AmOH gives (56% yield (45) (46) di-(2-anthraquinonyl) sulfide, cryst. from xylene, m.p. 290.5–291° (45). — C̄ with thiosalicylic acid (2-mercaptobenzoic acid) + solid KOH htd. in AmOH at 150° for 8 hrs. gives (77% yield (3)) *S*-(2-anthraquinonyl)thiosalicylic acid [Beil. X_1-(56)], m.p. 278° cor. (3); this prod. on htg. with H_2SO_4 or better with *p*-toluenesulfonyl chloride at 200° (3) (47) ring-closes by loss of H_2O to 1,2-phthalylthioxanthone [Beil. $XVII_1$-(291)], yel. ndls. from AcOH, m.p. 278° cor. (3).]

[C̄ with NaOH + glycerol htd. at 190° is claimed (48) to yield anthraquinone (1:9095). — C̄ with NaOH + $NaClO_3$ htd. 28 hrs. at 195° (49) cf. (50) (51) (52) gives (95% yield (49)) 1,2-dihydroxyanthraquinone (alizarin) (1:9105). — C̄ with NaSH boiled in aq. alc. yields (53) 2-mercaptoanthraquinone [Beil. VIII-346, $VIII_1$-(659)], yel. ndls. from AcOH, m.p. 206° (54). — C̄ with Na_2Se boiled in dil. alc. yields (55) 2-selenomercaptoanthraquinone, but C̄ with Se + NaOAc htd. at 205–210° in a mixt. of trichlorobenzene + tetralin for 8 hrs. yields (56) di-(2-anthraquinonyl) selenide.]

[C̄ with conc. aq. NH_4OH in pres. of Cu salts under press. and at elevated temp. (180–200°) gives (yields: 97.5% (57), 98.6% (2)) (27) (58) (59) (60) 2-aminoanthraquinone [Beil. XIV-191, XIV_1-(449)], red ndls., m.p. 302° (for study of influence of conditions see

(57) (2) (27) (61) (62)). — C̄ with hydrazine hydrate + pyridine in s.t. at 170° for 8 hrs. gives (20% yield (63)) 2-hydrazinoanthraquinone [Beil. XV_1-(200)], or.-yel. ndls. from pyridine, m.p. 228–229° (63).]

[C̄ with 4 moles C_6H_5MgBr in ether yields (64) (65) 2-chloro-9,10-diphenylanthracene, yel. cryst. powder, or. ndls. from AcOH, m.p. 194° (64), 193° (66), 185° (65).]

[For formn. of addn. cpds. of C̄ with $SbCl_5$ in $CHCl_3$ see (10); for formn. of 2-anthraquinonylpyridinium chloride from C̄ + $AlCl_3$ in pyridine see (67).]

[The direct sulfonation of C̄ appears not to have been reported in the scientific literature although C̄ with fumg. H_2SO_4 at 125–130° in pres. of Hg salts cf. (73) as directed is claimed in a patent (68) to yield 2-chloroanthraquinonesulfonic acid-5. — Two monosulfonic acids of C̄ are known, however, although prepared by indirect means; these are 2-chloroanthraquinonesulfonic acid-6 (corresp. sulfonyl chloride, deep yel. ndls. from chlorobenzene, m.p. 202° (69), from C_6H_6, m.p. 202–203° (71)), and 2-chloroanthraquinonesulfonic acid-7 (corresp. sulfonyl chloride, yel. cryst. from C_6H_6, m.p. 205° (70), 200–201° (71), 176° (69)); note that the alkali salts of *both* these acids are almost completely insoluble in aq. (71) and the above anomaly in m.p. of the sulfonyl chlorides may have been due to impure material. — C̄ on htg. with fumg. H_2SO_4 (40% SO_3) at 180° yields (72) a mixt. of sulfonated products which on alk. fusion give 1,2,6-trihydroxyanthraquinone (flavopurpurin) [Beil. VIII-513, $VIII_1$-(741)] and 1,2,7-trihydroxyanthraquinone (anthrapurpurin) [Beil. VIII-516, $VIII_1$-(742)].]

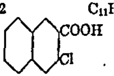
3:4928 3-CHLORONAPHTHOIC ACID-2 $C_{11}H_7O_2Cl$ Beil. IX - 661 IX_1-(278)



M.P. 216.5° (1)
216° (2)
212–213° (3)

Cryst. from MeOH + aq. (2) or from C_6H_6 (3). — Eas. sol. org. solv.

[For prepn. of C̄ from 3-aminonaphthoic acid-2 [Beil. XIV-535, XIV_1-(623)] via diazotization and use of Cu_2Cl_2 reactn. (alm. quant. yield) see (3); from the corresp. acid chloride (below) by hydrolysis with aq. see (1).]

C̄ with Cu bronze refluxed in nitrobenzene for 2 hrs. gives (48% yield (4)) β-naphthoic acid (1:0800), m.p. 185° (4).

[No record can be found of direct conv. of C̄ to the corresp. acid chloride (3-chloro-2-naphthoyl chloride); however, this compd., m.p. 56.5° (1), b.p. 248° at 160 mm. (1), has been obtd. indirectly from 3-hydroxy-2-naphthoic acid (1:0850), with PCl_5 in 49% yield (1); note that 3-hydroxy-2-naphthoic acid with $SOCl_2$ gives instead 3-*hydroxy*-2-naphthoyl chloride, m.p. 96° (5), 94.5° (6), in 82% yield (5).

[For condens. of C̄ with pyrazolanthrone see (8).]

Ⓓ Methyl 3-chloro-2-naphthoate: cryst. from MeOH, m.p. 58–59° (3), 58° (7). [From C̄ in MeOH with conc. H_2SO_4 (88% yield (7)), from C̄ with ethereal diazomethane (3), or from the acid chloride (above) with 5 pts. MeOH (3).] [For reactn. of this ester with 1-aminoanthraquinone see (7).]

Ⓓ Ethyl 3-chloro-2-naphthoate: lfts. from lt. pet. or from alc., m.p. 57–59° (3), 50° (1); b.p. 218–222° at 160 mm. (1), 195–197° at 18 mm. (3), volatile with steam. [From C̄ in EtOH with HCl gas (1) (3).]

Ⓓ 3-Chloro-2-naphthoamide: ndls. from AcOH, m.p. 236–237° (1). [From the acid chloride (above) with conc. aq. NH_4OH (1).]

3:4928 (1) [illegible] 1). (2) Hosaeus, *Ber.* **26**, 668–671 (1893). (3) [illegible] (4) Clemo, Spence, *J. Chem. Soc.* **1928**, 2818. [illegible] rs *Colourists* **56**, 170 (1940). 3:4930 *meso-α,α'*-**DICHLOROSUCCINIC ACID** $C_4H_4O_4Cl_2$ Beil. II - 619
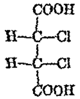
II_1-(267)
II_2-(558)



M.P. 220° cor., dec. (in sealed cap. tube) (1)
- 217–218° (2)
- 214–218° (10)
- 215° u.c. (3)
- 215° dec. (4) (5) (6) (11) (18)
- 213° (7) (16)
- 210° dec. (8)
- 209–213° (9)

[*See also d,l-α,α'-dichlorosuccinic acid* (3:4711).]

Hexag. pr. from aq — C̄ is readily sol. aq. although less so than its *d,l*-isomer; e.g., 100 cc. satd. aq. soln. of C̄ at 0° conts. 12.0 g. C̄ (4); C̄ is eas. sol. alc., ether, acetone or $CHCl_3$; spar. sol. C_6H_6 or lgr.

[For prepn. of C̄ from disodium salt of maleic acid (1:0470) in satd. aq. NaCl soln. with Cl_2 at 0° in dark or diffuse daylight (yields· 74.5% (7), 66% (10), 65% (1)) cf. (16) see indic. refs. (note that as a side reactn. some addn. of HOCl also occurs leading to as much as 7% (1) chloromalic acid): from fumaric acid (1:0895) with excess Cl_2 in s.t. in sunlight for 3–4 days see (6); from *meso-α,α'*-diaminosuccinic acid [Beil. IV-486, IV_1-(901)] in aq. HCl with NOCl or $AgNO_2$ (75% yield) see (3); from *meso-α,α'*-dichlorosuccinyl (di)-chloride (3 9087) by hydrolysis with aq. see (5).]

[For formn. of C̄ from *bis*-acetyl peroxide (9) by decomposition in chloroacetic acid (3 1370) at 85–95° ($CO_2 + CH_4$ are also formed) see (9).]

C̄ behaves as a normal dibasic acid: titration with standard dil. aq. alk. gives Neut. Eq. 93.5. — [For study of acid strength ($K_1 = 361 \times 10^{-4}$ at 20.2°, $K_2 = 9.4 \times 10^{-4}$ at 17.8° (4)) see (4) (8); (18) for study of conductivity see (11).]

[Salts (of metals). $Ag_2\bar{A}$, amorphous ppt. (6) which on boilg with aq. for 10 hrs. yields (12) both *d,l*-tartaric acid (1:0550) and *meso*-tartaric acid (1:0490); $Ca\bar{A}.2H_2O$, eas. sol. aq. and alc. (6), $Sr\bar{A}.H_2O$ (6); $Ba\bar{A}$, very eas. sol. aq., insol. alc. (6); $Zn\bar{A}.3H_2O$ (6); $Cd\bar{A}.3H_2O$, very eas. sol. aq., insol. alc. (6).]

C̄ with cold aq. KOH loses 1 HCl yielding (5) (7) (14) chlorofumaric acid (3:4853); C̄ with NaOAc/AcOH on boilg. (13) (17) or aq. soln. of $Na_2\bar{A}$ on boilg. ½ hr. (12) loses 1 HCl yielding chloromaleic acid (3:3432); C̄ on warming in dil. H_2SO_4 gives both (14) chlorofumaric and chloromaleic acids. [For study of rate of decompn. of C̄ by aq., acids, or alkalies see (7) (8) (15).]

$K_2\bar{A}$ in aq. soln. maintained at neutrality at 100° dec. with formn. (14) of acetaldehyde (1.0100), CO_2 + *meso*-tartaric acid (1:0490).

C̄ with Ac_2O at 150° yields (12) chloromaleic anhydride (3:0280).

The acid chloride (3.9087) corresp. to C̄ is known but is usually obtd. indirectly.

Ⓓ Dimethyl *meso-α,α'*-dichlorosuccinate: m p. 31.5–32° (see 3:0240).

Ⓓ *Diethyl meso-α,α'-dichlorosuccinate*: m.p. 63° (see 3:1364).

—— Acid salt of C̄ with *dl,-α*-phenylethylamine: tbls. from aq., m.p. 133–134° rap. htg. (13); satd. aq. soln. at 25° conts. 81.4 g./liter (13). [For the corresp. acid salts

of C̄ with the two opt. act. forms of this base see (13); both have m.p. 128–129°, and their satd. aq. solns. at 25° cont. 76.1 g./liter (13).]

3:4933 4-CHLORO-3-HYDROXYBENZOIC ACID $C_7H_5O_3Cl$ **Beil. S.N. 1068**

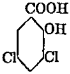
M.P. 219.5–220.5° (1)

Colorless ndls. from aq.

[For prepn. of C̄ from 4-amino-3-hydroxybenzoic acid (1) via diazotization and use of Cu_2Cl_2 reactn. see (1); note that the prod. formerly [Beil. X-143] supposed to have been C̄ is now regarded (1) as probably the 6-chloroisomer (3:4720).]

3:4933 (1) Beyer, *Rec. trav. chim.* **40**, 627 (1921).

3:4935 3,5-DICHLORO-2-HYDROXYBENZOIC ACID $C_7H_4O_3Cl_2$ **Beil. X - 104**
X_1-(48)
(3,5-Dichlorosalicylic acid)



M.P. 220–221°	(1)
219–220°	(2)
219.5°	(3) (10)
219°	(4) (5) (6) (7)
215°	(8)
214°	(9) (11) (12)

Colorless scales or ndls. from aq. alc.; very spar. sol. hot aq., eas. sol. alc., ether; sublimes with partial decomposition.

[For prepn. of C̄ from *o*-hydroxybenzoic acid (salicylic acid) (1:0780) in aq. KOH (3 *moles*) (11) (10), or in aq. KOH (1 mole) (14) (17), or in aq. KOH (2 *moles*) (15) (16), in EtOH (17), in AcOH (12) (10) (2), or in CS_2 susp. (17) with Cl_2 see indic. refs.; with 30% H_2O_2 + HCl (80% yield) see (4); by htg. with $SbCl_5$ see (13). (Note that by most of these methods 5-chloro-2-hydroxybenzoic acid (5-chlorosalicylic acid) (3:4705) may also be formed; from this C̄ may also be sep. via its spar. sol. $Ba\bar{A}_2$ (17).)]

[For prepn. of C̄ from sulfosalicylic acid with Cl_2 in aq. see (8); from K 2,4-dichlorophenolate with CO_2 at 140° see (11); from 3,5-dichlorosalicylaldehyde by oxidn. with alk.

$KMnO_4$ (yield 100%) see (9); from 3,5-dichloro-2-methoxybenzoic acid with 45% HI in s.t. at 120–130° see (3); *from chloral-3,5-dichlorosalicylamide by hydrolysis see* (1).]

$\bar{C}$ on htg. with CaO (17) (7) or at 200° in aniline (18) loses CO_2 yielding 2,4-dichlorophenol (3:0560).

$\bar{C}$ with $FeCl_3$ gives (13) (2) a dark violet color.

[$\bar{C}$ in 60% fumg. H_2SO_4 treated with Cl_2 at 80–90° for 15 hrs. gives (70% yield (19)) 3,5,6-trichlorosalicylic acid, white pl. from aq. alc. or aq. AcOH, m.p. 207° cor. (19); (this with Ac_2O + trace H_2SO_4 gives corresp. acetate, ndls. from lgr., m.p. 129.5° cor. (19)).]

$\bar{C}$ in AcOH treated with fumg. HNO_3 yields (20) 4,6-dichloro-2-nitrophenol, m.p. 122° (20).

$\bar{C}$ with PCl_5 (1 mole) yields (5) (10) 3,5-dichloro-2-hydroxybenzoylchloride (3,5-dichlorosalicyloyl chloride), ndls. from ether + pet. eth., m.p. 79°. [For details on various phosphorus compounds also formed in this reaction see (21).] [Note also existence of anhydride of $\bar{C}$ (from the acid chloride + Ag$\bar{A}$), cryst. from $CHCl_3$, m.p. 186–187° (5) (28).]

[$\bar{C}$ in aq./alc./H_2SO_4 gives (22) on electrolytic reduction 3,5-dichloro-2-hydroxybenzyl alcohol, ndls. from C_6H_6, m.p. 82° (22); for study of prepn. and thermal rearr. of allyl (23), crotyl (23), benzyl (24), and other (25) ethers of $\bar{C}$ see indic. refs.]

Ⓓ **Methyl 3,5-dichloro-2-hydroxybenzoate**: ndls. from alc. or ether, m.p. 150° (15), 147° (5) (26), 143–144° (7) (3), 142° (12). [From Ag$\bar{A}$ + MeI in s.t. at 135° (12), from 3,5-dichlorosalicyloyl chloride (above) with MeOH (5), or from methyl salicylate (1:1750) in AcOH with Cl_2 (26).] [This ester with Ac_2O yields (7) corresp. acetate, ndls. from MeOH, m.p. 57° (7).]

Ⓓ **Ethyl 3,5-dichloro-2-hydroxybenzoate**: cryst. from ether, m.p. 57° (5), 47° (12). [From Ag$\bar{A}$ + C_2H_5I as above (12) (3), from 3,5-dichlorosalicyloyl chloride (above) with EtOH (5), or from ethyl salicylate (1:1755) with Cl_2 (27).]

—— **3,5-Dichloro-2-hydroxybenzamide**: m.p. 209° (11).

—— **3,5-Dichloro-2-hydroxybenzanilide**: m.p. 134.5° (5) [From 3,5-dichlorosalicyloyl chloride (above) with aniline in ether (5).]

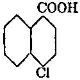
3:4936 4-CHLORONAPHTHOIC ACID-1



$C_{11}H_7O_2Cl$ **Beil. IX - 651**
IX_1—

M.P. 221–223° (2)
210° (1)

Ndls. from alc.; eas. sol. alc. or AcOH; spar. sol. aq., $CHCl_3$, ether, or hydrocarbons.

[For prepn. of C̄ from 4-aminonaphthoic acid-1 [Beil. XIV-533] by diazotization, conversion with CuCN to 4-chloronaphthonitrile (see below), and hydrolysis of the latter by boilg. with a mixt. of 50% AcOH (2 vols.) + conc. H_2SO_4 (1 vol.) see (1); from 1-chloro-4-(chloromethyl)naphthalene, m.p. 78–79° (2), by oxidn. with dil. HNO_3 see (2); or from 1-bromo-4-chloronaphthalene [Beil. V-548, V_2-(448)] by conv. to RMgBr and carbonation see (2).]

C̄ does not react either with conc. NH_4OH at 200° or with $(NH_4)_2CO_3$ at 220° (1).

Salts. *The alk. salts of C̄ are eas. sol. aq.; the calcium, barium, and silver salts are* sparingly sol. aq.; the iron, lead, and copper salts are insol. aq. (1).

—— Methyl 4-chloro-1-naphthoate: unreported.

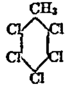
—— Ethyl 4-chloro-1-naphthoate: unreported.

—— 4-Chloro-1-naphthonitrile: long white ndls. from AcOH, m.p. 110° (1).

Ⓓ *p*-Bromophenacyl 4-chloro-1-naphthoate: m.p. 130.5–131° (2).

3:4936 (1) Friedländer, Weisberg, *Ber.* **28**, 1840, 1842–1843 (1895). (2) Horn, Warren, *J. Chem. Soc.* **1946**, 144.

3:4937 2,3,4,5,6-PENTACHLOROTOLUENE (*Eso*-Pentachlorotoluene)



$C_7H_3Cl_5$ Beil. V - 303 V_1-(153) V_2-(234)

M.P. 224.5–225.5°	(1)	B.P. 301° (6)
224–224.5°	(2)	
224°	(3)	
218°	(4) (5) (6) (7)	
217.5° u.c.	(8)	

White ndls. from C_6H_6 or pet. eth. — Spar. sol. hot alc. or ether; spar. sol. cold CS_2 but eas. sol. hot CS_2; sol. at 17° in 22 vols. or at 87° in 3.4 vols. toluene (8). — Sublimes readily. — Closely resembles hexachlorobenzene (3:4939), and the m.p. of mixtures of the two are but very slightly depressed (7) (8); furthermore, soly. of C̄ in C_6H_6 at 4 different temps. is alm. identical with that of hexachlorobenzene (9).

[For studies on dielectric characteristics of C̄ see (9) (10) (11) (12).]

[For prepn. of C̄ from toluene (1:7405) with SO_2Cl_2 + $AlCl_3$ + S_2Cl_2 at 100° for ½ hr. as directed (72% yield (8)), or by electrolysis in AcOH/conc. HCl in dark (7), or with Cl_2 in pres. of I_2 followed by further chlorination in pres. of $SbCl_5$ of the fraction boiling above 240° (6) see indic. refs.; for formn. of C̄ from isopropylbenzene (cumene) (1:7440) with Cl_2 in pres. of I_2 + Fe at 0°, or from *p*-cymene (1:7505) with Cl_2 in pres. of I_2 + Fe (1), or from 2-chlorotoluenesulfonyl chloride-4 with Cl_2 in pres. of $SbCl_3$ at 65–70° (4), or from 2,3,4-trichlorotoluene (3:0425) or 2,4,5-trichlorotoluene (3:2100) with SO_2Cl_2 + $AlCl_3$ + S_2Cl_2 (8), or from 2,3,4-trichlorobenzal (di)chloride on stdg. (5) see indic. refs.]

[C̄ on further treatment with SO_2Cl_2 + $AlCl_3$ + S_2Cl_2 gives (8) a prod. m.p. 272–274°. — C̄ on fusion and treatment with Cl_2 at 210–230° as directed (13) gives 70–80% yield pentachlorobenzal (di)chloride (3:3590) b.p. 199° cor. at 13 mm. (13).

[C̄ on partial hydrolysis with caustic alk. at 130–140° under press. yields (14) tetrachlorocresol.]

C̄ is unaffected by boilg. fumg. HNO_3 (6), but C̄ on oxidn. with 14.2 wt. pts. conc. HNO_3 ($D = 1.42$) in pres. of 0.1 pt. Hg by boilg. for 150 hrs. (8) yields pentachlorobenzoic acid (3:4910), m.p. 199.5° (8).

— C̄ is almost insol. in cold aq.; e.g., 100 ml. satd. aq soln. at 25° conts. ote that C̄ is thus much less sol. in aq. than *m*-chlorobenzoic acid (3:4392) than *o*-chlorobenzoic acid (3:4150). — At 14–16° 100 ml. satd. soln. of ıs 2 6 g. C̄, in EtOAc 1.6 g. C̄, in 75% AcOH 0.3 g. C̄, in CCl_4 0 04 g. C̄, C̄, in CS_2 0.16 g. C̄ (22). — [For study of soly. of C̄ in acetone (8), C_6H_6 (9) see indic. refs.]

distribution at 25° of C̄ between aq. + toluene or aq. + $CHCl_3$ see (35); of C̄ on charcoal from its solns. in acetone or C_6H_6 see (8); for soly. of C̄ in arious salts (including NaÃ) see (33).]

ıblimed in vac. (19). — C̄ is but very slightly volatile with steam (for details For crystallographic data see (36) (37).]

tems contg. C̄. [For f.p./compn. data on system C̄ + aq. see (38). — For data and diagrams of system C̄ + BzOH (1:0715), eutectic, m.p. 115°, contg. . % C̄, see (22) (16); for f.p./compn. data on systems C̄ + *p*-toluic acid (1:0795) *p*-hydroxybenzoic acid (1:0840) (11), or C̄ + *p*-methoxybenzoic acid (anisic 405) (15) *see indic. refs.*]

/compn data and diagrams on systems C̄ + *o*-chlorobenzoic acid (3:4150), n.p. 132°, contg. abt. 14 mole % C̄, see (22) (39); on system C̄ + *m*-chlorobenzoic 392), eutectic, m p. 140.9°, contg. 20 mole % C̄ (22) (39) (40), see indic. refs.]

p./compn data and diagrams on systems C̄ + *m*-bromobenzoic acid (16), C̄ + benzoic acid (16), C̄ + *p*-nitrobenzoic acid (41), C̄ + *p*-iodobenzoic acid (42) :. refs.]

ary systems contg. C̄. [For influence of addn. of C̄ to the eutectic mixt. of *o*-enzoic acid (3:4150) with *m*-chlorobenzoic acid (3:4392) see (43); *for data on* y system of all three chlorobenzoic acids, eutectic m.p. 104.9°, contg. 48.3 *mole %* + 44.0 mole % *meta* + 7.7 mole % *para* isomers, see (39).]

$+ Cl_2 +$ anhyd. $FeCl_3$ at 125° (33), cf. (34); from various addn. prods. of chlorine with trichloro- (35), tetrachloro- (36), or pentachloro- (37) benzenes usually by means of MeOH/NaOH, from 2,3,5,6-tetrachloro-*N*-nitroaniline, 2,3,5,6-tetrachloro-*N*-nitroacetanilide, or 2,3,5,6-tetrachloro-4-nitro-*N*-nitroaniline in boilg. AcOH + conc. HCl (8), from tetrachlorophthalyl *sym*-dichloride or from pentachlorobenzoyl chloride on distn. (38).]

C̄ with H_2 over Ni at 270° gives (39) C_6H_6, chlorobenzene, dichlorobenzene, trichlorobenzene, etc. — C̄ in boilg. alc. with large excess of Na is completely dehalogenated (40).

C̄ is unattacked by ICl in s.t. at 300° (41) and does *not* react with MeMgI or with MeMgBr in ether even on long boilg. (42).

[C̄ with liq. Cl_2 in s.t. in sunlight yields (37) by addn. both decachlorocyclohexane, m.p. 92°, and dodecachlorocyclohexane, m.p. in sealed cap. tube 285°. — C̄ with F_2 in CCl_4 soln. at 0° yields (43) small amts. of both hexachlorotetrafluorocyclohexene, $C_6Cl_6F_4$, m.p. 113–114°, and hexachlorohexafluorocyclohexane, $C_6Cl_6F_6$, m.p. 94–96°. — C̄ in vapor phase with F_2 in pres. of Cu gives a mixt. of 12 individual prods. (44).]

C̄ with aq. NaOH at 135–138° and 11–12 atm. for 3–4 hrs. (14) or with excess 5–15% soln. of NaOH in MeOH at 135° under press. (45) or C̄ with NaOH in EtOH in s.t. at 150–160° (47) or in dry glycerol at 250–280° (47) gives (80% yield (14)) sodium salt of pentachlorophenol (3:4850). — C̄ with MeOH/NaOH in ethyl methyl ketone soln. at b.p. for ½ hr. gives (43% yield (46)) methyl pentachlorophenyl ether, ndls. from alc., m.p. 108–109°. [For studies of kinetics of reactn. of C̄ with MeOH/NaOH in s.t. at 151° (2), at 176° (48), at 180° (48), at 183° (49) see indic. refs.; of C̄ with EtOH/NaOH or with NaOEt soln. at 175° see (2).]

C̄ on boilg. with mixt. of fumg. HNO_3 + conc. H_2SO_4 gives (50) tetrachlorobenzoquinone-1,4 (chloranil) (3:4978).

Cryst. from alc. — C̄ is almost insol. in cold aq.; e.g., 100 ml. satd. aq. soln. at 25° conts. 0.0068 g. C̄ (33); note that C̄ is thus much less sol. in aq. than *m*-chlorobenzoic acid (3:4392) and far less sol. than *o*-chlorobenzoic acid (3:4150). — At 14–16° 100 ml. satd. soln. of C̄ in acetone conts. 2.6 g. C̄, in EtOAc 1.6 g. C̄, in 75% AcOH 0.3 g C̄, in CCl_4 0 04 g. C̄, in C_6H_6 0.017 g. C̄, in CS_2 0.16 g. C̄ (22). — [For study of soly. of C̄ in acetone (8), C_6H_6 (8) (9), heptane (9) see indic refs.]

[For study of distribution at 25° of C̄ between aq. + toluene or aq. + $CHCl_3$ see (35); for adsorption of C̄ on charcoal from its solns. in acetone or C_6H_6 see (8); for soly. of C̄ in aq. solns. of various salts (including NaÃ) see (33).]

C̄ can be sublimed in vac. (19). — C̄ is but very slightly volatile with steam (for details see (10)). — [For crystallographic data see (36) (37).]

Binary systems contg. C̄. [For f.p./compn. data on system C̄ + aq. see (38). — For f.p./compn. data and diagrams of system C̄ + BzOH (1:0715), eutectic, m.p. 115°, contg. about 10 wt % C̄, see (22) (16); for f p./compn. data on systems C̄ + *p*-toluic acid (1:0795) (11), C̄ + *p*-hydroxybenzoic acid (1.0840) (11), or C̄ + *p*-methoxybenzoic acid (anisic acid) (1:0805) (15) see indic. refs.]

[For f.p./compn. data and diagrams on systems C̄ + *o*-chlorobenzoic acid (3:4150), eutectic, m.p. 132°, contg. abt [illegible] acid (3:4392), eutectic, m.p. [illegible]

[For f.p./compn. data and [illegible] *p*-bromobenzoic acid (16), C̄ [illegible] (41), C̄ + *p*-iodobenzoic acid (42) see indic. refs.]

Ternary systems contg. C̄. [For influence of addn. of C̄ to the eutectic mixt. of *o*-chlorobenzoic acid (3:4150) with *m*-chlorobenzoic acid (3:4392) *see* (43); *for data on* ternary system of all three chlorobenzoic acids, eutectic m.p. 104.9°, contg. 48.3 mole % *ortho* + 44.0 mole % *meta* + 7.7 mole % *para* isomers, see (39).]

Miscellaneous. [For study of fate of C̄ in animal organism see (44) (45) (46) (47); note that conjugation with glycine to yield the expected *N*-(*p*-chlorobenzoyl)glycine (*p*-chlorohippuric acid) [Beil. IX-341], m.p. 143° (45), does occur. — For study of toxicology of C̄ see (46) (48). — Note that sodium salt of C̄ (see also below) is widely used under name "Mikrobin" as preservative. — For use of C̄ as vulcanization regulator see (49).]

Preparation. [For prepn. of C̄ from *p*-chlorotoluene (3:8287) by oxidn. with boilg. 5% aq. $KMnO_4$ (60% yield (51)) (22) (50) (52) (53) (133), with MnO_2 + H_2SO_4 (100% yield (51)), with CrO_3 (54), with dil. HNO_3 in s.t. at 140–145° for ½ hr. (55) or at 115–120° for 5–6 hrs. (56) see indic. refs.; from *p*-chlorotoluene (3:8287) by oxidn. with air in the pres. of various catalysts (57), or at 235–240° and 50–60 atm. press. in pres. of FeO.OH (58), or in aq. alk. at 260° under press. (59) see indic. refs.; for formn. of C̄ from *p*-chlorotoluene (3:8287) by electrolytic oxidn. (2) (60), by action of NOCl (30), or by long exposure to I_2 + aq. in light (28) see indic. refs.]

[For prepn. of C̄ from *p*-chloroacetophenone (3:6735) by oxidn. with alk. $KMnO_4$ (61), with $CrO_3/AcOH/H_2SO_4$ (95% yield (7)), with Cl_2 + NaOH(NaOCl) in aq. MeOH (93% yield (62)), by liquid phase cat. oxidn. with air in pres. of MnO_2 (91% yield (6)) see indic. refs.; for formn. of C̄ from *p*-chloroacetophenone (3:6735) with NOCl see (63).]

[For formn. of C̄ from 4-chloro-isopropylbenzene (*p*-chlorocumene) (3:8705) by oxidn. with HNO_3 (64) (23), from 2,4′-dichlorobiphenyl (3:0670) (65) or from 4,4′-dichlorobiphenyl (3:4300) (66) by oxidn. with CrO_3/AcOH, from benzal-4-chloroacetophenone (24) by oxidn. with $KMnO_4$ in pyridine (90% yield (24)) see indic. refs.]

[For formn. of C̄ from *p*-chlorobenzaldehyde (3:0765) by oxidn. with $KMnO_4$ (67) (68) (69) (70) or CrO_3 (67) or even slowly by air see indic. refs.; from *p*-chlorobenzaldehyde copper during recrystn. (presumably as a result of oxidn. by air) see (31).]

[For prepn. of C̄ from *p*-chlorobenzonitrile [Beil. IX-341, IX_1-(140)] by hydrolysis with 75% H_2SO_4 (71), from *p*-chlorobenzoyl chloride (3:6550) by hydrolysis with aq., from *p*-chlorobenzotrichloride (3:6825) by hydrolysis, e.g., with aq. in s.t. at 200° (72) or with aq. alk., alk. carbonates, or alk.-earth carbonates (73) (note also formn. of C̄ as by-prod. of prepn. of *o*-chlorobenzaldehyde from *o*-chlorotoluene presumably due to hydrolysis of some *p*-chlorobenzotrichloride (81)), from *p*-chlorobenzal (di)chloride (3:6700) with CrO_3 (74) or on boilg. with aq. for 20 hrs. followed by oxidn. with $KMnO_4$ (85% yield (17)); from a mixt. of *p*-chlorobenzotrichloride + *p*-chlorobenzal (di)chloride by hydrol. with 70% H_2SO_4 or 80% AcOH or 5% NaOH at 90–100° in stream of air to effect immediate oxidn. (75) see indic. refs.]

[For prepn. of C̄ from 2-(*p*-chlorobenzoyl)benzoic acid [Beil. X-750, X_1-(356)] by hydrolytic cleavage with aq. + CaO under press. at 325° (93% yield (7)), or from *p*-chlorobromobenzene via conversion to *p*-chlorophenyl lithium bromide (76) or to *p*-chlorophenyl magnesium bromide (77) and subsequent carbonation (90% yield (76)) or from chlorobenzene (3:7903) with $AlCl_3$ + CO_2 at 100° and 60 atm. press. (82) see indic. refs.]

[For formn. of C̄ from benzoic acid (1:0715) with alk. NaOCl (20) cf. (78) or $Ca(OCl)_2$ (79) cf. (25), or from 4-chlorophthalic acid (3:4390) by cat. monodecarboxylation (80), see indic. refs.]

[For formn. of C̄ from di-(*p*-chlorobenzoyl) peroxide by htg. (2) (3), from *p*-aminobenzoic acid via diazotization and use of Cu_2Cl_2 reaction (82% yield (83)), from *p*,*p*′-diazoaminobenzoic acid (diazoaminobenzene-4,4′-dicarboxylic acid) [Beil. XVI-728] with conc. HCl (84), from *p*-chloroisonitrosoacetophenone with warm Ac_2O (21), from *p*-chlorophenacyl bromide by conv. to quaternary salt with quinoline and treatment with aq. NaOH (18), from *p*-borobenzoic acid with hot aq. $CuCl_2$ (26), from di-(*p*-chlorobenzoyl)butane on pyrolysis at 255–265° for 24 hrs. (85), from ethyl *p*-chlorophenyl-azo-carboxylate during oxidn. with H_2O_2 in AcOH (29), from *p*-hydroxybenzoic acid (1:0840) with PCl_5 followed by aq. (86) (87), or from treatment with aq. of the product from *p*-nitrotoluene with

$SOCl_2$ in s.t. at 200–220° (88), *p*-toluenesulfonyl chloride with $SOCl_2$ in s.t. at 230–250° (88), or sodium *p*-toluenesulfonate in chlorobenzene with $SOCl_2$ in s.t. at 250–260° (89) see indic. refs.]

Chemical behavior. No specific account of reduction of $\bar{C}$ to benzoic acid appears to be on record; note, however, detn. of chlorine in $\bar{C}$ by use of Na + alc. (90). — $\bar{C}$ on reduction with formic acid at 250–260° in pres. of TiO_2 gives *p*-chlorobenzaldehyde (3:0765) (89% yield on $\bar{C}$ consumed, or 41% on $\bar{C}$ used (91)). — $\bar{C}$ on electrolytic reduction in alc / H_2SO_4 gives (92) *p*-chlorobenzyl alcohol [Beil. VI-444, VI_1-(222)], m p. 73°, b.p. 234° (92); note proximity of m p. of this prod to that (72°) of corresp. prod. obtd. by similar reduction of *o*-chlorobenzoic acid (3:4150). — For study of reduction of $\bar{C}$ with H_2 + Ni in aq. alk. at ord. temp see (93).

[$\bar{C}$ on electrolytic oxidn. in $AcOH/H_2SO_4$ gives (2) 4-chloro-2-hydroxybenzoic acid (4-chlorosalicylic acid) (3:4908).]

$\bar{C}$ behaves normally as a monobasic acid; e.g, $\bar{C}$ on titration with standard dil. aq. alk. gives Neut. Eq. 156.5; ionization constant at 25° is 0.93×10^{-4} (94), 0.78×10^{-4} (95), 1.04×10^{-4} (96) cf. (97) (12). — [For study of acid strength of $\bar{C}$ in various alcohols see (98) (99) (100) (13) (101) (27).—For soly. of $\bar{C}$ in aq. solns. of various salts (including $Na\bar{A}$) see (33). — For sepn. of $\bar{C}$ from *o*-chlorobenzoic acid (3:4150) by use of difference in acid strength see (102).]

Salts of inorganic bases. $NH_4\bar{A}$ (103). — Hydroxylamine salt; m.p. 130° (104). — $Na\bar{A}$: widely used as food preservative under name " Mikrobin "; for prepn. from $\bar{C}$ + Na phenolate see (105); for study of influence on enzymes see (106) (107); for study of use as preservative see (108); for studies of detection and/or detn. in foods see (109) (110) (111) (112) (113) (114); forms liquid cryst. on fusion (115).

$Ag\bar{A}$, sol. in hot aq (50) (1 l. satd. aq. soln. at 20° conts. 1.08 g. (118)). (Note that this salt (1 mole) with I_2 (2 equivalents) in dry C_6H_6 refluxed 15–18 hrs. yields (116) phenyl *p*-chlorobenzoate, m p. 100° + CO_2 + AgI, and that analogous behavior is shown to lesser degree by corresp. salt of *m*-chlorobenzoic acid (3:4392) but *not* by corresp. salt of *o*-chlorobenzoic acid (3:4150).)

$Ca\bar{A}_2.3H_2O$ (25), 1 l. satd. aq. soln. at 20° conts. 7.37 g. (118). — $Ba\bar{A}_2.3\frac{1}{2}H_2O$ (66); $Ba\bar{A}_2.4H_2O$ (34); $Ba\bar{A}_2.H_2O$ (118); 1 l. satd. aq. soln. of latter at 20° conts. 1.09 g. $Ba\bar{A}_2.H_2O$ (118) (for use of Ba salt in sepn. of the three isomeric chlorobenzoic acids see (43)). — $Cd\bar{A}_2.2H_2O$ (117); 1 l. satd. aq. soln. at 20° conts. 7.79 g. (118). — For similar data on salts of $\bar{C}$ with other heavy metals see (118) (119). — For study of various metal ions as precipitants for $\bar{C}$ see (120).

Salts of organic bases. $\bar{C}$ with equiv. amt. benzylamine in boilg. EtOAc followed by evapn. of solvent yields (121) benzylammonium *p*-chlorobenzoate, m p. 157.4–158.4° u.c., 160.3–161.3° cor., Neut. Eq. 263 6. — $\bar{C}$ similarly treated with α-phenylethylamine yields (121) α-phenylethylammonium *p*-chlorobenzoate, m.p. 150.0–151.0° u c., 152.2–153.2° cor., Neut. Eq. 277.6.

$\bar{C}$ (1 mole) in alc. mixed with codeine (1 mole), m.p. 155°, htd several minutes, solvent evapd. and resultant sirup recrystd. from aq., yields (122) codeine *p*-chlorobenzoate, $C_{18}H_{21}O_3N.\bar{C}$, m.p. 162° on " Maquenne block "; note that this value although close to that (166°) of codeine *p*-bromobenzoate is widely different from and higher than those for the corresp. salts of either *o*-chlorobenzoic acid (3:4150) or *m*-chlorobenzoic acid (3:4392) which are 134° and 96° respectively. — $\bar{C}$ (1 mole) in alc. (or $CHCl_3$) with strychnine (1 mole) in alc., boiled for a few minutes, then cooled, yields (123) strychnine p-chlorobenzoate, $C_{21}H_{22}O_2N_2.\bar{C}$, m.p. 251° on " Maquenne block "; note that the m p. of this salt is far higher than the corresp. products from similar treatment of either the *o*- or *m*- isomers, which are 170° and 185°, respectively.

$\bar{C}$ with alcohols gives by conventional processes the corresp. esters: for details on methyl

p-chlorobenzoate (3:0535) or on ethyl p-chlorobenzoate (3:6750) see these compds. — [For study of rate of esterification of C̄ with MeOH (124) (125) (126), with EtOH (126) (1) (127), with cyclohexanol (128) see indic. refs.]

C̄ with oxalyl (di)chloride (3:5060) refluxed in C_6H_6 (129), or NaĀ htd. with p-chlorobenzoyl chloride (3:6550) (130) gives (50% yield (130)) p-chlorobenzoic acid anhydride, ndls. from dil. acetone or C_6H_6, m.p. 193–194° (129) (131), 194.8° (130), 191.5° (132); note that this prod. may also form in various other reactions involving C̄, especially in pres. of tertiary bases or Na_2CO_3 cf. (131) (132).

C̄ with PCl_5 (133) (50) (45) (132), with $SOCl_2$ (134) (135) (136), with $SOCl_2$ + $AlCl_3$ (137), or with p-chlorobenzotrichloride (3:6825) + $ZnCl_2$ (138) gives p-chlorobenzoyl chloride (3:6550).

[C̄ with chlorobenzene (3:7903) + $AlCl_3$ refluxed 5½ hrs. gives (98% yield (7)) a mixt. consisting mainly of 4,4′-dichlorobenzophenone (3:4270) accompanied by a small proportion of 2,4′-dichlorobenzophenone (3:1565).]

[C̄ with KCN + CuCN in aq. alc. htd. in s.t. at elevated temp. (139) or C̄ (as KĀ) with aq. KCN + CuCN refluxed 8–10 hrs. under H_2 in quartz flask exposed to ultra-violet light (140) gives (70% yield (140)) terephthalic acid (1:0910).]

Substitution of nucleus of C̄. C̄ on mononitration, e.g., with HNO_3 (D = 1.6) on warming until soln. occurs (141), or with 10 wt. pts. HNO_3 (D = 1.5) at 55–60° for 10 minutes (142), or with 4 vols. HNO_3 (D = 1.5) warmed until soln. occurs (143), followed by pouring into aq. gives (yields: 97% (141), 96% (142), 90% (143)) 4-chloro-3-nitrobenzoic acid [Beil. IX-402, IX_1-(165)], cryst. from hot aq., m.p. 184° (142), 182° cor. (141), 180° (143). — [Note that boilg. conc. HNO_3 (D = 1.42) has no action (143) on C̄; that the crude mononitration prod. sometimes (143) contains a small amt. of p-chloronitrobenzene, m.p. 82°; and that the other possible mononitration isomer, viz., 4-chloro-2-nitrobenzoic acid [Beil. IX-401, IX_1-(165)], m.p. 140°, is *not* formed in appreciable amt. by direct nitration of C̄.]

C̄ on dinitration, e.g., with 20 wt. pts. conc. H_2SO_4 + 3.3 wt. pts. KNO_3 at 140° for 1½ hrs. (144), or with 12½ wt. pts. conc. H_2SO_4 + 2.4 wt. pts. fumg. HNO_3 (D = 1.5) at 135–140° for 2 hrs. (145), then poured into aq., gives (yields: 95% (144), 82% (145)) 4-chloro-3,5-dinitrobenzoic acid [Beil. IX-416], pr. from C_6H_6, m.p. 159° (144) (145). For use in detection of C̄ see (161). — [Note that none of the three other isomeric 4-chlorodinitrobenzoic acids has ever been reported.]

[C̄ on sulfonation with SO_3 in fumg. H_2SO_4 (52) (146) (147) gives 4-chloro-3-sulfobenzoic acid [Beil. XI-387].]

—— Methyl *p*-chlorobenzoate: m.p. 43° (see 3:0535).

—— Ethyl *p*-chlorobenzoate: oil, b.p. 238° (see 3:6750).

Ⓓ *p*-Nitrobenzyl *p*-chlorobenzoate: m.p. 130° (148). [From C̄ (as NaĀ) with p-nitrobenzyl bromide (m.p. 99°) in boilg. alc. (148).]

Ⓓ Phenacyl *p*-chlorobenzoate: m.p. 89.5° (149), 87.6° (32). [From C̄ as (NaĀ) with phenacyl bromide (m.p. 50°) in boilg. alc. (98% yield (32)). — Note that the m.p. of this prod. is only slightly higher than that (85.5°) of the corresp. prod. similarly obtd. from o-chlorobenzoic acid (3:4150).]

—— *p*-Chlorophenacyl *p*-chlorobenzoate: unreported.

Ⓓ *p*-Bromophenacyl *p*-chlorobenzoate: m.p. 126° (32). [From C̄ (as NaĀ) with p-bromophenacyl bromide (m.p. 109°) in boilg. alc. (80% yield (32)).]

—— *p*-Iodophenacyl *p*-chlorobenzoate: unreported.

Ⓓ *p*-Phenylphenacyl *p*-chlorobenzoate: m.p. 160° cor. (150). [From C̄ (as NaĀ) with p-phenylphenacyl bromide (m.p. 126°) in boilg. alc. (150). — Note that m.p. of this prod. is only slightly higher than that (154°) of corresp. prod. similarly obtd. from m-chlorobenzoic acid (3:4392).]

—— *S*-Benzylthiuronium *p*-chlorobenzoate: unreported.

D *S*-(*p*-Chlorobenzyl)thiuronium *p*-chlorobenzoate: cryst. from dioxane, m.p. 173° cor. (151). [From Ĉ (as NaÃ or KÃ) in aq. with 1 equiv. of *S*-(*p*-chlorobenzyl)-thiuronium chloride, m.p. 197° (10% in alc.) (151).]

D *S*-(*p*-Bromobenzyl)thiuronium *p*-chlorobenzoate: m.p. 163° cor. (152). [From Ĉ (as NaÃ or KÃ) in aq. with 1 equiv. of *S*-(*p*-bromobenzyl)thiuronium bromide (m.p. 213°) in alc. (152). — Note that m.p. of this prod. is only slightly lower than that (165° cor.) of the corresp. prod. similarly obtd. from *o*-chlorobenzoic acid (3:4150).]

D *p*-Chlorobenzamide: ndls. from aq. or ether, m.p. 180° (153), 179° (154), 179° (67), 178.5° cor. (155), 175° (71). [From Ĉ by refluxing with AcOH + $(NH_4)_2CO_3$ (yield 80% (153), 51% (154)); from *p*-chlorobenzoyl chloride (3:6520) with conc. aq. NH_4OH (50) (155) (67), or from *p*-chlorobenzonitrile [Beil. IX-341, IX_1-(140)] by hydrolysis with hot conc. HCl (71).]

D *p*-Chlorobenzhydrazide: ndls. from hot aq., m.p. 163° (157), 162-163° (156). [From ethyl *p*-chlorobenzoate (3:6730) with alc. hydrazine hydrate on b.p. (yield 87% (156)); for use of this prod. as reagt. for identification of aldehydes and ketones see (156).]

—— *N*-(*p*-chlorobenzoyl)-*N'*-phenylhydrazine: unreported.

D *p*-Chlorobenzanilide: ndls. from alc., m.p. 194-195° (158), 194° (70), 193° (159). [From *p*-chlorobenzoyl chloride (3:6520) with aniline (2 moles) (70); also from *p*-(4-chlorobenzophenone oxime) by Beckmann rearr. (159). Note that the m.p. of this prod. is almost the same as that (192-193°) of the isomeric benz-*p*-chloroanilide [Beil. XII-612, XII_1-(306)].]

—— *p*-Chlorobenz-*p*-toluidide: unreported.

—— *p*-Chlorobenz-α-naphthalide: unreported.

—— *p*-Chlorobenz-β-naphthalide: unreported.

[*See also tetrachlorobenzoquinone-1,4 (chloranil)* (3:4978).]

Colorless scales or ndls. from C_6H_6; solvated pr. from AcOH losing solvate in air (2) (8). — For crystallographic data see (9). — Č sublimes with partial decompn. (10); for study of sublimation pressure see (11).

Č is insol. aq.; almost insol. C_6H_6, CCl_4, CS_2; eas. sol. alc., ether; spar. sol. AcOH.
[For study of ht. of formn. of Č see (12); for studies of heat of combustion see (13) (14).]
[For patent on use of Č as vulcanization accelerator see (15).]

PREPARATION OF Č

From tetrachlorobenzoquinone-1,4. For prepn. of Č from chloranil (3:4978) by reduction with various reagents see the following. [For use of aq. SO_2 see (10) (16) (note, however, that this reduction is so slow that it has been used (18) as a method of sepn. of 2,3,5-trichlorobenzoquinone-1,4 (3:4672) from tetrachlorobenzoquinone-1,4 (3:4978), and also that during the process substantial amounts of trichlorohydroquinonesulfonic acid and of dichlorohydroquinone disulfonic acid are formed (19)); for use of boilg. conc. HCl (9), conc. HBr (9) (10) in AcOH (3), with conc. HI + red (18) or yellow (20) phosphorus, or

with KI or NaI in cold acetone (38) see indic. refs.; for use of H_2S (5), $SnCl_2$ + HCl (9) (8) (6), aq. slightly alkaline hydroxylamine (13), alc. hydrazine hydrate (21), with EtOH on exposure to direct sunlight (7) (study of quantum efficiency of the photochemical reduction (22)), or with hydroquinone (1:1590) in ether (39) see indic. refs.]

[For formn. of $\bar{C}$ as by-product of use of tetrachlorobenzoquinone-1,4 (chloranil) (3:4978) in low-temp. dehydrogenations see (23) (24); for formn. of derivatives (ethers) of $\bar{C}$ as by-products of reaction of chloranil (3:4978) with free radicals see (25) (26) cf. (27); for formn. of $\bar{C}$ as by-product of reaction of chloranil (3:4978) with C_6H_5MgBr see (31).]

From 2,3,5-trichlorobenzoquinone-1,4. [For prepn. of $\bar{C}$ from 2,3,5-trichlorobenzoquinone-1,4 (3:4672) with conc. HCl on protracted boilg. (9) (28), with fumg. HCl in s.t. at 120° for 12 hrs. (29), or in AcOH soln. with dry HCl gas (30) see indic. refs.]

From other sources. [For formn. of $\bar{C}$ from hydroquinone (1:1590) in AcOH with Cl_2 (32), or from *p*-nitroaniline (or certain derivatives) with conc. HCl in s.t. at 180° (2), see indic. refs.]

CHEMICAL BEHAVIOR OF $\bar{C}$

Oxidation of $\bar{C}$. $\bar{C}$ on oxidation, e g., with aq. alc. $AgNO_3$ (10), $NH_4OH/AgNO_3$ (2), boilg. conc. HNO_3 (2) (20), etc., gives tetrachlorobenzoquinone-1,4 (chloranil) (3:4978).

[For studies of oxidn.-reductn. potential of system $\bar{C}$ + chloranil see (33) (34) (35) (1) (27) (6).]

[Note also that the quinhydrone to be expected from $\bar{C}$ with 1 mole of the corresp. tetrachlorobenzoquinone-1,4 (chloranil) (3:4978) is not reported.]

[Note also that, although $\bar{C}$ dissolves in aq. KOH without discoloration, the soln. upon exposure to air turns brown and on stdg. ppts. (16) di-potassium salt of chloranilic acid (2,5-dichloro-3,6-dihydroxybenzoquinone-1,4) (3:4970).]

Other reactions of $\bar{C}$. [$\bar{C}$ with PCl_5 (2 moles) gives (16) hexachlorobenzene (3:4939).— $\bar{C}$ with 2,3,5-trichlorohydroquinone (3:4052) + a little aq. htd. at 100° for ½ hr. undergoes a redistribution reaction (28) cf. (36).]

- Ⓓ Tetrachlorohydroquinone dimethyl ether: m.p. 164° (37), 160° (5). [From $\bar{C}$ by action of diazomethane in ether soln. (5).]
- Ⓓ Tetrachlorohydroquinone diethyl ether: m.p. 112° (16). [From $\bar{C}$ with EtI (2 moles) + KOH (2 moles) in alc. in s.t. at 130–140° (16).]
- Ⓓ Tetrachlorohydroquinone diacetate: m.p. 245° (16), 244–246° (7). [From $\bar{C}$ with AcCl (3:7065) (16) or from chloranil (3:4978) with AcCl in s.t. at 160–180° (16).]
- Ⓓ Tetrachlorohydroquinone dibenzoate: m.p. 233° (9). [From $\bar{C}$ with BzCl (3:6240) (9).]

3:4944 5-CHLORONAPHTHOIC ACID-1  $C_{11}H_7O_2Cl$ Beil. IX-651
IX_1—

M.P. 245° (1)
244–245° (3)

Ndls. which sublime even below m.p. — Eas sol. alc, spar. sol. C_6H_6 or AcOH.

[For prepn. of C̄ from α-naphthoic acid (1:0785) with Cl_2 in AcOH contg. I_2 (some of the isomeric 8-chloronaphthoic acid-1 (3:4680) also being formed) see (1); from 5-chloro-1-naphthonitrile (see below) on hydrolysis with fumg. HCl in s.t. see (1); from 5-aminonaphthoic acid-1 [Beil. XIV-533] via diazotization and use of Cu_2Cl_2 reactn. see (1); for

formn. (together with other prods.) from α-naphthoic acid (1:0785) via reactn. with $Hg(OAc)_2$ followed by treat. with Cl_2 in AcOH see (3).]

Salts. $Ca\bar{A}_2.2H_2O$; sol. in 116 pts. aq. at ord. temp. (1).

$\bar{C}$ on soln. in red. fumg. HNO_3 gives (2) on cooling 5-chloro-8-nitronaphthoic acid-1 [Beil. IX-654], ndls. from alc., m.p. 224–225° dec. (2) (ethyl ester, m.p. 121° (2)); if the soln. of $\bar{C}$ in red fumg. HNO_3 be heated there is also formed (2) some 4-chloro-1,8-dinitronaphthalene [Beil. V-561], pale yel. ndls. from AcOH, m.p. 180° (3), 175° (2).

—— **Methyl 5-chloro-1-naphthoate:** unreported.

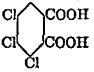
Ⓓ **Ethyl 5-chloro-1-naphthoate:** tbls. from alc., m.p. 42° (1). [From $Ag\bar{A}$ with EtI in s.t. at 100° (1).]

—— **5-Chloro-1-naphthonitrile:** ndls. from alc., m.p. 145° (1). [From α-naphthonitrile [Beil. IX-649, IX_1-(275)] with Cl_2 in CS_2 contg. I_2 (1).]

—— **5-Chloro-1-naphthoamide:** lfts. or ndls. from warm alc., m.p. 239° (1). [From 5-chloro-1-naphthonitrile (above) on boilg. with alc. KOH for several hrs. (1).]

3:4944 (1) Ekstrand, *J. prakt. Chem.* (2) 38, 147–150 (1888). (2) Ref. 1, pp 170–171. (3) Atterburg, *Ber.* 9, 928 (1876). (3) Whitmore, Fox, *J. Am. Chem. Soc.* 51, 3366–3367 (1929).

3:4946 TETRACHLOROPHTHALIC ACID



$C_8H_2O_4Cl_4$ Beil. IX - 819 IX_1-(366)

M.P. See text.

[*See also tetrachlorophthalic anhydride* (3:4947).]

Colorless lfts., tbls., or ndls. from aq. invariably contg. ½ H_2O, and therefore giving in this form Neut. Eq. = 156.5. — This hemihydrate can be recrystd. from anhyd. ether without change. — From anhyd. acetone the acid separates in cryst. contg. combined solv. lost in stream of dry air at room temp., yielding anhyd. $\bar{C}$, Neut. Eq. 152, which absorbs aq. from air giving hemihydrate. — $\bar{C}$ on htg. at 98° or above, or on attempts to recryst. from dry C_6H_6, $CHCl_3$, or higher-boilg. solvents, or on long drying over P_2O_5 in vac., is converted to tetrachlorophthalic anhydride (3:4947); for this reason the m.p. observed for $\bar{C}$ is always actually that of the corresponding anhydride. — For purification of comml. $\bar{C}$ see (1) (13).

$\bar{C}$ is spar. sol. aq., e.g., 100 g. aq. at 14° dis. 0.57 g., at 99° 3.03 g. of hemihydrate (2); $\bar{C}$ is eas. sol. alc. or ether (2); extremely sol. in acetone (1); spar. sol. C_6H_6 or $CHCl_3$ (2). — $\bar{C}$ is sol. in hot aq. Na_2CO_3 soln. (dif. from tetrachlorophthalic anhydride (3:4947)).

[For prepn. of $\bar{C}$ via hydrolysis of tetrachlorophthalic anhydride (3:4947) see that cpd.; other methods include the following: from phthalic anhydride (1:0725) (3), from phthalyl dichloride (3:6900) (4), or phthalic acid (1:0820) (5) with Cl_2 in pres. of Fe or $FeCl_3$ see indic. refs.; from 2-(trichloroacetyl)-3,4,5,6-tetrachlorobenzoic acid [Beil. X-693], with dil. aq. NaOH see (6); from 2-(pentachlorobenzoyl)-3,4,5,6-tetrachlorobenzoic acid [Beil. X_1-358], with conc. H_2SO_4 at 200–250° (pentachlorobenzene (3:2290) is also formed) see (7); from naphthoquinone-1,2 (1:9062), anthraquinone (1:9095), 1,2,3,4,5,6,7-heptachloroanthraquinone [Beil. VII_1-(414)], or 2-(pentachlorobenzoyl)-3,4,5,6-tetrachlorobenzoic acid (see above) on boilg. with excess $SbCl_5$ + a little I_2 see (7) (8); from 1,2,3,4,5-pentachloronaphthalene [Beil. V-546] (9) (10), 1,2,3,4,5,6,8-heptachloronaphthalene [Beil. V-547] (11), or octachloronaphthalene (3:4893) (12) by oxidn. with HNO_3 in s.t. as directed

see indic. refs.; from 2,5,6,7,8-pentachloronaphthoquinone-1,4 [Beil. VII-731] by oxidn. with CrO_3 or HNO_3 see (11).]

[$\bar{C}$ with Na/Hg in dil. aq. alc. (10) (2) yields phthalic acid (1:0825), but $\bar{C}$ in 96% alc. with Na/Hg is practically unaffected (1) (2). — $\bar{C}$ with H_2 in pres. of finely divided Ni at 190° and 20 atm. press. yields (14) 4,5,6,7-tetrachlorophthalide [Beil. XVII-312], m.p. 208.5° cor. — $\bar{C}$ with HI + P in s.t. at 230° for 6 hrs. yields (2) 4,5,6,7-tetrachlorophthalane [Beil. XVII-51], ndls. from toluene, m.p. 218° (2) (insol. in boilg. aq. NaOH), accompanied by a little 4,5,6,7-tetrachlorophthalide (above) (sol. in boilg. aq. NaOH).]

$\bar{C}$ with CrO_3 oxidizes much more slowly (2) than phthalic acid (1:0825) and is very resistant toward HNO_3 (2); for detn. of chlorine in $\bar{C}$ see (1) (16)

[$\bar{C}$ with aq. KOH + KCN + CuCN htd. under press. at 180° for 8–10 hrs. gives (60% yield (15)) benzenehexacarboxylic acid (mellitic acid) [Beil. IX-1008, IX_1-(443)]. — $\bar{C}$ with HBr + H_3PO_4 in nitrobenzene in pres. of $CuCl_2$ yields (17) mixts. of bromotrichlorophthalic acids and dibromodichlorophthalic acids. — For actn. of PCl_5 see under tetrachlorophthalic anhydride (3:4947). — $\bar{C}$ with hydrazine hydrate at 150° gives only (18) *N*-aminotetrachlorophthalimide, colorless ndls. from AcOH, m.p. 288° dec. (18); earlier opinions (19) (20) that this prod. was tetrachlorophthalcyclohydrazide have been shown (18) to be erroneous. — $\bar{C}$ with steam passed over cat. at 380–420° loses CO_2 presumably yielding (21) 2,3,4,5-tetrachlorobenzoic acid [Beil. IX-346], m.p. 186°.]

[For use of $\bar{C}$ as softener for animal fibers see (22) (23). — For use of $\bar{C}$ in prepn. of α-borneol (1·5990) from turpentine oil (crude pinene) by htg. at 108° for 12 hrs., removal of unchanged terpenes by distn. and alc. NaOH saponification of the remaining di-bornyl tetrachlorophthalate, white cryst. from ether, m.p. 128–129° (24), see (24) (25).]

Salts. $K_2\bar{A}$, very sol. aq., spar. sol. alc. (2), $Ba\bar{A}.2\frac{1}{2}H_2O$ see (2); $Ca\bar{A}$, on htg. gives octachloroanthraquinone [Beil VII-789] (17); $Cu\bar{A}.2H_2O$, spar. sol. aq. (2) (earlier report (27) that on dry distn. it gives dodecachlorofluorane later seriously questioned (28)); $Zn\bar{A}$, very sol. aq. (more sol. cold aq. than hot aq.) (2); $Ag_2\bar{A}$, spar. sol. aq.

Ⓓ **Dimethyl tetrachlorophthalate:** cryst. from MeOH, m.p. 92° (2). [From $Ag_2\bar{A}$ with MeI (2), from *sym*-tetrachlorophthalyl (di)chloride with NaOMe (2) or from $\bar{C}$ in 10% aq. NaOH (3 moles) on warming with Me_2SO_4 (29); note that $\bar{C}$ in MeOH satd. with HCl gas gives (30) only the half ester, methyl hydrogen tetrachlorophthalate, cryst. from C_6H_6 on addn. of lgr., m.p. 142° (30) with elimination of MeOH and conversion to tetrachlorophthalic anhydride (3:4947) q.v.]

Ⓓ **Diethyl tetrachlorophthalate:** cryst., m.p. 60–60.5° (2) (31). [From $Ag_2\bar{A}$ + EtI (2) or from *sym.*-tetrachlorophthalyl (di)chloride + NaOEt (2); note that *unsym.*-tetrachlorophthalyl (di)chloride with abs. alc at room temp. gives (31) *pseudo*-diethyl tetrachlorophthalate, tbls. from alc., m.p. 126° (19), and that this cpd. on stdg. in the reactn. mixt. is partially conv. to the normal ester of m p. 60.5° (31).]

Ⓓ **Di-(*p*-nitrobenzyl) tetrachlorophthalate:** ndls. from C_6H_6, or from aq. alc., m.p. 180–181° (32), 179–180° (33) [From $Na_2\bar{A}$ + *p*-nitrobenzyl bromide on refluxing in alc. (32), or from $Ag_2\bar{A}$ + *p*-nitrobenzyl iodide (33).]

Ⓓ **Di-(*p*-phenylphenacyl) tetrachlorophthalate:** cryst. from acetone, m.p. 193° (34). [From $Na_2\bar{A}$ with *p*-phenylphenacyl bromide (2 moles) on htg. in alc. (34).]

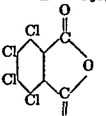
3:4947 TETRACHLOROPHTHALIC ANHYDRIDE $C_8O_3Cl_4$ Beil. XVII - 484 XVII$_1$-(254)



M.P.	255–257° cor.	(1)
	255–256.5° cor.	(2)
	255°	(3)
	252° (4), cor.	(5)
	245° u.c.	(5)

[*See also tetrachlorophthalic acid* (3:4946).]

Colorless pr. or ndls. by sublimation. — Insol. cold aq., but sol. in boilg. aq. because of hydrolysis to tetrachlorophthalic acid (3:4946); spar. sol. ether. — C̄ is insol. in Na_2CO_3 soln. (dif. from tetrachlorophthalic acid (3:4946)).

[For prepn. of C̄ from tetrachlorophthalic acid (3:4946) by htg. above m.p. (6), by htg. 8 hrs. at 110° (7), by htg. 120 hrs. at 100° (8) (9), by sublimation, htg. at 98°, by crystn. from hot C_6H_6, $CHCl_3$, AcOH (2), or by protracted drying over P_2O_5 in vac. (1) cf. (5) (10) see indic. refs.; from phthalic anhydride (1:0725) with Cl_2 in pres. of Fe salts at 160–260° (11), or with Cl_2 in pres. of $SbCl_5$ at 200° (10) (12), or with Cl_2 in pres. of fumg. H_2SO_4 (50–60% SO_3) and I_2 (2) (13) see indic. refs.; from naphthalene (1:7200) with $ClSO_3H$ in s.t. at 180° see (3).]

[C̄ on reduction with Zn dust + hot AcOH (10) or with H_2 + Ni at 190° and 20 atm. yields (14) 4,5,6,7-tetrachlorophthalide [Beil. XVII-312], m.p. 208.5° cor.]

C̄ reacts with monohydric alcs. to yield corresp. half esters: e.g., C̄ dislvd. in excess warm MeOH, htd. 5–10 min., evapd. yields (15) methyl hydrogen tetrachlorophthalate [Beil. IX-820], cryst. from hot C_6H_6 on addn. of lgr., m.p. 139–140° (15), 142° (16), Neut. Eq. 318; C̄ with abs. EtOH treated as for preceding case gives (15) ethyl hydrogen tetrachlorophthalate, m.p. 93–94° (15), 94–95° (10), Neut. Eq. 332. — [C̄ with *ter*-butyloxymagnesium

bromide in ether + dioxane at 50-55° for 1 hr. gives (54% yield (17)) *ter*-butyl hydrogen tetrachlorophthalate, decomposing at 142°, Neut. Eq. 360; for analogous formn. of *ter*-amyl, triethylcarbinyl, tri-*n*-propylcarbinyl, tri-*n*-butylcarbinyl and tri-*n*-amylcarbinyl hydrogen tetrachlorophthalates see (17).] — [For reactn. of $\bar{C}$ with glycerol and use in prepn. of resins of glyptal type see (3) (18).]

[$\bar{C}$ with 1 mole PCl_5 in s.t. 4 hrs. at 220° (19) cf. (10) or $\bar{C}$ with 1 mole PCl_5 + $POCl_3$ refluxed 72 hrs. (20) gives (90% yield (20)) *unsym.*-tetrachlorophthalyl (di)chloride (3,3,4,5,6,7-hexachlorophthalide) [Beil. XVII$_1$-(484)], cryst. from C_6H_6 with 1 mole solvent, m.p. 118° (10) (20), 118–120° (19), but losing C_6H_6 in air to give solvent free cpd., ndls. from pet. ether, m.p. 137° (19) (20); this prod. on distn. (19) undergoes partial rearr. to *sym.*-tetrachlorophthalyl (di)chloride, pr. from pet. ether, m.p. 48° (19). — Note that the latter *sym.*-phthalyl (di)chloride (which is very soluble in most org. solvents) gradually changes even in solid form and very rapidly in solution (particularly in pres. of animal charcoal) to the *unsym.*-tetrachlorophthalyl (di)chloride (which is spar. sol. in most org. solvents) (19). — $\bar{C}$ with $SOCl_2$ + $ZnCl_2$ at 200–240° yields (21) cf. (22) tetrachlorophthalyl (di)chloride but whether the *unsym.* or *sym.* forms or their mixture is not stated. — Note also that with abs. EtOH the *unsym.* acid chloride yields (19) *pseudo* diethyl tetrachlorophthalate, tbls. from alc., m.p. 126° (19), while the *sym.* acid chloride gives (19) *sym.* diethyl tetrachlorophthalate, m.p. 60.5° (19).]

[$\bar{C}$ with 2 moles PCl_5 in s.t. at 200° for 5–6 hrs. yields (10) a prod. (regarded as either 1,1,3,3,4,5,6,7-octachlorophthalide or 2-(trichloromethyl)-3,4,5,6-tetrachlorobenzoyl chloride), cryst. from ether, m.p. 140° (10), and practically unaffected by warm alc. KOH.]

[$\bar{C}$ with arom. hydrocarbons + $AlCl_3$ yields corresp. *o*-aroyl-tetrachlorobenzoic acids: e.g., $\bar{C}$ with C_6H_6 + $AlCl_3$ (23) (24) (25) or $\bar{C}$ with C_6H_5MgBr (26) gives 2-benzoyl-3,4,5,6-tetrachlorobenzoic acid [Beil. X-750], ndls. from 80% AcOH or C_6H_6, m.p. 201° (24), 200° (23), 188–189° (26), which on ring closure with 20 pts. conc. H_2SO_4 at 200° for 5 min. (23) gives 1,2,3,4-tetrachloroanthraquinone [Beil. VII-789], gold-yel. lfts., m.p. 191° (23). — $\bar{C}$ with toluene + $AlCl_3$ gives (yields: 100% (27), 95% (28), 94% (29)) 2-(*p*-toluyl)-3,4,5,6-tetrachlorobenzoic acid, cryst. from C_6H_6, m.p. 174.5° cor. (29), 172° (28) (30) (the value of 142° (27) may be a misprint for 172°), which on ring closure with 12 pts. $H_2SO_4.H_2O$ at 190–200° for 2 min. (27) or with 9 pts. fumg. H_2SO_4 (2% SO_3) at 120–130° for 30 min. (28) gives (21% yield (28)) 2-methyl-5,6,7,8-tetrachloroanthraquinone, yel. ndls from toluene, m.p. 195–196° (27), or from EtOAc, m.p. 192° (28) — For corresp. reactns. of $\bar{C}$ with *o*-xylene (1:7430), *m*-xylene (1:7420), *p*-xylene (1:7415), and ethylbenzene (1:7410) and use in identif. of these cpds. see (7). — For reactn. of $\bar{C}$ with α-naphthyl MgBr, *p*-methoxyphenyl MgBr, or *p*-bromphenyl MgBr yielding corresp. *o*-aroyl-tetrachlorobenzoic acids see (26).]

[$\bar{C}$ with chlorobenzene (3:7903) + $AlCl_3$ at 140° for 3 hrs. gives (92% yield (31)) 2-(*p*-chlorobenzoyl)-3,4,5,6-tetrachlorobenzoic acid, cryst. from AcOH, m.p. 162–165° (31), which with conc H_2SO_4 at 140° for 30 min. gives 2,5,6,7,8-pentachloroanthraquinone, yel. cryst. from AcOH, m.p. 192° (31). — For corresp. reactns. of $\bar{C}$ with *p*-dichlorobenzene (3:0980), with 1,2,4-trichlorobenzene (3:6120), or with nitrobenzene see (31).]

[$\bar{C}$ with phenols and appropriate condensing agents gives two different types of reactns. according to circumstances, viz., formation of corresp. *o*-hydroxyaroyltetrachlorobenzoic acids (cf. above) or of corresp. tetrachlorophthaleins. — E.g., $\bar{C}$ with 1 mole phenol + $AlCl_3$ in acetylene tetrachloride at 125° for 3 hrs gives (yields: 79% (32), 82% (33)) 2-(o-hydroxybenzoyl)-3,4,5,6-tetrachlorobenzoic acid [Beil. X$_1$-(470)], lfts. from xylene/AcOH, m.p. 216–218° cor. (32), 210° (33), which with boilg. NaOH loses HCl and ring-closes to 2,3,4-trichloroxanthonecarboxylic acid-1 [Beil. XVIII$_1$-(499)], colorless ndls. from alc., m.p. 261–264° cor. (32), 262–265° dec. (33). — For corresp. reactns. of $\bar{C}$ with

o-cresol (1:1400) (32) (34), *m*-cresol (1:1730) (32), *p*-cresol (1:1410) (32), α-naphthol (1:1500) (38), β-naphthol (1:1540) (32), anisole (1:7445) (34) see indic. refs., with hydroquinone (1:1590) + $AlCl_3$ + NaCl at 150–155° for 1½ hrs. giving 82% yield 2-(2′,5′-dihydroxybenzoyl)-3,4,5,6-tetrachlorobenzoic acid, m.p. 231°, or on further htg. in the above melt at 210–215° for 1 hr. ring closing to 1,4-dihydroxy-5,6,7,8-tetrachloroanthraquinone, red cryst. from xylene, m.p. 247°, see (35). — However, C̄ with 2 moles phenol in pres. of fumg. H_2SO_4 (20% SO_3) as directed (8) (36) gives 65% yield phenoltetrachlorophthalein [Beil. XVIII-148, $XVIII_1$-(375)], m.p. 316–317° dec. (36), accompanied by about 10% (37) of 3′,4′,5′,6′-tetrachlorofluoran [Beil. XIX-148, XIX_1-(676)], colorless pr. from C_6H_6, m.p. 298° dec. (33), 290–291° (37) (for sepn. of this by-prod. from the phenoltetrachlorophthalein see (37)). — For condens. of C̄ with *o*-cresol (1:1400) to *o*-cresoltetrachlorophthalein see (45); with resorcinol (1:1530) to 3′,4′,5′,6′-tetrachlorofluorescein [Beil. XIX-227, XIX_1-(722)] see (10) (9).]

[For condens. of C̄ with *m*-diethylaminophenol see (39); with *N*-aryl-*m*-aminophenols in prepn. of phthalein dyes see (40); for condens. of C̄ with hydroxyisodibenzanthrone in prepn. of vat dyes see (41); for use of C̄ as textile softener see (42).]

[C̄ with steam passed over cat. at 380–420° loses CO_2 presumably yielding (43) 2,3,4,5-tetrachlorobenzoic acid [Beil. IX-346], m.p. 186°.]

C̄ on fusion and treatment with NH_3 gas (10) (4), or on warming with formamide (2), or on fusion with $(NH_4)_2CO_3$ (47) gives (yields: 91% (2), 90% (47)) tetrachlorophthalimide [Beil. XXI-505, XXI_1-(391)], lfts. from AcOH, dimethylaniline or nitrobenzene, m.p 338–339° cor. (2), 336–337° (47); for reactn. of this prod. with KOMe forming K tetrachlorophthalimide and use of latter in identification of alkyl halides, etc., see (47). — [For reactn. of C̄ with hydrazine hydrate in dil. alc. yielding *N*-aminotetrachlorophthalimide, ndls. from AcOH, m.p. 288° dec., see (48); for reactn. of C̄ with hydroxylamine in aq. and in MeOH see (49). — C̄ in boilg. AcOH treated with aniline yields (2) cf. (50) *N*-phenyltetrachlorophthalimide (tetrachlorophthalanil) [Beil. XXI-505, XXI_1-(391)], m.p. 274–275° cor. (2). — For reactn. of C̄ with *o*-phenylenediamine see (6).]

C̄ on warming with aq., or with aq. alk. followed by acidification, yields tetrachlorophthalic acid (3:4946) q.v. [For use of differential hydrolysis of C̄ in sepn. from 3,4-dichlorophthalic anhydride (3:3695), 3,6-dichlorophthalic anhydride (3:4860), or 4,5-dichlorophthalic anhydride (3:4830) see under these cpds.]

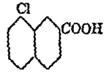
3:4948 8-CHLORONAPHTHOIC ACID-2 $C_{11}H_7O_2Cl$ Beil. IX - 662
IX_1—



M.P. 260° (1)

Fine ndls. best purified by sublimation (1)

[For prepn. of $\bar{C}$ from 8-aminonaphthoic acid-2 [Beil. XIV-536] via diazotization and use of Cu_2Cl_2 reactn. see (1).]

Salts. (1). $Ca\bar{A}_2.7H_2O$; $Ba\bar{A}_2.6H_2O$; both spar. sol. cold aq. but eas sol. hot aq.

$\bar{C}$ with Cl_2 in AcOH contg. I_2 yields (1) 5,8-dichloronaphthoic acid-2 [Beil. IX-662], ndls. from alc., m.p. 287° (1) (ethyl ester, m.p. 64–65° (1)).

—— Methyl 8-chloro-2-naphthoate: unreported.

Ⓓ Ethyl 8-chloro-2-naphthoate: lfts. from alc., m.p. about 29° (1). [From $\bar{C}$ in EtOH with dry HCl gas (1).]

3:4948 (1) Ekstrand, *J. prakt. Chem.* (2) 43, 417–418, 421 (1891).

3:4950 3,5-DICHLORO-4-HYDROXYBENZOIC ACID $C_7H_4O_3Cl_2$ Beil. X - 176
X_1-(78)

M.P. 268–269° cor.	(1)
265° cor.	(2)
265°	(3)
259–260°	(4)
257–258.5°	(5)
255–256°	(6) (9)

White ndls. from dil. alc. or dil. AcOH; spar. sol. cold but more sol. hot aq; eas. sol. alc., ether; sublimes at 250–260° (7) without appreciable decompn. (6).

[For prepn. of $\bar{C}$ from *p*-hydroxybenzoic acid (1:0840) in 10% AcOH (1) or in aq. KOH (3 moles) (7) with Cl_2, or on htg. with $SbCl_5$ (4 moles) (6) or with 30% H_2O_2 + HCl as directed (80% yield (8)) see indic. refs.; from 3-sulfo-4-hydroxybenzoic acid in aq. with

Cl_2 see (9); from potassium 2,6-dichlorophenolate with CO_2 at 140° see (7); from ethyl 3,5-dichloro-4-hydroxybenzoate (see below) by hydrolysis with 35% aq. KOH (5) or with Claisen's alk. (95% yield (1)) see indic. refs.; from 3,5-dichloro-4-methoxybenzoic acid with 45% HI for 15 hrs. in s.t. at 130–140° see (3) (2).]

$\bar{C}$ on htg with CaO (4) (7), or with dimethylaniline at 190° (78% yield (1)), or with quinoline at 190–200°·(80–85% yield (10)) loses CO_2 giving 2,6-dichlorophenol (3:1595).

$\bar{C}$ in conc. aq. soln. gives with $FeCl_3$ a brown ppt. (4).

[$\bar{C}$ on electrolytic reduction in aq./alc./H_2SO_4 gives (11) 3,5-dichloro-4-hydroxybenzyl ethyl ether [Beil. VI-898], m.p. 86° (11); for prepn. and study of thermal rearr. of the crotyl ether of $\bar{C}$ see (1).]

Ⓓ **Methyl 3,5-dichloro-4-hydroxybenzoate:** ndls. from dil. alc. or lgr., m.p. 124° (3), 122° (12), 121–122° (4) (5). [From $\bar{C}$ in MeOH by satn. with HCl gas (3) (4); also from methyl *p*-hydroxybenzoate (1:1549) with SO_2Cl_2 (2 moles) (5).] [This prod. with acetyl chloride yields (5) corresp. acetate, lfts. from MeOH, m.p. 70–71° (5), 68–69° (4).]

Ⓓ **Ethyl 3,5-dichloro-4-hydroxybenzoate:** ndls. of monohydrate, m p. 108–116° cor. (1), 116° (5) from 80% alc.; after long drying in vac. over P_2O_5 lose aq. yielding anhydrous ester, m.p. 111–112° cor. (1); note that this ester is extracted from ether soln. by aq. $NaHCO_3$ and is also titratable with stand. alk. (Neut. Eq. of monohydrate 253). [From ethyl *p*-hydroxybenzoate (1:1534) with excess SO_2Cl_2 (5) in 85% yield (1).]

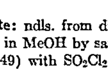
3:4952 5-CHLORONAPHTHOIC ACID-2 $C_{11}H_7O_2Cl$ Beil. IX - 662 IX_1—



M.P. 270° cor. (1)
263° (2)

Ndls. from alc. or AcOH. — Sol. in hot alc., in C_6H_6 or AcOH. — Sublimes in ndls. even below m.p.

[For prepn. of $\bar{C}$ from 5-amino-2-naphthoic acid [Beil. XIV-536] via diazotization and use of Cu_2Cl_2 reactn. see (2); from 5-chloro-2-naphthonitrile (below) by hydrolysis in AcOH/H_2SO_4/aq. medium (alm. 100% yield (1)) or with alc. KOH (2) see indic. refs.]

$\bar{C}$ with PCl_5 yields (1) 5-chloro-2-naphthoyl chloride, m.p. 89° cor., sol. in pet. eth. or C_6H_6, but only very slowly hydrolyzed by aq. even on htg. (1).

$\bar{C}$ on mononitration by soln. in excess conc. HNO_3 ($D = 1.42$) yields (2) on cooling 5-chloro-*x*-nitronaphthoic acid-2, ndls. from AcOH, m.p. 271° (ethyl ester, m.p. 118°); $\bar{C}$ on dinitration with red fumg. HNO_3 + a little conc. H_2SO_4 yields (1) 5-chloro-*x,y*-dinitronaphthoic acid-2, ndls. from AcOH, m.p. about 243° (ethyl ester, m.p. 132°); $\bar{C}$ on trinitration by conversion to mononitro-$\bar{C}$ (above) and treatment with excess fumg. HNO_3 + conc. H_2SO_4 yields (1) 5-chloro-*x,y,z*-trinitronaphthoic acid-2, yel. cryst. from AcOH, m.p. 260–261° dec. (ethyl ester, m.p. 188°).

Salts (2) $Na\bar{A}.2H_2O$ sol. aq.; $Ca\bar{A}_2.3\frac{1}{2}H_2O$, sol. in 4430 pts. cold aq.; $Ba\bar{A}_2.4\frac{1}{2}H_2O$, very spar. sol. cold aq.

Ⓓ Methyl 5-chloro-2-naphthoate: m p. 81° cor. (1). [From $\bar{C}$ in MeOH with conc. H_2SO_4 (90% yield (1)).]

Ⓓ Ethyl 5-chloro-2-naphthoate: ndls. from alc., m p. 45° (2).

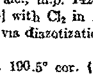
—— 5-Chloro-2-naphthonitrile: ndls. from alc., m.p. 142° cor. (1), 144° (2). [From 2-naphthonitrile [Beil IX-659, IX_1-(277)] with Cl_2 in AcOH contg. I_2 (2) or from 5-amino-2-naphthonitrile [Beil. XIV-536] via diazotization and use of Cu_2Cl_2 reactn. (28% yield (1)).]

—— 5-Chloro-2-naphthoamide: ndls, m.p. 190.5° cor. (1), 186–187° (2). [From 5-chloro-2-naphthonitrile (above) by hydrol. with alc. KOH (1) (2) or from acid chloride (above) with 4 pts. conc. aq NH_4OH for 2 hrs at ord. temp. (80% yield (1)).]

Ⓓ 5-Chloro-2-naphthoanilide: m.p 202.5° cor (1). [From the acid chloride (above) with 3 pts. aniline at 100° (90% yield (1))]

3:4952 (1) Goldstein, Matthey, *Helv Chim Acta* **21**, 65–66 (1938). (2) Ekstrand, *J. prakt. Chem* (2) **43**, 411–417 (1891).

3:4960 5-CHLOROISOPHTHALIC ACID (5-Chlorobenzenedicarboxylic acid-1,3) $C_8H_5O_4Cl$ Beil. IX - 838 IX_1—



M.P. 278° (1)

$\bar{C}$ cryst. from aq. in ndls. which even after drying over conc. H_2SO_4 cont. ½ mole H_2O; this water is lost, however, on htg. at 120° (1). — $\bar{C}$ is sol. at 15° in 3450 pts. aq. (1).

[For prepn. of $\bar{C}$ from 5-aminobenzenedicarboxylic acid-1,3 (5-aminoisophthalic acid) [Beil XIV-556, XIV_1-(636)] via diazotization and htg. sepg. diazonium salt with strong HCl see (1); from 5-chloro-3-methylbenzoic acid (3:4715) by oxidn. with $KMnO_4$ in dil. aq. KOH see (2).]

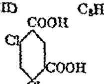
Salts. $Na_2\bar{A}$, $K_2\bar{A}$, eas. sol. aq. or alc.; $Ag_2\bar{A}$, ndls from aq.; $Mg\bar{A}$, $7H_2O$; $Ca\bar{A}$, $2H_2O$, sol. at 15° in 28 pts. aq.; $Sr\bar{A}$, H_2O, sol. at 15° in 108 pts. aq.; $Ba\bar{A}$, $2H_2O$ sol. at 15° in 71 pts. aq.; $Cd\bar{A}$, sol. at 15° in 330 pts. aq. (for details see (1)).

—— *Dimethyl 5-chloroisophthalate:* unrecorded.

Ⓓ Diethyl 5-chloroisophthalate: pr. from alc., m.p. 45° (1). [From $\bar{C}$ in EtOH with HCl gas (1).]

3:4960 (1) Beyer, *J. prakt. Chem.* (2) **25**, 506–515 (1882) (2) Klages, Knoevenagel, *Ber.* **28**, 2045–2046 (1895).

3:4965 4,6-DICHLOROISOPHTHALIC ACID (4,6-Dichlorobenzenedicarboxylic acid-1,3) $C_8H_4O_4Cl_2$ Beil. IX - 838 IX_1—



M.P. 279–281° (1)
280° u.c. (2)

Colorless ndls. from hot aq or dil. alc.; eas. sol. alc., ether, $CHCl_3$; insol. cold aq.

[For prepn. of $\bar{C}$ from 4,6-dichloro-1,3-dimethylbenzene [Beil. V-373, V_1-(291)] by

oxidn. with 20 pts. HNO_3 (D = 1.18) in s.t. at 220° for several hrs. (2) or with CrO_3/AcOH (2) see indic. refs.; from 1,3-dimethylbenzene-4,6-*bis*-(sulfonyl chloride) (1) with $SOCl_2$ in s.t. at 240° for 36 hrs. see (1).]

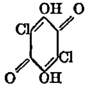
$Ag_2\bar{A}$, white ppt. (2), $Ba\bar{A}$, H_2O spar. sol. cold aq. but eas. sol. hot aq. (2).

Ⓓ **Dimethyl 4,6-dichloroisophthalate**: cryst. from dil. MeOH, m.p. 97–98° (1). [From $\bar{C}$ in MeOH on htg. (1).]

Ⓓ **4,6-Dichloroisophthaldianilide**: m.p. 205° (1). [From $\bar{C}$ on htg. with aniline (1).]

3:4965 (1) Pollak, Rudich, *Monatsh.* **43**, 221 (1922). (2) Claus, Burstert, *J. prakt. Chem.* (2) **41**, 558–560 (1890).

3:4970 2,5-DICHLORO-3,6-DIHYDROXY-BENZOQUINONE-1,4 $C_6H_2O_4Cl_2$ Beil. VIII - 379
(Chloranilic acid) $VIII_1$—



M.P. 283–284° s.t. (1)
282–284° s.t. (2)

Lustrous *red* lfts. with $2H_2O$ (3) (4) (lost at 100° or slowly on stdg. over conc. H_2SO_4 (3) (4)). — $\bar{C}$ on slow heating (even in s.t.) sublimes without melting; in s.t. inserted in bath or block preheated to about 278°, however, melts as stated above (1).

[For prepn. of $\bar{C}$ from chloranil (tetrachlorobenzoquinone-1,4) (3:4978) by actn. of dil. NaOH at 70–80° see (3) (2); for other methods see Beil. VIII-379.]

$\bar{C}$ is sol. in aq. yielding violet-red solns.; at 13.5 g. 100 pts. aq. dis. 0.19 pt., at 99° 1.4 pt. anhyd. $\bar{C}$ (3); addn. of HCl or H_2SO_4 ppts. $\bar{C}$ decolorizing soln. (5).

$\bar{C}$ behaves as strong dibasic ac. forming stable Na, K, Ba, Ag salts. — $Na_2\bar{A}.4H_2O$, dark red (7) triclinic (8) pr. sepg. on rapid cooling of warm soln. to 18° (6); loses $2H_2O$ over H_2SO_4 and becomes anhyd. at 110° (7). — $Na_2\bar{A}.3H_2O$, black cryst. sepg. from soln. above 35° (6). — $Na_2\bar{A}$; 100 pts. aq. at 21° dis. 1.06 g., at 99° 6.19 g. (3). — $Ag_2\bar{A}$, red ppt. spar. sol. aq. (8a).

$\bar{C}$ htd. in s.t. with conc. H_2SO_3 soln. for some hrs. (9) or treated with Sn + HCl (9) or Na/Hg (9) yields 3,6-dichloro-1,2,4,5-tetrahydroxybenzene (hydrochloranilic acid) [Beil. VI-1156], colorless cryst., no m.p. recorded but with AcCl in s.t. at 100° yielding tetra-acetyl deriv., colorless ndls. from alc. or by subl., m.p. 235° (9). [Use of insufficient SO_2 for reduction of $\bar{C}$ leads to pptn. of corresp. quinhydrone, fine black ndls. (9).] [For studies of oxidn.-reductn. potential of $\bar{C}$ see (2) (10) (11).]

$\bar{C}$ with alk. + I_2 — KI soln. yields (12) iodoform, m.p. 119°.

Ⓓ **2,5-Dichloro-3,6-dimethoxybenzoquinone-1,4** (dimethyl chloranilate) [Beil. VIII-380]: from $Ag_2\bar{A}$ + CH_3I (13) or from anhydrous $K_2\bar{A}$ + Me_2SO_4 (14); red pr. from C_6H_6 or $CHCl_3$, m.p. 141–142° (13) (14).

Ⓓ **2,5-Dichloro-3,6-diacetoxybenzoquinone-1,4** (chloranilic acid diacetate) [Beil. VIII-381]: from finely pdrd. $Ag_2\bar{A}$ + AcCl in dry ether (15); yel. ndls., m.p. 182.5° (15).

[*See also tetrachlorohydroquinone* (3:4941).]

Golden-yellow cryst. from AcOH, acetone, C_6H_6, toluene, or by sublimation. — For crystallographic data see (13) (14) (15).

$\bar{C}$ on careful htg. sublimes without melting (16); for purification of $\bar{C}$ by sublimation (4) under reduced press. (17) (18) see indic. refs.; for study of sublimation press. of $\bar{C}$ see (19).

$\bar{C}$ is insol. aq.; alm. insol. in cold alc.; sparingly sol. hot alc. but somewhat more readily in ether; $\bar{C}$ is sparingly sol. $CHCl_3$, CCl_4, CS_2; insol. lgr.

[For study of heat of formn. of $\bar{C}$ see (20); for studies of heat of combustion see (21) (22).]

[For studies of bactericidal properties of $\bar{C}$ (23) or toxicity of $\bar{C}$ (or its associated by-products or contaminants) (24) (25) (26) see indic. refs.]

$\bar{C}$ comprises the essential constituent (99% (27)) of the commercial fungicide "Spergon" [for studies on use of $\bar{C}$ as (seed) fungicide see (27) (28) (29) (30) (31) (32); for studies on toxicity of $\bar{C}$ in such use see (33)].

PREPARATION OF $\bar{C}$

$\bar{C}$ because of its great resistance to further oxidation is formed as the end product of the oxidation with *HCl + $KClO_3$* of a *very large number of aromatic organic compounds* [e.g., for a list of 16 such which do and 31 which do not give $\bar{C}$, see (34); for extension to 130 cases which do, see (35) cf. (36).]

$\bar{C}$ can also be prepared by a very large number of methods (see below): of these the best appear to be those from benzoquinone-1,4 (1:9025) using conc. HCl + 30% H_2O_2 at 60° (97% yield (37)) cf. (38), and from *p*-aminophenol by conversion with SO_2Cl_2 (10 moles) at 70° (6) or at 40–45° for 4 days (73% yield (1)) to *N,N*-dichloro-2,3,5,6-tetrachloro-4-aminophenol, m.p. 71.5° (6), and reaction of the latter with boilg. EtOH (1) (6) in pres. of an inert solvent (39) to give (80–85% overall yield from *p*-aminophenol (1)) of $\bar{C}$ of exceptional purity and free from 2,3,5-trichlorobenzoquinone-1,4 (3:4672).

From Various Phenols

From phenol. [For prepn. of $\bar{C}$ from phenol (1:1420) with conc. HNO_3 + fumg. HCl (i.e., with aqua regia) on htg. in open flask in direct sunlight (25% yield (17)) (40), or in fumg. HCl with Cl_2 followed by htg. with conc. HNO_3 at 100° for 20 hrs. (34% yield (17)) cf. (40), by electrolysis in HCl/AcOH (41), or by action of conc. HCl + $KClO_3$ (42) (43) (note, however, that this method gives (17) (44) (45) (46) (47) a product seriously contaminated with 2,3,5-trichlorobenzoquinone-1,4 (3:4672) q.v.) see indic. refs. — For prepn. of $\bar{C}$ from phenol-contg. industrial waste waters with Cl_2 in alk. soln. followed by oxidn. with HNO_3 see (48) (49) (50) (51) (52).]

From various halophenols. *From 2,4,6-trichlorophenol.* [For prepn. of $\bar{C}$ from 2,4,6-trichlorophenol (3:1673) with $ClSO_3H$ (53), with Cl_2 + fumg. H_2SO_4 followed by $ClSO_3H$ *(90% yield (54)), with aqua regia (17) (40), with HCl + $KClO_3$ (42) (55), with CrO_3/AcOH* (15), or with $K_2Cr_2O_7/H_2SO_4$ (15) see indic. refs. — Note also that many of the processes starting from phenol (above) doubtless pass through 2,4,6-trichlorophenol]

From pentachlorophenol. [For prepn. of $\bar{C}$ from pentachlorophenol (3:4850) with $ClSO_3H$ (53) (54), with cold fumg. HNO_3 (56) (57) (58), or with Cl_2 + conc. HCl at 100° (58) see indic. refs.]

From "hexachlorophenol." [For formn. of $\bar{C}$ from "hexachlorophenol" (hexachlorocyclohexadien-1,4-one-3) (3:3180) with conc. (68) or fumg. (69) HNO_3, with conc. H_2SO_4 at 100° (68) (69), with aq or HCl in s.t. at 160° (69), or with $AlCl_3$ (1/6 mole) in s.t at 160° (70) see indic. refs.]

From 2,4,6-triiodophenol. [For prepn. of $\bar{C}$ from 2,4,6-triiodophenol with Cl_2 in boilg. AcOH soln. (100% yield) see (10).]

From various nitroso- and nitro-phenols. [For prepn. of $\bar{C}$ from *p*-nitrosophenol in conc. HCl at 90° with Cl_2 see (59).]

[For formn. of $\bar{C}$ from *o*-nitrophenol (17) (40) (60), *p*-nitrophenol (17) (40) (60), 2,4,6-*trinitrophenol (picric acid) (17) (40) (61) with aqua regia, or from picric acid with Cl_2* (61) or Cl_2 + I_2 (62) in hot aq. soln., or from picric acid with HCl + $KClO_3$ (42) (47) see indic. refs.; for formn. of $\bar{C}$ from *p*-nitrophenol or 2,4-dinitrophenol with aq. NaOCl soln. see (63).]

From polyhydric phenols. *From resorcinol.* [For formn. of $\bar{C}$ from resorcinol (1:1530) with $ClSO_3H$ (40 wt. pts.) at 150–160° for 25 hrs. (note that much 2,3,5-trichlorobenzoquinone-1,4 (3:4672) is also formed) see (64) cf. (54).]

From hydroquinone. [For formn of $\bar{C}$ from hydroquinone (1:1590) with Cl_2 in AcOH (5), with Cl_2 + conc. HCl at 100° (65) (53), with aqua regia (4), with $ClSO_3H$ at 150–160° (8) see indic. refs.; for formn. of $\bar{C}$ from hydroquinone-pyridinium chloride with $SOCl_2$ (2) or from hydroquinone-2,6-*bis*-(sulfonyl chloride) with PCl_5 in s.t. at 140–150° for 6 hrs. (67) see indic refs.]

From pyrogallol. [For formn. of $\bar{C}$ from pyrogallol (1 1555) with $ClSO_3H$ at elevated temp. see (66)]

From various quinones. *From p-benzoquinone.* [For formn. of $\bar{C}$ from benzoquinone-1,4 (1.9025) with Cl_2 in conc. HCl (53) (65) with Cl_2 in AcOH (71) cf. (72), or with HCl + $KClO_3$ (42) see indic refs]

From the dichloro-p-benzoquinones. [For formn. of $\bar{C}$ from 2,3-dichlorobenzoquinone-1,4 (3:2855), from 2,5-dichlorobenzoquinone-1,4 (3:4470), or from 2,6-dichlorobenzoquinone-1,4 (3:3750) with Cl_2 in $CHCl_3$ see (73).]

From trichloro-p-benzoquinone. [For formn. of $\bar{C}$ from 2,3,5-trichlorobenzoquinone-1,4 (3:4672) with $Cl_2 + I_2$ + aq (47), or with Cl_2 + HCl (65), see indic. refs]

From various amines. [For formn. of $\bar{C}$ from aniline in 10% HCl by electrolytic oxidation (23% yield (9)) (74), with HCl + $KClO_3$ (75) (76), with $Na_2Cr_2O_7$ + HCl (89), or with aqua regia (60) see indic. refs. — For formn. of $\bar{C}$ from diphenylamine, 2,4-dichloroaniline, *m*-nitroaniline, aniline black, or phenylhydrazine with aqua regia see (60).]

[For formn. of $\bar{C}$ from *p*-phenylenediamine with aqua regia (60) (4), with $ClSO_3H$ (large excess) at 150–160° for 5 hrs. (77), with Cl_2 in AcOH (78), or with HCl + $KClO_3$ (3) see indic. refs.; from 2,6-dichloro-*p*-phenylenediamine with HCl + $KClO_3$ see (79).]

[For formn. of $\bar{C}$ from *o*-aminobenzoic acid (anthranilic acid) (42) (80), *m*-aminobenzoic acid (80), *p*-aminobenzoic acid (80), *l*-tyrosine (α-amino-β-(*p*-hydroxyphenyl)propionic acid) (81) with HCl + $KClO_3$ see indic. refs.; from sulfanilic acid (aniline-*p*-sulfonic acid) with aqua regia see (60).]

[For formn. of $\bar{C}$ from 2,3,5,6-tetrachloro-*p*-phenetidine by diazotization and boilg. see (82).]

From miscellaneous sources. [For formn. of $\bar{C}$ from 1,2,4,5-tetrachlorobenzene (3:4115) as by-product of nitration with fumg. HNO_3 see under (3:4115); from hexachlorobenzene (3:4939) on boilg. with mixt. of fumg. HNO_3 + conc. H_2SO_4 see (83); from *N*-nitro-2,4,6-trichloroaniline in dil alc. or AcOH soln. with HCl or H_2SO_4 see (84); from *N*-nitro-acet-2,3,5,6-tetrachloroanilide on boilg. in toluene or xylene see (85); from tetrachlorobenzoquinone-1,4-mono-(2,4,6-trichlorophenylimide) by H_2SO_4 hydrolysis see (86); from various azo dyes by oxidn. with NaOCl soln. at 0° see (87); from anisolesulfonic acid or phenetolesulfonic acid in aq. soln. with Cl_2 see (88); from nitrobenzene with $ClSO_3H$ (20 wt. parts) at 150° for 20 hrs. (95% yield) see (7)]

CHEMICAL BEHAVIOR OF $\bar{C}$

Reduction of $\bar{C}$

$\bar{C}$ upon reduction by a wide variety of reagents gives tetrachlorohydroquinone (3:4941) the text of which should be consulted for details.

Oxidation of $\bar{C}$

$\bar{C}$ is extremely stable to oxidizing agents in neutral or acid soln. and is unaffected by aqua regia or hot conc. HNO_3.

Behavior with Chlorine

[C̄ with MnO_2 + conc. HCl in s.t. at 180° for 10 hrs. adds 1 mole Cl_2 giving (45) hexachlorocyclohexen-2-dione-1,4 [Beil. VII-574], m.p. 89° (45).]

Behavior with Other Inorganic Reactants

In many of the reactions of C̄ with other reagents, 2 of the chlorine atoms are often replaced by other groups as exemplified below.

With aqueous alkali. C̄ with dil. aq. alk. at 70–80° readily replaces 2 chlorine atoms by hydroxyls giving (16) (3) (90) (91) (92) 2,5-dichloro-3,6-dihydroxybenzoquinone-1,4 (chloranilic acid) (3:4970), m.p. 282–284° s.t. (92).

With ammonia. [C̄ with alc. NH_3 on boilg. replaces 2 chlorine atoms by amino groups giving (75% yield (103)) (93) (94) 2,5-dichloro-3,6-diaminobenzoquinone-1,4 (chloroanilamide) [Beil. XIV-144]. — Note, however, that C̄ with aqueous NH_4OH gives (16) 2,5-dichloro-3-amino-6-hydroxybenzoquinone-1,4 (chloranilamic acid) [Beil. XIV-250]]

With various salts. [C̄ with sodium azide as directed (95) (96) gives 2,5-dichloro-3,6-*bis*-azidobenzoquinone-1,4. — C̄ with $NaNO_2$ (2 moles) in conc. aq. soln. on warming gives (97) cf. (98) 2,5-dihydroxy-3,6-dinitrobenzoquinone-1,4 (nitranilic acid) [Beil. VIII-384, $VIII_1$-(683)]. — C̄ with KCN (2 moles) in 85% MeOH gives (99) 2,5-dihydroxy-3,6-dicyanobenzoquinone-1,4 (cyananilic acid) [Beil. X_1-(520)].]

[C̄ with warm dilute aq. acid $KHSO_3$ gives mainly (100) (101) the salt of 2,5-dichloro-3,6-disulfohydroquinone [Beil. XI-301], while with conc. solns. (100) or with neutral K_2SO_3 (101) (102) the main prod. is the salt of thiochronic acid [Beil. XI-302, XI_1-(80)], now (102) recognized as cyclohexadien-2,5-ol-4-one-1-pentasulfonic acid-2,3,4,5,6.]

With PCl_5. [C̄ with PCl_5 + PCl_3 in s.t. at 190–200° for 4 hrs. gives (95% yield (104)) cf. (43) hexachlorobenzene (3:4939); note also, however, that C̄ with PCl_5 + PCl_3 at 135–140° followed by treatment with aq. may also yield (45) (105) mono-(pentachlorophenyl)-phosphoric acid (monohydrate), m.p. 224° (105), and other products.]

Behavior of C̄ with Organic Reactants

With aromatic hydrocarbons. [C̄ with various aromatic hydrocarbons yields addition compounds: e.g., C̄ with 1,2,4,5-tetramethylbenzene (durene) (1:7195) in hot AcOH gives (106) (107) a red cpd. C̄.2 durene; C̄ with hexamethylbenzene (1:7265) gives from hot AcOH (108) violet-brown ndls. of a 1:1 cpd., m.p. 198–202° (108) (for further study of this prod see (109) (110)); C̄ with acenaphthene (1:7225) gives (111) (112) from AcOH (107) a violet 1:1 addn. cpd.]

With dienes and other unsaturates. C̄ with many dienes and other highly unsaturated compounds forms addn. products and/or gives color reactions.

[C̄ with cyclopentadiene (1:8030) in C_6H_6 in pres. of a little Me_3N gives (113) a 1:1 addn. cpd, yellowish ndls. from abs. alc., m.p. 146–146.5° (113) (corresp. dibromide with Br_2 in $CHCl_3$ in direct sunlight, lfts. from AcOEt, m.p. 269° (113)); note that in absence of Me_3N yield in 14 days is only 40%, in presence of Me_3N 100% (for study of cat. influence of Me_3N and of $CCl_3.COOH$ see (114)).]

[For study of color reactions of C̄ in $CHCl_3$ soln. with various trienes see (115) cf. (116) (117).]

[For studies of influence of C̄ on polymerization of styrene (1:7435) see (118) (119) (120); for study of effect of C̄ on polymerization or depolymerization of natural rubber see (121); for use of C̄ as vulcanization accelerator see (122).]

With *organic OH (or SH) reactants. With alcohols.* [C̄ in boilg. MeOH gradually treated with calcd. amt. 1% MeOH/KOH gives (123) (124) a mixt. of 2,5-dichloro-3,6-

dimethoxybenzoquinone-1,4 (chloranilic acid dimethyl ether) [Beil. VIII-380], dark red pr. from C_6H_6, m p. 141–142° (123), and 2,6-dichloro-3,5-dimethoxybenzoquinone-1,4 (isochloroanilic acid dimethyl ether) [Beil. VIII-387], dark red pr., m.p. 159° (125) (126), 157–158° (123), 155.5° (127). — Note, however, that C̄ with MeOH/NaOMe (5–6 moles) gives 2,5-dichloro-3,6-dimethoxybenzoquinone-1,4-*bis* (monomethyl acetal) [Beil. VIII-381] accompanied by tetrachlorohydroquinone (3:4941).]

With phenols. [C̄ (1 mole) with phenol (2 moles) in aq. KOH at 100° gives (128) 2,5-dichloro-3,6-diphenoxybenzoquinone-1,4 (chloranilic acid diphenyl ether) [Beil. VIII-380], dark red pr. from C_6H_6, m p. 243° (128). — C̄ (1 mole) with aq. K *p*-cresolate (2 moles) at 100° gives (129) 2,5-dichloro-3,6-di-(*p*-toloxy)benzoquinone-1,4 (chloranilic acid di-*p*-tolyl ether) [Beil. $VIII_1$-(681)], cryst. from toluene, m.p. 254–255° (129)]

With mercaptans. [C̄ (1 mole) with EtSH (4 moles) with EtOH/KOH (4 moles) as directed gives (95% yield (130)) 2,3,5,6-tetra-*kis*-(ethylthio)benzoquinone-1,4 [Beil. VIII-535], dark green ndls from alc., m.p. 90–91° (131).]

With thiophenols. [C̄ (1 mole) with C_6H_5SH in alk. soln. might be expected to yield 2,3,5,6-tetra-*kis*-(phenylmercapto)benzoquinone-1,4, but neither this reaction nor the expected product appears to have been reported. — However, various analogous cases are known: e.g., C̄ (1 mole) with *p*-thiocresol (4 moles) in AcOH at 100° for ½ hr. gives (132) 2,3,5,6-tetra-*kis*-(*p*-tolylthio)benzoquinone-1,4, cryst. from AcOH, m.p. 203° (132). — C̄ (1 mole) with *o*-nitrothiophenol in boilg. EtOH for 1 hr. gives (96) 2,3,5,6-tetra-(*o*)-nitrophenylmercapto)benzoquinone-1,4, no m.p. given.]

With organic amines. *General.* The behavior of C̄ with aliphatic amines appears to have been little studied from the structural viewpoint. [However, for studies on color reactions of C̄ with *prim.*, *sec.*, and *ter*-amines (or their salts) (133), for use of C̄ (in epichlorohydrin soln.) as a test for plasmochin (134) (135), or for use of C̄ in detection of $MeNH_2$, Me_2NH, or Me_3N and differentiation from NH_3 (136) (137), for use in spot test reactions of 38 different amines (147) see indic. refs.]

With primary aliphatic amines. [C̄ with $MeNH_2$ might be expected to give 2,5-dichloro-3,6-*bis*-(methylamino)benzoquinone-1,4 or even 2,3,5,6-tetra-*kis*-(methylamino)benzoquinone-1,4, but the reaction has not been reported and neither product is known.]

With primary aromatic amines. [C̄ with aniline in boilg. alc. refluxed 30 min gives (81% yield (138)) (100) (93) (139) 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 [Beil. XIV-144, XIV_1-(421)], yel.-br. lfts. from C_6H_6 or nitrobenzene, m p. 292–293° (138), 290° (140), 288–290° (141); note that this product serves as bases for prepn. of many complex dyestuffs which cannot be discussed here. — C̄ with many other homologous and analogous primary aromatic amines behaves similarly.

[C̄ with phenylhydrazine in absol. alc. evolves N_2 and gives (10) a chlorine-contg prod., m.p. 229–230°, of undetermined structure.]

With various organometallic reactants. [C̄ (1 mole) in alc. with diethyl sodiomalonate (4 moles) in C_6H_6 gives (10% yield (142)) tetraethyl 2,5-dichloro-*p*-benzoquinone-3,6-dimalonate [Beil. X-940], yel. ndls. from alc., m.p. 132° (143).]

[For behavior of C̄ with ethyl sodio-acetoacetate see (144) (145), Beil. X-860, and Beil. X-935]

[For behavior of C̄ with excess C_6H_5MgBr see (146).]

Ⓟ Color tests for C̄. Of the large number of color tests shown by C̄ with various reactants, the following have been especially employed as preliminary tests for C̄ itself; note that for details, limitations, etc., the original references should be consulted.

With dimethylaniline. C̄ on warming with dimethylaniline gives intense violet color (Mulliken).

With ethyl cyanoacetate. C̄ with ethyl cyanoacetate (2–3 drops) + excess alc. NH_4OH (2–3 ml. of mixt. of 1 pt. abs. EtOH + 1 pt. conc. NH_4OH) gives intense bluish-violet coloration, changing to blue, green, and finally reddish brown (148). [Note that the reaction is also shown by certain other quinones, e.g., benzoquinone-1,4 (1:9025), *o*-toluquinone, thymoquinone, and naphthoquinone-1,4 (1:9040), but is *not* given by anthraquinone (1:9095), phenanthraquinone (1:9086), naphthoquinone-1,2 (1:9062), or 2,5-dichloro-3,6-diaminobenzoquinone-1,4 (chloranilamide) (148).]

With triphenylphosphine. C̄ with 20% soln. of $(C_6H_5)_3P$ in $CHCl_3$ gives (149) a wine-red color. [Note, however, that a similar behavior is also shown by 2,3,5-trichlorobenzoquinone-1,4 (3:4672) and certain other quinones (149).]

solvents at pressures below 1 atm. see (32) cf. (33); for patent on removal of C̄ from contaminated drinking water by extraction with org. solvents see (34)].

[For technical papers (36) (37) (38) (39) (40) (41) (42) (43) (44) (45) and patents (46) on adsorption of C̄ by various forms of carbon see indic. refs.]

[For influence of C̄ in extinction of H/O flames see (47).]

PHYSIOLOGICAL ASPECTS OF C̄

C̄ is more than ten times as toxic as Cl_2. An atmosphere contg. 1 part by vol. of C̄ in 6000 may cause lung injuries in 2 min., 1 part in 30,000 is very dangerous, and 1 part in 200,000 is probably fatal for exposures of 30 min. The maximum permissible concn. for prolonged exposure is about 1 p.p.m., i.e., 0.004 mg./l. (48).

The least detectable odor of C̄ is 5.6 p.p.m., the least concn. that affects the throat is 3.1 p.p.m., the least concn. that causes irritation of the eyes is 4.0 p.p.m., the least concn. that causes coughing is 4.8 p.p.m. (48) (49). A concn. of 0.02–0.05% is lethal to most animals in a short time, a concn. of 0.0025% is dangerous for exposures of 30–60 min., and the maximum concn. to which animals can be exposed for several hours without serious effects is 0.0001% or 1 p.p.m. (48) (50).

[For report of industrial accidents from C̄ (51), for legal (British) aspects of industrial poisoning by C̄ (52), for toxicology and treatment of poisoning by C̄ (53), for immunization against C̄ (54), for variations in toxicity of C̄ for small animals with duration of exposure (55) see indic. refs.]

[For studies relating to chemical warfare aspects of C̄ with respect to foodstuffs see (56) (57).]

USES OF C̄

Apart from the uses of C̄ as a chemical warfare agent (above), many chemical utilizations are indicated below under its chemical behavior. [In addition will be mentioned here a few further examples as follows: for use of mixt. of C̄ + HF for cracking of hydrocarbon oils see (58); for use as dehydrating agent in conversion of amides to corresp. nitriles see (59); for use in sepn. of Pt metals see (60).]

DETECTION OF C̄

C̄ may be detected by its characteristic odor (see above) and by various color reactions of which the following represent the more important types.

For detection of C̄ by the yellow or orange color produced by reaction with Harrison's reagent (a soln. in EtOH (100 ml.) of *p*-dimethylaminobenzaldehyde [Beil. XIV-31, XIV_1-(360)] (5 g.) (for prepn. see (61)) and of diphenylamine [Beil. XII-174, XII_1-(163)] (5 g.)) see (62) (63) (64) (65) (66) (67) (68) (69) (70) (71) (83); note that this test suffers interference from HCl, Cl_2, $ClSO_3H$, $TiCl_4$, chloromethyl chloroformate (3:5275), diphosgene (3:5515), and triphosgene (3:1915); for application of this reagent in an absorptive tube see (72) cf. (73).

For detection of C̄ by green color imparted to a test paper impregnated with a xylene soln. of 0.5% 6-nitroso-3-dimethylaminophenol (4-dimethylamino-*o*-benzoquinoneoxime-1) [Beil. XIV-131] and a xylene soln. of 0.5% *m*-diethylaminophenol [Beil. XIII-408, $XIII_1$-(130)] see (74) (75) (76).

For spot test detection of C̄ by use of phenylhydrazine cinnamate (for prepn. see (77)) in $CHCl_3$ or CCl_4 followed by treatment with 1% $CuSO_4$ soln. to give a red-violet color from the 1,5-diphenylcarbohydrazide [Beil. XV-292, XV_1-(72)] produced see (78).

For study of detection of C̄ with resorcinol (1:1530) or vanillin (1:0050) see (79); by

indirect use of the Gilman color test for RMgX compounds see (80) cf. (81); for study of utility of various dyestuffs in detection of $\bar{C}$ see (82).

DETERMINATION OF $\bar{C}$

Methods for the quant. detn. of $\bar{C}$ may be classified under three main types according to whether they are based upon hydrolysis, reaction with alkali iodides, or reaction with aniline.

Detn. by methods based on hydrolysis. [For studies of methods based upon alkaline hydrolysis of $\bar{C}$ and subsequent detn. of resultant chloride ion see (83) (84) (85) (86) (87) (88) (89) (90); for especial criticism of this method see (91).]

Detn. by reaction with alkali iodide. [For studies of methods based upon reaction of $\bar{C}$ with NaI (92) (91) or KI (93) in acetone followed by thiosulfate titration of the liberated I_2 see indic. refs.]

Detn. by reaction with aniline. [For study of methods based upon reaction of $\bar{C}$ with aniline and gravimetric estn. of the resultant N,N'-diphenylurea (carbanilide) (94) (95) cf. (91) or titration of the residual aniline HCl in the filtrate (96) see indic. refs.]

Related topics. [For detn. of small amts. Cl_2 in pres. of $\bar{C}$ (97), of HCl in $\bar{C}$ (98) (85), for analysis of mixts. of $\bar{C} + Cl_2 + NOCl$ (99), for anal. of mixts. of $\bar{C}$ with CO, CO_2, Cl_2, CCl_4, C_2Cl_6 (88) (86), for anal. of industrial $\bar{C}$ (89), or for detn. of $\bar{C}$ in air by means of an ultraviolet photometer (R. + H. Tri-Per Analyzer) (100) see indic. refs.]

PREPARATION OR FORMATION OF $\bar{C}$

From CO + Cl_2. The photochemical reaction of CO with Cl_2 to yield $\bar{C}$ was the method by which it was first prepared in 1812 (9) (for extensive history see (10)). Over the years the reaction has been very extensively studied. The more important earlier reports include those of Wilm and Wischin (101), Wildermann (102), Dyson and Hardin (103), Weigert (104), Coehn and Becker (105), Chapman and Gee (106), etc. Since 1920 the number of studies of this reaction has so greatly increased as to preclude in this text any detailed analysis; however, the following references ((107)–(134), incl.) arranged in receding chronology will be found fruitful from one viewpoint or another.

[For studies on formn. of $\bar{C}$ from CO + Cl_2 in dark at 349–452° (135) in liq. medium (145), or over cat. such as Pt at 300–400° (136), activated carbon (6) (137), or $AlCl_3$ at 30–35°, or in $CHCl_3$ soln. (138) see indic. refs. — For formn. of $\bar{C}$ from CO + NOCl over activated carbon at 100–250° see (139) cf. (137).]

[For formn. of $\bar{C}$ from CO passed over heated AgCl (140) (141), over $CuCl_2$, $PbCl_2$, or $NiCl_2$ at 450–750° (141), over heated $AuCl_3$ (142), or through boilg. $SbCl_5$ (143), or over chlorides of Pt metals (144) see indic. refs.]

From various chlorinated hydrocarbons. *From CCl_4.* [For studies on formn. of $\bar{C}$ from CCl_4 (3:5100) during use of latter as fire extinguisher see (146) (84) cf. (147) (368); for patents on repression of formn. of $\bar{C}$ in such use see (148) (149) (150) cf. (368); for formn. of $\bar{C}$ from CCl_4 fire extinguishers on Mg see (151); for phosgene content of smoke from Berger mixt. (Zn + chlorohydrocarbons) see (152).]

[For formn. of $\bar{C}$ from CCl_4 with O_2 in light of 2537 Å (153) or with atomic oxygen (154) see indic. refs.]

[For formn. of $\bar{C}$ from CCl_4 by chemical oxidizing agents such as O_2 over white-hot Pt (155), air over $CuCl_2$ or $FeCl_3$ at elev. temp. (156), GeO_2 (157), chromic acid (1) (158), pyrosulfuryl chloride (1 mole) + sulfuric acid monohydrate (2 moles) on warming (158) (159) (160) (161) (162) (163) see indic. refs.]

[For formn. of $\bar{C}$ from CCl_4 by passing with CO_2 over pumice at 350° (164), by htg. with

ZnO at 200° (164), with P_2O_5 at 200–220° for 2 days (165), or over gypsum at 900° (166), or even by htg. with a little aq. in s.t. at 250° (220) see indic. refs.]

From $CHCl_3$. [For an extensive account of formn. of $\bar{C}$ from $CHCl_3$ (3:5050) by oxidn. in air and light see (167). Note that such oxidn. is not effected by air in absence of light, nor by light in absence of air (168). With limited air in sunlight $CHCl_3$ reacts according to equation $CHCl_3 + O \rightarrow COCl_2 + HCl$, but with excess air in sunlight in sense $2CHCl_3 + 5O \rightarrow 2CO_2 + 3Cl_2 + H_2O$ (169). Note that $CHCl_3$ + air over dry KOH gives some $\bar{C}$ (170). For studies on photochem. oxidn. of $CHCl_3$ (171) in tropical sunlight (172) including search for possible intermediate peroxides (173) (174) see indic. refs. For studies of Cl_2-sensitized photochem. oxidn. of $CHCl_3$ see (175) (176) (177). For oxidn. of $CHCl_3$ by atomic oxygen see (154).]

[For formn. of $\bar{C}$ from $CHCl_3$ (3:5050) by shaking with siloxen + excess O_2 (178), by action of O_3 (179) (180), by passing over CuO at 350–550° (181) or gypsum at 900° (166), with $K_2Cr_2O_7 + H_2SO_4$ (1) (158), with $ClSO_3H$ at 120° (187), or during explosion of $CHCl_3$ with alkali metals (182) see indic. refs.]

From $Cl_2C{=}CCl_2$. [For formn. of $\bar{C}$ from tetrachloroethylene (3:5460) during Cl_2-sensitized photochem. oxidn. see (183) (184) (185).]

From $Cl_2C{=}CHCl$. [For formn. of $\bar{C}$ from trichloroethylene (3:5170) with air or O_3 see (186).]

From various compounds containing the trichloromethyl group. [For formn. of $\bar{C}$ from trichloroacetaldehyde (chloral) (3:5210) by Cl_2-sensitized (188) or Br_2-sensitized (189) photochem. oxidn. with O_2 at 70–90°, with Cl_2 in sunlight (190), or with $AlCl_3$ on warming (191) see indic. refs.]

[For formn. of $\bar{C}$ from trichloroacetic acid (3:1150) on htg. with $ZnCl_2$ (192), on illuminating dry acid in pres. of air (193), or on electrolysis of aq. soln. (194) see indic. refs.; from trichloroacetyl chloride (3:5420) at 600° (195); from trichloroacetonitrile in air (196); from trichloroacetyl hydrogen peroxide on warming (200); from trichlorobromomethane + Br_2 + O_2 in light (197) see indic. refs.]

[For formn. of $\bar{C}$ from di-(trichloromethyl) carbonate (triphosgene) (3:1915) on distn. (198), htg. at 200° in s.t. (199), or on mixing with charcoal and htg. just above m.p. (78°) (198) see indic. refs.; from trichloromethyl chloroformate (diphosgene) (3:5515) on htg. above 300° (200) (209) or on contact with activated carbon, charcoal, or iron oxide at ord. temp. (198); from methyl trichloromethyl carbonate [Beil. III-17, III_1-(8), III_2-(15)], b.p. 57–58° at 17 mm. (204), D_4^{17} = 1.5228 (204), n_D^{17} = 1.4487 (204), on boilg. at ord. press. (202) or on warming with $AlCl_3$ (203) (204); from ethyl trichloromethyl carbonate, b.p. 78° at 19 mm. (204), D_4^{20} = 1.4205 (204), n_D^{20} = 1.4450 (204), or from *n*-propyl trichloromethyl carbonate, b.p. 93° at 12 mm. (204), D_4^{20} = 1.359 (205), n_D^{20} = 1.4451 (205), on warming with $AlCl_3$ (203); from isoamyl trichloromethyl carbonate, b.p. 120° at 23 mm. (204), D_4^{20} = 1.2644 (204), n_D^{20} = 1.4466 (204), phenyl trichloromethyl carbonate [Beil. VI_1-(88)], m.p. 70.5° (204), or *p*-tolyl trichloromethyl carbonate (206) on warming with aq. (but not with aq. NaOH) (206); from *bis*-(trichloromethyl) oxalate [Beil. III-17] at 350–400° (207); or from trichloromethyl perchlorate (208) see indic. refs.]

[For formn. of $\bar{C}$ from trichloronitromethane (chloropicrin) [Beil. I-76, I_1-(20), I_2-(41)] in u.v. light (210), on boilg. (at 112°) under ord. press. (211), on passing with HCl over pumice at 400° (212), or on treatment with fuming H_2SO_4 (20% SO_3) at 100° (213) see indic. refs.]

From miscellaneous sources. [For formn. of $\bar{C}$ from CO_2 + CCl_4 (3:5100) + cat. at elevated temp. (225), from CS_2 with aqua regia (214) or Cl_2O (215); from COS with Cl_2 at red heat (1); from COS over fused $CuCl_2$ (1) or through boiling $SbCl_5$ (1); from thiophosgene with air or O_2 under various conditions (216); from anhydrous Na_2CO_3 with

PCl_5 (217); from pentachloropropionyl chloride (3:0470) with $AlCl_3$ at 60° (218); from oxalyl (di)chloride (3:5060) at 600° or with $AlCl_3$ in CS_2 on warming (219) see indic. refs.]

CHEMICAL BEHAVIOR OF Ĉ

Pyrolysis of Ĉ. Ĉ on heating above 300° decomposes in two ways: (1) into $CO + Cl_2$ (CO equilibrium) and (2) into $CO_2 + CCl_4$ (CO_2 equilibrium). The extent of these reactions together with the influence of various factors has been extensively studied. [For a concise summary of earlier work see the review of Dyson (11); for many important details see the original references represented by (225) (221) (222) (5) (135) (6) (223) (224).]

Photochemical decompn. of Ĉ. [Ĉ on exposure to short-wave u.v. light decomposes yielding (105) (226) $CO + Cl_2$; for more recent studies of this photochem. decompn. see (227) (228) (229) (230) (231); for application to problem of separation of isotopes of Cl_2 see (232).]

Electrolysis of Ĉ. [Ĉ or a soln. of $AlCl_3$ in Ĉ upon electrolysis gives (233) $CO + Cl_2$.]

Behavior of Ĉ with Inorganic Reactants

Reduction of Ĉ. [Ĉ + H_2 in u.v. light at 10° gives CO + HCl + traces of formaldehyde (1:0145) but at 80° gives $CO + CO_2 + CH_4$ + HCl (234). — Ĉ + H_2 over Pd or Ni on pumice, or over vanadium carbide, at 300–450° gives (235) cf. (236) CO + HCl + small amts. formaldehyde (1:0145) cf. (229).]

Oxidation of Ĉ. [For study of photochem. oxidn. of Ĉ see (230).]

Hydrolysis of Ĉ. Contrary to earlier reports Ĉ with aq. is almost instantly hydrolyzed but the rate is influenced by the manner in which contact is effected and whether the aq. is in vapor or liquid state. [For studies on the hydrol. of Ĉ see (237) (4) (96) (238); for study of rate of hydrolysis in dioxane at 25° (239) or in toluene at 25° and at 45° (240) see indic. refs.]

Behavior of Ĉ with metal oxides, sulfides, or phosphates. [Ĉ with metallic oxides on htg. at 250–600° (depending upon the metal) gives the corresp. metal chloride which in some cases, e.g., $FeCl_3$, $ThCl_4$, readily sublimes in pure form; for examples of this reaction see (211) (212) (213); for use in prepn. of $AlCl_3$ see (219).]

[Ĉ on htg. with metal sulfides gives (216) COS [Beil. III-131, III_1-(61), III_2-(101)], b.p. −50.2° (211), f.p. −138.2° (214) (use with CdS in prepn. (215)), and the metal chloride cf. (211).]

[Ĉ on htg. with certain phosphates (217) gives $CO_2 + POCl_3$ + metal chloride (use in prepn. of $POCl_3$ (218)).]

Analogs of Ĉ. *Carbonyl fluoride.* [This compound, b.p. −83.1° (250), m.p. −114.0° (250), has been prepd. from AgF_2 + CO (250), F_2 + CO (251) cf. (250), or from acetone with F_2 (252), but has not been reported from Ĉ. Note that Ĉ with HF at 80° and 280 lb./sq. in. in Cu bomb gives (25–50% yield (253)) carbonyl chlorofluoride, COClF, b.p. −42°, m.p. 138° (253).]

Carbonyl bromide. [Ĉ with BBr_3 at 150° (254) or with $AlBr_3$ (255) gives carbonyl bromide [Beil. III-29, III_1-(9), III_2-(7)], but this prod. is better prepd. from CBr_4 by oxidn. with conc. H_2SO_4 (256) (257) (258) (for study of photochemical oxidn. see (259)); for studies of structure (26) and pyrolysis (260) (261) (262) see indic. refs.]

Carbonyl cyanide. [This compound, b.p. 65.0–65.5° (263), D_4^{20} = 1.124 (263), n_D^{20} = 1.3919 (263), has been prepd. from acetonedicarboxylic acid (1:0485) by conversion (264) to diisonitrosoacetone [Beil. I-806, I_1-(413)], thence to diacetyl-di-isonitrosoacetone (265), then acetoxime acetyl cyanide (263) which was then pyrolyzed at 160–180° and

210–220 mm. (263) cf. (265). For formn. using propionyl (instead of acetyl) derivatives see (266).]

Behavior of $\bar{C}$ with inorganic acids. [$\bar{C}$ with HF as directed (250) (see analogs of $\bar{C}$ above) gives carbonyl chlorofluoride. — $\bar{C}$ with HBr does not react even at 200° (267). — $\bar{C}$ as liq. does not react with HI, but $\bar{C}$ as gas reacts with HI gas even at room temp. with sepn. of I_2 (267).]

Behavior of $\bar{C}$ with inorganic salts. [$\bar{C}$ with KI or NaI in acetone solns. gives $CO + I_2$ (use in detn. of $\bar{C}$ (91) (92) (93)).]

[The behavior of $AlCl_3$ with $\bar{C}$ has been extensively studied; for studies of solns. of $AlCl_3$ in liq. $\bar{C}$ from viewpoint of vapor pressure (268), density (269), and conductance (270) see indic. refs. — For general studies of liq. $\bar{C}$ as solvent (271) (272) including studies on system $\bar{C} + Cl_2$ (273) and on phosgeno salts such as calcium phosgeno-aluminate (274) (275) and others (276) see indic. refs.]

Behavior with various inorganic nitrogen compounds. *With NH_3.* [$\bar{C}$ in lgr. (277) or C_6H_6 (278) gives urea, biuret, cyanuric acid, cyamelide, ammelide, etc.; $\bar{C}$ as gas with NH_3 as gas gives urea (279) cf. (280) (143), guanidine, cyanuric acid (281), and cyamelide (282). — For reaction of $\bar{C}$ in toluene soln. with aq. NH_4OH as a source of isocyanic acid see (283). — Note also that $\bar{C}$ with sodamide reacts in cold in sense $COCl_2 + 3NaNH_2 \rightarrow NaNCO + 2NaCl + 2NH_3$, but at about 250° in sense $COCl_2 + 5NaNH_2 \rightarrow Na_2N{-}C{\equiv}N + 2NaCl + NaOH + 3NH_3$ (284).]

[$\bar{C}$ with NH_4Cl at elevated temps., e.g., 200–400°, gives (285) (286) carbamyl chloride, $NH_2.CO.Cl$ [Beil. III-31, III_1-(15)], b.p. 61–62° dec. (285). — For study of analogous carbamyl fluoride and carbamyl bromide (previously unknown) see (287).]

With hydroxylamine. [For studies on behavior of $\bar{C}$ with NH_2OH see (288) (289)]

With hydrazine: [$\bar{C}$ with 1 mole hydrazine would be expected to give *N*-aminocarbamyl chloride, $NH_2.NH.CO\,Cl$, but this compound appears to be unknown; $\bar{C}$ with 2 moles hydrazine should yield *N,N'*-diaminourea (carbohydrazide) [Beil. III-121, III_1-(57), III_2-(96)], but this compound has not been reported as prepd. by this method.]

Behavior of $\bar{C}$ with Organic Reactants

With hydrocarbons. [For studies on photochem. reaction of $\bar{C}$ with alkanes (290) or with cycloalkanes (291) or with aliphatic or alicyclic acid chlorides (292) as a means of replacement of hydrocarbon H atoms by the CO.Cl group see indic. refs. — For reaction of $\bar{C}$ with satd. nonaromatic hydrocarbons in pres. of cat. yielding ketones see (293). — Note also that $\bar{C}$ with $CH_4 + H_2$ + cat. is claimed (236) to give acetaldehyde (1:0100).]

$\bar{C}$ with aromatic hydrocarbons in pres. of a Friedel-Crafts' type cat. condenses according to conditions with either one or two moles of hydrocarbon yielding, respectively, the corresp. acid chloride or ketone. No attempt can be made here to collect the reported cases of these types since the many acid chlorides contained in this book afford numerous examples.

[$\bar{C}$ with ethylene + $AlCl_3$ in CS_2 adds to the unsatd. linkage giving (295) (296) (297) (298) β-chloropropionyl chloride (3:5690) although the method has been questioned (299) (300). — $\bar{C}$ with propylene + $AlCl_3$ as directed (301) gives β-chloroisobutyryl chloride (3:9101).]

[$\bar{C}$ with acetylene (302) or acetylene homologs (303) gives complex condensation products suitable for molding.]

With alcohols. $\bar{C}$ with alcohols reacts according to circumstances with either 1 mole alcohol giving the corresponding chloroformate (chlorocarbonate) esters, or with 2 moles alcohol giving the corresponding carbonate ester. The countless known cases cannot here be cited in detail but the following examples are given; see also the summary of Dyson (308).

$\bar{C}$ with MeOH (1:6120) gives (304) methyl chloroformate (3:5075) q.v. and/or dimethyl carbonate (1:3046); $\bar{C}$ with EtOH (1:6130) gives ethyl chloroformate (3:7295) q.v and/or diethyl carbonate (1:3150); $\bar{C}$ with *n*-PrOH (1:6150) gives *n*-propyl chloroformate (3:7540) q.v. and/or di-*n*-propyl carbonate (1:3373); $\bar{C}$ with isopropyl alcohol (1:6135) gives isopropyl chloroformate (3:7405) q.v. and/or di-isopropyl carbonate (1:3261); $\bar{C}$ with *n*-butyl alcohol (1:6180) gives *n*-butyl chloroformate (3:7980) q.v. and/or di-*n*-butyl carbonate (1:3626), $\bar{C}$ with isobutyl alcohol (1:6165) gives isobutyl chloroformate (3:7760) q.v. and/or di-isobutyl carbonate (1:3501), $\bar{C}$ with *n*-AmOH (1:6205) presumably gives *n*-amyl chloroformate (3:9380) q.v., but di-*n*-amyl carbonate appears to be unreported; $\bar{C}$ with isoamyl alcohol (1:6200) gives isoamyl chloroformate (3:8215) q.v. and/or di-isoamyl carbonate (1:3937).

$\bar{C}$ with allyl alcohol (1:6145) gives allyl chloroformate (3:7487) q.v. and/or diallyl carbonate; $\bar{C}$ with cyclohexanol (1:6415) gives cyclohexyl chloroformate (3:5770) q.v.; $\bar{C}$ with benzyl alcohol (1:6480) gives benzyl chloroformate (3:9565) q.v. — [For analogous reaction of $\bar{C}$ with unsatd. monohydric alcohols such as methallyl alcohol, crotyl alcohol, etc., see (305).]

$\bar{C}$ with *monohydroxyethers* gives analogous products: e.g., $\bar{C}$ with β-methoxyethanol (1:6405) gives β-methoxyethyl chloroformate (3:9140) q.v.; $\bar{C}$ with β-ethoxyethanol (1:6410) gives β-*ethoxyethyl chloroformate* (3:9280) *q.v.* — [*For reaction of* $\bar{C}$ *with* polyhydroxyethers such as diethylene glycol (1:6525), triethylene glycol (1:6538), tetraethylene glycol, *etc., giving corresp. bis-(chloroformates), see* (306).]

[For study of behavior of $\bar{C}$ toward various alkali alkoxides see (307).]

[*Note that* $\bar{C}$ *as liq. reacts with enol form of acetone (1:5900) in* ½ hr. at room temp. giving (330) isopropenyl chloroformate (3:7358).]

With phenols. The reaction of $\bar{C}$ with phenols is more sluggish than with alcohols, and the corresp. diaryl carbonates are usually obtained from $\bar{C}$ with 2 moles of the corresponding sodium phenolate cf. (308).

[$\bar{C}$ (as liquid) with phenol (1:1420) in s.t. at 140–150° (309), or $\bar{C}$ in toluene (310) or trichloroethylene (3:5170) (311) with aq. phenol (311) or aq. Na phenolate (310), or $\bar{C}$ with Na phenolate in toluene (312), or $\bar{C}$ with 10% aq. Na phenolate at 30° (313) gives (yields: 45% (312), 44% (313)) phenyl chloroformate [Beil. VI-159, VI_1-(88), VI_2-(157)], b.p. 97–98° at 25 mm. (310), 83–84° at 12 mm. (313), $n_D^{11} = 1.5180$ (313); for use as acylating agent see (314).]

[$\bar{C}$ in toluene shaken with a soln. of *o*-cresol (1:1400) in aq. NaOH (310) (315) gives *o*-tolyl chloroformate [Beil. VI-356], b.p. 119° at 35 mm. (310), 114° at 25 mm. (310). — $\bar{C}$ in toluene shaken with a soln. of *m*-cresol (1:1730) in aq. NaOH (315) gives *m*-tolyl chloroformate [Beil. VI-379], b.p. 103° at 22 mm. (315). — $\bar{C}$ in toluene shaken with a soln. of *p*-cresol (1:1410) in aq. NaOH (315), or $\bar{C}$ passed as gas into aq. Na *p*-cresolate below 10° (316), gives (78–80% yield (316)) *p*-tolyl chloroformate [Beil. VI-398, VI_2-(380)], b.p. 108° at 30 mm. (315) (316).]

Countless other phenols behave with $\bar{C}$ in generally similar fashion but cannot be detailed here.

With carboxylic and sulfonic acids. $\bar{C}$ with carboxylic acids or sulfonic acids or their salts at elevated temps. or in pres. of tertiary bases effects conversion to the corresponding carboxylic acid chlorides or sulfonyl chlorides.

[E.g., $\bar{C}$ with AcOH (1:1010) at 110–120° (317), or at 160° over $MgCl_2$ on diatomaceous earth (318) cf. (319) (320), or $\bar{C}$ with NaOAc at 120° under press. (321), or $\bar{C}$ with Ac_2O (1:1015) + cat. (322) gives acetyl chloride (3:7065). — $\bar{C}$ with chloroacetic acid (3:1370) over activated carbon at 200° gives (323) chloroacetyl chloride (3:5235). — $\bar{C}$ with anhydrous oxalic acid (1:0535) in pres. of tertiary amines yields (321) oxalyl (di)chloride

(3:5060). — $\bar{C}$ with cinnamic acid (1:0735) in pres. of tertiary amines yields (324) cinnamoyl chloride (3:0330). — $\bar{C}$ with phenoxyacetic acid (1:0680) in pres. of tertiary amines yields (324) phenoxyacetyl chloride (3:8790). — $\bar{C}$ with lauric acid (1:0605) at 140–150° gives (85–90% yield (325)) lauroyl chloride (3:9858). — $\bar{C}$ with palmitic acid (1:0650) at 140–150° gives (70–75% yield (325)) palmitoyl chloride (3:9912). — $\bar{C}$ with stearic acid (1:0660) at 140–150° gives (70–75% yield (325)) stearoyl chloride (3:9960). — $\bar{C}$ with oleic acid (1:0565) gives (325) oleoyl chloride (3:9940).]

[$\bar{C}$ with benzoic acid (1:0715) at 140–200° (326), or in pres. of tertiary bases or their salts (324), or $\bar{C}$ with AgOBz in s.t. at 100° (327) gives benzoyl chloride (3:6240). — $\bar{C}$ with salicylic acid (1:0780) in toluene (328) or in C_6H_6 in presence of tertiary bases (324) gives salicyloyl chloride (3:0085). — $\bar{C}$ with furoic acid (1:0475) under press. at not above 100° gives (329) furoyl chloride (3:8515).]

[Many other cases including sulfonic acids, e.g., (324), cannot be detailed here.]

With amines. *With primary amines.* $\bar{C}$ with primary amines reacts in various ways according to conditions to yield *N*-alkyl (or aryl) carbamyl chlorides, *N*-alkyl (or aryl) isocyanates, or *N*,*N'*-dialkyl (or aryl) ureas. Examples of these types of reaction are included below.

[$\bar{C}$ with $CH_3NH_2.HCl$ at 250–300° gives (285) (331) *N*-methylcarbamyl chloride [Beil. IV-64]; for stabilization of this prod. by formn. of insol. compds. with $AlCl_3$, etc., see (332); note that treatment with CaO causes loss of HCl giving (285) methyl isocyanate [Beil. IV-77, IV_1-(337), IV_2-(578)], best prepd. by other means, e.g., from NaN_3 with Ac_2O (333) or AcCl (334) (335). — $\bar{C}$ with CH_3NH_2 in C_6H_6 + aq. alkali, however, gives *N*,*N'*-dimethylurea [Beil. IV-65, IV_1-(331), IV_2-(568)], m.p. 106°.]

[$\bar{C}$ with $C_2H_5NH_2.HCl$ at 250–300° gives (285) *N*-ethylcarbamyl chloride [Beil. IV-114]; note that treatment of this prod. with CaO causes loss of HCl giving (285) ethyl isocyanate [Beil. IV-122, IV_1-(357), IV_2-(613)], b.p. 60°.]

[$\bar{C}$ with other primary aliphatic or cycloaliphatic amine hydrochlorides under conditions such that HCl is removed from reaction mixt. gives corresp. isocyanates (336) cf. (337).]

[$\bar{C}$ with aniline·hydrochloride presumably yields *N*-phenylcarbamyl chloride [Beil. XII-346, XII_1-(230)], m.p. 58–59°, but this compound is usually prepd. by other means (338) (339) since it readily loses HCl at 90–100° or by action of aq. or aq. alk. (340) giving phenyl isocyanate; for stabilization of *N*-phenylcarbamyl chloride by formn. of molecular compound with $AlCl_3$ see (332). — $\bar{C}$ *in dry aniline* (341) *or aq. aniline* (342) (96) gives *N*,*N'*-diphenylurea (carbanilide) [Beil. XII-352, XII_1-(233)], m.p. 238°; for use of this reaction as method of quant. detn. of $\bar{C}$ see (94) (95) cf. (91). — $\bar{C}$ with fused aniline HCl or carbanilide (343), or $\bar{C}$ with aniline HCl in C_6H_6 at 120° under press. (344) cf. (337), gives phenyl isocyanate [Beil. XII-437, XII_1-(259)], b.p. 166°.]

$\bar{C}$ with countless other arom. prim. amines behaves in generally similar fashion but details cannot be included here [however, for reaction of $\bar{C}$ with *p*-nitroaniline in EtOAc soln. giving *N*-*p*-nitrophenylcarbamyl chloride which on recrystn. from CCl_4 loses HCl yielding *p*-nitrophenyl isocyanate see (345) (346) (347)].

With secondary amines. [$\bar{C}$ with $(CH_3)_2NH$ in C_6H_6 at 0° (348) (349), or $\bar{C}$ over fused $(CH_3)_2NH$ HCl (350) (351), gives *N*,*N'*-dimethylcarbamyl chloride [Beil. IV-73], b.p. 167°, which with dimethylamine in C_6H_6 yields (349) *N*,*N*,*N'*,*N'*-tetramethylurea [Beil. IV-74, IV_1-(335), IV_2-(574)], liquid, b.p. 177°.]

[$\bar{C}$ with $(C_2H_5)_2NH.HCl$ at elev. temp. (350), or with $(C_2H_5)_2NH$ in C_6H_6 (352), gives *N*,*N*-diethylcarbamyl chloride [Beil. IV-120, IV_2-(611)], liquid, b.p. 186–190°, which with diethylamine gives (353) cf. (354) *N*,*N*,*N'*,*N'*-tetraethylurea [Beil. IV-120, IV_2-(611)], liquid, b.p. 210–215°.]

[$\bar{C}$ with piperidine HCl would be expected to give *N*-piperidylformyl chloride (" penta-

methylenecarbamyl chloride") [Beil. XX-54], b.p. 237–238°, but this compound has been reported only by other means.]

$\bar{C}$ with aromatic secondary amines behaves in generally analogous fashion but cannot be detailed here.

With tertiary amines. [$\bar{C}$ with *N*,*N*-dimethylaniline at ord. temp. is claimed (355) (356) to give 4,4'-*bis*-(dimethylamino)benzophenone ("Michler's ketone") [Beil. XIV-89; XIV_1-(391)], m.p. 174°. However, $\bar{C}$ passed into boilg *N*,*N*-dimethylaniline evolves CH_3Cl (3:7005) and gives (almost quant yield (357)) *N*,*N'*-dimethyl-*N*,*N'*-diphenylurea [Beil. XII-418, XII_1-(251)], m.p 121°. — Similarly, $\bar{C}$ with boilg. *N*,*N*-diethylaniline evolves C_2H_5Cl (3:7015) and gives *N*,*N'*-diethyl-*N*,*N'*-diphenylurea [Beil. XII-422], m p. 79°]

[For use of $\bar{C}$ in sepn. of a mixture of aniline, *N*-ethylaniline, and *N*,*N*-diethylaniline see (361).]

With arylhydrazines [$\bar{C}$ in toluene added to cold ether soln of phenylhydrazine gives (358) 1,5-diphenylcarbohydrazide ("diphenylcarbazide") [Beil XV-292, XV_1-(72)], m.p 175–175 5° u c. when pure (359) For use of this reaction, followed by $CuSO_4$ treatment of the resultant product, as a delicate test for $\bar{C}$ see (78).]

With other nitrogenous organic reactants [For a concise review of behavior of $\bar{C}$ with other nitrogenous classes such as amides, amidoximes, thioureas, thiosemicarbazides, etc., see the review of Dyson (360).]

With hexamethylenetetramine. $\bar{C}$ with hexamethylenetetramine in $CHCl_3$ gives (362) (363) (364) a compound of compn $\bar{C}.2C_6H_{12}N_4$, m p. 187–190° dec., (363) 196–197° from MeOH (364). — [For use of hexamethylenetetramine in paints protective against $\bar{C}$ see (365); for use of alumina or silica gels contg. hexamethylenetetramine as absorbents for $\bar{C}$ see (366)]

3:5005 1,1-DICHLOROETHYLENE (Vinylidene (di)chloride; *unsym.*-dichloroethylene) $H_2C{=}C(Cl){-}Cl$ $C_2H_2Cl_2$ Beil. I - 186; I_1-(77); I_2-(158)

B.P. 31.7° at 760 mm. (1) F.P. −122.1° (1) D_4^{20} = 1.2129 (1) n_D^{20} = 1.4249 (1)

Care must be taken to avoid confusion of C̄ with vinyl chloride (3:7010), with 1,2-dichloroethane (ethylene (di)chloride) (3:5130), or especially with the isomeric compounds *cis*-1,2-dichloroethylene (3:5042), *trans*-1,2-dichloroethylene (3:5028), or their ordinary mixture (3:5030).

C̄ when pure is colorless liq. with mild and characteristic odor; note, however, that at temps. above 0° and especially in pres. of oxygen or other cat. C̄ polymerizes to a white powder insoluble in the monomeric C̄. (For much further comment on polymerization see below.)

PREPARATION OF C̄

[For prepn. of C̄ from 1,1,2-trichloroethane (3:5330) by elimination of 1 HCl with alc. KOH (2) (by this process C̄ was initially prepared (3)), or with excess aq. $Ca(OH)_2$ at 70–80° (90% yield (4)) (5), or with aq. or alc. NH_3 at ord. temp. (100% yield (7)), or with Na in dry ether (36) see indic. refs.; from 1,1,1-trichloroethane (3:5085) with excess aq $Ca(OH)_2$ at 70–80° see (4) (5); for formn. of C̄ (as by-product of the isomeric 1,2-dichloroethylenes (3:5030)) from trichloroethane by catalytic pyrolytic dehydrochlorination see (6).]

[For prepn. of C̄ from 1,1,1,2-tetrachloroethane (3:5555) by loss of HCl by actn. of aq. + Fe, Zn, or Cd on warming under reflux see (8); from 1-bromo-1,1,2-trichloroethane by loss of Br-Cl with Zn dust + boilg. alc. see (37).]

[For formn. of C̄ (together with vinyl chloride) from ethyl trichloroacetate (3:5950) by actn. of Zn in alc. see (9).]

[For formn. of C̄ (20% yield) from 1,2-dichloroethane (ethylene (di)chloride (3:5130) with Cl_2 in pres. of $AlCl_3/NaCl/FeCl_3$ at 400–480° see (10); note that some 22% 1,2-dichloroethylenes (3:5030) + 29% trichloroethylene (3:5170) + 29% higher chlorination prods. are also formed.]

PURIFICATION AND STABILIZATION OF MONOMERIC C̄

[For purification of C̄ by distn. as an azeotrope with MeOH, followed by removal of the latter by extraction with aq., see (11).]

Many compds. recommended as stabilizers or polymerization inhibitors for monomeric $\bar{C}$ have been described in patents: e.g., see (12) (13) (14) (15) (16).

CHEMICAL BEHAVIOR OF MONOMERIC $\bar{C}$

$\bar{C}$ + **chlorine.** [$\bar{C}$ with Cl_2 at 25–35° in pres. of absence of cat. adds 1 mole halogen giving (85–92% yield (17)) 1,1,1,2-tetrachloroethane (3:5555).]

$\bar{C}$ + **bromine.** $\bar{C}$ with Br_2 adds 1 mole halogen yielding (18) 1,1-dichloro-1,2-dibromoethane [Beil. I-93], oil, b.p. 175° at 760 mm. decg., 65° at 13 mm., f.p. −66.85°, D_4^{25} = 2.2203, D_4^{20} = 2.2449, D_4^{15} = 2.2695, n_D^{15} = 1.55930 (18).

$\bar{C}$ + **hydrogen chloride.** $\bar{C}$ with dry HCl gas at 25–35° in pres. of $AlCl_3$ or $FeCl_3$ adds 1 mole HCl giving (85–90% yields (19) (20)) 1,1,1-trichloroethane (3:5085).

$\bar{C}$ + **hydrogen bromide.** The addition to $\bar{C}$ of HBr appears to be unreported.

Polymerization of $\bar{C}$. Polymerization of $\bar{C}$ either with itself or with other cpds. (especially other substituted ethylene derivs.) leads to a large group of industrially important materials broadly designated as "vinylidene polymers" Certain plasticized and stabilized copolymer compositions have been named "Saran." [For extremely valuable comprehensive reviews of this general field see (1) (21) (22); in view of the comprehensive surveys and prior literature (including patents) references given (especially in (1)), the following text will in general include only citations since 1942.]

$\bar{C}$ when carefully purified and free from oxygen polymerizes only very slowly; however, in the pres. of various catalysts, notably peroxides, polymerization readily occurs (for amplification see (1)).

[For patents involving polymeric $\bar{C}$ from viewpoint of purification (23), storage of supercooled material (24), heat treatment to increase tensile strength (25), improvement of stability to light and heat (26) (27) (28) (29), or coloring (30) see indic. refs. — For studies on structure of fibers of polymeric $\bar{C}$ see (1) (31). — For identification of common comml. plastics (including "Saran" and "Velon") see (32).]

[For review of copolymerization of $\bar{C}$ see (1); for copolymerization with butadiene (33), with vinyl chloride or vinyl acetate (34), with styrene, acrylonitrile, various methacrylates, etc. (35), see indic. refs.]

3:5010 DICHLOROACETYLENE (1,2-Dichloroethyne) Cl—C≡C—Cl C_2Cl_2 Beil. I - 245, I_1-(106), I_2-(222)

B.P.	F.P.	
32–33° at 748 mm. (1) (2) (3)	−66 to −64.2° (1)	$D_4^{20} = 1.261$ (9)
29° cor. at 743 mm. (4)		$n_D^{20} = 1.42790$ (9)

Colorless oil which ignites in air and explodes even on stirring; however, its 5–10% soln. in ether is safely handled (4).

[For prepn. of $\bar{C}$ from acetylene + aq. alk. KOCl soln. under N_2 see (1) (2) (3); from 1,1,2-trichloroethylene (3:5170) in N_2 at 130° over solid granular KOH (65% yield (4)) see (4) (5) (9); from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) with KOH in xylene under N_2 (can be carried out as a lect. expt.) see (6) (9); for formn. of $\bar{C}$ from barium salt of α,β,β-trichloroacrylic acid (3:1840) by htg. in H_2 see (13).]

$\bar{C}$ forms with diethyl ether a molecular cpd., $\bar{C}.C_4H_{10}O$, eas. decomposed by aq. into its components (5); for *D* and *n* of ether solns. of $\bar{C}$ see (9).

$\bar{C}$ on combustion yields CO, CO_2, $COCl_2$ (4) together with other products (5).

[For use of $\bar{C}$ in extraction of coffee see (7).]

$\bar{C}$ in CCl_4 treated 9 hrs. with strong Cl_2/CCl_4 soln. gives (1) on evapn. hexachloroethane (3:4835), m p. 187° in s.t. (1).

$\bar{C}$ on passing into Br_2/aq. yields (1) a heavy oil which on stdg. under the excess reagt. solidifies to cryst. of 1,2-dichloro-1,1,2,2-dibromoethane; after recrystn. from alc., m.p. 209–210° dec., with yellowing at 200° (1). [Note that $\bar{C}$ in CCl_4 treated with Br_2/CCl_4 can add 1 mole Br_2 giving (65% yield (4)) 1,2-dichloro-1,2-dibromoethylene, b.p. 172° at 760 mm. (8), $D_4^{15} = 2.3036$ (8), $n_D^{15} = 1.57984$ (8), m.p. +4.40° (8), 4.9° (4).]

$\bar{C}$ with I_2 in ether (4) or CCl_4 (5) gives slowly 1,2-dichloro-1,2-diiodoethylene, cryst. from ether or pet. eth., m.p. 70° (4). [Another stereoisomer, m.p. 5–7°, is formed only to extent of 10% and is removed by the solvent (5).]

[For studies on behavior of $\bar{C}$ on polymerization (10), and its reactions with NH_3 (10), amines (10) (11), alcoholates (10), diethyl sodio-malonate (10), organic Mg compds. (12), ethyl diazoacetate (12), and NO_2 (12) see indic. refs.]

Note 1. For study of vap. press. of C̄ over range −87° to +38° see (7).

Note 2. For influence of very high press. on f.p. of C̄ see (20).

For D_4^t over range t = −100° to +40° see (25); −273 to −194° see (10).

MISCELLANEOUS PHYSICAL PROPERTIES OF C̄

Various Solubility Relations

With water. C̄ is only slightly soluble in aq. and readily volatile with steam. E.g., 100 g water dissolves following amts. of C̄: 2.363 g. at 0° (27), 2.122 g. at 10° (27), 2.000 g. at 20° (27) (15), 1.969 g. at 30° (27). — *For study of soly. of water in C̄ at 0°, 25°, and 30°* see (28) (29); for study of reciprocal soly. of C̄ and water see (30) (68). — C̄ with H_2O is claimed (35) to form a hydrate stable up to +2°.

With organic compounds. [For studies on soly. of C̄ in 35 org. solvents of various types see (31); for soly. of C̄ in cellosolve acetate (33), carbitol acetate (32) (33), diethylene glycol diethyl ether (32), tetraethylene glycol dimethyl ether (32), and tetraethylene glycol diethyl ether (33) see indic. refs]

Binary Systems Containing $\bar{C}$

(See also azeotropes containing $\bar{C}$)

$\bar{C}$ + Cl_2: for f.p./compn. data and diagram (various compounds and eutectics are formed) see (21).

$\bar{C}$ + C_2H_5Cl (*3:7015*): for f.p./compn. data and diag (eutectic, f.p. −149.7°, conts. 31.7 wt. % $\bar{C}$) see (17). — $\bar{C}$ + $CHCl_3$ (*3:5050*): for f.p./compn. data and diag. (eutectic, f.p. −108 4°, conts. 70 5 wt. % $\bar{C}$) see (17); for data on b.p., D_4^{20}, and liq./vapor equilibria see (34). — $\bar{C}$ + CCl_4 (*3:5100*): for data on b.p., D_4^{20}, and liq./vapor equilibria see (34). — $\bar{C}$ + 1,1,-*dichloroethane* (*3:5035*): for f.p./compn. data see (19). — $\bar{C}$ + 2,2-*dichloropropane* (*3:7140*): for f.p./compn. data see (22).

$\bar{C}$ + *isobutyl bromide:* for f.p./compn. data see (19). — $\bar{C}$ + *methylene (di)bromide:* for f.p /compn data see (19)

$\bar{C}$ + *methylene (di)iodide:* for f.p./compn. data see (19).

$\bar{C}$ + *dimethylaniline:* for D_4^{25} and $n_D^{24.8}$ for 0–100% $\bar{C}$ *see* (23); for f.p./compn. data and diagram (eutectic, m.p. −97.2°, conts. 91 wt. % $\bar{C}$) see (168).

Ternary Systems Containing $\bar{C}$

(See also azeotropes containing $\bar{C}$)

$\bar{C}$ + $CHCl_3$ + CCl_4: system forms ternary eutectic, f.p. −111.4°, contg. 60 wt. % $\bar{C}$ + 27.0 wt. % $CHCl_3$ (3:5050) + 13 0 wt. % CCl_4 (3:5100) (17).

Binary Azeotropes Containing $\bar{C}$

$\bar{C}$ + H_2O: $\bar{C}$ forms with aq. a const -boilg. mixt., b.p. 38.1°, contg. 98.5 wt. % $\bar{C}$ (68).

$\bar{C}$ + *MeOH:* $\bar{C}$ forms with MeOH (1:6120) a const.-boilg. mixt., b.p. 39.2° (4) at 760 mm (3), contg. 92 wt. % (3), 94 wt. % (4) $\bar{C}$. — $\bar{C}$ + *EtOH:* $\bar{C}$ forms with EtOH (1:6130) a const.-boilg. mixt., b.p. 41.0° at 760 mm. (3), contg. 96.5 wt. % (3) $\bar{C}$. — $\bar{C}$ forms with formaldehyde dimethylacetal (1:0105) a const -boilg. mixt., b.p. 45.0° (36), contg. (36) 41 wt. % $\bar{C}$, cf. (37). — $\bar{C}$ + *acetone:* note that this system forms no azeotrope; note also *that* $\bar{C}$ *is the only known liquid which with* MeOH (see above) gives a const.-boilg. mixt boilg. lower than acetone and at the same time not forming a binary azeotrope with acetone (4).

Ternary Azeotropes Containing $\bar{C}$

$\bar{C}$ + H_2O + *EtOH:* forms no ternary azeotrope (68).

$\bar{C}$ + *MeOH* + *acetone:* this system forms no ternary azeotrope; for discussion see (4) (38).

$\bar{C}$ + $CHCl_3$ + *acetone:* for discussion see (4).

Other Physical Properties of $\bar{C}$

[For study of thermal conductivity of $\bar{C}$ see (39); for studies of heat capacity of $\bar{C}$ (40) as calculated from spectroscopic data (41) see indic. refs.; for studies of critical temp. of $\bar{C}$ (7) (15) (6) and method for its microdetermination (6) see indic. refs.; for ebullioscopic const , viz., 2.6° for 1000 g. $\bar{C}$, see (43).]

[For studies of adsorption of $\bar{C}$ on wood charcoal at 25° and 50° (44) or on cocoanut charcoal over range −31.5° to 184° (45), on $Al(OH)_3$ gel (46), on $Fe(OH)_3$ gel (47), on Cr_2O_3 (48) see indic. refs ; $\bar{C}$ is preferentially adsorbed (42) by silica gel from its mixt. with $CHCl_3$ (3:5050).]

[For study of attempt to separate isotopes of Cl_2 by reversible fractional distn. of $\bar{C}$ see (49).]

PHYSIOLOGICAL ASPECTS OF $\bar{C}$

$\bar{C}$ has low toxicity compared to other chlorinated hydrocarbon solvents; the maximum allowable conc. for 8 hrs. daily exposure is 500 p p m. (50). [For study of relative toxicity of $\bar{C}$ see (51); for extensive study of industrial hygiene and toxicity of $\bar{C}$ (together with 12 other chlorinated solvents (52)) (53) (50) see indic. refs.; for study of $\bar{C}$ upon running activity of male rat see (54).]

USES OF $\bar{C}$

$\bar{C}$ is widely used as a solvent, as a fluid for refrigeration processes, and for removing water from other organic materials; examples of all these aspects are cited below.

[For study of utility of $\bar{C}$ as solvent for the ozonization of org. compds. see (10); for use of $\bar{C}$ as solvent for the extraction of vitamin A (55) or of soy-bean oil (56) see indic. refs.; for general studies (15) (57) (58) and patents (59) (60) (61) (62) (63) (64) (65) on use of $\bar{C}$ in refrigerating machines and systems see indic. refs.; for use of $\bar{C}$ in detn. of water content of liquids (66) (67) or for prepn. of abs. EtOH (68) (69) (70) see indic. refs.]

DETECTION OR DETERMINATION OF $\bar{C}$

[For detection of $\bar{C}$ in pres. of acetone (by means of Fujiwara color test with pyridine + NaOH) see (71); for distinction of $\bar{C}$ from $CHCl_3$ (3:5050) and from CCl_4 (3:5100) by color tests see (72) (73) (also under ⓑ below).]

[For detn of $\bar{C}$ in blood by removal through aeration, pyrolytic decompn. of $\bar{C}$, and alk. absorption of resultant HCl as directed see (74); for detn. of C, H, and Cl in $\bar{C}$ by combustion see (75). Note that the R. + H. Tri-Per Analyzer, a recording ultra-violet photometer very useful for detn. of trichloroethylene (3:5170) and tetrachloroethylene (3:5460), is insensitive (76) to $\bar{C}$.]

PREPARATION OR FORMATION OF $\bar{C}$

From methane. [The chlorination of CH_4 under various conditions to yield $\bar{C}$ (accompanied by more or less CH_3Cl (3:7005), $CHCl_3$ (3.5050), and CCl_4 (3:5100)) has been extensively studied and no attempt will be made here to sift out details. For examples of leading scientific papers ((77)–(88), incl.) and patents ((89)–(96), incl.) see indic. refs.]

From methyl chloride. [The chlorination of MeCl to $\bar{C}$ has also been extensively studied; many of the relevant data are included in the papers and patents on the chlorination of methane (see preceding paragraph), to which should be added the following patents (91) (97) (98) (99) (100). Note patent (98) on separation of MeCl (3:7005) from $\bar{C}$ by hydrolysis of former to MeOH (1:6120) with $Ca(OH)_2$ under press.]

From chloroform. [For formn. of $\bar{C}$ from $CHCl_3$ (3:5050) by replacement of 1 chlorine by hydrogen using Zn + alc. HCl (101), Zn + AcOH (103), Zn dust + alc. NH_3 (102) (8) (2), Al/Hg + aq. (103), Fe + AcOH (103), or Si_3H_8 + $AlCl_3$ in absence of air (104) see indic. refs]

From carbon tetrachloride. [For prepn. of $\bar{C}$ from CCl_4 (3:5100) using aq. $FeSO_4$ + NaOH see (105).]

From miscellaneous sources. [For prepn. or formn. of $\bar{C}$ from CH_2I_2 with Cl_2 (first prepn. of $\bar{C}$) (106) cf. (158); from polyoxymethylene with PCl_5 in s t. (107); from MeOH + S_2Cl_2 + Cl_2 (108); or from chloroacetic acid (3:1370) by electrochem. oxidn. (109) see indic. refs.]

CHEMICAL BEHAVIOR OF $\bar{C}$

Oxidation of $\bar{C}$. [$\bar{C}$ with air at ord. temps. and press. does not give inflammable mixts.; at high temps. vapor of $\bar{C}$ becomes inflammable and ignites at 642° in air, at 606° in O_2;

limiting concns. of C̄ for inflammability in O_2 are 15.5–66.4%; N_2 does not greatly affect the lower limit of inflammability in O_2 but greatly reduces the upper limit (110). — For study of inflammability of mixts. of C̄ with $O_2 + N_2$, air + CO, or $O_2 + N_2$ + MeBr see (111). — For effect of C̄ on flash point of solvents see (115).]

[C̄ with atomic O gives (112) $COCl_2$ (3:5000), Cl_2, HCl, $CO_2 + H_2O$; C̄ with air over CuO at 450° gives (113) little $COCl_2$ (3:5000); for study of Cl_2-sensitized photochem. oxidn. of C̄ see (114).]

Fluorination of C̄. [C̄ with SbF_3 + cat. readily gives (126) (127) CH_2F_2, b.p. −51.6°, + CH_2ClF, b.p. −9.0°.]

Chlorination of C̄. [C̄ with Cl_2 as directed (116) (117), or C̄ with HCl gas + air over $CuCl_2$ at 440° (118), gives $CHCl_3$ (3:5050) and CCl_4 (3:5100).]

Bromination of C̄. [C̄ with Br_2 cf. (158) in pres. of Al gives (128) cf. (129) CH_2BrCl + CH_2Br_2 [Beil. I-67, I_1-(16), I_2-(32)], b.p. 96.95° at 760 mm., f.p. −52.7°, D_4^{25} = 2.48417, D_4^{20} = 2.49702 (130). — For an alternative synthesis of CH_2Br_2 (88–90% yield) from *$CHBr_3$ with Na_3AsO_3 + NaOH see (138).*]

Hydrolysis of C̄. C̄ on suitable hydrolysis yields formaldehyde (1:0145). [E.g., C̄ with aq. in pres. of weakly alk. reacting salts such as $NaHCO_3$, Na_2HPO_4, NaOAc, etc., at 165° under press. (119), or C̄ + N_2 over dry Na_2CO_3 at 310–320° (120), C̄ with steam over activated carbon at 260–270° (121), C̄ with aq. at 140–170° under press. (122), C̄ with steam at 550–850° over cat. (123), or C̄ with steam over tin phosphate at 460° (124) gives formaldehyde (1:0145) + HCl. Note that C̄ on protracted htg. with aq. at 180° gives (125) formic acid (1:1005), MeCl (3:7005), MeOH (1:6120) HCl + CO.]

Behavior with inorganic salts. [C̄ with NaI in acetone htd. in press. bottle for 20 hrs. as directed (131), or C̄ with NaI in acetone, MeOH, or EtOH at 120–130° under press. (132), gives (60% yield (131)) methylene (di)iodide [Beil. I-71, I_1-(18), I_2-(37)], b.p. 151–153° cor. at 330 mm. (133), 88° at 39 mm. (134), 66–67° at 11–12 mm. (24); exists in two crystn. forms, stable form, m.p. + 5.85° (135), metastable form, m.p. 40° (136); D_4^{25} = 3.3078 (130); D_4^{20} = 3.3212 (130); D_4^{15} = 3.3345 (130); n_D^{15} = 1.74428 (130). — For an alternative synthesis of CH_2I_2 (90–97% yield) from iodoform by treatment with Na_3AsO_3 + NaOH see (137).]

[C̄ with 2 moles K_2SO_3 in aq. at 150–1[illegible] potassium salt of methanedisulfonic acid ([illegible]

[C̄ with alc. $AgNO_3$ does *not* react even [illegible] $CHCl_3$ (3:5050) nor CCl_4 (3:5100) reacts either, CH_3Cl (3:7005) gives a ppt. within 3 hrs. (140).]

[For formn. of polymeric prods. from reaction of C̄ with metal sulfides or polysulfides see (141); for study of photochem. reaction of C̄ with H_2S see (149).]

Behavior with metals. C̄ (like many other polyhalogenated hydrocarbons) in presence of metallic K, Na, K/Na alloy, or even of certain other active metals explodes under the influence of mechanical or thermal shock. [For study of this characteristic (142), especially with regard to sensitivity toward Li, Na, K, Ca, Sr, Ba (143), see indic. refs.]

[Note that C̄ with molten sodium at 200–300° gives (144) C, H, and CH_4, together with smaller amts. of ethane, ethylene, and acetyle[illegible] of H_2 gives (145) 92% CH_4 + 8% ethylene, while C̄ [illegible] ethylene; for further studies of behavior of C̄ [illegible] attempts to obtain a free methylene radical (CH_2) with C̄ + Na vapor have been unsuccessful (148).]

[For study of stability of various metals with respect to corrosion by C̄ under various conditions see (15).]

Behavior with various organic reactants. [$\bar{C}$ with CO + $AlCl_3$ at 260° and 800 atm. press. for 8 hrs. gives (150) chloroacetyl chloride (3:5235); but $\bar{C}$ with CO, COS, or $COCl_2$ (3:5000) + cat. at 700° gives (151) malonyl (di)chloride (3:9030).]

[$\bar{C}$ with C_6H_6 + $AlCl_3$ gives (152) cf. (153) diphenylmethane (1:7120); $\bar{C}$ with toluene + $AlCl_3$ gives (152) di-*p*-tolylmethane [Beil. V-615, V_1-(289), V_2-(518)], m.p. 28° (154), b.p. 302° cor. at 768 mm (154), accompanied by considerable (152) (155) 2,7-dimethylanthracene, m.p. 241° cor. (155), $\bar{C}$ with *o*-xylene (1:7430) + $AlCl_3$ in acetylene tetrachloride (3·5750) as solvent gives (156) 2,3,6,7-tetramethylanthracene, m.p. 299° (156); for behavior of $\bar{C}$ in pres. of $AlCl_3$ with *m*-xylene (1.7420) or with pseudocumene (1:7470) see (152).]

[$\bar{C}$ with CH_2Br_2 + 5–10% KCl in pres. of moistened $AlCl_3$ at 180° in s.t. for 16 hrs. undergoes a redistribution reaction giving (157) a mixt. contg 33% $\bar{C}$ + 18% CH_2Br_2 + 50% $ClCH_2Br$; $\bar{C}$ with CH_2I_2 similarly treated at 114° for 18 hrs. gives (157) a mixt. contg. 33% $\bar{C}$ + 21% CH_2I_2 + 46% $ClCH_2I$.]

[$\bar{C}$ with NaOMe in s.t. at 100° (158), or vapor of $\bar{C}$ over NaOMe + pumice at 200° (37), gives formaldehyde dimethylacetal (1:0105); $\bar{C}$ + NaOEt in s.t. at 100° (158), or $\bar{C}$ with excess EtOH + calcd amt. NaOH at 100–125° under press. (159), gives formaldehyde diethylacetal (1:0135); for analogous behavior of other alcoholates (158) (159) or phenolates (158) see indic. refs.]

[$\bar{C}$ with alc. NH_3 at 125° in s.t. gives (160) hexamethylenetetramine [Beil. I-583, I_1-(306)]. — $\bar{C}$ with Me_2NH in s.t. at 70° gives (161) *bis*-(dimethylamino)methane. — $\bar{C}$ with Me_3N in 90% acetone at 55° or more slowly in ether undergoes a quaternization reaction giving trimethyl-chloromethyl-ammonium chloride (constants not detd) (162).]

Ⓟ **Beilstein test for halogen.** Note that because of its low b.p. $\bar{C}$ often appears to fail in Beilstein copper gauze test for halogen compds.; in such cases use the modification described by (163) (164)

Ⓟ **Hydrolysis to formaldehyde.** $\bar{C}$ (2 g.) in 10% MeOH/alk. (20 ml.) boiled 20 min. under good reflux, subsequently acidified with dil. H_2SO_4, gives soln. containg. Cl^- and formaldehyde (1:0145).

Ⓟ **Color reaction with α-naphthol/cyclohexanol.** $\bar{C}$ (1 drop) with 2 ml. of a 2% soln. of α-naphthol (1:1500) in cyclohexanol (1:6415) + 1 pellet of solid NaOH, boiled 25 seconds and cooled, gives (72) blue color; one portion of this blue soln. underlaid with equal volume 85% H_2SO_4, stood 1 minute and shaken, turns green-blue; a second portion of the alkaline blue soln. acidified with equal volume of AcOH (1:1010) stood 1 minute and shaken becomes yellow. [Note that the alkaline boiling also gives a blue color with $CHCl_3$ (3:5050) and with CCl_4 (3.5100) while other chlorinated solvents (72) give yellow-brown, gray, or brown; in the H_2SO_4 acidification both $CHCl_3$ and CCl_4 give blue rather than green-blue; in the AcOH acidification $CHCl_3$ gives an orange-yellow, CCl_4 a red color]

Ⓟ **Color test with 2,7-dihydroxynaphthalene/cyclohexanol.** $\bar{C}$ (1 drop) with 2 ml. pure cyclohexanol (1:6415) + 1 pellet NaOH + a few mgms. 2,7-dihydroxynaphthalene htd. at 197° (b p. of ethylene glycol) for 45 seconds, decanted from undissolved NaOH, cooled, and shaken with 2 ml. AcOH + 4 ml. 96% EtOH, gives steel-blue color (73) [Note that under these conditions $CHCl_3$ (3:5050) gives a deep-red color while CCl_4 (3 5100) gives a pale yellow brown.]

Ⓟ **Color test with cyclopentanol.** $\bar{C}$ (1 drop) in cyclopentanol (1 ml.) with 1 pellet NaOH boiled 25 seconds, then shaken vigorously for 35 seconds, gives deep red color; upon addition of 4 ml. 96% EtOH and shaking color intensifies or becomes reddish brown (73). [Note that after addn. of alc. $CHCl_3$ gives only a pale citron-yellow or

yellowish brown and that as little as 20% of C̄ can be detected by this means in $CHCl_3$ (73); CCl_4 gives (73) after addn. of alc. an intense nut-brown.]

—— Formaldehyde di-α-naphthylacetal (methylene di-α-naphthyl ether): unreported.

Ⓓ Formaldehyde di-β-naphthylacetal (methylene di-β-naphthyl ether): m.p. 134° (165), 133–134° (166). [From CH_2I_2 with Na β-naphtholate refluxed in alc. (165) (166) (167); not actually reported from C̄ but presumably resulting by above method if some KI be added to refluxing mixture of C̄ + Na β-naphtholate in acetone. Note that this ether fails (165) (167) to form any PkOH addition compound.]

3:5025 1,1,3-TRICHLORO-2-METHYLPROPENE-1 $C_4H_5Cl_3$ Beil. S.N. 11

$$\begin{array}{c} \qquad\quad CH_3 \\ \qquad\quad | \\ ClCH_2—C{=}CCl_2 \end{array}$$

B.P. 45–46° (1)

Note: C̄ readily undergoes allyl transposition so that in reactions of C̄ products derived from the isomeric 1,1,1-trichloro-2-methylpropene-2 (3:5605) may be expected (1) (2) (3)

[For prepn. of C̄ (57% yield (1)) from β,β,β-trichloro-*ter*-butyl alc. ("Chloretone") (3:2662) by htg. to 200° with P_2O_5 and dimethylaniline see (1).] [A 15% yield of the isomeric 1,1,1-trichloro-2-methylpropene-2 (3:5605) together with some α-chloroisobutyric acid (3:0235) are separated from C̄ by redistillation (1).]

C̄ on hydrolysis by boilg. 2 days with AgOH at 100° under pressure gives (22% yield (2)) 3,3-dichloro-2-methylpropen-2-ol-1, b.p. 78–79°, $D^{20}_{-} = 1.298$, $n^{20}_{-} = 1.493$. [The corresp. ether, b.p. 129° at 11 mm., $D^{20}_{-} = 1.330$, $n^{20}_{-} = 1.5108$, is also formed in 22%

yield (2).] The alc may be characterized by its *p*-nitrobenzoate, m.p. 91°, or its *N*-phenylcarbamate, m.p. 64° (2).

Č on htg. with NaOAc + AcOH gives (2) 3,3-dichloro-2-methylpropen-2-yl acetate, b.p. 79° at 12 mm., D_-^{20} = 1.257, n_-^{20} = 1.4718 (2). [With boilg. NaOH this ester regenerates the corresp. alc. (2).]

Č with NaOEt gives in the cold 70% yield (2) of 3,3-dichloro-2-methylpropen-2-yl ethyl ether, b.p. 56° at 12 mm., D_-^{20} = 1.1285, n_-^{20} = 1.4610 (2).

Č in $CHCl_3$, treated with O_3, then hydrolyzed gives α-chloroacetone (3:5425), b.p. 60–62° at 50 mm (1).

[For reactns. of Č with CaI_2 and with CH_3MgBr see (2).]

- ⓓ 1,1,1,2,3-Pentachloro-2-methylpropane (3:1265): m.p. 59.5° (2). [From Č by direct treatment with Cl_2 (2).]
- ⓓ 1,2-Dibromo-1,1,3-trichloro-2-methylpropane: m.p. 108° (2). [From Č on warming 1 day with excess Br_2, then distg. at 12 mm. (2).]
- ⓓ 3,3-Dichloro-2-methylpropen-2-yl *p*-nitrobenzoate: m.p. 91° (2). [From Č on boilg. with dil. alc. soln. of K *p*-nitrobenzoate (2).]

See also both *cis*-1,2-dichloroethylene (3:5042) and ordinary (mixt. of *cis* and *trans*) 1,2-dichloroethylene (3:5050); *the following text is restricted to studies on substantially pure trans stereoisomer.*

Note carefully that 1,2-dichloroethylene is not the same as ethylene (di)chloride (3:5130) (*there are an almost incredible number of errors in the literature involving this point*); neither is it the same as the now very important 1,1-dichloroethylene (vinylidene (di)-chloride) (3:5[illegible]5).

GENERAL DATA ON Č

Note that substantially pure Č is a commercial solvent in U.S.A. under designation "Di 45" (referring to the two chlorine atoms and the b.p.). [*For study of thermal conductivity and for tabulation of constants of commercial* Č *see* (14). — *For toxicity of* Č *see* (26) (15). — *For use of* Č *in extraction of caffeine from coffee see* (16).]

3:5030 1,2-DICHLOROETHYLENE (Acetylene dichloride) } ord. mixt. $C_2H_2Cl_2$ Beil. I - 187, I_1-(77), I_2-(158)

cis (3:5042) *trans* (3:5028)

The text under this heading refers to the ordinary mixt. of the two individual stereoisomeric forms, viz., *cis*-1,2-dichloroethylene (3:5042) and *trans*-1,2-dichloroethylene (3:5028). Since the proportion of the two stereoisomers differs according to conditions and previous treatment no definite physical constants can be given, and those for each pure stereoisomer should be consulted.

Note carefully that 1,2-dichloroethylene is *not* the same as ethylene (di)chloride (3:5130) (there are an almost incredible number of errors in the literature involving this point); *neither is it the same as 1,1-dichloroethylene (vinylidene (di)chloride) (3:5005).*

Furthermore note that some confusion exists in the literature on the relationship between the two isomers; the high-boilg. stereoisomer (3:5042) is now definitely regarded as the *cis* form and the lower-boilg. stereoisomer (3:5028) as the *trans*; however, some records (including "International Critical Tables") have inverted these designations.

PHYSICAL DATA ON C̄

General. Ordinary comml. C̄ consists of a mixt. of the two stereoisomers; by careful fractional distn. the two stereoisomers can be separated (for references see text of the two pure stereoisomers). — *An equilibrium mixt. contg. about 20% of the lower-boilg. (trans)* (3:5028) and 80% of the higher-boilg. (*cis*) (3:5042) forms can be obtd. from either by treatment at ord. temp. in sunlight with 1–2% Br_2 (for data on thermal isomerization see text of both individual stereoisomers). — Note also that the two pure stereoisomers (q.v.) form a eutectic, f.p. −91°, contg. about 29% *trans* + 71% *cis* forms.

Solubility relationships of C̄. Soly. of C̄ in aq. is 0.8 ml. per 100 ml. aq. at ord. temp. (1). — [For soly. of I_2 in C̄ over range 11–25° (2) and use of such solns. in detn. I_2 number of oils and fats (3) (4) see indic. refs. — For solv. power of C̄ for various org. cpds. see (5) (6).]

Inflammability of C̄. C̄ with air forms explosive mixt. in range contg. 3.3–15.3% C̄ (7); 9.7–12.8% C̄ (8). [For studies of influence of vapors of C̄ on mixts. of air with CH_4 (8), acetylene (10), CO (10) (12), or H_2 (10) see indic. refs.]

Miscellaneous data. [Ebullioscopic const. of C̄ (for 1 mole solute in 100 g. C̄) = 29.6 (14).]

USES OF C̄

[For use of C̄ as solv. for fats and oils (15), as refrigerating liquids (16) (17) (18) (19) (20) (21), for extraction of caffeine from coffee (22), for dehydration (concentration) of propionic acid from aq. solns. (23), for sepn. of *o*- and *p*-isomers of various phenols (24), in dewaxing of mineral lubricating oils (25), for pretreatment in dyeing of cellulose esters and ethers (26) see indic. refs.]

PHYSIOLOGICAL BEHAVIOR OF C̄

C̄ acts as an anesthetic and narcotic, but full treatment of this aspect is beyond the scope of this work; for lead references, however, see below.

Toxicity of C̄. [For studies on toxicity of C̄ see (27) (28) (29) (30) (31); for studies of narcotic action (31) (33) (34) (35) (36) see indic. refs.]

Antiseptic and disinfectant props. of Č. [For studies of Č from this viewpoint see (37) (38) (1).]

DETERMINATION OF Č

Č is detd. by conversion of its halogen by pyrolytic or by chem. means completely to chloride ion followed by either volumetric or gravimetric detn. of the latter.

[For detn. of Č by methods involving *pyrolytic decompn. of* Č see (39) (40) cf. (41).]

[For detn. of Č by methods involving decompn. of Č with Na + ethanolamine in dioxane see (42) cf (43).]

[For detn. of Č by means of $HgSO_4$ catalyzed addn. of Br_2 (from bromide/bromate soln.) to its unsatd. linkage see (44).]

PREPARATION OF Č

From various polychloroethanes. *From 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750).* [For prepn. of Č from acetylene tetrachloride by removal of 2 chlorine atoms with H_2 over Ni at 300–320° (45), with Fe or Al + aq. (46) (47) or Zn + aq. (47) (48), with acetylene over hydrogenating cat. (such as Ni) on activated carbon at 350° (49) preferably in pres. of aq vapor (50), or by electrolytic reduction in pres of $ZnCl_2$ (51) cf (52) see indic refs. — Note that Č is also one of the prods. of *pyrolysis* of acetylene tetrachloride over pumice at 700° (53).]

From 1,1,1,2-tetrachloroethane (3:5555). [For prepn. of Č from *unsym.*-tetrachloroethane with acetylene over hydrogenating cat. (such as Ni) on activated carbon at 350° (49) preferably in pres. of aq. vapor (50) see indic. refs.; note that mechanism yielding this result is unknown.]

From 1,1,2-trichloroethane (3:5330). [For prepn. of Č from 1,1,2-trichloroethane (by loss of HCl) over $CuCl_2$ on pumice at 400° (54) or with MeOH over Al_2O_3 at 290° (MeCl (3:7005) is also formed) (55) see indic. refs]

From 1,2-dichloroethane (3:5130). [For formn. of Č (22% yield) together with other prods. from ethylene (di)chloride with Cl_2 in pres. of $AlCl_3/NaCl/FeCl_3$ at 400–480° see (56).]

From various mixed-halogenated ethanes. [For formn. of Č from 1,2-dibromo-1,2-dichloroethane (Beil. I-93, I_1-(29), I_2-(64)] by removal of 2 Br with Zn in alc. (57) or with H_2 over Ni at 300–320° (45) see indic. refs.; from 2-bromo-1,1,2-trichloroethane (by elimination of Br-Cl) with Zn dust in boilg. alc. (58) (59) or from 2-iodo-1,1,2-trichloroethane on distn. at atm. press. (60) see indic. refs.]

From acetylene. *With chlorine.* [Starting from acetylene the addition of 1 mole of Cl_2 yields Č to which further addn. of Cl_2 gives 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3.5750), for this reason most of the processes for prepn. of the latter cpd. by this method yield (or may be made to yield) Č as a by-product. Since the patents on the addn. of chlorine to acetylene have been extensively cited under the text of 1,1,2,2-tetrachloroethane (3:5750) (prepn. from acetylene), refer to that compound; however, see also (61) (62) (63)]

With other reagents. [For formn. of Č from acetylene with $SbCl_5$ (64) (65) cf. (57), with $SbCl_5 + SbCl_3$ (66), or with aq. ICl soln. (57), see indic. refs.]

CHEMICAL BEHAVIOR OF Č

Pyrolysis of Č. [Č *in s.t. at 360° for 10 hrs. is completely decomposed* (64) into carbon + HCl.] (See also above under detn. of Č.)

Oxidation of Č. [Č with O_2 in pres. of suitable cat. (e.g., Br_2 or H_2SO_4) gives (67)

chloroacetyl chloride (3:5235). — $\bar{C}$ with O_2 + N_2 in ultra-violet light evolves HCl but yields (68) only resinous (perhaps polymerization) products.]

[For study of rate of reactn. of $\bar{C}$ (in AcOH) with O_3 see (69).]

[Note that $\bar{C}$ with NH_3 + air over Pt/Rh cat. at 820–850° gives (70) HCN.]

[$\bar{C}$ with air over (strongly chlorinated) CuO at 450° gives (76) much phosgene (3:5000).]

Stabilization of $\bar{C}$. [For stabilization of $\bar{C}$ by addn. of small amts. of alc. NH_3 (71), with Et_3N (72), or with various phenols, amines, and aminophenols (73), see indic. refs.] (See also under corresp. subtopic of 1,1,2-trichloroethylene (3:5170).)

Polymerization of $\bar{C}$. [$\bar{C}$ in the pres. of dibenzoyl peroxide (or other org. peroxides) on htg. under press. reacts with itself yielding mainly (74) a dimer, viz., 1,3,4,4-tetrachlorobutene-1 (3:9058), accompanied by other prods.]

[For study of influence of radiation of 1980–1860 Å (from Al arc) and accompanying polymerization see (75).]

Reaction with halogens. *Behavior of $\bar{C}$ with Cl_2.* [$\bar{C}$ adds 1 mole Cl_2 giving (69% yield (58)) 1,1,2,2-tetrachloroethane (3:5750); for study of this reactn. in light of 4360 Å see (77).] (See also under the individual *cis*- (3:5042) and *trans*- (3:5028) stereoisomers)

Behavior with Br_2. [$\bar{C}$ adds 1 mole Br_2 giving (60) (57) 1,2-dibromo-1,2-dichloroethane [Beil. I-93, I_1-(29), I_2-(64)], b.p. 195° at 760 mm. (78) (59), b.p. 79.0–79.5° at 15 mm. (79); for study of photochem. addn. of Br_2 in gas phase (80) (81) and in CCl_4 soln. (81) (82) in sunlight (83) (84) see indic. refs.]

Behavior with ICl. [$\bar{C}$ in $CHCl_3$ adds ICl in sunlight yielding (60) 2-iodo-1,1,2-trichloroethane, b.p. 77° at 9 mm., D_4^{15} = 2.2760 (60).]

Reaction with halogen hydrides. *Reaction with HCl.* [$\bar{C}$ in the absence of cat. does not add dry HCl; $\bar{C}$ with dry HCl in the pres. of small amts. $AlCl_3$ at 30–40° gives (87% yield (86)) (85) (104) 1,1,2-trichloroethane (3:5330) accompanied (85) by 1,1,2,3,4-pentachlorobutane (3:0750); this latter prod. and doubtless various others appear to be formed in the pres. of the $AlCl_3$ by various condensations among the various organic materials (see below).]

Reaction with H_2SO_4. [$\bar{C}$ is only slightly attacked at 20° by either 85% or 96% H_2SO_4 and no polymerization occurs (87); on running the H_2SO_4 layer into 10 vols. of cold aq. qual. evidence of formn. of chloroacetaldehyde (3:7212) was obtd. (87). — $\bar{C}$ with conc. H_2SO_4 is unchanged up to 120° but at higher temps. carbonizes without evidence of formn. of chloroacetaldehyde (88).]

[However, $\bar{C}$ with fuming H_2SO_4 (50% SO_3) or $\bar{C}$ with SO_3 followed by aq. gives (88) (89) chloroacetaldehydesulfonic acid from which htg. with 80% H_2SO_4 gives (88) (89) chloroacetaldehyde (3:7212).]

Behavior with alkali. [$\bar{C}$ with alc. KOH (90) (91) loses 1 HCl yielding chloroacetylene (3:7000); this prod. sometimes (92) (93) causes spontaneous ignition of the system especially when its alc. soln. comes in contact with air in cleaning the reaction flask (91).] (See also under the individual *cis*- (3:5042) and *trans*- (3:5028) stereoisomers.)

[Note that $\bar{C}$ with alc. NaSH does *not* react even after 6 hrs. reflux. (92).]

Behavior with NH_3. [$\bar{C}$ with liq. NH_3 under high press. reacts only very slightly although a small amt. of chloroacetylene (3:7000) (from loss of HCl) is formed (94).]

Behavior with metals. [For study of corrosion of common metals by $\bar{C}$ see (5).]

Behavior with other inorganic reactants. [$\bar{C}$ with liq. nitryl chloride ($ClNO_2$) in s.t. at 100° for 3 hrs. gives by addn. to unsatd. linkage (67% yield (95)) 2-nitro-1,1,2-trichloroethane, pale yel. oil, b.p. 63° at 13 mm. — $\bar{C}$ cautiously added to 4 vols. of a mixt. of conc. + fumg. HNO_3 and warmed gives (96) a small amt. of nitro-trichloromethane (chloropicrin).— $\bar{C}$ with liq. N_2O_4 at ord. temp. for 24 hrs. in an *unsealed* tube (use of sealed tube leads to serious explosions) reacts (96) to give a little oxalic acid dihydrate (1:0445) together with an unidentified lachrymatory oil.]

BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons. [$\bar{C}$ (1 mole) with cyclopentadiene (1 mole) (1:8030) in s.t. at 180–190° for 15 hrs. yields (97) two Diels-Alder type adducts. — For reactn. of $\bar{C}$ with C_6H_6 + Al/Hg see under individual *cis*- (3:5042) and *trans*- (3:5028) stereoisomers.]

With other chlorinated hydrocarbons. (For reaction of $\bar{C}$ with itself see above under polymerization.)

With methylene (di)chloride (3:5020). [$\bar{C}$ (1 wt. pt.) with CH_2Cl_2 (3 wt. pts.) + $AlCl_3$ (0.3 wt. pt.) at 40° for 8 hrs. gives (24% yield (98)) 1,1,2,3-tetrachloropropane (3:6035)].

With chloroform (3:5050). [$\bar{C}$ (1 wt. pt.) with $CHCl_3$ (3 wt. pts.) + $AlCl_3$ (0.25 wt. pt.) stirred with sand for 20 hrs. at 30° (99) cf. (100) (101) (102) gives (yields: 63% (99), 70–75% at 50° (100), 46% at 17° in 22 hrs. (100)) 1,1,2,3,3-pentachloropropane (3:6280).]

With carbon tetrachloride (3:5100). [$\bar{C}$ with CCl_4 + $AlCl_3$ gives (101) (102) cf. (103) 1,1,1,2,3,3-hexachloropropane (3:6460); for reactn. of this system yielding heptachloropentenes see (103).]

With 1,1,2-trichloroethane (3:5330). [$\bar{C}$ with 1,1,2-trichloroethane + $AlCl_3$ (1%) at 35–40° for 5 days gives (104) two diastereoisomeric 1,1,2,3,4-pentachlorobutanes, viz., liq. (3:9068) and solid (3:0750).]

With 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). [$\bar{C}$ with acetylene tetrachloride + $AlCl_3$ gives a mixt. from which can be isolated only (104) solid 1,1,2,3,4-pentachlorobutane (3:0750).]

With 1,1,1,2-tetrachloroethane (3:5555). [$\bar{C}$ with *unsym.*-tetrachloroethane + $AlCl_3$ at 40° for 10 days gives (104) 1,1,1,4,4-pentachlorobutene-2 (3:9054).]

With pentachloroethane (3:6880). [$\bar{C}$ with pentachloroethane + $AlCl_3$ at 40° for 12 days presumably first forms both 1,1,2,2,3,4,4-heptachlorobutane (3:9056) and 1,1,1,2,3,4,4-heptachlorobutane, but the latter loses HCl and by further reaction and/or resinification is lost in the accompanying resins (104); the HCl thus split out adds (in the pres. of $AlCl_3$) to $\bar{C}$ yielding 1,1,2-trichloroethane which then condenses with more $\bar{C}$ as stated above (104).]

With hexachloropropene (3:6370). [$\bar{C}$ with hexachloropropene + $AlCl_3$ in CH_2Cl_2 soln. yields (105) a single 1,1,2,3,3,4,5,5-octachloropentene-1, b.p. 145–147° at 11 mm., 113–113.5° at 2 mm., $D_{21}^{21} = 1.749$, $n_D^{21} = 1.5607$ (105). This prod. with conc. H_2SO_4 gives (80% yield (105)) a mixt. of pentachlorobutenecarboxylic acids (105).]

Behavior with organic OH or SH derivs. [$\bar{C}$ (1 mole) with C_2H_5SH (2 moles) in alc. KOH (2.6 moles) refluxed ½ hr. gives (yield not stated (106)) 1,2-*bis*-(ethylthio)ethylene, b.p. 170° at 13 mm.]

[$\bar{C}$ (1 mole) with benzyl mercaptan (2 moles) in alc. KOH refluxed 7 hrs. gives (yield not stated (106)) 1,2-*bis*-(benzylthio)ethylene, white ndls. from alc. or AcOH, m.p. 61°; this prod. in CS_2 adds 1 Br_2 giving 1,2-dibromo-1,2-*bis*-(benzylthio)ethane, ndls. from ether, m.p. 73–74°.]

[$\bar{C}$ (1 mole) with thiophenol (2 moles) in alc. NaOEt (2 moles) refluxed 24 hrs., poured into aq., gives (yield not stated (108)) 1,2-*bis*-(phenylthio)ethylene, b.p. 235–242° at 760 mm., pl. from lt. pet., m.p. 62°.]

$\bar{C}$ (1 mole) with *p*-tolylmercaptan (2 moles) in 7% alc. KOH refluxed 3 hrs. gives (90% yield (107)) 1,2-*bis*-(*p*-tolylthio)ethylene, ndls. from alc., m.p. 93°; this prod. in $CHCl_3$ adds 1 mole Br_2 giving (100% yield) 1,2-dibromo-1,2-*bis*-(*p*-tolylthio)ethane, cryst. from pet. ether, m.p. 72° (107).

[For analogous reactn. with $\bar{C}$ of *o*-nitrothiophenol or *p*-nitrothiophenol see (106).]

[$\bar{C}$ (1 mole) with an alk. salt of thiosalicylic acid (*o*-mercaptobenzoic acid) reacts similarly giving (109) (110) cf. (111) (112) 1,2-*bis*-(*o*-carboxyphenylthio)ethylene ("*S,S*-vinylene-

bis-thiosalicylic acid") [Beil. X-128, X_1-(55)]; this prod. with KOH/NaOH at 220–230° gives (113) 3-hydroxythionaphthene (thioindoxyl) [Beil. XVII-110, $XVII_1$-(60)], or by actn. of acid condensing agents (e.g., fuming H_2SO_4, $ClSO_3H$, etc.) yields (114) the important dyestuff thioindigo [Beil. XIX-177, XIX_1-(690).] — Note that the corresp. condens. of $\bar{C}$ with salicylic acid (*o*-hydroxybenzoic acid) or with anthranilic acid (*o*-aminobenzoic acid) *cannot* be effected (112).]

Behavior with other misc. organic reactants. [$\bar{C}$ with paraformaldehyde (1:0080) + conc. H_2SO_4 gives (115) a resin (cf. behavior of 1,1,2-trichloroethylene (3:5170)).]

[$\bar{C}$ (1 mole) with EtMgBr (2 moles) yields (116) C_2H_6 + $BrMgC{\equiv}C{-}MgBr$ + $MgCl_2$.]

[$\bar{C}$ does *not* (117) react with acetyl iodide even after 150 days at 25°.]

COLOR TESTS FOR $\bar{C}$

Ⓟ Color test with α-naphthol/cyclohexanol. $\bar{C}$ (1 drop) with 2 ml. of a 2% soln. of α-naphthol (1:1500) in cyclohexanol (1:6415) + 2 pellets solid NaOH boiled 25 seconds, cooled, gives after acidification with AcOH or 85% H_2SO_4, stdg. 1 min., and shaking a violet or red-violet color (118). — [Note that under these conditions the response given by methylene (di)chloride (3:5020) is green-blue; by both $CHCl_3$ (3:5050) and CCl_4 (3:5100) is intense blue; by 1,2-dichloroethane (ethylene dichloride) (3:5130) is colorless to pale green; by 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) is intense green-blue; by pentachloroethane (3:5880) is gray-green; by 1,1,2-trichloroethylene (3:5170) is intense green-blue; and by tetrachloroethylene (3:5460) is green (118).]

—— Mercury *bis*-(chloroacetylide) $Hg(-C{\equiv}C-Cl)_2$. Shining white pl. from hot $CHCl_3$; although reported to melt at 185° (119) (120) (121) has also been found (122) to explode *with great violence* well below that temperature, i.e., 174–175° (122). [From $\bar{C}$ with aq. $Hg(CN)_2$ + KOH on shaking at room temp. (91) (123) for 48 hrs. (119), or from $\bar{C}$ in alc. run into a stirred aq. soln. of $HgCl_2$ + NaCN + KOH (120), or from $\bar{C}$ shaken with an aq. soln. of HgO + NaCN + NaOH (122). — Note, however, that in fact this prod. results only from the higher-boilg. (*cis*) stereoisomer of $\bar{C}$ (3:5042) and that the lower-boilg. (*trans*) stereoisomer (3:5028) reacts much more slowly and quite differently to yield mercury *bis*-(α,β-dichloroethylenide), m.p. 50.3° (122). — *Note further that by the above treatment 1,1,2-trichloroethylene* (3:5170) *gives* mercury *bis*-(trichloroethylenide), m.p. 83°, but this prod. is much more sol. in $CHCl_3$ than the analogous material from $\bar{C}$ (for use in detect. of $\bar{C}$ in pres. of 1,1,2-trichloroethylene see (123)).]

57.1°	at 760 mm.	(8)			n_D^{20} = **1.41638**	(8)
56.7–56.9°	at 743 mm.	(9)			n_D^{15} = **1.41975**	(1)

Liquid. — [For b.p. at various press. from 70–277 mm. see (11).] — Alm. insol. aq. [for precise data see (5) (6) (7) (11).] — [For f.p./compn. data of mixts. with 2,2-dichloropropane (3:7140) see (10).] — [For use as dry cleaning fluid see (12); for use as corrosion inhibitor for alk. on tinned metal see (13).]

C̄ forms with EtOH (1:6130), b.p. 78.3°, a const.-boilg. mixt., b.p. 54.6°, contg. 88.5 wt. % C̄ (4); C̄ forms with isopropyl alc. (1:6135), b.p. 82.45°, a const.-boilg. mixt., b.p. 56.6°, contg. 82 wt. % C̄ (4); C̄ forms with *ter*-butyl alc. (1:6140), b.p. 82.5°, a const.-boilg. mixt., b.p. 57.1°, contg. 94 wt. % C̄ (14); C̄ forms with acetone (1:5400), b.p. 56°, a const.-boilg. mixt., b.p. 57.55°, contg. 70 wt. % C̄ (14); C̄ forms with CS_2, b.p. 46.3°,

const.-boilg. mixt., b.p. 44.75°, contg. about 28 wt. % $\bar{C}$ (14). [For study of b.p., *D*, and vapor-liq. equil. of binary mixts. of $\bar{C}$ with $CHCl_3$ (3:5050), CCl_4 (3:5100), or with 1,2-dichloroethane (3:5130) see (27).]

[For soly. of aq. in $\bar{C}$ see (29); for adsorption of $\bar{C}$ by activated carbon at various temps. see (30).]

[For prepn of $\bar{C}$ from acetaldehyde (1:0100) with PCl_5 see (15) (16) (17); from vinyl chloride (3:7010) by catalyzed addn. of HCl see (18) (19) (20) (note that in absence of catalyst addn. of HCl to vinyl chloride is very slow (21)); for formn. of $\bar{C}$ (22.6%) together with other products from ethane with Cl_2 above 290° in pres. of ethylene see (28).]

$\bar{C}$ on passing over pumice at dark red heat yields (22) (23) vinyl chloride (3:7010) + HCl.

[For reactn. of $\bar{C}$ + $AlCl_3$ with 1,2-dichloroethylene (3:5030) or with trichloroethylene (3:5170) yielding polychlorobutanes see (24); for reactn. of $\bar{C}$ with amylidene disodium see (25).]

$\bar{C}$ on htg. in s.t. at 120° with aq. alc. soln. of 2 moles Na (or K) α-naphtholate yields (26) acetaldehyde di-α-naphthylacetal, ndls., m.p. 117° (26).

See also both *trans*-1,2-dichloroethylene (3:5028) and ordinary (mixt. of *cis* and *trans*) 1,2-dichloroethylene (3:5030); the following text is restricted to studies on substantially pure *cis*-stereoisomer.

Note carefully that 1,2-dichloroethylene is *not* the same as ethylene (di)chloride (3:5130) (there are an almost incredible number of errors in the literature involving this point); neither is it the same as the now very important 1,1-dichloroethylene (vinylidene (di)-chloride) (3:5005).

GENERAL DATA ON C̄

Note that substantially pure C̄ is commercial solvent in U.S.A. under designation "Di-60" (referring to the two chlorine atoms and the b.p.) [for study of thermal conductivity and for tabulation of constants of comml. C̄ see (18). — For toxicity of C̄ see (40) (23). — For use of C̄ in extraction of caffeine from coffee see (24)].

[For data on vap. press. of C̄ over temp. range 27–59.8° see (12). — For data on flammability of C̄ see (19). — For ebullioscopic constant of C̄, viz., 34.4° (for 1 mole solute in 100 g. C̄), see (20).]

Binary systems contg. C̄. (See also below under azeotropes.) — [C̄ + *trans-1,2-dichloroethylene* (3:5028): for use of n_D^{25} in detn. of composition of mixt. see (11); for f.p./compn. data (eutectic, f.p −91°, contg. about 71% C̄) see (17). — For f.p./compn. data on binary systems *C̄ + ethylene (di)chloride (3:5130), C̄ + 1,1,2,2-tetrachloroethane* (acetylene tetrachloride) (3:5750), or *C̄ + ethylene (di)bromide* see (17). — For study of soly. of various other *cis/trans* isomers in C̄ see (5).]

Quaternary systems contg. C̄. [For study of system contg. C̄ + $CHCl_3$ (3:5050) + trichloroethylene (3:5170) + EtBr (eutectic, f.p. −139.1°, contg. 13.8 wt. % C̄ + 19 7 wt. % $CHCl_3$ + 21.6 wt. % trichloroethylene + 44.9 wt. % EtBr recommended as a non-inflammable mixt. for low-temp. cryostats) see (22); for mixt. of the above four compds. + methylene dichloride (3:5020) (similarly recommended) see (22).]

Azeotropes contg. C̄. *Binary azeotropes — C̄ with aq* forms a const.-boilg. mixt., b.p 55 3°, contg. 96.65% C̄ (41) (42). — *C̄ with EtOH* (1:6130) forms a const.-boilg. mixt., b.p. 57.7° at 760 mm. (21) (41) (42), contg. 90 20% C̄ (41) (42) = 81.4 mole % C̄ (21)

Ternary azeotropes. C̄ with EtOH (1:6130) + aq. forms a const.-boilg. mixt, b p. 53.8°, contg. 90.50% C̄ + 6.65% EtOH + 2.85% aq. (41) (42).

PREPARATION OF $\bar{C}$

Pure $\bar{C}$ is usually obtd. by careful fractional distillation at ord. press. of the mixt. of *cis* and *trans* stereoisomers comprising ord. 1,2-dichloroethylene (3:5030) [for brief comments on this mode of sepn. see (1) (2) (6) (7) (8) (9) (10) (11) (13) (15) (27); note that some workers (13) recommend distn. in atmosphere of CO_2. — For detn. of the % compn. of mixts. of $\bar{C}$ with its stereoisomer by means of n_D^{25} see (11); by means of dielectric const. see (13) (27)].

[For study of possibility of sepn. of $\bar{C}$ from its stereoisomer by differential adsorption on silica gel see (25).]

[For prepn. of $\bar{C}$ from pure *trans* stereoisomer (3:5028) by isomerization with 6 wt. % Br_2 in dark for 24 hrs. followed by subsequent fractionation of the resultant mixt. see (11).]

ISOMERIZATION OF $\bar{C}$

$\bar{C}$ under the influence of heat, light, or various catalysts in part isomerizes to *trans*-1,2-dichloroethylene (3.5028). — [For study of thermal isomerization of $\bar{C}$ in vapor phase at 185–275° (26), up to 350° (27), up to 975° (28), in liquid phase or in various solutions (13) see indic. refs.; note that the equilibrium mixt. at 300° conts. 60.8 ± 0.7% $\bar{C}$, at 350° conts. 59 4 ± 0.3% $\bar{C}$ (27), at 975° conts. 52.3% $\bar{C}$ (28) — For study of kinetics of thermal isomerization see (29).]

[For patent on isomerization of pure $\bar{C}$ to a mixt. contg. 18% *trans* stereoisomer by means of a small amt. Br_2 at 30° or above in pres. of cat. or in vapor phase at not over 300° see (30).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Reactions with inorganic compds. $\bar{C}$ (in vapor phase at 95° in light of 4360 Å (31)) with Cl_2 (in absence of O_2), or $\bar{C}$ as liquid with SO_2Cl_2 (1½ moles) in pres. of trace of dibenzoyl peroxide refluxed 3 hrs. in dark (8), adds 1 mole halogen giving (85% yield (8)) 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3.5750).

$\bar{C}$ with Br_2 in sunlight adds 1 mole halogen yielding (2) (32) 1,2-dibromo-1,2-dichloroethane [Beil. I-93, I_1-(29), I_2-(64)], b p. 195° at 760 mm. (3) (33), b.p. 79.0–79.5° at 15 mm. (2). — [For extensive study of influence of O_2 and other factors see (32); for study of kinetics in CCl_4 soln. see (2) (34) (35); note that rate of addn. of Br_2 either directly or in CCl_4 is half as great as for the stereoisomeric *trans* form (3:5028) but that it is increased in pres. of $SbBr_3$ (35).]

$\bar{C}$ in the absence of $AlCl_3$ or other cat. does not add dry HCl; satn. of $\bar{C}$ with dry HCl changes n_D^{25} by an amount corresp. to only 2% change in compn. (11).

[$\bar{C}$ with alc. KOH splits out 1 HCl yielding chloroacetylene (3:7000); note that this reactn. is about 20 times as fast for $\bar{C}$ as for its *trans* stereoisomer (2)]

$\bar{C}$ with aq. $NaOH/Hg(CN)_2$ behaves quite differently from its *trans* stereoisomer (3:5028): on shaking at room temp. with specified concns. (16) $\bar{C}$ begins to react within 30 min., losing 1 HCl and pptg mercuric *bis*-(chloroacetylide), $Hg(—C{\equiv}C—Cl)_2$; this prod. cryst. from $CHCl_3$ (36) (37) (38) in white shining pl. with characteristic acetylene-like odor and although alleged to melt at 185° (36) (37) has also been found to explode *with great violence* well below that temp , i.e., 174–175° (16).

Reactions with organic compds. [$\bar{C}$ with C_6H_6 + Al/Hg at 0° gives same prods. as does the ordinary (mixture) 1,2-dichloroethylene (3:5030) (presumably indicating partial isomerization of $\bar{C}$); these prods. include dibenzyl, triphenylethane, tetraphenylethane, etc. (15).]

[For extraordinarily comprehensive reviews of the history and general chemistry of C̃ see (1) (60).]

[*See also methylene (di)chloride* (3:5020) *and carbon tetrachloride* (3:5100).]

MISCELLANEOUS PHYSICAL PROPERTIES OF C̃

Various Solubility Relations

With water. C̃ is only very slightly sol. aq. and is eas. volat. with steam; e.g., 100 g. aq. at 15° dissolves 0.852 g. C̃ (18); water satd. with C̃ conts. at 20° 0.8% C̃ (63) cf. (64). For studies of soly. of aq. in C̃ at 0° (65), 20° (63), 25° (65), and 30° (65) see indic. refs.; note that at 20° C̃ satd. with aq. conts. 99.8% C̃ and has D_4^{20} = 1.486 (63).

With various inorganic compounds. [For data on soly. in C̃ of H_2 (66), O_2 (78), HCl (67) (68) (69) (79), HBr (68) (69), H_2S (67), NH_3 (67), CO_2 (70) (80) (81), N_2O (81), and NO_2 (70) see indic. refs. — For data on soly. of I_2 in C̃ see (71) (72) (73) (74); for study of nature of I_2 solns. in C̃ see (75); for soly. of I_2 in vapor of C̃ see (76).]

With organic materials. [For study of absorption of vapor of C̃ by kerosene see (77).]

BINARY SYSTEMS CONTAINING $\bar{C}$

(See also azeotropes containing $\bar{C}$)

$\bar{C}$ with various inorganic compounds. $\bar{C}$ + *aq.*: for soly. data and diag. see (64); note that a previously described (82) hydrate of $\bar{C}$ could *not* be confirmed (64). — $\bar{C}$ + Cl_2: for f.p./compn. data and diag. (note that 4 different compounds are formed) see (34). — $\bar{C}$ + Br_2: for f.p./compn. data and diag. see (34) (36) (note that no compds. are formed and that eutectic has m.p. −72° (34) with about 86 mole % $\bar{C}$).

$\bar{C}$ with org. cpds. of Order 1. $\bar{C}$ + *n-hexane* (1:8530): for f.p./compn. data see (83); for densities over range −90° to +60° see (85). — $\bar{C}$ + C_6H_6 (1:7400): for f.p./compn. data and diag. see (38); for D_4^{25}/compn. and n_D^{25}/compn. data over entire range see (19); for D_{25}^{25}/compn. data see (18); for liq. vapor equil. see (19) (117) (112) (124). — $\bar{C}$ + *toluene* (1:7405): for f.p./compn. data see (83); for data on specific gravity of system from 15-25° see (86); for study of liq.-vapor equil. see (123). — $\bar{C}$ + *cyclohexane* (1:8405): for f.p./compn. data see (83); for D_4^{20} compn. see (47).

$\bar{C}$ + *MeOH* (1:6120): for f.p./compn. data see (37) (84); for D_-^{25}/compn. and n_D^{25}/compn. see (44). — $\bar{C}$ + *EtOH* (1:6130): for D_4^{25}/compn. data see (45) (46). — $\bar{C}$ + *benzyl alc.* (1:6480): for density/compn. data over entire range see (87).

$\bar{C}$ + *diethyl ether* (1:6110): for f.p./compn. data and diag. see (42) (88); for D_4^{20}/compn. see (47). — $\bar{C}$ + *diisopropyl ether* (1:6125): for D_4^{20}/compn. see (47). — $\bar{C}$ + *dioxane-1,4* (1:6400): for D_4^{20}/compn. see (47). — $\bar{C}$ + *ethylene glycol dimethyl ether* (1:6141): for study of heat of mixing see (89). — $\bar{C}$ + *tetraethylene glycol dimethyl ether:* for study of heat of mixing see (89).

$\bar{C}$ + *dimethyl carbonate* (1:3046): for D_4^{25}/compn. data see (20). — $\bar{C}$ + *diethyl carbonate* (1:3150): for D_4^{25}/compn. data see (20).

$\bar{C}$ + *acetone* (1:5400): for f.p./compn. data see (27); for D_4^{20}/compn. (47), D_4^{25}/compn. (19) (46), n_D^{25}/compn. (19), and $n_D^{25.4}$/compn. (49) data see indic. refs.; for refractive index/compn. for light of various wave lengths see (52).

With org. cpds. of Order 2. $\bar{C}$ + *nitrobenzene:* for f.p./compn. data and diag. (eutectic, f.p. −71.0° conts. 81.5 wt. % $\bar{C}$) see (61). — $\bar{C}$ + *aniline:* for f.p./compn. data and diag. see (27). — $\bar{C}$ + *N,N*-dimethylaniline: for D_4^{25}, D_4^{40}, $n_D^{24.8}$, and $n_D^{39.5}$ over entire range of composition see (43). — $\bar{C}$ + *quinoline:* for D_4^{20}/compn. data see (47).

With org. cpds. of Order 3. $\bar{C}$ + CH_2Cl_2 (3:5020): for f.p./compn. data and diag (eutectic, f.p. −108.4° conts. 29.5 wt. % $\bar{C}$) see (39); for data on b.p., D_4^{20}, and liq.-vapor equil. see (90). — $\bar{C}$ + CCl_4 (3:5050): for f.p./compn. data and diag. (eutectic, f.p. −81.4° conts. 50.6 wt. % $\bar{C}$ (39)) (36) (83) (91) see indic. refs.; for D_4^{20}/compn. (48) (90), D_{25}^{25}/compn. (8), b.p. and liq.-vapor equil. (90) see indic. refs. — $\bar{C}$ + *1,1-dichloroethane* (3:5035): for b.p., D_4^{20}, and liq.-vapor equil. see (90). — $\bar{C}$ + *1,2-dichloroethane* (3:5130): for data on vap. press. (92) and liq.-vap. equil. (93) see indic. refs. — $\bar{C}$ + *1,1,1-trichloroethane* (3:5058): for f.p./compn. data see (94). — $\bar{C}$ + *1,1,2-trichloroethylene* (3:5170): for f.p./compn. data and diag. (eutectic, f.p. −100.2°, conts. 31.2 wt. % $\bar{C}$) see (39). — $\bar{C}$ + *β,β'-dichlorodiethyl ether* (3:6025): for D_4^{20}/compn. data see (47).

With org. cpds. of higher orders. $\bar{C}$ + *1,2-dibromoethane:* for D_4^{20}/compn. data see (47). — $\bar{C}$ + CBr_4: for f.p./compn. data and diag. see (91). — $\bar{C}$ + CHI_3: for vap. press. data see (95). — $\bar{C}$ + CS_2: for f.p./compn. data see (83); for D_{15}^{15} compn. (96) or D_{25}^{25}/compn. (8) see indic. refs.; for liq.-vapor equil. data see (97).

Ternary Systems Containing $\bar{C}$

(See also azeotropes containing $\bar{C}$)

$\bar{C}$ + *acetone* (1:5400) + *H_2O:* for studies of liq. equil. at 25° see (98) (99) (100) (101) (102). — $\bar{C}$ + *acetone* (1:5400) + *MeOH* (1:6120): for ternary b.p. diag. see (103). — $\bar{C}$ + *acetone* (1:5400) + *diethyl ether* (1:6110): for data on refraction see (104). — $\bar{C}$ + *acetone* (1:5400) + *diisopropyl ether* (1:6125). for ternary b.p. diag. see (103).

$\bar{C}$ + *acetone* (1:5400) + *C_6H_6* (1:7400): for ternary b.p. diag. see (103) (19) (105); for refractive data see (104).

$\bar{C}$ + *acetone* (1:5400) + *CH_2Cl_2* (3:5020): for ternary b.p. diag. see (103).

$\bar{C}$ + *acetic acid* (1·1010) + *aq.:* for studies of liq. equil. at 25° see (104) (106) cf. (99). — $\bar{C}$ + *acetic acid* + *lubricating oil:* for studies of liq. equil. at 25° see (107).

$\bar{C}$ + *CH_2Cl_2* (3:5020) + *CCl_4* (3:5100): eutectic, f.p. −111.4°, conts. 27 wt. % $\bar{C}$ + 60 wt. % CH_2Cl_2 + 13 wt. % CCl_4 (39).

Quaternary Systems Containing $\bar{C}$

$\bar{C}$ + *acetone* (1·5400) + *AcOH* (1:1010) + *aq.:* for study of liq. equil. at 25° see (100); for study of use of system in mixed solv. extraction of lubricating oils see (107) (108). — $\bar{C}$ + *trans-1,2-dichloroethylene* (3.5028) + *1,1,2-trichloroethylene* (3:5170) + *C_2H_5Br:* eutectic, f.p −139.1°, conts. 17 7 wt % $\bar{C}$ + 13.8 wt. % *trans*-1,2-dichloroethylene + 21.6 wt. % trichloroethylene + 44.9 wt. % C_2H_5Br (39).

Binary Azeotropes Containing $\bar{C}$

$\bar{C}$ + *H_2O:* $\bar{C}$ forms with aq. a const.-boilg. mixt., b.p. 56.1°, contg. 97.5 wt. % $\bar{C}$ (14).

$\bar{C}$ + *MeOH* (1:6120): $\bar{C}$ forms with MeOH a const.-boilg. mixt , b p. 53.5° (103) (109), contg 87.5 wt. % (103) = 65 mole % (109) $\bar{C}$, cf also (110) (111) (4) (112) (113) — $\bar{C}$ + *EtOH* (1.6130): $\bar{C}$ forms with EtOH a const.-boilg. mixt., b.p. 59.3° at 760 mm. (111), 59.35° at 760 mm. (14), contg. 93.2 wt. % $\bar{C}$ (111) cf. (14) = 84 mole % $\bar{C}$ (111) (see also (4) (110)) of D_{15}^{15}= 1.4112 (14);
study of liq -vap equil. see (45).
alc. a const.-boilg. mixt., b.p. 60
mole % $\bar{C}$ (111). — $\bar{C}$ + *formic acid* (1:1005): $\bar{C}$ forms with formic acid a const.-boilg. mixt , b.p. 59.15° at 760 mm. (115), contg 85 wt. % $\bar{C}$ (115). — $\bar{C}$ + *ethyl formate* (1:3000): $\bar{C}$ forms with ethyl formate a const.-boilg. mixt., b.p 62 8° (116), 62.7° (111) at 760 mm., contg. 87 wt. % $\bar{C}$ — $\bar{C}$ + *methyl acetate* (1:3005): $\bar{C}$ forms with methyl acetate a const.-boilg. mixt., b p. 64.8° at 760 mm (111), contg. 77 wt. % $\bar{C}$ (111); b.p. 63.0° at 726.3 mm. contg. 50 wt. % $\bar{C}$ (117); b.p. 62.6° at 717.5 mm. contg. 56 wt. % $\bar{C}$ (117); for study of constant evapn. system see (125). — $\bar{C}$ + *diisopropyl ether* (1:6125): $\bar{C}$ *forms with di-*
36.5% wt % $\bar{C}$ (103). — $\bar{C}$ + *acetone*
b.p. 64.5° at 760 mm. (109) (103)
wt. % $\bar{C}$ (19) (105), 65 5 mole % $\bar{C}$
(109); b.p. 62.4° at 732.0 mm. contg. 80 wt. % $\bar{C}$ (117); b p. 62 25° at 719 mm. contg 86 wt. % $\bar{C}$ (117) cf also (112); b.p. 61.95° at 716.5 mm contg 85 wt. % $\bar{C}$ (117): for studies of liq.-vapor equil. of $\bar{C}$ + acetone see (19) (105) (117) (112), for study of vap. press. see (26) (49) (118) (119) (120) (121): for study of distn. of $\bar{C}$ + acetone in wetted wall column see (122).

Ternary Azeotropes Containing $\bar{C}$

$\bar{C}$ + *EtOH* (1.6130) + *aq* : $\bar{C}$ forms with EtOH + aq. a ternary const.-boilg. mixt., b p 55.4–55.5° at 760 mm., contg. about 92.5 wt. % $\bar{C}$ + 4 0 wt. % EtOH + 3.5 wt. % aq (14).

indic. refs. For formn. of $\bar{C}$ from various chlorinated ketones by action of alkali hypochlorites (haloform reaction) see (235) (236).]

From alcohols. [For concise reviews of prepn. of $\bar{C}$ from EtOH (1:6130) by action of alkaline hypochlorite solns. see (1) (214); for formn. of $\bar{C}$ from various other primary and secondary alcohols in similar fashion see (237).]

From miscellaneous sources. [*For prepn. of $\bar{C}$ from trichloroacetic acid (3:1150)* by loss of CO_2 under a wide variety of conditions see text of that compound under decarboxylation; from dichloroacetyl chloride (3:5290) on warming with $AlCl_3$ see text of that compound; from mixtures of salts of fatty acids with inorganic chlorides by electrolysis see (238); from lignin with alkali hypochlorite see (239).]

[For prepn. of trichlorodeuteriomethane (deuteriochloroform) ($CDCl_3$) from chloral deuterate + NaOD (443) or from chloral (3:5210) + D_2O + CaO (444) see indic. refs.; for rate of isotopic exchange between $\bar{C}$ and D_2O see (445).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis of $\bar{C}$. [$\bar{C}$ passed at red heat over asbestos (240), over Pt wire at 1000° (241), with 1% I_2 over pumice at red heat (242) cf. (243), or in electric arc (249) undergoes decomposition, and various proportions of carbon, HCl, hexachloroethane (3:4835), hexachlorobenzene (3:4939), tetrachloroethylene (3:5460), pentachloroethane (3:5880), and other products are claimed to result. $\bar{C}$ over htd. TiO_2 gives (245) HCl + CO + hexachlorobenzene (3:4939) + $TiCl_4$. For other studies of pyrolysis of $\bar{C}$ at 368–400° (246), at 425° (247), and at 512° (248) see indic. refs.]

Oxidation of $\bar{C}$. $\bar{C}$ is readily oxidized to carbonyl chloride (phosgene) (3:5000) by air, oxygen, ozone, or chemical oxidizing agents. In view of the extremely toxic character of phosgene, and of the extensive use of $\bar{C}$ in anesthesia, this aspect is of great importance and has been very extensively studied.

By air or oxygen. [For an extensive account of the earlier literature on the oxidation of $\bar{C}$ in air and light see (250). Note that such oxidation is *not* effected by air in absence of light, nor by light in absence of air (251). $\bar{C}$ with limited air in sunlight reacts according to the following equation: $CHCl_3 + O \rightarrow COCl_2$ (3:5000) + HCl (252) but with excess air in sunlight in sense $2CHCl_3 + 5O \rightarrow 2CO_2 + 3Cl_2 + H_2O$ (252). Note that $\bar{C}$ + air over dry KOH gives (253) some phosgene (3:5000). For later studies on the photochemical oxidation of $\bar{C}$ (254) in tropical sunlight (255), including search for possible intermediate peroxides (256) (257), see indic. refs. For studies on chlorine-sensitized photochem. oxidn. of $\bar{C}$ see (258) (259) (260). For oxidn. of $\bar{C}$ by atomic oxygen see (261). The photochem. oxidn. of $\bar{C}$ is repressed by various inhibitors of which EtOH has been most extensively studied (262).]

By ozone. [$\bar{C}$ dissolves ozone yielding a blue soln in which some $\bar{C}$ is gradually oxidized (270) (271) to phosgene; for study of $\bar{C}$ as ozonization solvent see (24).]

By other chemical means. [$\bar{C}$ with $ClSO_3H$ at 120° (263), with $K_2Cr_2O_7 + H_2SO_4$ (264), or with air over CuO at 350–550° (265) gives phosgene (3:5000). Note, however, that $\bar{C}$ with conc. H_2SO_4 above 200° gives (266) (267) $CO + CO_2 + HCl + SO_2$ while $\bar{C}$ with an equimolal mixt. of $H_2S_2O_7 + SO_3$ at 55–60° as directed (268) cf. (269) reacts in sense $CHCl_3 + H_2S_2O_7 + SO_3 \rightarrow CO + 3ClSO_3H$ with $S_2O_5Cl_2$ (pyrosulfuryl chloride) being formed using more SO_3, and H_2SO_4 using less SO_3.]

Inflammability of $\bar{C}$. [For studies of inflammability of $\bar{C}$ in air, oxygen, or O_2/N_2O mixts. see (272) cf. (273).]

Reduction of $\bar{C}$. [$\bar{C}$ with Zn + alc. HCl (274), Zn + AcOH (275), Zn dust + alc. NH_3 (276) (277) (278), Al/Hg + aq. (275), Fe + AcOH (275), or $Si_3H_8 + AlCl_3$ in abs. of air

(279) gives CH_2Cl_2 (3:5020) or further reduction products, e.g., CH_3Cl (3:7005) or CH_4 (280); C̄ with conc. HI on htg. gives (281) CH_2I_2 [Beil. I-71, I_1-(18), I_2-(37)]; C̄ with atomic hydrogen gives (282) CH_3Cl (3:7005) + HCl.]

Substitution of C̄. Note that the text of this section refers only to replacement of the single hydrogen atom of $CHCl_3$.

Fluorination. [The product of replacement of the H atom of C̄ by F (289), viz., trichlorofluoromethane, CCl_3F [*Beil I-64*], *is usually prepd. by indirect means from sources other* than C̄, e g, from CCl_4 (3:5100) + F_2 in pres of As + Br_2 (283). However, beyond noting a few leading articles on its physical consts, including b p. = 23.66° (284), 23 77° (285) at 760 mm., m.p. = −110 48° (284), vapor press (284) (285), liquid density (286), and $P/V/T$ relationships (287), no complete review of CCl_3F and its relatives (cf. (288)) can be given here.]

Chlorination. C̄ on suitable chlorination yields CCl_4 (3:5100). [E.g., C̄ with Cl_2 in sunlight (290) or u.v. light (291) (292) (293) (294), at 260–320° (295), or in pres. of $FeCl_3$ (296) or of aq (297), or C̄ with ICl at 165° (298), or C̄ with aq NaOCl (reaction very slow and incomplete (299)) gives CCl_4 (3:5100). Note, however, that C̄ is *not* chlorinated with SO_2Cl_2 even in presence of organic peroxides (200).]

Bromination C̄ on suitable bromination gives bromotrichloromethane. [E g., C̄ with Br_2 in s t. (301) (298) at 225–275° for 14 hrs. as directed (302), or C̄ with Br_2 in light of 5460 Å (303) or 2650 Å in pres. of O_2 (304), or over carbon at 180–350° (305), or C̄ with aq. NaOBr (299), gives CCl_3Br [Beil I-67, I_2-(31)], b.p. 105° (302), 104.2–104.35° at 758.5 mm. (308), m.p. −21° (302) For prepn. of CCl_3Br from trichloroacetyl bromide by pyrolysis at 400° at ord. press. see (306); for studies of behavior of CCl_3Br with Cl_2 in light (307) (308) or of its halogen-sensitized photochem. oxidn. (309) see indic. refs.]

Iodination. [C̄ with aq. NaOI (299) gives iodotrichloromethane, CCl_3I [Beil. I-71], b p. 142° (299) (310); for prepn of this prod from CCl_4 (3:5100) with AlI_3 in CS_2 (310) or from trichloroacetyl iodide by distn. at ord press. (306) see indic. refs.]

Nitration. [C̄ with HNO_3 in s.t. at 90–100° for 120 hrs. (311) or in boilg. acetyl nitrate (312) gives nitrotrichloromethane (chloropicrin) [Beil. I-76, I_1-(20), I_2-(41)], b.p. 111–112°, but this product is usually prepd. by other means, e.g., from calcium picrate with $Ca(OCl)_2$ (313) (314).]

Nitrosation [No record can be found of any reaction between chloroform and nitrous acid. However, nitrosotrichloromethane [Beil. I_2-(39)] has been obtd. indirectly from sodium trichloromethane sulfinate, CCl_3SOONa, by the action of HNO_3 (315) (316). It is a dark blue liq, b.p. 5 0–5.5° at 70 mm (315), but decomposing on distn at ord. press. The compound is of considerable interest because on reduction with H_2S (315), Al/Hg (315), $SnCl_2$ (316), or SO_2 (316) it yields dichloroformaldoxime, $Cl_2C{=}NOH$, a chemical warfare agent with especially terrifying characteristics.]

Hydrolysis of C̄. C̄ on hydrolysis gives formic acid (1:1005) in such a form that the reaction mixt. is able to reduce Fehling soln. or $NH_4OH/AgNO_3$ even at room temp. or more rapidly on warming (dif. from CCl_4 (3:5100), 1,2-dichloroethane (3:5130), 1,1,2,2-tetrachloroethane (3:5750) and hexachloroethane (3:4835)). Note that, although some CO has been detected, yet formaldehyde (1:0145) is *not* produced (317).

[C̄ with aq. on protracted htg in s t. at 225° gives (318) HCOOH (1:1005) + CO +

[C̄ is also hydrolyzed in alc. alk. solns. even more readily than CCl_4 (3:5100) (321) (101); for use of this principle in estimation of C̄ see above under determination of C̄. For study of kinetics of hydrolysis of C̄ with alc. KOH (325), with $N/10$ KOH in 95% alc. at 90°

(326) cf. (327), or with $Ba(OH)_2$ or TlOH in 50% alc. (328) (327) see indic. refs. Note that C̄ with alc. KOH is also claimed by one worker (253) to give ethylene.]

[For further details on ability of C̄ to reduce Fehling soln. see (317) (329) (330).]

Behavior of C̄ with inorganic salts. [C̄ with $AlCl_3$ gives a gummy hygroscopic addn prod. which with aq. regenerates C̄ (331), but C̄ with $AlBr_3$ is more or less (yields: 58-90% (332), 100% (333)) converted to bromoform [Beil. I-68, I_1-(16), I_2-(33)], b.p. 149.55° at 760 mm. (334), m.p. 8.05° (334), D_4^{25} = 2.87757 (334), D_4^{20} = 2.89054 (334), D_4^{15} = 2.90350 (334), n_D^{15} = 1.60088 (334).]

[C̄ with CaI_2 in s.t. at 100° is partially converted (335) to CHI_3, but C̄ with aq. KI even in pres. of Cu decomposes yielding (336) $CH_4 + H_2 + CO + CO_2$.]

[For leading reference on behavior of C̄ with various metal fluorides see (337).]

Behavior of C̄ with metals. [C̄ with alkali or even alkaline-earth metals undergoes explosive decompn. on htg. or even at room temp. if subjected to sufficient mechanical shock. For studies of the explosion of C̄ with alkali metals see (338) (339) (340); for further data on explosions of C̄ with Li, Na, K, Ca, Sr, Ba, and Mg, especially with reference to sensitivity to mechanical shock, see (341). C̄ with molten Na at 260–370° as directed (342) gives C̄ + H_2 + CH_4 with smaller amts. of C_2H_6, C_2H_4, and C_2H_2; for study of C̄ with Na vapor see (343).]

[For study of hazards of behavior of $CHCl_3/CCl_4$ mixts. with Al or Mg see (344); for extensive study of corrosion of metals by C̄ see (345).]

[Note that C̄ with Mg in boilg. ether does *not* react, even in pres. of various catalysts (346).]

Behavior of C̄ with various organic reactants. *With carbon monoxide.* [C̄ with CO + water vapor above 200° in pres. of suitable cat. as directed is claimed (347) to give acetic acid (1:1010); C̄ with CO + $AlCl_3$ at 150° and 900 atm. for 6 hrs. gives (21% yield (348)) dichloroacetyl chloride (3:5290).]

With hydrocarbons. [C̄ (excess) with octene-1 (1:8375) in pres. of small amts. (0.02 mole) of dibenzoyl peroxide (or diacetyl peroxide) adds to unsatd. linkage giving (349) 1,1,1-trichlorononane; under similar conditions C̄ adds to one of the unsatd. linkages of diallyl (1:8045) giving 8,8,8-trichloroheptene-1. — (For other addns. of C̄ to unsatd linkages see below).]

[C̄ with C_6H_6 (excess) in pres. of $AlCl_3$ (350) (351) (352) (353), $FeCl_3$ (354), chromium powder (355), or Al powder (356) gives triphenylmethane (1:7220); other aromatic hydrocarbons presumably give analogous results but cannot be detailed here.]

With saturated halohydrocarbons. [C̄ (1.2 moles) with EtBr (3.8 moles) + $AlCl_3$ (0.07 mole) on htg. as directed (357) gives EtCl (3:7015) + 90% yield $CHBr_3$ (for physical constants see above under behavior of C̄ with inorganic salts ($AlBr_3$)). — C̄ (1 mole) with MeI (3 moles) + $AlCl_3$ (0.04 mole) on similar treatment gives MeCl (3:7005) + (95% yield (357)) iodoform, m.p. 119°. — C̄ with $CHBr_3$ + 5–10% KCl in pres. of moistened $AlCl_3$ under CO_2 in s.t. at 135° for 14 hrs. undergoes a redistribution reaction giving (358) 17% C̄ + 43% $CHCl_2Br$ + 31% $CHClBr_2$ + 9% $CHBr_3$.]

With unsaturated halohydrocarbons. [C̄ (3 wt. pts.) with ord. 1,2-dichloroethylene (3:5030) + $AlCl_3$ (0.25 wt. pt.) stirred with sand for 20 hrs at 30° (359) cf. (360) (361) (362) gives (yields: 63% (359), 70–75% at 50° (360), 46% at 17° in 22 hrs. (360)) 1,1,2,3,3-pentachloropropane (3:6280).]

[C̄ with 1,1,2-trichloroethylene (3:5170) + $AlCl_3$ at 20° gives (361) (362) 1,1,1,2,3,3-hexachloropropane (3:6460); note that at higher temp., e.g., 50–60°, yield is greatly diminished and several other prods. (361) are formed.]

[C̄ (2 moles) with 1,1,2,2-tetrachloroethylene (3:5460) + $AlCl_3$ (0.2 mole) refluxed 15–20 hrs. gives (85–93% yield (363)) (364) (365) (366) (367) (368) (369) 1,1,1,2,2,3,3-

heptachloropropane (3:0200); for study of equil. of system $\tilde{C}$ + tetrachloroethylene (3:5460) + *unsym.*-heptachloropropane (3:0200) see (370).]

With unsaturated nitriles. [$\tilde{C}$ with acrylonitrile (vinyl cyanide) in pres. of trimethylbenzyl-ammonium hydroxide at 0–5° for 24 hrs or solid KOH at 0–5° for 4 hrs. adds to unsatd. linkage giving (11–12% yield (371)) (372) γ,γ,γ-trichloro-*n*-butyronitrile, m.p 41°, b p 214–216° at 760 mm , 90–95° at 12 mm (371) (372).]

With alcohols or alcoholates. [$\tilde{C}$ with MeOH over cat. at 200–350° gives (373) MeCl (3:7005), $\tilde{C}$ with EtOH under similar conditions gives (373) EtCl (3:7015).]

[$\tilde{C}$ with Na alcoholates gives the corresp trialkyl orthoformates. E.g., $\tilde{C}$ with $NaOCH_3$ gives (374) (375) trimethyl orthoformate (1:3087); $\tilde{C}$ with $NaOC_2H_5$ gives (27–31% yield (376), 36% (377)) (374) (375) triethyl orthoformate (1 .3241); orthoformate esters of higher alcs are similarly prepd cf (374) (377) For study of behavior of $\tilde{C}$ with mixts. of sodium alcoholates see (378); *for treatise on chemistry of aliphatic orthoesters see* (379).]

With mercaptans or mercaptides [$\tilde{C}$ with $NaSCH_3$ should yield trimethyl trithioorthoformate [Beil II_1-(39)], m.p. 16° (380), b p 220° dec (380), 103–104° at 12 mm (381), 96° at 9 mm. (380), n_D^{15} = 1.5696 (381), but this prod has been reported only by other means, e g , from CCl_4 (3:5100) with $NaSCH_3$ (381) and from anhydrous HCOOH (1:1005) with CH_3SH in s t at ord. temp. (380)]

[$\tilde{C}$ with $NaSC_2H_5$ gives (382) (383) (386) triethyl trithioorthoformate [Beil. II-93, II_1-(39)], b p 235° dec (380), 174° at 760 mm (384), 136.5° at 23 mm. (385), 133° at 21 mm. (386), 126.5–128° at 12 mm. (381), 127–128° cor. at 12 mm (387), D_4^{20} = 1.053 (386), n_D^{15} = 1 5410 (381), but this product is usually prepd by indirect means, e.g., from anhydrous HCOOH (1:1005) with C_2H_5SH in pres. of dry HCl (384) (385) or from CCl_4 (3:5100) with $NaSC_2H_5$ (381).]

With phenols or phenolates $\tilde{C}$ with phenols (or with substituted phenols having at least one free ortho or para position) in presence of aq alk. condenses with eventual introduction *of the formyl radical and formn. of phenolic aldehydes (Reimer-Tiemann reaction* (388)). The countless recorded examples of this reaction cannot be detailed here but the following leading references will be found useful. [For modern studies of the Reimer-Tiemann reaction see (389) (390); for studies of influence of substituents in the phenolic component see (391) (392) (393) (394) (395); for extension of the Reimer-Tiemann reaction to other classes such as substituted indoles (396), thiazoles (397) see indic. refs.; for application to β-naphthol (1:1540) giving (38–48% yield (398)) 2-hydroxy-1-naphthaldehyde, m.p. 79–80°, *to β-tetralol (5,6,7,8-tetrahydronaphthol-2)* (399) *see indic refs ; for* studies on theory of Reimer-Tiemann reaction see (400) (401) (402).]

[$\tilde{C}$ with dry KOC_6H_5 at 110° for 4 hrs. under N_2 gives (15% yield (403)) triphenyl orthoformate [Beil VI-152, VI_1-(153)], ndls. from alc., m p. 76–77° (404), 75° (403), 71.5° (405); note that this prod is also formed (405) in the Reimer-Tiemann reaction cf. (390)]

With aldehydes or ketones. $\tilde{C}$ with aromatic (but not aliphatic (406)) alde[illegible]
of aq KOH undergoes addition yielding trichloromethyl-ar[illegible]
benzaldehyde (1 .0195) + aq KOH gives (16% [illegible]
phenyl-carbinol [Beil. VI-476, VI_1-(237), [illegible] at 15 mm.
(400) cf. (406) (corresp acetate, m p. 87 [illegible] [illegible]oate, m p 97.5° (409); corresp. *p*-nitrobenzoate, m p. 100° (410)) [illegible] [an]alogous behavior of $\tilde{C}$ + alkali with *o*-chlorobenzaldehyde (3:6410) (411), *m*-chlorobenzaldehyde (3:6475) (412), *p*-chlorobenzaldehyde (3:0765) (413), *p*-tolualdehyde (1:0215) (412), and furfural (1:0185) (406) see indic. refs. Note that trichloromethyl-aryl-carbinols are also obtd by reaction of arom. hydrocarbons with chloral (3:5210) q v.]

[$\tilde{C}$ with acetone (1:5400) in pres. of dry powdered KOH (0 5 mole) below 0° (414) or 2–3° (415), or KOH in alc. as directed (416), or even $NaNH_2$ (418) gives (yields: 25% (416),

23% (414)) (417) (415) 1,1,1-trichloro-2-methylpropanol-2 (β,β,β-trichloro-*ter*-butyl alcohol = "Chloretone") (3:2662) q.v.; note that use of NaOH lowers the yield (414) and that $Ca(OH)_2$ (416), $Zn(OH)_2$ (414), or $Al(OH)_3$ (414) yields no such product; note also that the crude prod. contains some diacetone alcohol (1:6423) best removed by treatment with aq. (416) since otherwise it forms with the "Chloretone" a const.-boilg. mixt.]

[C̄ (2 moles) with ethyl methyl ketone (1:5405) in pres. of dry powdered KOH (419) or of $NaNH_2$ (418) gives (13.5% yield (419)) by addition 1,1,1-trichloro-2-methylbutanol-2 [Beil. I_2-(424)], b.p. 162–165° (418), 110–113° dec. at 620 mm. (419), D_4^{20} = 1.2128 (419), n_D^{20} = 1.4460 (419). Note, however, that analogous addition of C̄ does *not* occur with diethyl ketone (1:5420) (420), di-*n*-propyl ketone (1:5447) (420), ethyl *n*-propyl ketone (420), methyl isobutyl ketone (1:5430) (420), or methyl phenyl ketone (acetophenone) (1:5515) (419), but *will* occur to a very small extent with cyclopentanone (1:5446) (421) or cyclohexanone (1:5465) (421) cf. (418).]

With amines. C̄ with primary amines in pres. of alc. caustic alkali condenses with loss of 3 HCl giving the corresp. isocyanides whose extremely characteristic odor has caused this general procedure to be used as a test (422) for primary amines. The reaction has, however, been very little studied in the aliphatic series.

[C̄ with CH_3NH_2 + alc. NaOH should give methyl isocyanide (methyl carbylamine) [Beil. IV-56, IV_1-(328), IV_2-(561)], b.p. 59.6° at 760 mm. (423), 59–60° (424), D_4^{20} = 0.734 (424), D_4^{20} = 0.7464 (425), n_{He}^{20} = 1.343 (424), but this highly explosive (425) (426) (427) substance has been reported only by other means, e.g., from MeI with dry AgCN (425) (423), CuCN (428), or CH_3HgI (429). — C̄ with $C_2H_5NH_2$ + alc. NaOH gives (430) ethyl isocyanide (ethyl carbylamine) [Beil. IV-107, IV_1-(351), IV_2-(600)], b.p. 78.1° at 760 mm. (431), 78° (424), D_4^{20} = 0.747 (424), D_4^{20} = 0.7405 (425), n_{He}^{20} = 1.362 (424), but this less explosive prod. (427) is usually obtd. by other means, e.g., from EtI with AgCN (425) (431), etc. — C̄ with *n*-$BuNH_2$ + aq. NaOH gives (only 5% yield (432)) *n*-butyl isocyanide (*n*-butyl carbylamine) which is better obtd. (40% yield (432)) from *n*-BuI + AgCN.]

[C̄ with aniline in alc. KOH (433) (435) cf. (438) or in C_6H_6 + $NaNH_2$ (436), or better in MeOH/NaOH (50% yield (434)) or powdered KOH without solvent (35–40% yield (437)) cf. (438), gives phenyl isocyanide (phenyl carbylamine) [Beil. XII-191, XII_1-(168)], b.p. 165–166° at ord. press. with partial polymerization (435), 78° at 40 mm. (435), 64° at 20 mm. (435), $D_4^{15.1}$ = 0.9823 (424), $n_{He}^{15.1}$ = 1.5282S (424). — For analogous reactions of C̄ with *o*-toluidine giving *o*-tolyl isocyanide [Beil. XII-788], b.p. 183–184° cor. at 753 mm. (439), with *p*-toluidine giving (440) (441) *p*-tolyl isocyanide [Beil. XII-903], b.p. 99° at 32 mm. (441), 94° at 25 mm. (434), m.p. 21° (441), 19.5° (434), with *p*-methoxyaniline (*p*-anisidine) giving *p*-methoxyphenyl isocyanide, m.p. 33° (438), 30° (434), with *o*-methoxyaniline (*o*-anisidine) giving *o*-methoxyphenyl isocyanide, b.p. 112° at 16 mm. (438), with *p*-phenylenediamine to give (442) either *p*-aminophenyl isocyanide, m.p. 74°, or *p*-phenylene diisocyanide see indic. refs. — Many other isocyanides are known but cannot be detailed here.]

Ⓟ Color reaction with α-naphthol/cyclohexanol. A. C̄ (1 drop) with 2 ml. of a 2% soln. of α-naphthol (1:1500) in cyclohexanol (1:6415) + 1 pellet of solid NaOH, boiled 25 seconds and cooled, gives (174) blue color; one portion of this blue soln. underlaid with equal vol. of 85% H_2SO_4, stood 1 minute and shaken turns intensely blue; a second portion of the alkaline blue soln. acidified with equal vol. of AcOH (1:1010) stood 1 minute and shaken becomes orange-yellow. [Note that the alkaline boiling also gives a blue color with CH_2Cl_2 (3:5020) and with CCl_4 (3:5100) while other chlorinated solvents (174) give yellow-brown, gray, or brown; in the H_2SO_4 treatment CH_2Cl_2 (3:5020) gives greenish-blue and CCl_4 (3:5100) an intense blue; in the AcOH treatment CH_2Cl_2 (3:5020) gives a yellow, CCl_4 (3:5100) a red, color.]

B. $\bar{C}$ (1 drop) with 2 ml. cyclohexanol (1:6415) + a few mgms. α-naphthol (1:1500) + 2 ml. 20% aq. KOH boiled 15 seconds with vigorous shaking gives (175) blue color in upper layer. [Neither CH_2Cl_2 (3:5020) nor CCl_4 (3:5100) gives any color, and this form of the test may be used to detect as little as 1% $\bar{C}$ in either of the other two.]

Ⓟ **Color test with 2,7-dihydroxynaphthalene/cyclohexanol.** $\bar{C}$ (1 drop) with 2 ml. pure cyclohexanol (1:6415) + 1 pellet NaOH + a few mgms. 2,7-dihydroxynaphthalene htd. at 197° (b.p. of ethylene glycol) for 45 seconds, decanted from undissolved NaOH, cooled, and shaken with 2 ml. AcOH + 4 ml. 96% EtOH, gives deep red color (175). [Note that under these conditions CH_2Cl_2 (3:5020) gives a steel-blue color while CCl_4 (3:5100) gives pale yellow-brown color (175).]

Ⓟ **Color test with cyclopentanol.** $\bar{C}$ (1 drop) in 1 ml. cyclopentanol (1:6412) + 1 pellet NaOH boiled for 25 seconds, then shaken vigorously for 35 seconds, then treated with 4 ml. 96% EtOH and shaken, gives with $\bar{C}$ only a pale citron-yellow color (175). [Note that in this test CH_2Cl_2 (3.5020) gives a deep red color which intensifies or turns reddish-brown upon addition of EtOH; CCl_4 (3:5100) gives an intense brown color.]

3:5060 OXALYL (DI)CHLORIDE

O=C—Cl
|
O=C—Cl

$C_2O_2Cl_2$ Beil. II - 542; II_1-(234); II_2-(508)

B.P.		M.P.		
63.5-64° at 763 mm. (1)		−10.0° (3)	D_4^{20} = 1.4785 (3)	n_D^{20} = 1.4316 (3)
62.1-62.3°	(2)	−12.0° (1)	1.480 (4)	1.4301 (4)
61.1° at 743 mm.	(3)		$D_4^{13.4}$ = 1.4484 (4)	
60-61°	(4)		$D_4^{12.0}$ = 1.4888 (4)	$n_D^{12.9}$ = 1.43445 (4)
59-60°	(5)			1.43395 (4)

[*See also ethoxalyl chloride* (3:5025).]

Colorless liq. whose vapors strongly attack respiratory passages. — Solns. of $\bar{C}$ in ether, $CHCl_3$, or alkanes are colorless, but those in phenol, anisole, thioethers, piperonal, and dipentene are yellow (5). — Note that the presence in samples of $\bar{C}$ of phosphorous compds.

(such as might remain from the reagts. used in its prepn.) *increases* the refractive index (4); such contaminants may be removed by treatment with Cl_2 and subsequent fractionation (4) (7). — C̄ is stable to fumg. H_2SO_4.

C̄ is an important reagent in organic synthesis; its reactions may conveniently be classified under four main types, viz.: (*A*) those in which it reacts as an acid chloride (either one or both groups being involved); (*B*) those in which it acts like a mixture of $COCl_2$ (3:5000) + CO; (*C*) those in which it acts as a chlorinating agent; and (*D*) those in which it acts as a dehydrating agent. Examples of all these types will be found in the subsequent text, but naturally combinations of the distinctive types may occur simultaneously.

C̄ is also employed in the preparation of various dyestuffs although these cannot be discussed here. [For toxicity of C̄ see (6); for protection of stopcocks from action of C̄ see (16).]

Preparation. [For prepn. of C̄ from anhydrous oxalic acid (1:0535) with PCl_5 (2 moles) (yields: 70% (8), 45–50% (1)) in pres. of an inert solid or liq. diluent (9) and even in units as much as 5 times the original (10), or with PCl_3 in $POCl_3$ in stream of Cl_2 (11), or with $COCl_2$ (3:5000) in pres. of tertiary amines (14) see indic. refs.; from diethyl oxalate (1:1055) with PCl_5 (poor yields) see (12) (1) (13).]

[For prepn. of C̄ from $COCl_2$ (3:5000) + CO, or from CO + Cl_2 over suitable cat. at 200–400° and 200 atm. press., see (15).]

[For formn. of C̄ (19% yield (1)) from ethoxalyl chloride (3:5625) with PCl_5 in s.t. at 170° see (1).]

Pyrolysis or decomposition of C̄. [C̄ on passing through tube at 600° (1) or on htg. at 340° for 70 hrs. in an evacuated s.t. (7) dec. quant. into $COCl_2$ (3:5000) and CO; note, however, that at 200° C̄ shows no trace of phosgene even after 18 hrs. (7) and at ordinary temp. (when protected from light and moisture) can be preserved indefinitely.]

C̄ (1 mole) on slight warming with $AlCl_3$ (2 moles) in CS_2 dec. quant. (1) into phosgene (3:5000) + CO and may thus serve as a source of $COCl_2$ in Friedel-Crafts reactns. (see below).

C̄ when exposed to light of any wave length below 3800 Å slowly dec., the final prods. being $COCl_2$ (3:5000) + CO although the initial prods. appear to include Cl_2 and CO (16); this photochemical decn. plays an important part in its use as a reagent for introduction of the —CO.Cl group (chloroformylation) (see below).

Behavior of C̄ with inorganic reactants. C̄ with liq. aq. or dil. aq. alk. yields quant. (1) CO + CO_2 + HCl, no trace of oxalic acid (1:0445) or of its semi-acid chloride being formed; however, C̄ as vapor on treatment with steam does yield also some oxalic acid crystals (1).

[C̄ in ether on treatment with dry H_2S for several hrs. is unchanged, but if quinoline (2 moles) is added, vigorous reactn. occurs (1) with evolution of gaseous CO + COS.]

[C̄ on treatment with HBr gas for 12 hrs. gives (85% yield (7)) (17) (18) oxalyl (di)-bromide [Beil. II_1-(236), II_2-(509)], b.p. 106° (18), 102–103° at 720 mm., 16–17° at 10 mm., f.p. −19.5° (7) (for study of thermal and photochemical decn. of this prod. see (18)). — C̄ with HI is reduced (7) yielding CO + I_2 (cf. phosgene (3:5000)).]

C̄ with 2 NaI in *dry acetone* yields quant. (41) CO + I_2 + 2NACl but C̄ with aq. NaI does *not* set free iodine giving instead the usual aqueous hydrolysis with formn. of CO + CO_2 + 2HCl (41).

[C̄ (2 moles) with As_2O_3 (1 mole) gives (95% yield (19)) $AsCl_3$, b.p. 130°; similarly C̄ with dry CrO_3 refluxed 5 hrs. gives (80% yield (19)) chromyl chloride, CrO_2Cl_2, b.p. 114–116° at 748 mm.]

[C̄ in C_6H_6 with H_2 in pres. of $Pd/BaSO_4$ cat. gives only gaseous products, no trace of glyoxal or glyoxylic acid being formed (20).]

59-60°	(5)			1.43395 (4)

[*See also ethoxalyl chloride* (3:5625).]

Colorless liq. whose vapors strongly attack respiratory passages. — Solns. of Č in ether, $CHCl_3$, or alkanes are colorless, but those in phenol, anisole, thioethers, piperonal, and dipentene are yellow (5). — Note that the presence in samples of Č of phosphorous compds.

(such as might remain from the reagts. used in its prepn.) *increases* the refractive index (4); such contaminants may be removed by treatment with Cl_2 and subsequent fractionation (4) (7). — Č is stable to fumg. H_2SO_4.

Č is an important reagent in organic synthesis; its reactions may conveniently be classified under four main types, viz.: (*A*) those in which it reacts as an acid chloride (either one or both groups being involved); (*B*) those in which it acts like a mixture of $COCl_2$ (3:5000) + CO; (*C*) those in which it acts as a chlorinating agent; and (*D*) those in which it acts as a dehydrating agent. Examples of all these types will be found in the subsequent text, but naturally combinations of the distinctive types may occur simultaneously.

Č is also employed in the preparation of various dyestuffs although these cannot be discussed here. [For toxicity of Č see (6); for protection of stopcocks from action of Č see (16).]

Preparation. [For prepn. of Č from anhydrous oxalic acid (1:0535) with PCl_5 (2 moles) (yields. 70% (8), 45–50% (1)) in pres. of an inert solid or liq. diluent (9) and even in units as much as 5 times the original (10), or with PCl_3 in $POCl_3$ in stream of Cl_2 (11), or with $COCl_2$ (3·5000) in pres. of tertiary amines (14) see indic. refs.; from diethyl oxalate (1:1055) with PCl_5 (poor yields) see (12) (1) (13).]

[For prepn. of Č from $COCl_2$ (3:5000) + CO, or from CO + Cl_2 over suitable cat. at 200–400° and 200 atm. press., see (15).]

[For formn. of Č (19% yield (1)) from ethoxalyl chloride (3:5625) with PCl_5 in s.t. at 170° see (1).]

Pyrolysis or decomposition of Č. [Č on passing through tube at 600° (1) or on htg. at 340° for 70 hrs. in an evacuated s.t. (7) dec. quant. into $COCl_2$ (3:5000) and CO; note, however, that at 200° Č shows no trace of phosgene even after 18 hrs. (7) and at ordinary temp. (when protected from light and moisture) can be preserved indefinitely.]

Č (1 mole) on slight warming with $AlCl_3$ (2 moles) in CS_2 dec. quant. (1) into phosgene (3:5000) + CO and may thus serve as a source of $COCl_2$ in Friedel-Crafts reactns. (see below).

Č when exposed to light of any wave length below 3800 Å slowly dec., the final prods. being $COCl_2$ (3:5000) + CO although the initial prods. appear to include Cl_2 and CO (16); this photochemical decn. plays an important part in its use as a reagent for introduction of the —CO.Cl group (chloroformylation) (see below).

Behavior of Č with inorganic reactants. Č with liq. aq. or dil. aq. alk. yields quant. (1) CO + CO_2 + HCl, no trace of oxalic acid (1:0445) or of its semi-acid chloride being formed; however, Č as vapor on treatment with steam does yield also some oxalic acid crystals (1).

[Č in ether on treatment with dry H_2S for several hrs. is unchanged, but if quinoline (2 moles) is added, vigorous reactn. occurs (1) with evolution of gaseous CO + COS.]

[Č on treatment with HBr gas for 12 hrs. gives (85% yield (7)) (17) (18) oxalyl (di)-bromide [Beil. II_1-(236), II_2-(509)], b.p. 106° (18), 102–103° at 720 mm., 16–17° at 10 mm., f.p. −19.5° (7) (for study of thermal and photochemical decn. of this prod. see (18)). — Č with HI is reduced (7) yielding CO + I_2 (cf. phosgene (3:5000)).]

Č with 2 NaI in *dry acetone* yields quant. (41) CO + I_2 + 2NACl but Č with aq. NaI does *not* set free iodine giving instead the usual aqueous hydrolysis with formn. of CO + CO_2 + 2HCl (41).

[Č (2 moles) with As_2O_3 (1 mole) gives (95% yield (19)) $AsCl_3$, b.p. 130°; similarly Č with dry CrO_3 refluxed 5 hrs. gives (80% yield (19)) chromyl chloride, CrO_2Cl_2, b.p. 114–116° at 748 mm.]

[Č in C_6H_6 with H_2 in pres. of $Pd/BaSO_4$ cat. gives only gaseous products, no trace of glyoxal or glyoxylic acid being formed (20).]

C̄ in C_6H_6 with NH_3 gas in cold reacts vigorously yielding (21) oxalic acid diamide (oxamide) [Beil. II-545, II_1-(237), II_2-(509)], m.p. above 400° (and therefore useless as derivative for identification), + NH_4Cl. — C̄ with hydrazine hydrate (excess) presumably yields oxalic acid dihydrazide ("oxalhydrazide") [Beil. II-559, II_1-(243), II_2-(514)], m.p. 244° dec., although this method of prepn. seems to be unreported.

[C̄ with K/Na alloy is (like many halogen compds.) sensitive to detonation by mechanical shock (GREAT DANGER) cf. (22). — For behavior of C̄ with other metals see (7).]

Behavior of C̄ with organic reactants. *Reaction of C̄ with alkanes and cycloalkanes.* [C̄ with satd. aliphatic hydrocarbons and with cycloparaffins in pres. of light and peroxides reacts to replace 1 H atom by the —CO.Cl group (22) (10); since this group represents the radical corresponding to the unisolatable acid chloride of formic acid, the process might well be designated as "chloroformylation"; however, since the resultant prods. may readily be hydrolyzed to the corresp. carboxylic acids, the process has also (unfortunately) been designated as "carboxylation." — E.g., C̄ (1 mole) with cyclohexane (1:8405) (2 moles) + dibenzoyl peroxide (0.005 mole) refluxed for 24 hrs. in light from low-press. Hg vapor lamp (10) or 300-watt tungsten lamp (23) gives (yields: 85% (23), 65% (10)) cyclohexanecarboxylic acid chloride (hexahydrobenzoyl chloride) (3:8580). — Note that neither simple olefins such as 2-methylbutene-2 (1:8220), octene-1 (1:8375), hexadecene-1 (cetene) (1:7000), nor cycloalkenes such as cyclohexene (1:8070) undergo this type of reactn. (24), although phenylethylene (styrene) (1:7435) gives cinnamoyl chloride (3:0330) (0% yield of cinnamic ac. after hydrolysis (24)) and phenylacetylene (1:7425) gives β-chlorocinnamoyl chloride (16% yield of β-chlorocinnamic acid after hydrolysis (24)). — Note also that C̄ under similar conditions with aralkyl hydrocarbons *chloroformylates the side chain but yields are very low (5–10%) (25).*]

Reactions of C̄ with aromatic hydrocarbons. [C̄ with aromatic hydrocarbons (R.H.) in pres. of $AlCl_3$ shows both (*A*) and (*B*) types of reactn. mentioned above in 2nd paragraph; on one hand (*A*) C̄ reacts like phosgene yielding R.CO.Cl (which during the usual subsequent treatment is hydrolyzed to the corresp. acid) and ketones of the type R_2CO; on the other (*B*) C̄ reacts with 2 PH as a bifunctional acid chloride yielding the corresp. 1,2-diketones, which with some of the polycyclic hydrocarbons comprise new cyclic systems of the quinone type. Examples of these various combinations are listed below.]

[C̄ with C_6H_6 + $AlCl_3$ in CS_2 gives according to mode of procedure either (1) 100% yield benzoyl chloride (3:6240) or 89% yield diphenyl ketone (benzophenone) (1:5150); note that no benzil (dibenzoyl) (1:9015) is formed here although it has been obtd. (in small proportion) together with benzophenone from oxalyl (di)bromide with C_6H_6 + $AlBr_3$ in CS_2 (17). — C̄ with toluene + $AlCl_3$ in CS_2 gives (65% yield (26)) *p*-toluic acid (1:0795). — C̄ with *o*-xylene (1:7430) + $AlCl_3$ in CS_2 gives (75–80% yield (27)) (26) 3,4-dimethylbenzoic acid [Beil. IX-535, IX_1-(210)], m.p. 166°, accompanied by some 3,4,3′,4′-tetramethylbenzil (4,4′-*o*-xylil), m.p. 128.5° cor. (27); C̄ with *m*-xylene (1:7420) similarly gives (40–50% yield (26)) 2,4-dimethylbenzoic acid [Beil. IX-531, IX_1-(209)], m.p. 126°; C̄ similarly with *p*-xylene (1:7415) gives (100% yield (26)) 2,5-dimethylbenzoic acid [Beil. IX-534, IX_1-(210)], m.p. 132°. — C̄ with ethylbenzene (1:7410) gives (29) *p*-ethylbenzoic acid [Beil. IX-529], m.p. 112°.]

[C̄ with arom. hydrocarbons contg. two uncondensed benzene nuclei shows a distinct tendency to yield dicarboxylic acids despite the fact that the first member is exceptional. E.g., C̄ with biphenyl (1:7175) + $AlCl_3$ in CS_2 gives (30) 40% yield di-*p*-xenyl ketone, m.p. 230°, + 25% *p*-xenil, m.p. 140–141°, although the formation in 75% yield of *p*-phenylbenzoic acid (*p*-xenoic acid) [Beil. IX-671, IX_1-(280)], m.p. 224°, has also been reported (31); for examples of dicarboxylic acid formn. from C̄ + $AlCl_3$ with 2,2′-dimethylbiphenyl (26), diphenylmethane (32), phenyl *p*-tolylmethane (26), di-*p*-tolylmethane (26), α,β-

diphenylethane (bibenzyl) (32), α,β-diphenylethylene (stilbene) (32), triphenylmethane (32), see indic. refs.]

[C̄ with polycyclic arom. hydrocarbons frequently, but not always, also gives polycyclic quinones; e.g., C̄ with naphthalene (1:7200) + $AlCl_3$ in CS_2 gives (35) a mixt. of α-naphthoic acid (1:0785) + β-naphthoic acid (1:0800); C̄ with 2-methylnaphthalene (1:7605) + $AlCl_3$ in CS_2 gives (33) a mixt. of acids + 2,2′-dimethylnaphthil + 3-methylacenaphthenequinone-1,2; for analogous results with 1,6-, 2,6-, and 2,7-dimethylnaphthalenes see (33) (34); C̄ with anthracene + $AlCl_3$ in CS_2 gives (70% yield (35)) aceanthrenequinone (1,9-oxalylanthracene) [Beil. VII_1-(436)], red pr. from C_6H_6, m.p. 270°, accompanied by some anthracene-9-carboxylic acid (*meso*-anthroic acid).]

[For behavior of C̄ + $AlCl_3$ with 2-methylanthracene (36) (38), 1,2-dibenzanthracene (37), retene or dihydroretene (39), or fluoranthene (40) see indic. refs.; many analogous cases are known but cannot be included here.]

Reaction of C̄ with alcohols and thiols. [C̄ with 2 moles primary alcs. especially in pres. of pyridine yields corresp neutral esters: e g., C̄ with MeOH (1:6120) (2 moles) gives dimethyl oxalate (1.0415), m.p. 54°; C̄ with EtOH (1:6130) (2 moles) gives diethyl oxalate (1.1055), b.p. 185°; for analogous behavior of C̄ with *n*-propyl alc. (1:6150) yielding di-*n*-propyl oxalate (1.3726), with isobutyl alc. (1:6165) yielding di-isobutyl oxalate (1:3897), with isoamyl alc. (1·6200) yielding diisoamyl oxalate (1:4181) all in 100% yield see (42). — C̄ with *secondary* alcs. (2 moles) also yields (42) (50) the corresp. neutral esters, but yields are less satisfactory and the ability of C̄ to act as a dehydrating agent begins to become evident (42); e.g., C̄ with methyl-phenyl-carbinol (1:6475) yields no ester, but only phenylethylene (styrene) (1:7435). — C̄ with *tertiary* alcs replaces OH by Cl; e.g., C̄ with *ter*-butyl alc. (1:6140) gives *ter*-butyl chloride (3:7045); C̄ with triphenylcarbinol (1:5985) gives chlorotriphenylmethane (3:3410) (42)]

[Note that C̄ with only 1 mole of primary alcs. yields the corresponding half esterification prods.; e g., C̄ (1 mole) with EtOH (1:6130) (1 mole) gives (60% yield (43)) ethoxalyl chloride (3 5625); for other examples together with use of such oxalic ester chlorides in prepn of cellulose esters see (43).]

[C̄ with ethylene glycol (1 6465) (1 mole) directly (42) or in pyridine (44) or in dry ether (45) gives (57% yield (45)) monomeric ethylene glycol oxalate (2,3-dioxodioxane-1,4) [Beil. XIX-153, XIX_1-(679)], m.p. 143° (45), 149° (44), 153° (42); for relationships of this monomer to the polymeric forms see (46).]

[C̄ with CH_3SH (2 moles) (13) in dry ether (47) gives dimethyl dithioloxalate [Beil. II-565, II_1-(514)], yel. cryst. from ether or lgr., m p. 82.5–83.5° (13), 80° (47), b.p. 218° at 760 mm. (47). — C̄ with EtSH (2 moles) (13) (48) in dry ether (1) gives diethyldithioloxalate [Beil. II-565, II_1-(244)], m.p. 27–27.5° (13), 24–25° (1), b.p. 238–240° at 757 mm. (1), 235° (13).]

Behavior of C̄ with phenols and thiophenols. [C̄ (1 mole) with phenol (2 moles) in dry ether with metallic Na (2 moles) gives (21% yield (49)) diphenyl oxalate [Beil. VI-155, VI_1-(87)], m p. 131° u c. (49). — C̄ (1 mole) with *o*-cresol (1:1400) (2 moles) + Na similarly gives (49) di-*o*-tolyl oxalate [Beil VI-355], ndls. from alc., m.p. 90–91° u.c. (49); C̄ with *m*-cresol (1 1730) similarly gives (49) di-*m*-tolyl oxalate [Beil. VI-379, VI_1-(187)], ndls. from alc , m.p. 105° u.c (49); C̄ with *p*-cresol (1:1410) similarly (49) or in pyridine (51) gives di-*p*-tolyl oxalate [Beil VI-398, VI_1-(201)], pl. from alc. + ether, m p. 148° (49), 147° (51), for similar behavior of still other phenols see (51)]

[Note, however, that C̄ (1 mole) with phenols (1 mole) in pres. of $AlCl_3$ leads to monoesterification followed by elimination of HCl and ring closure; e.g., C̄ (1 mole) with β-naphthol (1:1540) + $AlCl_3$ in CS_2 gives (85% yield (52) (53)) 4,5-benzocumarandione-2,3 [Beil. $XVII_1$-(267)], orange ndls. from AcOH, m p. 180–181° (52).]

[For behavior of C̄ with resorcinol (1:1530) + Na or K in moist ether see (54).]

[C̄ with β-thionaphthol (2-mercaptonaphthalene) + $AlCl_3$ in CS_2 esterifies and ring-closes with loss of HCl yielding (55) 4,5-benzothiocumarandione-2,3 (4,5-benzothionaphthenequinone-2,3), red pdr., m.p. 153°. — For extension of this type of reactn. to prepn. of halogenated thionaphthisatins from C̄ with halogenated 1- or 2-mercaptonaphthalenes + $AlCl_3$ see (56+).]

[For behavior of C̄ with dithiopyrocatechol (o-dimercaptobenzene) see (57).]

[For study of a series of molecular cpds. of C̄ with various hydroxy-azo compds. see (58).

Behavior of C̄ with phenol ethers. [C̄ with mononuclear phenol ethers + $AlCl_3$ reacts in general according to types *A* and *B* of paragraph 2 (above) so that after aqueous treatment involved in destroying the $AlCl_3$ there results either a diketone or a carboxylic acid; which of these is formed or their proportion varies with nature of components and with conditions. E.g., C̄ (1 mole) with anisole (methyl phenyl ether) (1:7445) (2 moles) + $AlCl_3$ (2 moles) in CS_2 gives (yields: 90% (59), 80% (60), 76% (17)) anisil (4,4′-dimethoxybenzil) [Beil. VIII-428, $VIII_1$-(705)], golden-yel. ndls. from alc., m.p. 133° (60), 132° (59); C̄ (1 mole) with phenetole (ethyl phenyl ether) (1:7485) (2 moles) + $AlCl_3$ in CS_2 gives (80% yield (29)) phenetil (4,4′-diethoxybenzil), pr. from ether + alc., m.p. 149°; C̄ similarly with o-cresol methyl ether (1:7480) + $AlCl_3$ in CS_2 gives (76% yield (61)) (59) 4,4′-dimethoxy-3,3′-dimethylbenzil, pale yel. ndls. from AcOH, toluene, or pyridine, m.p. 177° (61), 174° (59). — Note, however, that C̄ with *m*-cresol methyl ether (1:7510) + $AlCl_3$ in CS_2 yields no diketone, but only (59) 2-hydroxy-6-methylbenzoic acid (6-methylsalicylic acid) [Beil. X-217, X_1-(95)], m.p. 168°; C̄ with *p*-cresol methyl ether (1:7495) gives no diketone but only (12% yield (59)) 2-hydroxy-5-methylbenzoic acid (5-methylsalicylic acid) [Beil. X-227, X_1-(98)], m.p. 149° (59). — Many analogous cases of each type are known but cannot be included here.]

[C̄ with pyrocatechol dimethyl ether (veratrole) (1:7560) + $AlCl_3$ gives (60) 2,3,2′,3′-tetramethoxybenzophenone; C̄ with resorcinol dimethyl ether (1:7570) gives (60) 2,4,2′,4′-tetramethoxybenzophenone; C̄ with hydroquinone dimethyl ether (1:7160) gives (60) 2,5,2′,5′-tetramethoxybenzophenone, but C̄ with orcinol dimethyl ether (3,5-dimethoxytoluene) + $AlCl_3$ gives (29) by ring closure 6-methoxy-4-methylcoumarandione-2,3, m.p. 165° (29).]

Behavior of C̄ with organic acids or their derivatives. [C̄ with silver oxalate in dry ether does *not* yield the unknown oxalic anhydride but instead immediately evolves CO + CO_2 until all the salt has disappeared (1).]

[C̄ with organic acids, their salts, or their anhydrides, gives the corresp. acid chlorides in good yield (19); furthermore under appropriate conditions C̄ with aromatic acids gives good yields (50) of the corresp. arom. anhydrides; for numerous examples see indic. refs.]

Behavior of C̄ with amines or their derivatives. C̄ with primary or secondary amines (2 moles) reacts normally as a bifunctional acid chloride yielding corresp. *N*-substituted oxamides (see also below under Ⓓ's).

[Note, however, that with amine salts reaction takes a different course. — E.g., C̄ with aniline hydrochloride at 15° evolves HCl and gives (100% yield (62)) oxanilyl chloride, C_6H_5.NH.CO.CO.Cl [Beil. XII-283, XII_1-(206)], pr. from pet. ether, m.p. 82.5°; C̄ with α-naphthylamine.HCl in chlorobenzene at 15° similarly yields (12) *N*-(α-naphthyl)oxamidyl chloride, $C_{10}H_7$.NH.CO.CO.Cl, m.p. 86° (62); C̄ with β-naphthylamine HCl similarly yields (62) *N*-(β-naphthyl)oxamidyl chloride, ndls. from C_6H_6, m.p. 114–115° dec. (62). — Note that these prods. with condensing agents such as $AlCl_3$.$FeCl_3$ or H_2SO_4 ring-close with loss of HCl to yield homologs of isatin: e.g., *N*-(α-naphthyl)oxamidyl chloride + $AlCl_3$ at 80–85° for 8 hrs. gives (63) 6,7-benzoisatin [Beil. XXI-524, XXI_1-(414)] ("1,2-naphthisatin"), red ndls., m.p. 255°; *N*-(β-naphthyl)oxamidyl chloride with $AlCl_3$ in

nitrobenzene at 80° gives (75–80% yield (63)) 4,5-benzoisatin ("2,1-naphthisatin") [Beil. XXI-525, XXI_1-(415)], m.p. 252–253°.]

[Note, furthermore, that the above general synthesis of isatin homologs can be carried out starting with N-acylated arom. amines: e.g., $\bar{C}$ with Na salt of N-(p-toluenesulfonyl)-p-toluidide in CS_2 splits out NaCl giving (64) N-(p-toluenesulfonyl)-N-(p-tolyl)oxamidyl chloride, cryst. from C_6H_6, m.p. 91–93° (64); this prod. on htg. with $AlCl_3$ loses HCl and ring-closes to N-(p-toluenesulfonyl)-5-methylisatin, cryst. from AcOH or C_6H_6, m.p. 202–205°, hydrolysis of which by stdg. 1 day with conc H_2SO_4 yields (64) 5-methylisatin [Beil. XXI-509, XXI_1-(401)], red ndls. from aq. or alc., m.p. 187°.]

[For analogous reactn. of $\bar{C}$ with secondary arom amines and ring closure to N-substituted isatins see (65).]

[$\bar{C}$ with N,N-dimethylaniline gives various prods. according to conditions: $\bar{C}$ (1 mole) with dimethylaniline (2 moles) in dry ether in cold gives (100% yield (66)) (p-dimethylaminobenzoyl)formyl chloride, $(CH_3)_2N.C_6H_4.CO.CO.Cl$, stable only in soln. and on treatment with aq. giving (80% yield (66)) (p-dimethylaminobenzoyl)formic acid, golden-yel. lfts. from AcOH or MeOH, m.p. 186–187° dec., $\bar{C}$ (1 mole) with dimethylaniline (4 moles) in C_6H_6, stood 15 hrs. in cold, then heated gives tetramethyldiaminobenzil + the carbinol base of "Crystal Violet" (for many further details see (66)); for use of $\bar{C}$ in prepn. of "Crystal Violet" see (67).]

[$\bar{C}$ with o-aminothiophenol (80) or with its Zn salt (68) at 60–80° until reactn. begins, then htd. at 100° for 1 hr., gives (60% yield (68)) *bis*-2,2′-benzothiazolyl [Beil. XXVII-744, $XXVII_1$-(626)], m.p. 300.5° u.c. (68), 304° (80); similarly $\bar{C}$ with Zn salt of o-aminoselenophenol gives (69) *bis*-2,2′-benzoselenazolyl, m.p. 314° u c (69).]

Behavior of $\bar{C}$ with certain amides. [$\bar{C}$ with urea directly or in ether gives (8) (21) parabanic acid (N,N′-oxalylurea) [Beil. XXIV-449, $XXIV_1$-(401)], cryst. from alc., m p. 244°, accompanied by more or less oxaldiureide, insol, m p. 270–275° dec. (8). — $\bar{C}$ with N,N′-dimethylurea gives (70% yield (8)) N,N′-dimethylparabanic acid [Beil. XXIV-453, $XXIV_1$-(404)], m p. 154° (8). — $\bar{C}$ with N-phenylurea in ether refluxed 3 hrs. gives (88% yield (8)) N-phenylparabanic acid [Beil. XXIV-454, $XXIV_1$-(405)], lfts. from alc., m p 213–214° cor, after sintering at 208° (8). — $\bar{C}$ with N,N′-diphenylurea in ether gives (100% yield (8)) N,N′-diphenylparabanic acid [Beil. XXIV-455, $XXIV_1$-(405)], ndls. from alc., m p 202° cor., after prelim. sintering (8)]

[For examples of condensation of $\bar{C}$ with various other amides see (21) (70) (71) (73); with various amino acids see (72).]

Behavior of $\bar{C}$ with carbonyl compounds. [$\bar{C}$ with ketones often acts like PCl_5 by replacing the oxygen with 2 chlorine atoms with evolution of CO + CO_2· for many specific examples see (74); also note that $\bar{C}$ with xanthone (1:7275) gives (75) (76) xanthone dichloride; $\bar{C}$ with N-methyl- or N-phenylacridone gives (77) dichlorides.]

Behavior of $\bar{C}$ with organometallic compounds. [$\bar{C}$ with nickel carbonyl reacts according to equation $Ni(CO)_4 + (CO\,Cl)_2 \rightarrow NiCl_2 + 6CO$ (13) — $\bar{C}$ with Et_2Cd (from C_2H_5MgBr + $CdCl_2$) gives (27% yield (77)) 3-ethylhexanol-3-one-4 (diethyl-propionyl-carbinol) [Beil. I-841, I_2-(881)], b.p. 178–179° (78). — For interference of $\bar{C}$ with the Michler's ketone test for RMgX cpds. see (79).]

Ⓓ **Oxalyl (di)chloride/1,4-dioxane mol. cpd.:** ndls. or pr. from pet. ether, m.p. 67–68° (81). [From $\bar{C}$ with 5 wt. pts. dioxane-1,4 (1:6400) in 25 vols. pet. ether at −5° in stream of dry air or N_2; the 1:1 mol. cpd. ppts. in 71–78% yield (81). — Note that this prod. may with aniline be converted to oxanilide (see below) or may be dislvd. in excess stand. alk. and titrated back with stand. acid; furthermore, on stdg. in moist air, it is quant. converted to oxalic acid dihydrate (1:0445). — Note also that

under same conditions no ppt. results with acetyl chloride (3:7065), benzoyl chloride (3:6240), malonyl (di)chloride (3:9030), succinyl (di)chloride (3:6200), fumaryl (di)chloride (3:5875), *sym.*-phthaloyl (di)chloride (3:6900), *unsym.*-phthaloyl (di)-chloride (3:2395) or terephthaloyl (di)chloride (3:2205) (81).]

Ⓓ **Oxanilide** (oxalic acid dianilide): pl. from C_6H_6 or nitrobenzene m.p. 254° (21) 252–253° (71). [From $\bar{C}$ + aniline in cold ether or from $\bar{C}$ + aniline hydrochloride in boilg. C_6H_6 (21); note that by virtue of the relative insolubility of oxanilide and its easy quantitative formn. it is often employed as means for quant. detn. of $\bar{C}$ cf. (1). — Note also that the half reactn. prod. oxanilyl chloride m.p. 82.5° has been mentioned above in main text.]

—— **Oxal-*bis*-(*p*-toluidide)**: m.p. 268° (cf. 1:0445).

—— **Oxal-*bis*-(α-naphthalide)**: m.p. 234°.

—— **Oxal-*bis*-(β-naphthalide)**: m.p. 275°.

Ⓓ **Oxal-*bis*-(phenylhydrazide)**: cryst. from alc. or AcOH m.p. 278° (82). [From $\bar{C}$ (1 mole) in C_6H_6 with phenylhydrazine (4 moles) in dry ether (82).]

—— **Oxal-*bis*-(*p*-nitrophenylhydrazide)**: unreported.

—— **Oxal-*bis*-(2,4-dinitrophenylhydrazide)**: yel. cryst. from alc. m.p. 292° after darkening at about 270°. [Prepd. indirectly.]

3:5075 METHYL CHLOROFORMATE $Cl.COOCH_3$ $C_2H_3O_2Cl$ Beil. III - 9
("Methyl chlorocarbonate") III_1-(5)
III_2-(9)

B.P. 72–73° at 767 mm.	(1)	$D_4^{20} = 1.2231$ (1)	$n_D^{20} = 1.38675$ (1)
71.4–72.4°	(2)		
71.2–71.5° at 733 mm.	(3)	$D_4^{15.9} = 1.2240$ (6)	
71.4° cor.	(4)		
71.0–71.5° at 750 mm.	(7)		
71–71.5°	(20)		
69° at 720 mm.	(5)		

[*See also ethyl chlorocarbonate* (3:7295).]

C̄ is colorless liquid with penetrating odor and strong lachrymatory properties.

[For prepn. of C̄ from carbonyl chloride (phosgene)(3:5000) with MeOH see (8) (9) (7) (4) (10) (20) (21); from methyl formate (1:1000) with Cl_2 see (11) (12) (chloromethyl chloroformate (3:5275) is also formed); from pentachloroethyl chloroformate [Beil. III-13, III_1-(6)] (13) or from *bis*-(trichloromethyl) oxalate [Beil. III-17] (14) or from methyl trichloromethyl carbonate [Beil. III-17 III_1-(8) III_2-(15)] (15) with MeOH see indic. refs.]

Pyrolysis of C̄. Unlike the case of ethyl chloroformate (3:7295) the pyrolysis of C̄ appears to have been little studied: in quinoline the decomposition temp. is given (16) (17) as 36°; presumably the decomposition yields MeCl (3:7005) + CO_2.

Reactions of the —COOMe group of C̄. C̄ is *not* readily decomposed by cold aq. (4) (11) (18) and can even be washed to remove alc.; C̄ on boilg. with aq. or dil. acid or dil. alk., however, is readily hydrolyzed yielding MeOH (1:6120) + CO_2 + HCl.

[C̄ with Cl_2 under various conditions (19) (20) (21) (22) (23) yields successively chloromethyl chloroformate (3:5275) dichloromethyl chloroformate (3:5315) and ultimately trichloromethyl chloroformate ("diphosgene") (3:5515).]

[C̄ (10% excess) with $MeHSO_4$ at 100° under reflux for 6–8 hrs. gives (100% yield (24))

3:5085 1,1,1-TRICHLOROETHANE $CH_3.CCl_3$ $C_2H_3Cl_3$ Beil. I - 85
(Methylchloroform) I_1—

See also Notes 1, 2, and 3.

Note 1. For studies of vap. press. of C̄ over range −20° to +283° (72) and range +10.2 to 76.4° (73) see indic. refs.

Note 2. For studies of effect on b.p., vap. press., vapor density of very intensive drying see (74) (75) (76) (77) (79) (80).

Note 3. For study of detn. of b.p. range of C̄ as method of estimation of impurities see (81).

Note 4. For studies on effect of prior history of sample on detn. of f.p. of C̄ see (82) (52) (51).

Note 5. For studies of influence of high press. of f.p. see (41) (83).

Note 6. Solid C̄ has a transition point variously determined as follows: −47° (85) cf. (17), −47.55° (33), −47.63° (15), −47.66° (32) (36), −47.84° (39), −48.1° (47), −48.5° (86), −48.54° (87).

Note 7. For studies of density of C̄ over ranges −186° to −80° (88), 0° to 283° (crit. temp.) (72), and −18° to +60° (89) see indic. refs.

[*See also methylene (di)chloride* (3:5020) *and chloroform* (3:5050).]

MISCELLANEOUS PHYSICAL PROPERTIES OF C̄

Various Solubility Relations

With water. C̄ is only very slightly sol. aq. and is eas. volatile with steam; e.g., 100 g aq. at 0° dis. 0.097 g. C̄ (91), at 10° 0.083 g. (91), at 15° 0.081 g. (8), at 20° 0.080 g. (91), at 30° 0.077 g. (8), 0.085 g. (91); for study of salting-out effect of KCl or $MgSO_4$ see (92). — For studies of soly. of aq. in C̄ at 0° (93), 10° (94), 20° (94), 25° (93), and 30° (93) (94) see indic. refs.; for study of reciprocal soly. of C̄ + aq. see (95).

With various inorganic compounds. [For data on soly. in C̄ of H_2 (96), O_2 (97) (98), O_3 (99) (100), air (96), N_2 (at high pressure) (101), NO (107), NO_2 (102), N_2O (96), NH_3 (103), H_2S (103), SO_2 (96) (116), HCl (103) (104) (105) (106), HBr (106), Cl_2 (108) (109) (110), or CO_2 (111) (112) see indic. refs. — For data on soly. of I_2 in C̄ see (113) (121) (122) (123) (124) (125); for study of nature of I_2 solns. in C̄ see (114); for soly. of I_2 in CCl_4 vapor see (115). — For data on soly. of sulfur in C̄ see (128) (129) (130). — For data on soly. of $AlCl_3$ in C̄ see (135).]

With various organic compounds. [For data on soly. in C̄ of ethane (116), ethylene (116) under high press. (101), acetylene (116), dimethyl ether (117), CH_3Cl (117) (118), $COCl_2$ (119) (120) see indic. refs.]

Binary Systems Containing C̄

(See also azeotropes containing C̄)

C̄ with various inorganic compounds. *C̄ + Cl₂:* for f.p./compn. data and diag. (note that 5 different cpds. are formed) see (20) cf. (17) (126). — *C̄ + Br₂:* for f.p./compn. data and diag. (eutectic has f.p. about −47.6° and conts. about 82.7 mole % C̄ (38)) see (38) cf. (125). — *C̄ + I₂:* see above under soly. of I_2 in C̄. — *C̄ + I-Cl:* for f.p./compn. data and

diag. (series of solid solns.) see (31) cf. (127). — $\bar{C}$ + SO_2: for f.p./compn. data and diag see (131) — $\bar{C}$ + H_2S: for f.p./compn diag see (132). — $\bar{C}$ + N_2O_4: for f.p./compn data and diag. see (133) — $\bar{C}$ + PCl_5: for formn. of compd. $2PCl_5 \cdot CCl_4$ see (134). — $\bar{C}$ + PBr_5: for formn. of 2 cpds see (134). — $\bar{C}$ + $TiCl_4$: for f.p./compn. data and diag see (53); for b.p and liq vapor compn see (48)

$\bar{C}$ with org. cpds. of Order 1. $\bar{C}$ + *n-heptane* (1:8575): for study of ht. of mixing see (136); for n_D^{20}/compn see (165) — $\bar{C}$ + C_6H_6 (1:7400): for f.p./compn. data and diag see (137) (138) (90), for data on D_{20}^{20} (12), D_{23}^{23} (12), D_{25}^{25} (12), D_4^{25} (57) (140) (166), and D_{30}^{30} (141) versus compn see indic refs , for $n_D^{16.8}$ (142), n_D^{20} (10), or n_D^{25} (65) (68) (166) versus compn see indic refs ; for refractive indices at various wave lengths see (67); for data on b.p. at 720 mm (10), vap press. (2) (58) (10) (65) (143) (163), heat of mixing (141) (144), liq.-vapor equil (145), or study of distn through packed column (139) see indic refs. — $\bar{C}$ + *toluene* (1:7405): for data on vap press (4) (143), D_{20}^{20} (12) cf (4), D_4^{25} (166), n_D^{15} (146), and n_D^{25} (4) (166) see indic refs — $\bar{C}$ + *cyclohexane* (1:8405). for f.p./compn data (147), D_4^{20} (62), D_4^{25} (140) (58), n_D^{25} (140) see indic refs.

$\bar{C}$ + *MeOH* (1:6120): for D_4^{25} and n_4^{25}/compn see (151). — $\bar{C}$ + *EtOH* (1:6130): for vap. press data/compn see (148) (149); for D_4^{25} (59) (166) and n_D^{15} (167) or n_D^{25} (166) see indic refs — $\bar{C}$ + *n-PrOH* (1:6150): for n_D^{25}/compn see (66) — $\bar{C}$ + *n-BuOH* (1:6180): for n_D^{20}/compn see (165) — $\bar{C}$ + *isoAmOH* (1.6200): for D_4^{25} and n_4^{25} versus compn. see (166) — $\bar{C}$ + *cyclohexanol* (1:6415): for f.p./compn data see (150)

$\bar{C}$ + *diethyl ether* (1.6110): for data on f.p./compn. (152), D_4^{20} (62), D_4^{25} (166), and n_D^{25} (166) see indic refs. — $\bar{C}$ + *diisopropyl ether* (1.6125): for D_4^{20}/compn. see (62). — $\bar{C}$ + *dioxane-1,4* (1:6400) for D_4^{20}/compn. see (62). — $\bar{C}$ + *anisole* (1:7445): for f.p./compn. data and diag see (153) — $\bar{C}$ + *diphenyl ether* (1:7125): for f.p./compn. data and diag see (153)

$\bar{C}$ + *acetone* (1:5400): for f.p./compn. data and diags see (90) (147); for D_4^{20} (62), D_4^{25} (59), and n_D^{25} (166) versus compn see indic refs

$\bar{C}$ + *MeOAc* (1:3005): for D_4^{25} and n_D^{25} versus compn. see (166) — $\bar{C}$ + *EtOAc* (1:3015): for f.p./compn data and diag see (152); for data on vap. press. (65) (192), D_4^{25} (166), n_D^{20} (27), n_D^{25} (166) cf (65) versus compn. see indic. refs — $\bar{C}$ + *EtOBz* (1:3721): for D_4^{20} compn see (61) — $\bar{C}$ + *diethyl carbonate* (1:3150): for D_{25}^{25}/compn. see (5).

$\bar{C}$ with org cpds. of Order 2. $\bar{C}$ + *nitrobenzene*: for f.p./compn. data and diag. (eutectic, f.p. −31.5°, conts 81.5 wt. % $\bar{C}$ (44)) see (44) cf. (138); for D_-^{20}, D_-^{44}, and n_D^{20} versus compn. see (154) — $\bar{C}$ + *aniline*: for f.p./compn data (147) and D_4^{25}/compn (155) see indic. refs — $\bar{C}$ + *quinoline*: for D_4^{20}/compn. see (62)

$\bar{C}$ with org. cpds. of Order 3. $\bar{C}$ + CH_2Cl_2 (3:5020): for data on b.p., D_4^{20}, and liq.-vapor equilibria see (156) — $\bar{C}$ + $CHCl_3$ (3:5050): for f.p./compn data and diag. (eutectic, f.p. −81.1°, conts 49.4 wt % $\bar{C}$ (16)) (38) (147) (157) cf. (125) see indic. refs.; for D_4^{20}/compn. see (156) (158) cf. (12); for n_D^{25} compn. see (166); for b.p and liq.-vapor equil. see (156). — $\bar{C}$ + *1,1-dichloroethane* (3:5035): for b.p., D_4^{20}, and liq.-vapor equil. see (156). — $\bar{C}$ + *1,2-dichloroethane* (3:5130): for data on b.p. (49) (159), liq.-vapor equil (49) (159) (160), D_{20}^{20}/compn (49) see indic. refs. — $\bar{C}$ + *pentachloroethane* (3:5880): for f.p./compn. data and diag see (157) — $\bar{C}$ + *1,1,2,2-tetrachloroethylene* (3:5460): for f.p./compn. data (15), vap. press (3) and liq.-vapor equil. (3) see indic. refs. — $\bar{C}$ + *2,2-dichloropropane* (3:7140): for f.p./compn. data see (45). — $\bar{C}$ + *ter-butyl chloride* (3:7015): for f.p./compn. data and diags (complete series of solid solns.) see (47) (161) — $\bar{C}$ + *chlorobenzene* (3:7903): for D_4^{20}/compn see (61)

$\bar{C}$ with org. cpds. of higher orders. $\bar{C}$ + CBr_4: for extensive study of this system see (162); for D_4^{25}/compn see (54). — $\bar{C}$ + C_2H_5Br: for D_4^{20}/compn. see (158) — $\bar{C}$ + *1,2-dibromoethane*: for f.p./compn. data and diag see (138).

$\bar{C}$ + CHI_3: for f.p./compn. data see (45). — $\bar{C}$ + *EtI:* for vap. press., liq.-vapor equil, and $n_D^{25.2}$ see (65).

$\bar{C}$ + CS_2: for f.p./compn. data (147), study of distn. (164) (168), D_{20}^{20}/compn. (164), D_{25}^{25}/compn. (12), and n_D^{15}/compn. (168) see indic. refs.

Ternary Systems Containing $\bar{C}$

(See also azeotropes containing $\bar{C}$)

$\bar{C}$ + *MeOH* (1:6120) + *aq.*: for studies of phase relations (169) cf. (170) and colloidal character (171) see indic. refs. — $\bar{C}$ + *EtOH* (1:6130) + *aq.*: for data on soly. relations incl. density and refractive indices see (173) cf. (170). — $\bar{C}$ + *EtOH* (1:6130) + C_6H_6 (1:7400): for data on vap. press see (148) — $\bar{C}$ + *EtOH* (1:6130) + *glycerol* (1:6540): for study of soly. relations see (172). — $\bar{C}$ + *n-PrOH* (1:6150) + *aq.*: for data and diags. of soly. relations at 20°, and n_D^{25}/compn., see (66) cf. (170). — $\bar{C}$ + *AcOH* (1:1010) + C_6H_6 (1:7400): for data on density and n_D^{25} see (68); for vap. press. data see (2). — $\bar{C}$ + *toluene* (1:7405) + *1,2-dibromoethane:* for extensive study see (4) (174). — $\bar{C}$ + CH_2Cl_2 (3:5020) + $CHCl_3$ (3:5050): for f.p./compn. data (ternary eutectic, f.p. −111.4°, conts. 13 wt. % $\bar{C}$ + 60 wt. % CH_2Cl_2 + 27 wt. % $CHCl_3$) see (46).

Binary Azeotropes Containing $\bar{C}$

$\bar{C}$ + *MeOH* (1:6120): $\bar{C}$ forms with MeOH a const.-boilg. mixt., b.p. 55.70° at 760 mm., contg 79.44 wt. % = 44 5 mole % $\bar{C}$ (175), b.p 54.4° at 734 mm., contg. 77 wt. % $\bar{C}$ (176), b.p. 54.2° at 718 mm., contg. 79 wt. % $\bar{C}$ (176); cf. also (177) (178). — $\bar{C}$ + *EtOH* (1:6130): $\bar{C}$ forms with EtOH a const.-boilg. mixt., b.p. 64.95° (175), 65.08° (179) at 760 mm., contg. 84 15 wt. % = 61.3 mole % (175) $\bar{C}$; cf. also (180) (181); for effect of press. on this azeotrope see (182). — $\bar{C}$ + *n-PrOH* (1:6150): $\bar{C}$ forms with *n*-PrOH a const.-boilg. mixt., b.p. 72.8° (175), 73.1° (179) at 760 mm , contg. 88.5 wt. % = 75 mole % (175) $\bar{C}$; cf. also (183). — $\bar{C}$ + *isoPrOH* (1:6135): $\bar{C}$ forms with isopropyl alc. a const.-boilg. mixt., b.p. 67.5° (175), 68 95° (184), contg. about 82 wt. % (175) (184) = 64 mole % $\bar{C}$; cf. also (183) — $\bar{C}$ + *n-BuOH* (1:6180). $\bar{C}$ forms with *n*-butyl alc. a const.-boilg. mixt., b.p. 76 55° at 760 mm., contg. 97.5 wt. % $\bar{C}$ (179). — $\bar{C}$ + *isoBuOH* (1:6165): $\bar{C}$ forms with isobutyl alc. a const.-boilg mixt., b.p. 75.8° at 760 mm., contg. 94.5 wt. % = 89 mole % $\bar{C}$ (175) cf. (183) (186) — $\bar{C}$ + *ter-BuOH* (1:6140): $\bar{C}$ forms with *ter*-butyl alc. a const.-boilg. mixt., b.p. 69.5° (175), 70.5° (185) at 760 mm., contg 83 wt. % (175), 76 wt. % (185) $\bar{C}$. — $\bar{C}$ + *ter-AmOH* (1:6160): $\bar{C}$ forms with dimethyl-ethyl-carbinol a const.-boilg. mixt., b.p. about 76° at 760 mm., contg about 95 wt. % $\bar{C}$ (185). — $\bar{C}$ + *allyl alcohol* (1:6145): $\bar{C}$ forms with allyl alc. a const.-boilg mixt., b.p. 72.5°, contg. 79 5 mole % $\bar{C}$ (187).

$\bar{C}$ + *acetone* (1:5400): $\bar{C}$ forms with acetone a const.-boilg. mixt , b.p. 55.9° at 763 mm. (188), about 56° at 760 mm. (185), contg. about 11.5 wt. % (185) $\bar{C}$. — $\bar{C}$ + *methyl ethyl ketone* (1:5405): $\bar{C}$ with methyl ethyl ketone forms a const -boilg mixt., b.p. 73.8° at 760 mm., contg 71 wt. % = 53.4 mole % (175) $\bar{C}$.

$\bar{C}$ + *AcOH* (1:1010): $\bar{C}$ forms with AcOH a const.-boilg. mixt., b.p. about 77° at 760 mm., contg. about 97 wt. % $\bar{C}$ (189).

$\bar{C}$ + *EtOAc* (1:3015): $\bar{C}$ forms with ethyl acetate a const.-boilg. mixt , b.p. 74.75° at 760 mm. (175) (190), contg 57 wt. % $\bar{C}$ (190); b.p. 76.15° at 789.2 mm. contg. 55 6 mole % $\bar{C}$ (191); b.p. 71.56° at 685.0 mm. contg 58 2 mole % $\bar{C}$ (27); b p. 66 72° at 583.7 mm. contg. 60.75 mole % $\bar{C}$ (191); b p. 61.32° at 484.5 mm. contg. 63.75 mole % $\bar{C}$ (191); b.p. 55.22° at 385.2 mm. contg. 67 75 mole % $\bar{C}$ (191); b.p. 47.36° at 285 7 mm. contg. 72 6 mole % $\bar{C}$ (191): for study of thermodynamics of system see (193). — $\bar{C}$ + *methyl propionate* (1:3020): $\bar{C}$ forms with methyl propionate a const.-boilg. mixt., b.p. 75.5° at 760 mm.,

contg. 60 wt. % = 46 mole % (175); b p. 76° at 760 mm. contg. about 75 wt. % (194) C̄. — *C̄ + n-Pr formate* (1:3030): C̄ forms with n-propyl formate a const.-boilg. mixt, b.p. 74 6° at 760 mm., contg about 69 wt. % C̄ (184).

C̄ + nitromethane: C̄ forms with nitromethane a const.-boilg. mixt., b.p. 71.3° at 760 mm., contg about 83 wt. % C̄ (184) — *C̄ + 1,2-dichloroethane* (3:5130): C̄ forms with ethylene dichloride a const -boilg. mixt., b.p. 75.30° at 760 mm, contg. about 70 mole % C̄ (49) cf. (159); b.p. about 76° at 760 mm contg 79 wt. % C̄ (185).

Ternary Azeotropes Containing C̄

C̄ + EtOH (1:6130) + *aq :* this system forms a ternary two-phase const -boilg. mixt., b.p. 61.8° at 760 mm. (181) (175), contg. 86 3 wt. % = 57.6 mole % C̄ + 10.3 wt. % = 23.0 mole % EtOH + 3 4 wt. % = 19 4 mole % aq ; for use of this azeotrope in detn. of water content of wood see (195). — *C̄ + n-PrOH* (1·6150) + *aq :* this system forms a ternary two-phase const.-boilg mixt., b.p 54.4° at 760 mm., contg 54 4 mole % C̄ + 18 0 mole % n-propyl alc. + 27 6 mole % aq. (175). — *C̄ + allyl alc.* (1:6145) + *aq :* this system forms a const.-boilg mixt, b p. 65 4° at 760 mm, contg. 90.43 wt % = 64.5 mole % C̄ + 5.44 wt. % = 10 4 mole % allyl alc. + 4.13 wt. % = 25.1 mole % aq. (187); b.p. 65.15° at 760 mm contg 53 8 mole % C̄ + 18.7 mole % allyl alc. + 27.5 mole % aq (175). — *C̄ + ter-BuOH* (1.6140) + *aq :* this system forms a const -boilg mixt., b p 64.7° at 768 mm., contg about 85 wt % C̄ + 11.9 wt. % ter-BuOH + 3.1 wt % aq (188)

C̄ + methyl ethyl ketone (1:5405) + *aq :* this system gives a const -boilg. mixt., b.p. 65.7° at 760 mm, contg 76 9 wt. % C̄ + 20.1 wt. % methyl ethyl ketone + 3.0 wt. % aq. (188); for use of this azeotrope in detn of water in wood see (195).

Other Selected Physical Characteristics of C̄

[For studies of thermal conductivity of C̄ see (196) (197) (198); for studies of heat capacity of C̄ (39) (15) (183) as calcd. from spectroscopic data (199) (200) see indic. refs.; for studies of specific heat of C̄ see (21); for studies of heat of fusion and/or of transition see (39) (15) (36) (86) (157); for studies on ebullioscopic const. of C̄, viz., 4.88° (201), 4 68° (202) per mole solute in 1000 g C̄, see indic. refs.; for studies on cryoscopic const. of C̄, viz., 29.9° (203), 29 8° (204) per mole solute in 1000 g. C̄, see indic. refs.]

[For studies of adsorption of C̄ on various carbons (205) (206) (207) (208) (209) (210) (211) (212) (213) at low press. (214) (215), animal charcoal (216), wood or cocoanut charcoal (217) (218) (219) (220) (221) (222) (223) (224), alumina gel (225) (226), silica gel (227) (224) (228), $Fe(OH)_3$ gel (229) (230), $Cr(OH)_3$ gel (231), TiO_2 gel (232), or mica (233) see indic. refs.]

PHYSIOLOGICAL ASPECTS OF C̄

C̄ (as vapor) does not cause acute poisoning until exposure for 30 min. to concns. of 1000–1500 p.p.m. (234) but constant exposure to concns. above 100 p.p m. (234) (235) or even 50 p.p.m. (236) will cause serious physiological disturbances. The least concn. of C̄ in air detectable by odor is 71.8 p p.m. (237). For further studies of toxicity and industrial hygiene of C̄ see (238) (239) (240); for study of comparative toxicity of C̄ and 1,1,2-trichloroethylene (3:5170) see (241).

USES OF C̄

C̄ is widely used as solvent, fire extinguisher, *fumigant, anthelmintic, etc.;* although any detailed survey of these aspects is beyond the scope of this book, a few special uses are cited. [For study of use of C̄ as solvent for ozonization see (24); for use in concn. of HNO_3 (242)

or AcOH (243) or in drying of higher alcs. (244) see indic. refs.; for use of molecular compound (245) of $\bar{C}$ with rotenone in extraction (245) and detn. (246) (247) (248) of rotenone see indic. refs.]

DETECTION OR DETERMINATION OF $\bar{C}$

Detection of $\bar{C}$. [For detection of $\bar{C}$ in pres. of $CHCl_3$ (3:5050) q.v. by methods based on differences in aq. soly. (249), or on solv. power for papaverine HCl (250) or quinine sulfate (251), or on color reactions with pyrocatechol (1:1520) (252) (253), α-naphthol (1:1500) (254) cf. (255), or 2,7-dihydroxynaphthalene (255) cf. (254) (for further details on last two see at end of text of this compd. under Ⓟ), see indic. refs. For review of literature of tests for $\bar{C}$ see (256).]

Note that $\bar{C}$ does *not* (251) reduce Fehling soln. [dif. from $CHCl_3$ (3:5050)].

Determination of $\bar{C}$. Methods for the detn. of $\bar{C}$ are based upon both physical and chemical procedures or combinations of the two.

Physical methods include those based upon adsorption of $\bar{C}$, e.g., on activated carbon (257) or silica gel (258); by thermal conductivity of vapor of $\bar{C}$ (259); by measurement of vapor press. (260); or on interference refractrometry (234).

Chemical methods include those based upon decompn. of $\bar{C}$ by combustion and/or hydrolysis followed by detn. of HCl or of chloride ion, or those based upon color reactions. [For examples of methods based upon combustion followed by detn. of HCl (261) (262) (263) (264) (265) (266) (267) (268) (279) (for combustion in H_2 see (269)); methods based upon hydrolysis with alc. alk. (270) (271) (272) or reduction with Na + ethanolamine (273) (274) followed by detn. of chloride ion; or methods based upon use of color (Fujiwara) reaction with pyridine + alkali (275) (276) (277) (278) see indic. refs.]

DETECTION OF OTHER COMPOUNDS IN $\bar{C}$

[For studies on removal of $CHCl_3$ (3:5050) from $\bar{C}$ by digestion with Fehling soln. at 60–70° for several hrs. (280); on detection in $\bar{C}$ of CS_2 by addn. of MeOH (1:6120) and formn. of CS_2/MeOH azeotrope of b.p. 37.1° at 751 mm. (188) or by use of xanthate reaction (281); on removal of CS_2 from $\bar{C}$ by use of alc. hydrazine hydrate (282) see indic. refs.; for detection in $\bar{C}$ of carbonyl chloride see (283) (284) (285) (286) and also under phosgene (3:5000).]

PREPARATION OR FORMATION OF $\bar{C}$

The principal methods of prepn. of $\bar{C}$ are those involving chlorination of CS_2 or of hydrocarbons, but many other procedures have been studied as exemplified below.

From carbon disulfide. [Prepn. of $\bar{C}$ from CS_2 by action of Cl_2 was first effected (287) by passage through red-hot tube; in subsequent development of this method use of various catalysts has been found to reduce the required temperature. The overall reaction is believed to occur in two stages, viz., (1) $CS_2 + 3Cl_2 \rightarrow CCl_4 + S_2Cl_2$ and (2) $CS_2 + 2S_2Cl_2 \rightarrow CCl_4 + 6S$. The resultant sulfur may be recovered and used again in prepn. of CS_2.]

[For an extensive account of prepn. of $\bar{C}$ prior to 1906 see monograph of Margosches (288); for longer summary as of 1938 see (289); for still later patents and articles on use of Cl_2 (290) (291) (292) (293) (294) (295) or various sulfur chlorides (296) (297) (298) (299) see indic. refs.]

[For studies on use of various catalysts, e.g., Br_2 (300), I_2 (301), I_2 + Fe (302), $MoCl_5$ (303), $SbCl_5$ (304), or $FeCl_3$ (304), see indic. refs.; note that CS_2 reacts with $SbCl_5$ even without addn. of Cl_2 to give $\bar{C}$ (305).]

[Note that in chlorination of CS_2 with restricted amts. Cl_2 various intermediate carbon chlorosulfides have been detected (306) (307).]

From methane. The formation of $\bar{C}$, together with CH_3Cl (3:7005), CH_2Cl_2 (3:5020), $CHCl_3$ (3:5050), and other products, has been very extensively studied from many viewpoints. The literature of this reaction is diffuse and interlocked with that of methane and of the various other chlorination products. For this reason and because detailed treatment of this topic is beyond the scope of this book, the following citations must be regarded only as leading references.

[The formn. of $\bar{C}$ from CH_4 by action of Cl_2 was first discovered in 1840 by Dumas (308). For examples of more recent technical papers ((309)–(317), incl.) and patents ((318)–(332), incl.) see indic. refs.]

From other hydrocarbons. [For examples of patents on prepn. of $\bar{C}$ from aliph. hydrocarbons higher than methane (including in some cases also their halogen derivatives) see (313) (333) (334) (335) (336) (337). — For prepn. of $\bar{C}$ from acetylene + Cl_2 + cat. at 100–200° (338) or with Cl_2 + eutectic of $AlCl_3/NaCl/FeCl_3$ at 175–200° (339) see indic. refs. (see also below under prepn. of $\bar{C}$ from tetrachloroethylene). — For prepn. of $\bar{C}$ from naphthalene by destructive chlorination see (340).]

From various chloro and polychloro compounds. [For technical papers on prepn. of $\bar{C}$ from chlorinolysis of various chloro and polychloroparaffins (341) or chloropentanes (342) see indic. refs.]

[For patents on prepn. of $\bar{C}$ from tetrachloroethylene (3:5460) with Cl_2 at 700–800° (343) or with Cl_2 over activated carbon at 600–650° (337) see indic. refs.; for study of this reaction see (344). For formn. of $\bar{C}$ from hexachloroethane (3:4835) pyrolyzed in air at 550–600° see (342).]

[For prepn. of $\bar{C}$ from $CHCl_3$ (3:5050) by chlorination with Cl_2 in sunlight (first prepn. of $\bar{C}$) (345) or u.v. light (346) (347) (348) (349), at 260–300° (350), or in pres. of $FeCl_3$ (351) or of aq. (352), or from $CHCl_3$ with ICl at 165° (353), or with NaOCl (reaction very slow and incomplete (354)), see indic. refs.]

[For formn. of $\bar{C}$ from $CFCl_3$ with $AlCl_3$ see (355); from $CBrCl_3$ with Cl_2 in dark at 100° (356) or in light (357) (358) see indic. refs.]

From miscellaneous sources. [For formn. of $\bar{C}$ from charcoal or other form of carbon + Cl_2 see patents (359) (361) and technical papers (344) (360); from trichloroacetyl chloride (3:5420) on htg. with $AlCl_3$ (362) or pyrolysis through glass tube at 600° (363), from trichloromethyl chloroformate (3:5515) on htg. with $AlCl_3$ (364), from chloral (3:5210) with Cl_2 in sunlight (365), or from acetone (1:5400) with NaOCl soln. (366) cf. (354), or from phosgene (3:5000) on htg. with cat. (344) cf. (372), see indic. refs.]

[For formn. of $\bar{C}$ from dimethyl sulfide [Beil. I-288, I_1-(144), I_2-(276)] with Cl_2 + I_2 at 100–120° in daylight see (367) (368) (369); from trichloromethyl sulfur chloride ("perchloromethyl mercaptan") [Beil. III-135, III_1-(63), III_2-(106)] on htg. with Fe filings or ZnF_2 (370) cf. (307) (371) or with Cl_2 + I_2 in sunlight (370) see indic. refs.; from thiophosgene [Beil. III-134, III_1-(63), III_2-(105)] with Fe at 37° for many months or from "trichloromethyl dithiochloroformate" [Beil. III-215, III_2-(155)] with Fe in s.t. at 100° see (307).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis of $\bar{C}$. [$\bar{C}$ on pyrolysis at 600–1500° (373) (374) cf. (344) (375) (376) gives tetrachloroethylene (3:5460) (80% yield (374)), hexachloroethane (3:4835), and other products. $\bar{C}$ by action of electric arc (377) cf. (378), dark electric discharge (in H_2) (379), radium emanation (380), gives hexachloroethane (3:4835) and various other products.]

[Note also that $\bar{C}$ in X-radiation (381) (382) or ultrasonic radiation (383) splits off some Cl_2. For action of X-radiation on mixts. of $\bar{C}$ with aq., $CHCl_3$, CHI_3, lgr., or cyclohexane see (381) (384); for decompn. of $\bar{C}$ in u.v. light below 2750 Å see (385).]

Oxidation of $\bar{C}$. $\bar{C}$ under various oxidizing conditions yields phosgene and other products. [E.g., $\bar{C}$ with O_2 in light of 2537 Å (386) or with atomic oxygen (387) gives carbonyl chloride (3:5000); $\bar{C}$ with O_2 over white-hot Pt (375), or with air over $CuCl_2$ or $FeCl_3$ at elev. temp. (388), or $\bar{C}$ over GeO_2 (389), or $\bar{C}$ with pyrosulfuryl chloride (1 mole) + sulfuric acid monohydrate (2 moles) on warming (390) (391) (392) (393) gives phosgene (3:5000). For formn. of phosgene (3:5000) q.v. during thermal decompn. of $\bar{C}$ (as in use as fire extinguisher) see (394), also below under behavior of $\bar{C}$ with metals.] [Note that $\bar{C}$, unlike $CHCl_3$ (3:5050), is *not* oxidized by Fehling soln.]

Reduction of $\bar{C}$. [$\bar{C}$ with K/Hg + aq. gives (395) methane; $\bar{C}$ with $Fe(OH)_2$ + aq. alk. gives (396) CH_2Cl_2 (3:5020) + $CHCl_3$ (3:5050); $\bar{C}$ with Zn + H_2SO_4 (397) (398), finely divided Fe + aq. (399) + cat. (400) (401), or on electrolytic reduction (402) gives $CHCl_3$ (3:5050). For behavior of $\bar{C}$ with atomic hydrogen see (403).]

[Note that $\bar{C}$ + H_2 over pumice in hot tube gives (404) $CHCl_3$ (3:5050), CH_2Cl_2 (3:5020), tetrachloroethylene (3:5460) + hexachloroethane (3:4835), and at red heat (395) methane and ethylene. $\bar{C}$ with excess H_2 over reduced Ni at 270° gives (405) hexachloroethane (3:4835) + HCl.]

Substitution of $\bar{C}$. $\bar{C}$ by reaction with F_2, metallic fluorides, or HF, etc., each in the presence of appropriate catalysts, undergoes replacement of one or more of its chlorine atoms by fluorine and consequent formation of mixed derivatives such as CCl_3F, CCl_2F_2 ("Freon" = "Freon-12" "F-12"), $CClF_3$, etc., to whose properties as refrigerants, etc., much attention is currently being given. [Detailed analysis of the conversion of $\bar{C}$ to these materials is far beyond the scope of this book, but for examples of leading technical papers (406) (407) (408) (409) (410) (411) and patents ((412)-(429)) see indic. refs.] (See also below under behavior of $\bar{C}$ with inorganic salts.)

Hydrolysis of $\bar{C}$. [$\bar{C}$ with aq. on long exposure (e.g., 7 months (430)) to sunlight gives CO_2 + HCl; $\bar{C}$ with large excess of aq. in s.t. at 250° also gives CO_2 + HCl, but $\bar{C}$ with very small proportion of aq. under same conditions gives (431) some phosgene (3:5000). At ord. temp. hydrolysis of $\bar{C}$ by pure aq. is scarcely perceptible, but in presence of Fe, Cu, acid, or alkali, hydrolysis is strongly accelerated especially at higher temperatures (432). $\bar{C}$ is hydrolyzed by aq. + reduced Fe but not by aq. $NaHCO_3$ (342) under reflux.]

[$\bar{C}$ with boilg. alc. alk. is eventually completely hydrolyzed (use in detn. of $\bar{C}$ by estimation of resultant chloride ion (see above)); however, reaction is slow and with *N* aq. or alc. KOH or NaOEt at 60° is very slight in 2 hrs. (433). For study of rate of hydrolysis of $\bar{C}$ with KOH in 95% alc. (434) cf. (435), or with $Ba(OH)_2$ or TlOH in 50% alc. (436), see indic. refs.]

Behavior of $\bar{C}$ with inorganic salts. [$\bar{C}$ with $AlBr_3$ at room temp. for 3 days gives (358) $CBrCl_3$ [Beil. I-67, I_2-(31)], b.p. 104.2–104.35° at 758.5 mm. (358), but $\bar{C}$ with $AlBr_3$ at 60° gives (437) cf. (438) CBr_4 [Beil. I-68, I_1-(17), I_2-(35)], m.p. 94°, b.p. 189.5° at 760 mm. with slight decompn. (439).]

[$\bar{C}$ with AlI_3 (440), Al + I_2 in CS_2 (441), CaI_2 + $2H_2O$ or LiI + $1.5H_2O$ in evacuated s.t. at 90–92° for 5 days (50–55% yield (442)) (443), with BI_3 (444), or $\bar{C}$ (1 mole) + C_2H_5I (4 moles) + $AlCl_3$ (0.1 mole) (445), or best $\bar{C}$ (0.7 mole) with CH_3I (2.94 moles) + $AlCl_3$ (0.015 mole) at 40° (92% yield (446)) gives carbon tetraiodide, CI_4 [Beil. I-74, I_1-(19), I_2-(39)].]

$\bar{C}$ with alc. $AgNO_3$ does not react even after several days; note that in this respect $\bar{C}$ behaves like CH_2Cl_2 (3:5020) and $CHCl_3$ (3:5050) while CH_3Cl (3:7005) gives a ppt. within 3 hrs. (446).

Behavior of $\bar{C}$ with metals. $\bar{C}$ with alkali or even alkaline-earth metals undergoes explosive decompn. on htg. or even at room temp. if subjected to sufficient mechanical shock. [For studies on the explosion of $\bar{C}$ with alkali metals see (477) (448); for further studies on explosion of $\bar{C}$ with Li, Na, K, Ca, Sr, Ba, Mg, Al, and Tl, expecially with reference to sensitivity to mechanical shock, see (449). — For behavior of $\bar{C}$ with Na vapor see (450); for rate of reaction of $\bar{C}$ with Na atoms see (451); for study of $\bar{C}$ + Na/Hg as means of sepn. of isotopes of chlorine see (452) cf. (453).]

[For study of hazards of behavior of $CCl_4/CHCl_3$ mixts. with Mg (454) (455) or Al (454) see indic. refs., note also that $\bar{C}$ refluxed with Al powder (456) or Al/Hg (457), or $\bar{C}$ with Al + $AlCl_3$ at 60–75° (458), or $\bar{C}$ with Cu powder at 120° (458) or molecular Ag at 200° (431) gives (yields. 80% (456), 65% (457)) hexachloroethane (3:4835).]

Note that $\bar{C}$ with Mg in boilg. ether does *not* react, even in the presence of various catalysts (459).

[For extensive study of corrosion of metals by $\bar{C}$ (460) cf. (461) (462) (463) (432) see indic. refs.]

Behavior of $\bar{C}$ with other inorganic reactants. [$\bar{C}$ is claimed to be unaffected by conc. H_2SO_4 at 237° (464) although over H_2SO_4 on pumice at 150° $\bar{C}$ is reported (465) to give HCl, SO_2, $COCl_2$ + CO_2.]

[For study of photochem. reaction of $\bar{C}$ with H_2S giving hexachloroethane (3:4835) + S + CCl_3SH see (466); for studies on photochem decompn. of Cl_2O in $\bar{C}$ see (467) (468) (469) (470) cf. (471); for behavior of $\bar{C}$ with Br_2O giving phosgene (3:5000) + Cl_2 + Br_2 see (472).]

[$\bar{C}$ with NH_3 under high press. in pres. of Cu + I_2 at 140° for 17 hrs. gives (35–40% yield (473)) guanidine hydrochloride [Beil. III 82, III_1-(39), III_2-(69)]. — $\bar{C}$ with hydrazine hydrate in stream of NH_3 refluxed for several days gives (poor yield (474)) N,N',N''-triaminoguanidine [Beil. III-122, III_1-(57), III_2-(97)], as monohydrochloride, m.p. 228° dec.]

Behavior of $\bar{C}$ with organic reactants. *With carbon monoxide.* [$\bar{C}$ with CO + $AlCl_3$ at 200° and 250 atm for 6 hrs gives (37% yield (475)) trichloroacetyl chloride (3:5420).]

With hydrocarbons. [$\bar{C}$ (excess) with octene-1 (1:8375) in pres. of small amts. (0.02 mole) of dibenzoyl peroxide (or diacetyl peroxide) adds to unsatd. linkage giving (476) 1,1,1,3-tetrachlorononane; under similar conditions $\bar{C}$ adds to one of the unsatd. linkages of diallyl (1:8045) giving *5,7,7,7-tetrachloroheptene-1 or to both giving* 1,1,1,3,6,8,8,8-octachloro-octane. — For other addns of $\bar{C}$ to olefin linkages see below.]

[$\bar{C}$ with C_6H_6 in pres. of $AlCl_3$ gives according to conditions triphenylchloromethane (3:3410) (477), triphenylmethane (1:7220) (478), or benzophenone (1:5150) (479). Other arom. hydrocarbons and aryl halides behave similarly but cannot be detailed here.]

With saturated halohydrocarbons. $\bar{C}$ (0.7 mole) with MeI (2.94 moles) + $AlCl_3$ (0.015 mole) at 40° gives (92% yield (446)) carbon tetraiodide (see also above under behavior of $\bar{C}$ with inorganic salts). — $\bar{C}$ with CBr_4 in pres. of slightly moistened $AlCl_3$ at 170° for 7 hrs. undergoes a redistribution reaction giving (480) an equil. mixt. of CCl_4, CCl_3Br, CCl_2Br_2, $CClBr_3$, and CBr_4.]

With unsaturated halohydrocarbons. [$\bar{C}$ with ord. 1,2-dichloroethylene (3:5030) + $AlCl_3$ gives (481) (482) cf. (483) 1,1,1,2,3,3-hexachloropropane (3:6460); for reaction of this system yielding heptachloropentenes see (483).]

[$\bar{C}$ with trichloroethylene (3:5170) + $AlCl_3$ at 20–30° for 48 hrs. gives (49% yield (484)) (481) (482) 1,1,1,2,3,3,3-heptachloropropane (3:6860).]

With alcohols or alcoholates. [$\bar{C}$ with MeOH over cat. at 200–350° gives (485) MeCl (3:7005); $\bar{C}$ with EtOH under similar circumstances gives EtCl (3:7015).]

[$\bar{C}$ with $NaOCH_3$ would be expected to yield tetramethyl orthocarbonate [Beil. III_2-(4)],

b.p. 112–113° at 724 mm. (486), n_D^{19} = 1.3841 (486), but this reaction is unreported, the expected prod. having been made only by other methods. — C̄ with $NaOC_2H_5$ would be expected to yield tetraethyl orthocarbonate [Beil. III-5, III_1-(4), III_2-(5)], b.p. 157–158° (487), 59.6–60° at 14 mm. (486), $D_4^{18.5}$ = 0.9197 (488), $n^{18.5}$ = 1.39354 (488), but this reaction is unreported cf. (505); however, the prod. has been prepd. from CBr_4 with NaOEt in dry ether in s.t. at 170° (487), from "thiocarbonyl tetrachloride," $CSCl_4$ cf. (489) refluxed in dry ether with NaOEt, and in other ways.]

With mercaptans or mercaptides. [C̄ with $NaSCH_3$ might be expected to give tetramethyl tetrathioorthocarbonate, $C(SCH_3)_4$, but this appears to be unreported; C̄ with $NaSCH_3$ has been found (492) to react differently giving trimethyl trithioorthoformate [Beil. II_1-(39)], m.p. 16° (493), b.p. 220° dec. (493), 103–104° at 12 mm. (492), 96° at 9 mm. (493), n_D^{15} = 1.5696 (492), and dimethyl disulfide, b.p. 39–41° at 18 mm. (492). — C̄ with $NaSC_2H_5$ is claimed (491) to give the expected homologous tetraethyl tetrathioorthocarbonate $C(SC_2H_5)_4$, but this material was not well characterized, and C̄ with $NaSC_2H_5$ has subsequently (492) been found to give triethyl trithioorthoformate [Beil. II-95, II_1-(39)], b.p. 235° dec. (493), 174° at 760 mm. (494), D_D^{20} = 1.053 (495), n_D^{15} = 1.5410 (492). — For behavior of C̄ with salts of *n*-propyl, *n*-butyl, and *ter*-butyl mercaptans see (492).]

With phenols or phenolates. [C̄ with phenol (1:1420) in pres. of $ZnCl_2$ + ZnO at 120° gives (496) diphenyl carbonate (1:2335), various dihydroxybenzophenones, and other products; for analogous study of C̄ with *o*-cresol (1:1400) see (497).]

[C̄ with K phenolate at 170° gives mainly (498) aurin (pararosolic acid) (4′,4″-dihydroxyfuchsone) [Beil. VIII-361, $VIII_1$-(671)]; for analogous behavior of C̄ with K *o*-cresolate and K *m*-cresolate see (498).]

With diacyl peroxides. [C̄ refluxed with di-*n*-butyryl peroxide for 17 hrs. gives (499) *n*-propyl chloride (3:7040) + hexachloroethane (3:4835) + ethyl *n*-butyrate (1:3127); C̄ refluxed similarly with di-*n*-isobutyryl peroxide gives (499) isopropyl chloride (3:7025) + hexachloroethane (3:4835) + ethyl isobutyrate (1:3095).]

[C̄ with di-α-naphthyl peroxide under reflux gives (500) CO_2, α-chloronaphthalene (3:6878), α-naphthoic acid (1:0785), and other products; C̄ with di-β-naphthyl peroxide under reflux gives (500) CO_2, β-chloronaphthalene (3:1285), β-naphthoic acid (1:0800), and other products.]

[C̄ with dibenzoyl peroxide under reflux gives (501) (502) (503) 4-(trichloromethyl)-benzoic acid, hexachloroethane (3:4835), phosgene (3:5000), chlorobenzene (3:7903), and other products; for study of kinetics of reaction see (504).]

With salts of enolic esters. [C̄ with diethyl sodio-malonate (505) (507) or with diethyl disodio-malonate (506) (507) (508) (509) gives the Na enolate of tetraethyl α,γ-dicarboxyglutaconate, $(C_2H_5OOC)_2C{=}CH{-}CH(COOC_2H_5)_2$ [Beil. II-876, II_1-(336), II_2-(710)], b.p. 208–210° at 23 mm. (510), 200–204° at 18 mm. (510); note that this product is also obtd. from $CHCl_3$ (3:5050) with diethyl sodio-malonate (505) (511) (512) (513) (514) (515) (516) (517).]

[C̄ with 4 moles of Na enolate of ethyl cyanoacetate in alc. at 100° gives (505) cf. (508) the sodium enolate of diethyl α,γ-dicyanoglutaconate, $C_2H_5OOC{-}C(CN){=}CH{-}CH(CN)COOC_2H_5$ [Beil. II-878, II_2-(712)], also obtd. from $CHCl_3$ (3:5050) with the Na enolate of ethyl cyanoacetate (518) (519) (520).]

With amines. The behavior of C̄ with amines has been little studied. [For studies on the behavior of C̄ with aniline (521) and also with other aromatic amines in pres. of Cu powder (522) or I_2 (523) see indic. refs.]

Ⓟ Color reaction with α-naphthol/cyclohexanol. C̄ (1 drop) with 2 ml. of a 2% soln. of α-naphthol (1:1500) in cyclohexanol (1:6415) + 1 pellet of solid NaOH, boiled

25 seconds and cooled, gives (254) blue color; one portion of this blue solution underlaid with equal volume 85% H_2SO_4, stood 1 min and shaken, remains blue; a second portion of the alkaline blue soln. acidified with equal vol. AcOH (1:1010), stood 1 min. and shaken, becomes red. [Note that the alkaline boilg. also gives a blue color with CH_2Cl_2 (3.5020) and with $CHCl_3$ (3:5050), while other chlorinated solvents (254) give yellow-brown, gray, or brown; in the H_2SO_4 acidification CH_2Cl_2 (3:5020) gives greenish blue, while both $CHCl_3$ (3.5050) and $\bar{C}$ give intense blue; in the AcOH acidification CH_2Cl_2 (3.5020) gives yellow while $CHCl_3$ (3:5050) gives an orange-yellow color.]

Ⓟ **Color test with 2,7-dihydroxynaphthalene/cyclohexanol.** $\bar{C}$ (1 drop) with 2 ml. pure cyclohexanol (1.6415) + 1 pellet NaOH + a few mgms 2,7-dihydroxynaphthalene htd at 197° (b.p. of ethylene glycol) for 45 seconds, decanted from undissolved NaOH, cooled, and shaken with 2 ml. AcOH + 4 ml 96% EtOH, gives a pale yellow-brown color (255). [Note that under these conditions CH_2Cl_2 (3.5020) gives a steel-blue color while $CHCl_3$ (3.5050) gives a deep red color.]

Ⓟ **Color test with cyclopentanol.** $\bar{C}$ (1 drop) in 1 ml. cyclopentanol (1:6412) + 1 pellet NaOH boiled 25 seconds, then shaken vigorously for 35 seconds, and treated with 4 ml. 96% EtOH and shaken, gives an intense brown color (255) [Note that, after addition of alc., CH_2Cl_2 (3:5020) gives a more intense red or becomes reddish brown while $CHCl_3$ (3 5050) gives only a pale citron-yellow. By comparing with authentic known samples, this test is claimed (255) to be able to detect as little as 5% $\bar{C}$ in $CHCl_3$.]

[For prepn. of Č from 1,2,2-trichloropropane (3:5475) with MeOH/NaOMe or EtOH NaOEt at ord. temp. (55–58% yield (1)), or with alc. KOH (2) or with aq. on htg. in s.t. (3), see indic. refs.]

Č with abs. MeOH (1:6120) forms a const.-boilg. mixt., b.p. 56.5–56.8° at 760 mm., n_D^{25} = 1.4030, contg. 75 wt. % Č (1).

Č with Cl_2 at 0° in strong light adds 1 mole halogen giving (1) 1,1,2,2-tetrachloropropane (3:5825).

C̄ with Br_2 at 0° slowly adds 1 mole halogen giving (1) (3) 1,2-dibromo-1,2-dichloropropane, b.p. 190° (3).

C̄ with O_3 in CCl_4 at −15° followed by aq. gives (1) acetic acid (1:1010) and formic acid (1:1005).

Note 1. For b.p. of $\bar{C}$ at press. 660–860 mm. (25), 400–1080 mm. (2), see indic. refs.; $\bar{C}$ has b.p. 84.9–85.5° at 777 mm. (53).

Note 2. For vap. press. of $\bar{C}$ over range −30 to 100° (1), or 0–30° (8), or 0–25° (55) see indic. refs.; for relation between vap. press. and temp. see (56) (25).

Note 3. For values of $n^{18.4}$ at 14 different wave lengths see (57).

Care must be taken to avoid confusion of $\bar{C}$ with either *cis* (3:5042) or *trans* (3:5028) 1,2-dichloroethylene.

MISCELLANEOUS PHYSICAL PROPERTIES

Various solubility relations. $\bar{C}$ is almost insol. aq., but easily volatile with steam (see under azeotropes); soly. of $\bar{C}$ in 100 g. aq at 0° is 0.873 g. (58), 0.922 g. (8); at 10° = 0.885 g. (8); at 15° = 0 872 g. (59), at 20° = 0.869 g. (8), 0.849 g. (58); at 25° = 0.865 g. (15); at 30° = 0.90 g. (59), 0.894 g. (8); at 35° = 0.895 g. (58); at 56° = 1.030 g. (58). — [For influence of added salts in diminishing soly. of $\bar{C}$ in aq. see (16). — Note that $\bar{C}$ with aq. under press. forms a solid hydrate which can be maintained up to +18° under 100 atm. but which at ord. press. decomposes below 0° (60). — For soly. of aq. in $\bar{C}$ at 0°, 25°, and 30° (as detd. by Karl Fischer reagt.) see (61).]

[For soly. in $\bar{C}$ of NH_3 at 20° and 1 atm. (62), of H_2S at 20° and 1 atm. (62), of HCl at various temps. and press. (62) (63), of ethylene at 0–40° (4), or of chlorine at −9° to +40° (4) see indic. refs.]

[For soly. in $\bar{C}$ of I_2 over range 11–25° (and comparison with other chlorinated solvents) see (64).]

[For study of industrial recovery of $\bar{C}$ by countercurrent absorption in kerosene see (65).]

Adsorption of $\bar{C}$ by solids. [For studies on adsorption of $\bar{C}$ by activated carbon (66) (67) (68) (69) (70), by silica gel (67), or by alumina gel (71) see indic. refs. — For patent on sepn. of $\bar{C}$ from other solvents by adsorption on carbon see (72).]

Other properties. [For study of thermal conductivity of $\bar{C}$ see (73); for study of diffusion of vapors of $\bar{C}$ through films of various cellulose esters see (74).]

Binary systems contg. $\bar{C}$. (See also azeotropes (below).)

$\bar{C}$ with hydrocarbons — *$\bar{C}$ + n-heptane* (1:8575): use in testing of distg columns (detn. of number of theoret. plates) see (75). — *$\bar{C}$ + cyclohexane* (1:8405): for values of D_0^{20} and n_D^{20} (49), for use in detn. of number of theoret. plates in distg. columns (75), or for sepn. of $\bar{C}$ from system by forming azeotrope of cyclohexane with MeOH (76), see indic. refs. (see also below under azeotropes).

$\bar{C}$ + benzene (1:7400): note that because of the proximity of the b.p.'s of the components, because of the importance of both as industrial solvents, and because they are *not* readily separable by chemical means (such as H_2SO_4, etc.) a great deal of study has been given to the system from various viewpoints.

For f p./compn. data on system $\bar{C}$ + C_6H_6, eutectic, f.p. −54.2°, contg. about 67 mole % $\bar{C}$ see (24) cf. (77); for D_{20}^{20} (78) (79), n_D^{20} (78) (79) (49), or $n_D^{25.2}$ (80) (89) cf. (81) see indic. refs — For use of this system as test liq. for studying efficiency of distn. columns see (81) (78) (79) (82), for study of distn. of the system see (78) (79) (81) (82) (83) (84) (85); for use in detn. number of theoret. plates see (75) (78); for data on vap. press. of system, vapor liq. compn., etc., see (86) (87) (88) (80) (49) (89) (90).

$\bar{C}$ + toluene (1:7405): for n_D^{25} for system see (91) (92); for vapor-liq. equil. data and study of distn. of system see (83) (91) (92) (93).

$\bar{C}$ with other cpds. of Order I. *$\bar{C}$ + acetic acid* (1:1010): for values of D and n for the system see (94), for vapor-liq. equil. see (95); see also under *uses* of $\bar{C}$ (below). — *$\bar{C}$ + phenol* (1:1420): for vap. press. of system see (96). — *$\bar{C}$ + acetone* (1:5400): for D and n_D^{20} see (49) (94), for vapor-liquid equil. see (49). — *$\bar{C}$ + diethyl ether* (1:6110): for f p./compn. data and diag. see (21); for D'_0 over range 0–40° see (97). — *$\bar{C}$ + ethylene oxide* (1:6105): for soly. and vap. press. (98) and vapor-liq. equil. (106) see indic. refs.

$\bar{C}$ with cpds. of Order III. *$\bar{C}$ + $CHCl_3$* (3:5050): for b.p./compn. diag. see (99). — *$\bar{C}$ + CCl_4* (3:5100): for D_{20}^{20} (100) and vapor-liq. compn. data and diagrams (100) (99) (88) (see also below under azeotropes).

$\bar{C}$ + 1,1-dichloroethane (3:5035): for b p at 760 mm., D_4^{20}, and vapor-liq. equil. data see (101). — *$\bar{C}$ + 1,1,2-trichloroethane* (3:5330): for f.p./compn. data, eutectic f.p. −79°

Note that oxidn. of $\bar{C}$ with CrO_3/H_2SO_4 in pres. of Hg yields CO_2 quantitatively (196) (dif. from many polychloro cpds.). — Note also that $\bar{C}$ does *not* respond to the R + H "Tri-Per Analyzer" (a recording ultra-violet photometer) (197).

For detn. of $\bar{C}$ in organs and tissues see (198).

PREPARATION OF $\bar{C}$

The most-studied method for prepn. and manufacture of $\bar{C}$ is that from ethylene by addn. of chlorine; this method is also of historical interest as leading to the discovery of $\bar{C}$ in 1795 (199) and its initial designation as "oil of the four Dutch chemists." — Various other modes of formn. of $\bar{C}$ have since been discovered and will be indicated below.

Preparation from ethylene. *By use of chlorine.* Ethylene with chlorine under certain conditions adds chlorine quant. yielding only $\bar{C}$; under other conditions, however, the system gives 1,1,2-trichloroethane (3:5330) + HCl. — In the absence of catalysts, the substitution reactn. is avoided by use of very low temperatures; in the presence of catalysts addition (rather than substitution) is facilitated even at the higher temperatures (e g., 120°) resulting from heat of reactn.

For general articles discussing the various factors involved see (200) (201) (53) (202) (203) (204) (205) (69); for articles discussing the reaction from the viewpoint of utilization of the ethylene of industrial gases see (206)–(214) incl.; for patents on prepn. of $\bar{C}$ from ethylene + Cl_2 see (215)–(236) incl. [For prepn. of "heavy" $\bar{C}$ contg. one C^{13} atom see below under miscell. prepns.]

By use of HOCl ($Cl_2 + H_2O$, etc.). Although ethylene with HOCl solns. gives mainly ethylene chlorohydrin (3:5552) nevertheless some $\bar{C}$ is formed; for studies of this reactn. see (237) (238) (239) (240) (241).

By other miscellaneous reagts. [For formn. of $\bar{C}$ (together with other prods.) from ethylene with Cl_2 in AcOH or Ac_2O soln. (242), with HCl + air over pumice contg. $CuCl_2$ at 300° (243), with aq. ICl (244), with NCl_3 in CCl_4 soln. at 20–25° for 7 days (245), with nitryl chloride ($ClNO_2$) (246), with $SbCl_5$ or $CuCl_2$ (247), or with *N*-chlorourea (253) see indic. refs.]

Formation of $\bar{C}$ from ethane or acetylene. [For formn. of $\bar{C}$ from ethane with NOCl at 300° (248) or with $Cl_2 + O_2$ + cat. at 300–650° (249) see indic. refs.; for formn. of $\bar{C}$ (together with other prods.) from acetylene with HCl gas in pres. of NO_2 (250), or with Cl_2 in pres. of $CCl_4 + AlCl_3/NaCl/FeCl_3$ at 175–250° (251) cf. (252), see indic. refs.]

Formation of $\bar{C}$ from miscellaneous sources and by various methods. [For formn. of $\bar{C}$ (together with other prods.) from methyl chloride (3:7005) in dark elec. discharge (254); from ethyl chloride (3:7015) with Cl_2 in light (255), with NCl_3 (256), or with $SbCl_5$ in s.t. at 100° (257); from 1,2-dibromoethane (ethylene dibromide) (1 mole) with $SbCl_5$ (2 moles) (note that use of only 1 mole $SbCl_5$ yields ethylene chlorobromide) (258); from 1-chloro-2-iodoethane (ethylene chloro-iodide) with finely divided Ag at 160° (259) see indic. refs.]

[For formn. of $\bar{C}$ (together with other prods.) from ethylene glycol (1:6465) with excess fumg. HCl in s.t. at 100° (260), with $PCl_3 + ZnCl_2$ (57% yield (261)), with PCl_5 (262), or $PCl_5 + ZnCl_2$ (37% yield (261)), with $SOCl_2$ + pyridine (62% yield (261)) see indic. refs.; from ethylene oxide (1:6105) with S_2Cl_2 (263); from 1,4-dioxane (1:6400) with Zn + acid chlorides (264); from 2-chloroethanol-1 (ethylene chlorohydrin) (3:5552) by disproportionation in s.t. at 184° for 10 hrs. (265) or during reactn. with HBr (266); from *bis*-(β-chloroethyl) sulfite with Cl_2 (267); from *bis*-(β-chloroethyl) sulfate with conc. aq. HCl (268) or with alk. chloride + dil. HCl (269) see indic. refs.]

[For formn. of $\bar{C}$ (together with other prods.) from diazomethane with $ZnCl_2$ in ether (270), from ethylenediamine with NOCl in xylene (271), see indic. refs.]

[For prepn. of "heavy" $\bar{C}$ contg. 1 C^{13} atom (from $NaC^{13}N$ via $CH_3C^{13}N$, $CH_3.C^{13}H_2NH_2$, $CH_3.C^{13}H_2N(CH_3)_3OH$, $CH_2{=}C^{13}H_2$) and its reactn. with Cl_2 see (272).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis of $\bar{C}$. $\bar{C}$ on suitable htg. especially in pres. of dehydrohalogenating cat. loses 1 mole HCl yielding vinyl chloride (3:7010) [e.g., $\bar{C}$ over activated carbon at 230–250° (273), or with aq. vapor over cat. at 800–1000° (274), or over pumice at 600° (275) cf. (276) (277), or over alumina at low red heat (278) yields vinyl chloride (3·7010)].

Behavior of $\bar{C}$ with Inorganic Reactants

Reaction of $\bar{C}$ with Cl_2. $\bar{C}$ with Cl_2 gives according to the conditions chlorinated derivatives either of the ethylene or ethane series.

[E.g., $\bar{C}$ with Cl_2 in pres. of $AlCl_3/NaCl/FeCl_3$ at 400–480° gives (279) a mixt. contg. 20% 1,1-dichloroethylene (3:5005) + 22% 1,2-dichloroethylene (3:5030) + 29% trichloroethylene (3·5170) + 29% higher chlorination prods.; $\bar{C}$ with Cl_2 over suitable cat. at 300–500° gives (280) tetrachloroethylene (3:5460).]

[On the other hand, $\bar{C}$ with Cl_2 in ultra-violet light at 50° (281) (282), or 25° (283), or $\bar{C}$ with Cl_2 + suitable cat. at not above 60° (284), or $\bar{C}$ (as liquid) with Cl_2 (285), or $\bar{C}$ with Cl_2 in pres. of $AlCl_3/NaCl/FeCl_3$ at 300–425° as directed (279), or $\bar{C}$ with SO_2Cl_2 + trace of dibenzoyl peroxide refluxed 2 hrs. in dark (286) gives (yields: 80% (284), 70% (283) (286), 50% (279)) 1,1,2-trichloroethane (3:5330). — Furthermore, $\bar{C}$ with Cl_2 as directed (287) (288) or Cl_2 + $AlCl_3$ at 70–80° (289) (327) gives 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). — Finally $\bar{C}$ (in vapor phase) with Cl_2 + cat. (290) cf. (285) or $\bar{C}$ with Cl_2 at elev. temp. and press. (291) yields hexachloroethane (3:4835).]

Reaction of $\bar{C}$ with alkalies. $\bar{C}$ with alkalies or substances behaving as such may according to circumstances undergo either (or both) of two reactions: on the one hand $\bar{C}$ may lose HCl (1 mole) (dehydrohalogenation) yielding vinyl chloride (3:7010); on the other $\bar{C}$ may be hydrolyzed to ethylene glycol (1:6465).

Dehydrohalogenation. $\bar{C}$ with aq. alk. at elev. temp. and press. (292) especially in pres. of tetramethylene glycol, etc. (293), or $\bar{C}$ with MeOH/alk. (294), or EtOH/alk. (53) (295), loses HCl giving (91–93% yield (53)) vinyl chloride (3 7010). — [For study of rate of reactn. of $\bar{C}$ with KOH in 95% EtOH at 90° and 100° (296) (297), with NaOEt or KOEt in 95% EtOH or 48% EtOH at 90° (296) (297), or with MeOH/NaOMe at 17–19° (298) see indic. refs. — Note that $\bar{C}$ with alc. NaOEt at 100° under press. gives 90% yield (299) ethyl vinyl ether (1 7810).]

Hydrolysis. $\bar{C}$ under appropriate conditions hydrolyzes to ethylene glycol (1:6465); for general articles from this viewpoint see (110) (214) (314).

[For hydrolysis of $\bar{C}$ to ethylene glycol with aq. vapor over cat. at 550–850° (300), with aq. at 200° under press. in absence of any acid acceptor (301), or with aq. at 120° under press (302) see indic. refs. cf. (110).]

[For hydrolysis of $\bar{C}$ to ethylene glycol with aq. KOH at elevated temp. and press. see (110). — For study of use of Na_2CO_3 and/or $NaHCO_3$ in aq. (214) (303) (304) (305) (306) or in 85% EtOH (307) cf. (214) see indic. refs. — For use of aq. $CaCO_3$ in pres. of NH_4 salts (308) (309), or aq. $BaCO_3$ (310) at elev. temp. and press., see indic. refs. — For use of sodium formate in MeOH at 165° under press. (311) cf. (214), aq. + PbO in s.t. at 170° (312), or Fe_2O_3 (?) (313) see indic. refs.]

For use of hydrolysis with alk. followed by $KMnO_4$ oxidn. of resultant ethylene glycol to oxalic acid as means of distinction between $\bar{C}$ and the isomeric 1,1-dichloroethane (3:5035) see (256).

[For prepn. of "heavy" ... actn. of C̄ with aq. 2,4-dichlorophenol (3:0560) or with 2,4,6-tri-
H_2NH_2, $CH_3C^{13}H_2N(C73)$ at 73–98° for 24–66 hrs. giving respectively 1,2-*bis*-(2,4-dichloro-

... rate of reactn. of C̄ with other amines, e.g., with benzylamine (296) (297), piperidine
... 96) (297) (298), pyridine (298) (378), see indic. refs.]

COLOR REACTIONS OF C̄

... With Weber reagent. C̄ (2 drops) with 2% soln. of phenolphthalein in cyclohexanol
(2 ml.) + trace solid NaOH htd. 5 min. at 190–200° (preferably in bath as directed (379)),
... then cooled and acidified with AcOH (1 ml.) gives lilac color. [Note that acetylene tetra-
... chloride (3:5750) with this reagt. gives a somewhat similar result.]

Comment on $NH_4OH/CuCl$ reagt. Note that C̄ with $NH_4OH/CuCl$ does *not* (380) give any color (dif. from 1,1-dichloroethane (ethylidene (di)chloride) (3:5035) which in 10 min. gives cloudy amethyst coloration (380)).

Comment on Fehling's soln. Note that C̄ does not reduce Fehling's soln. even on htg. (dif. from ethylidene (di)chloride (3:5035)).

Ⓓ **1,2-Diphenoxyethane** (ethylene glycol diphenyl ether) (1:7235). Lfts. from alc., m.p. 98°. [From C̄ with aq. K phenolate refluxed 48 hrs. (70–85% yield (353)); note, however, that if only one of the two chlorine atoms reacts some β-chloroethyl phenyl ether, m.p. 28°, b.p. 217–220° at 760 mm. (355), may be formed.]

—— **1,2-Di-α-naphthoxyethane** (ethylene glycol di-α-naphthyl ether) [Beil. VI-607]. Lfts. from alc., m.p. 127.5° (381). [From C̄ + α-naphthol + aq. NaOH at 120° in s.t. for 8 hrs. (381). — Note that the half reactn. prod., β-chloroethyl α-naphthyl ether, has m.p. 28° (355).]

—— **1,2-Di-β-naphthoxyethane** (ethylene glycol di-β-naphthyl ether) [Beil. VI-642]. Lfts. from C_6H_6, m.p. 217° (381). [From C̄ + β-naphthol + aq. NaOH at 120° in s.t. for 8 hrs. (381). — Note that the half reactn. prod., β-chloroethyl β-naphthyl ether, has m.p. 83° (355).]

Ⓓ **Ethylene 1,2-bis-(isothiourea picrate):** ndls. from alc., m.p. 260° (382), 259° (332). [From C̄ with thiourea refluxed in alc. and subsequently treated with PkOH (332).]

Ⓓ **1,2-Diphthalimidoethane** (ethylene diphthalimide) [Beil. XXI-492, XXI_1-(384)]. Ndls. from AcOH, dil. AcOH or alc., m.p. 236° (383), 232–233° (384), 232° (385). [From C̄ + K phthalimide (2 moles) in s.t. at 200° (386); note that C̄ in very large excess with K phthalimide in s.t. at 180–190° for 3 hrs. gives (387) the half reactn. prod., *N*-(β-chloroethyl)phthalimide, cryst. from CS_2 or alc., m.p. 81° (388), 79–81° (387) (389).]

—— **1,2-Disaccharinoethane:** m.p. 253–254° (392). [Not reported from C̄ itself, but obtd. (20% yield) from ethylene (di)bromide with sodium saccharin in aq. butyl-carbitol (1:6517) contg. KI on refluxing for 3 hrs.; note that with shorter reflux (1 hr.) some half reactn. prod., viz., *N*-(β-bromoethyl)saccharin, m.p. 99°, is formed (392).]

3:5140 3,3-DICHLOROPROPENE-1 $C_3H_4Cl_2$ Beil. I - 199

(1,1-Dichloropropene-2; allylidene (di)chloride; " acrolein dichloride ")

$$CH_2{=}CH{-}\overset{\displaystyle Cl}{\underset{\displaystyle Cl}{C}}H$$

Beil. I - 199, I_1—, I_2—

B.P. 84.4° cor. (1)	$D_{24.5}^{24.5} = 1.170$ (1)	
85° (5)	$D_{-}^{21} = 1.169$ (2)	$n_D^{21} = 1.450$ (2)

[*See also* 1,3-*dichloropropene*-1 (3:5280).]

Note that C̄ represents the synionic mesomer of 1,3-dichloropropene-1 (3:5280); reactions of either mesomer may under certain conditions lead to derivatives of the other; however, in practice the tendency appears to be strongly in the direction of 1,3-dichloropropene-1 (3:5280) so that most of the known reactions of C̄ yield the same products as does the mesomer; the rate of reaction, however, is generally very much slower with C̄.

[For prepn. of C̄ from acrolein (1:0115) with PCl_5 (16% yield C̄ accompanied by 32% 1,3-dichloropropene-1 and some 1,1,3-trichloropropane (3:5660) (3)) (1) (4), or from 1,1,3-trichloropropane (3:5660) with alc. KOH (5) (other products are also formed), see indic. refs.]

[C̄ with Cl_2 adds 1 mole halogen giving (4) 1,1,2,3-tetrachloropropane (3:6035), b.p. 179–180° at 756.6 mm. (4).]

[Č with conc. HCl in s.t. at 100° for 10 hrs. (4) isomerizes to 1,3-dichloropropene-1 (3:5280).]

[Č with NaOEt reacts much more slowly than its mesomer; however, after 15 hrs. refluxing with large excess NaOEt, Č gives 1-chloro-3-ethoxypropene [Beil. I-439], b.p. 126–127°, $D_{-}^{16} = 1.018$, $n_{-}^{16} = 1.438$ (3), i e, the same product as from the mesomer.]

[Č with Na phenolate in abs. alc. refluxed for 4 hrs. gives (3) ω-chloroallyl phenyl ether, the same prod. as correspondingly obtd. in ½ hr. from the mesomer, q.v.]

[Č with Et_2NH in dry ether for 20 days gives (3) only a slight ppt. of diethylamine hydrochloride and but very small yield of *N,N*-diethyl-γ-chloroallylamine (cf. the mesomer).

[Č with NaOAc (3), $CaBr_2$ (3), CaI_2 (3) cf. (6), or C_6H_5MgBr (3) gives more slowly and in poor yields the same products as are formed readily from the mesomeric 1,3-dichloropropene-1 (3:5280), q.v]

Ternary azeotropes. $\bar{C}$ + *EtOH (1:6130)* + H_2O: forms a ternary heteroazeotrope, b.p. 67.25° at 760 mm., contg. 38.4 mole % $\bar{C}$ + 41.2 mole % EtOH + 20.4 mole % H_2O (56a): note that this azeotrope conts. 69.4 vol. % $\bar{C}$ + 23.8 vol. % EtOH + 6.8 vol. % H_2O (53), and that upon condensation at 15° it separates into two layers, the upper having the composition 0.8 vol. % $\bar{C}$ + 7.2 vol. % EtOH + 5 vol. % H_2O (total upper layer = 13

vol. %), the lower having the composition 68.6 vol. % C̄ + 16.6 vol. % EtOH + 1.8 vol. % H_2O (total lower layer = 87%) (53). — For further discussion and data see also (8) (49).

C̄ + n-propyl alc. (1:6150) + H_2O: forms a ternary heteroazeotrope, b.p. 71.55° at 760 mm., contg. 51.1 mole % C̄ + 16.6 mole % *n*-propyl alc. + 32.3 mole % H_2O (56b).

C̄ + allyl alc. (1:6145) + H_2O: forms a ternary heteroazeotrope, b.p. 71.4° at 760 mm., contg 49.2 mole % C̄ + 17.3 mole % allyl alc. + 33.5 mole % H_2O (56c).

USES OF C̄

Most of the utility of C̄ in industry depends upon its physical properties especially as a solvent; these applications include the dehydration of alcohols and acids, degreasing of metal, wool, and leather, dry cleaning of fabrics, extracting of oils from seeds, etc.; dewaxing of mineral lubricating oils, use as fumigant and insecticide, refrigerant, etc. [For an excellent brief survey of these uses see (57) (58); for further and more recent examples see below.]

Use in dehydration of alcohols. [For use of C̄ in dehydration of EtOH (or MeOH) by azeotropic distn. (Drawinol process) see (8) (49) (53) (59) (60) (61) (62); for patents on this method see (63). — For use of C̄ in denaturing alc. see (64).]

Use in dehydration of acids. [For use of C̄ in concn. of AcOH (1:1010) see patents (65) (66). — For sepn. of AcOH (1:1010) from formic acid (1:1005) by distn. of mixt. with C̄, the condensate sepg. into an upper layer of an azeotropic mixt. of C̄ + formic acid, the lower layer being C̄ see (67).]

Use of C̄ for degreasing of metal. [For patents on use as metal degreaser of mixts. of C̄ + an alc. + soap (68), C̄ + oleic acid (69), C̄ + ethylene dichloride (3:5130) (70) (71), or C̄ (72) (73) see indic. refs. — *For use of C̄ + rosin + boiled linseed oil in cleaning and* leaving coating preparatory to etching see (74). — Because of great toxicity of C̄ (see below) special attention (75) must be given to ventilation of degreasers using it.]

Use of C̄ in dry cleaning of fabrics. Because of its solvent power supported by its low b.p. and non-inflammability C̄ is widely used as dry cleaner's solvent [for general articles from this viewpoint see (76) (77) (78); for patent see (79); for solv. actn. of C̄ on dyes see (26)].

Use of C̄ in extraction of fats and oils. [For use of C̄ as solv. for extraction see (81) (82) (83). — For use of C̄ for extraction of soybean oil (84) including n_D^{25} and D in g/cc. at 77°, 100°, and 122° F. (19) see indic. refs. — For study of losses of C̄ in extn. of fats see (85).]

[For use of C̄ in detn. of fats in foods (butter, margarine, etc.) see (86) (87).]

[For use of C̄ in detn. of aq. in fats and oils see (88); cf. use of acetylene tetrachloride (3:5750) for this purpose]

Use of C̄ in dewaxing of mineral lubricating oils. [For articles including use of C̄ for this purpose see (89) (90); for patents see (91).]

Use of C̄ as fumigant, insecticide, etc. [For comparative tests of C̄ see (92); for patents on such use of C̄ (93) or mixts. contg. C̄ (94) see indic. refs.]

Use of C̄ as component of refrigerating liquids. [For use of C̄ with dichloroethylene (3:5030) see (95) cf. (96); for use of C̄ or its mixts. in low-temp. cryostats see (16).]

Miscellaneous uses of C̄. [For use of C̄ with MeBr (97) or with CCl_4 (98) as fire extinguishing compn. see indic. refs.; for use of C̄ as boiler or radiator cleaner (99) or as rust-retarder (100) see indic. refs.; for use of C̄ as weed-killer see (101); for addition to liq. HCN to diminish inflammability see (102); in prepn. of starch see (103); in recrystn. of T.N.T. see (104); for use as solv. in ebullioscopy ($K = 44.3$ per 100 g. solv.) see (105); to replace xylene in histological technique see (106) (107) (108).]

PHYSIOLOGICAL BEHAVIOR OF $\bar{C}$

$\bar{C}$ is one of the more toxic of the group of chlorinated solvents; it is absorbable into the body not only by inhalation but also through the skin (109). — Although full detailed treatment of this aspect of $\bar{C}$ is beyond the scope of this work, yet the following citations will be found useful as lead references for further information.

Toxicity of $\bar{C}$. [For important surveys of physiological properties (110), toxicity (111), comparative toxicity of $\bar{C}$ and CCl_4 (112) see indic. refs.]

[For studies of liver injury by $\bar{C}$ (113), of anemia from $\bar{C}$ (114), of American cases since 1932 of industrial poisoning by $\bar{C}$ (115), or role of impurities in toxicity of $\bar{C}$ (116), of industrial hazards of $\bar{C}$ (117) (118) (119), of relation between toxicity and b.p. (120) see indic. refs. — For other studies of toxicity or of poisoning by $\bar{C}$ see (121)–(130), incl.]

$\bar{C}$ as narcotic, anesthetic, analgesic, etc. [$\bar{C}$ has very important use in treatment of trigeminal neuralgia (131) (132) (133); for toxic effects of $\bar{C}$ after long use as antineuralgic see (134), for chem. exam. of $\bar{C}$ for medical use see (21).]

[For use of $\bar{C}$ as anesthetic see (135) (136) (137); for use of $\bar{C}$ in treatment of migraine see (138); for effect on pain threshold see (139); for neural depressing effect (140) and narcotic actn. of $\bar{C}$ (141) (142) (143) (144) see indic. refs.]

[For studies of antiseptic and disinfectant actn. of $\bar{C}$ see (145) (146) (147) (148) (149) (150) (24)]

Miscellaneous related topics. [From dogs after inhalation anesthesia with $\bar{C}$ from 5–8% of initial $\bar{C}$ is excreted (151) as trichloroacetic acid (3:1150). — For study of anthelmintic actn. of $\bar{C}$ see (152). — For actn. of $\bar{C}$ on alc. fermentation see (153).]

DETERMINATION OF $\bar{C}$

By physical methods. For detn. of $\bar{C}$ (as vapor) by use of the R + H "Tri-Per-Analyzer" (a recording ultra-violet photometer (154)) see (155); this instrument will measure $\bar{C}$ in concns. of 10–2000 p.p.m. and is insensitive to methyl chloride (3:7005), methylene (di)chloride (3:5020), $CHCl_3$ (3:5050), CCl_4 (3:5100), vinyl chloride (3:7010), ethylene (di)chloride (3:5130), acetylene tetrachloride (3:5750), and to many (but not all) common non-chlorinated solvents such as methyl, ethyl, and amyl alcohols, ethyl acetate, etc.; for details see (155). — For detn. of $\bar{C}$ in air by adsorption on charcoal see (45).

By chemical methods. *Those involving decomposition of $\bar{C}$ and subsequent detn. of resultant chloride ion.* One class of these methods involves pyrolytic decomposition of $\bar{C}$ by appropriate htg. (156) (157) cf. (158) (159) cf. (127); note that $\bar{C}$ with air at 900–1000° gives exclusively $CO_2 + HCl$, provided that concn. of $\bar{C}$ is not more than 12 mg. per liter; above this amt. from 2–20% of the total carbon and chlorine are converted to $CO + Cl_2$, but $COCl_2$ (3:5000) is *not* found up to concns. of 100 mg. $\bar{C}$ per liter (159). — For variation of the pyrolytic method involving burning of $\bar{C}$ (or solns. of $\bar{C}$) in a lamp see (160) (161) (162) (163) (164).

A second class involves decomposition of $\bar{C}$ by chem. means, e.g., by use of Na + ethanolamine in dioxane (165) (166), or by complete hydrolysis of $\bar{C}$ with excess aq. 25% KOH in s.t. at 150° for 1 hr. (167).

Note that $\bar{C}$ on oxidn. with CrO_3/H_2SO_4 as directed (168) gives quant. CO_2.

Detn. of $\bar{C}$ by conversion to mercuric trichloroethylenide $Hg(CCl=CCl_2)_2$. $\bar{C}$ with aq. KOH soln. of $Hg(CN)_2$ on shaking 24 hrs at room temp. ppts. (169) $Hg(CCl{=}CCl_2)_2$ (for amplification see below under *behavior of $\bar{C}$ with inorganic reacts.*). — For use of this method in detn. of $\bar{C}$ even in pres. of methylene (di)chloride (3:5020), $CHCl_3$ (3:5050), CCl_4 (3:5100), 1,2-dichloroethylene (3:5030), or tetrachloroethylene (3:5460) see (169).

Detn. of C̄ colorimetrically by use of Fujiwara reaction with pyridine + alkali. C̄ with pyridine + aq. alk. gives on short warming a red coloration (similar to but recognizably different from the red-violet color obtd. with $CHCl_3$) which on further warming changes to orange; for use of this color in detn. of C̄ in air (accuracy ±11% except that at concns. of C̄ as low as 20 p.p.m. error may be as much as 50%) see (170) cf. (111) (127); for use in detn. of C̄ in animal tissue see (171); for table of sensitivity of this test under comparable conditions from C̄ as compared with $CHCl_3$ (3:5050), CCl_4 (3:5100), 1,1,2-trichloroethane (3:5320), 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750), and tetrachloroethylene (3:5460) see (151).

PREPARATION OF C̄

The principal method of preparation or manufacture of C̄ is from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) by elimination of 1 HCl (see below), but it is formed as a by-product from various other reactions (see below). — [For general reviews of prepn. of C̄ and its relationships with other "chlorinated solvents" see (31) (172).]

From 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). *By pyrolytic loss of HCl (dehydrochlorination).* [For prepn. of C̄ from acetylene tetrachloride in s.t. at 300° for 15 hrs. (173), over pumice at 700° (174) or 400–500° (175), over pumice + cat. at 500° (176), over pumice contg. $Cu_3(PO_4)_2$ at 450–500° (177), over ThO_2 below 390° (178), over $BaCl_2$ at 300° (179), over bone char at 300–310° (180), over activated carbon at 200–300° (181), 260° (182), or 500° (176) see indic. refs. — Note claim (183) that formn. of C̄ by dehydrochlorination of acetylene tetrachloride over charcoal at 250–300° is not effective and yield of C̄ diminishes with increase of temp.]

By pyrolytic loss of HCl in pres. of an org. acceptor. [For prepn. of C̄ from acetylene tetrachloride (3:5750) or pentachloroethane (3:5880) or 1,1,1,2-tetrachloroethane (3:5555) with acetylene over cat. at 250° (181) cf. (184) or with MeOH over Al_2O_3 at 280° (185) see indic. refs.]

By loss of HCl in pres. of an inorganic acceptor. [For prepn. of C̄ from acetylene tetrachloride (3:5750) by htg. with aq. alk. or alk. carbonates (186) in pres. of tetraethylene glycol, etc., as promoter (187), or with aq. $Ca(OH)_2$ or alk. carbonates (186) (188) (192) (193) (for test of Ger. 171,900 (186) see (190) (191)), or with alc. KOH (194) (195) cf. (173), or with alc. NaOEt (194) see indic. refs.]

[For prepn. of C̄ from acetylene tetrachloride (3:5750) by elimination of 1 HCl with excess NH_3 gas in pres. of aq. at 60–70° (196), with conc. aq. NH_4OH at 160–170° (196) (191) (for test of Ger. 351,463 (196) see (191)), with liq. NH_3 at −40° (13) (197), or by refluxing with dry pyridine (198), or by action of C_6H_5MgBr (199) see indic. refs.]

Note on impurities in C̄. Note that tech. C̄ obtained from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) by elimination of HCl often contains in its high-boilg. fractions ("Tri-Nachlauf" and "Tetra-Nachlauf") other chlorinated materials such as 1,1,2,3,4,4-hexachlorobutane (3:3155), 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), solid 1,2,3,4-tetrachlorobutadiene-1,3 (3:0870), liq 1,2,3,4-tetrachlorobutadiene-1,3 (3:6150), and hexachloroethane (3:4835), (207). — [For use of these "Nachlaufe" as insecticides and weed-killers see (268).]

From other halogenated ethanes. [For formn. of C̄ from 1,2-dichloroethane (ethylene dichloride) (3:5130) as by-product (29% yield) of action of Cl_2 in pres. of $AlCl_3/NaCl/FeCl_3$ at 400–480° (200), or as by-product of actn. of Cl_2 in u.v. light (201), see indic. refs.]

[For formn. of C̄ from 1-bromo-1,1,2-trichloroethane by elimination of HBr with hot alc. Na phenolate (60% yield) see (245).]

[For formn. of C̄ from pentachloroethane (3:5880) with acetylene over cat. at 250° (181), or with H_2 over Ni at 270° (22) (note that C̄ resists further hydrogenation; also

that pentachloroethane over $NiCl_2$ without H_2 yields (22) tetrachloroethylene (3:5460)), or by actn. of MeMgI (203) see indic. refs. — For formn. of C̄ from 1,1,2-trichloro-1,2-dibromoethane with H_2 over NI at 300° or without H_2 over $BaCl_2$ at 400° see (202).]

From miscellaneous sources. C̄ is formed as a by-product of actn. of acetylene with Cl_2 but no citations will be given here [for formn. of C̄ from chloral (3:5210) with P_2S_5 at 160–170° (204) or from di- or tri-thioparachloral on dry distn. (205), or from 2-(trichloroacryloyl)-3-sulfamidobenzoic acid by alk. hydrolytic cleavage (206), see indic. refs.].

CHEMICAL BEHAVIOR OF C̄

Pyrolysis of C̄. [C̄ passed over pumice at 700° decomposes yielding (174) methylene (di)chloride (3.5020), $CHCl_3$ (3:5050), CCl_4 (3:5100), 1,1,1,2-tetrachloroethane (3:5555), pentachloroethane (3:5880), hexachloroethane (3:4835), 1,2-dichloroethylene (3:5030), tetrachloroethylene (3:5460), pentachlorobenzene (3:2290), hexachlorobenzene (3:4939), and other prods.]

Hydrogenation. [C̄ resists hydrogenation even with H_2 over Ni at 270° (22). — Note, however, that C̄ with HI in sunlight for 2 weeks in absence of air at room temp. is partially (25% (245)) reduced to 1,1,2-trichloroethane (3:5330).]

Oxidation. C̄ on total oxidation with CrO_3/H_2SO_4 as directed (168) gives quant. CO_2. — C̄ over chlorinated CuO at 450° gives $CO_2 + H_2O$ accompanied (209) by some phosgene (3:5000).

[C̄ with O_2 in ultra-violet light (210) (198) (211) or in pres. of cat. (e g., Br_2, I_2, H_2SO_4, HNO_3, etc.) (212) (213) (214) yields dichloroacetyl chloride (3:5290). — Note that C̄ in absence of O_2 is not decomposed either by direct or diffused sunlight (9).]

[For study of auto-oxidn. of C̄ see (215); for study of acidity developed from C̄ with air or oxygen over range −23° to 150° see (9).]

[C̄ with O_3 gives (215) a very unstable ozonide which decomposes into phosgene (3:5000), CO, HCl, and oxides of chlorine.]

Stabilization. Since in the presence of O_2 (air) C̄ has a definite tendency toward oxidation (see above), much study has been given to the problem of its stabilization by addn. of small amts of other materials. — [For general study of the stability of C̄ under a wide variety of conditions see (9); for study of method of testing stability and the efficacy of various stabilizers see (216), for use of 2–3% of EtOH (1:6130) or of cyclohexane (1:8405) as stabilizers see (217).]

For stabilization of C̄ a wide variety of compds. have been recommended in the patent literature [e.g., for use of 0.01% or less of hydroquinone monomethyl ether (1:1435) or hydroquinone monobenzyl ether (1:1539) see (218); for use of 0.1% or less of *p-ter*-butylphenol (1:1510) or *p-ter*-amylphenol (1:1495) see (219); for use of 0 001% *n*-hexylresorcinol (1:1465) see (220); for use of oil-sol. azo dyes contg. phenolic groups see (221); for use of various phenols, amines, and aminophenols see (222) (235); for use of very small amts. alc. NH_3 see (223); for use of trimethylamine (228) di-isopropylamine (224), triethylamine (225) (226), or other alkylamines (226), various nitrogenous cpds. such as dialkylated cyanamides, allylthiourea, hexamethylenetetramine, propionitrile, etc. (227), pyridine (228), caffeine (229), see indic. refs.].

[For stabilization of C̄ with mercaptans, e.g , *n*-butyl mercaptan (230), with amylene (231) cf. (222), with gasoline (232), with alk. oleate (233), with fatty acids or soaps (234) see indic. refs.]

Polymerization. C̄ under certain conditions reacts with itself forming dimeric, trimeric, and prob. polymeric products [e.g., C̄ in glass, porcelain, or enameled vessels at 180–210° under press. (236) and in pres. of small amts. of various antioxidants (237) gives a dimer, a hexachlorobutene (b.p. 200° at 710 mm.) of undetermined structure, accompanied by

higher polymers and by hexachlorobenzene (3:4939); $\bar{C}$ at elev. temp. and press. or under reflux in pres. of peroxides (such as Bz_2O_2) gives (238) (239) mainly dimer, accompanied by some trimer and polymer; $\bar{C}$ with $AlCl_3$ gives on refluxing (240) a mixt. of resinous polymers suitable (especially in mixts. with trichlorobenzene) for use as electric-insulating material].

[For copolymerization of $\bar{C}$ with various dienes (such as chloroprene (3:7080), etc.) see (241).]

Reaction with halogens. *Behavior with fluorine.* [$\bar{C}$ with F_2 at 0° for 10 hrs. gives (242) by addition 1,2-difluoro-1,2,2-trichloroethane, b.p. 72.3–72.6°, $D_4^{20} = 1.5555$, $n_D^{20} = 1.3967$, accompanied by other prods. such as 1-fluoro-1,2-dichloroethylene, and a hexachlorobutene (3:9050), m.p. 9.5–11.0°, b.p. 125.5° at 25 mm., $D_4^{20} = 1.6880$, $n_D^{20} = 1.5442$, which, however, is *not* 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), etc.]

Behavior with chlorine. $\bar{C}$ under appropriate circumstances adds 1 mole Cl_2 giving pentachloroethane (3:5880) [e.g., for study of addn. of Cl_2 at 80°, 95°, and 115° in light of 4360 Å see (243); note, however, that reaction may go further and that $\bar{C}$ with Cl_2 over activated charcoal at 60–70° either in light or in dark gives (98% yield (244)) hexachloroethane (3:4835)].

Behavior with bromine. $\bar{C}$ readily adds 1 mole Br_2 (245) (even when used as Br_2 aq. (202)) yielding 1,2-dibromo-1,1,2-trichloroethane, b.p. 204° dec. at 760 mm. (245), 125–126° at 85 mm. (202), 116.5° at 50 mm. (245), $n_D^{20} = 1.5710$ (245). [For study of rate of addn. to $\bar{C}$ of Br_2 in CCl_4 see (246).]

Behavior with iodine or thiocyanogen. $\bar{C}$ does *not* add I_2 (Wijs method) or $(SCN)_2$ (Kaufmann method) (167).

Behavior with halogen hydrides. *Reactn. of $\bar{C}$ with dry HCl.* $\bar{C}$ (1 mole) with dry HCl gas (1.57 moles) in pres. of anhydr. $FeCl_3$ (0.003 mole) in dark 6 days at room temp in abs. of air or peroxides, or $\bar{C}$ (1 mole) with dry HCl gas (1.62 moles) in pres. of $AlCl_3$ (0.004 mole) in dark 3 days at 0° in abs. of air or peroxides gives exclusively (245) (yields: 49% and 22%, respectively) 1,1,1,2-tetrachloroethane (3:5555). [Note that $\bar{C}$ with dry HCl in pres. of 5–10% $AlCl_3$ at 30–40° gives (86–88% (247)) 1,1,1,2-tetrachloroethane (3:5555), but that $\bar{C}$ + $AlCl_3$ with dry HCl at 50° gives also (248) the *sym.*-1,1,2,2-tetrachloroethane (3:5750), two pentachlorobutadienes (cf. (249)), and hexachlorobenzene (3:4939).

Reaction of $\bar{C}$ with dry HBr. $\bar{C}$ in the pres. of an anti-oxidant does *not* react with HBr even after several days at 100° or after 30 days in sunlight (245).

However, $\bar{C}$ in the pres. of suitable cat. adds HBr readily, but the mode of addn. differs according to conditions: e g., $\bar{C}$ + HBr in pres. of small amts. $FeCl_3$ or $AlCl_3$ gives exclusively in yields up to 81% (245) 1-bromo-1,1,2-trichloroethane, b.p. 152° at 760 mm., b.p. 54° at 20 mm., $n_D^{20} = 1.5217$ (245); but $\bar{C}$ with HBr in pres. of air and/or peroxides gives exclusively in yields up to 91% 2-bromo-1,1,2-trichloroethane, b.p. 171° at 760 mm., b.p. 68.9° at 20 mm., $n_D^{20} = 1.5302$, $n_D^{14.5} = 1.5326$ (245).

Behavior of $\bar{C}$ with dry HI. $\bar{C}$ does *not* add HI even after 4 days at room temp. in dark and abs. of air; on exposure of the system for 2 weeks in sunlight 25% of $\bar{C}$ was *reduced* to 1,1,2-trichloroethane (3:5330) (245).

Behavior with oxygenated mineral acids. *Reaction of $\bar{C}$ with H_2SO_4.* [$\bar{C}$ with strong H_2SO_4 at elev. temp. undergoes reactns. leading ultimately (250) (189) to high yields of chloroacetic acid (3:1370). — For patents exemplifying various conditions see (251) (252) (253) (254) (255) (256). — Note also that the H_2SO_4 may be replaced by arom. sulfonic acids such as benzenesulfonic acid, etc. (257)]

[$\bar{C}$ with fumg. H_2SO_4 (10% SO_3) shaken at 88° for ¾ hrs. gives (258) cf. (255) (259) α-chloro-α-sulfoacetic acid.]

Reaction of $\bar{C}$ *with* HNO_3. [$\bar{C}$ with conc. HNO_3 ($D = 1.42$, 4 vols.) refluxed 3 hrs. gives mainly (260) cf. (258) dichlorodinitromethane [Beil. I-78, I_1-(21), I_2-(44)], accompanied by some trichloronitromethane (chloropicrin); for behavior of $\bar{C}$ with N_2O_5 in s t. at 50° for 6 hrs. see (260).]

Behavior with alkali. $\bar{C}$ in either aq. susp. or alc. soln. does *not* neutralize $N/10$ aq. alk. (261) (for contrary earlier claim see (262)), but $\bar{C}$ with excess 2 N MeOH/KOH in s.t. at 100° for 30 min. uses alk. corresp. to 2 moles, i.e , apparent Sap. Eq. = M.W /2 = 65.8.

[$\bar{C}$ with aq. alk. or alk.-earth hydroxides at 175° under press. in pres. of copper salts is claimed (263) to yield salts of glycolic acid (1.0430).]

[$\bar{C}$ with ether passed as vapor with N_2 over solid KOH + CaO at 130° loses HCl giving (84–90% yield (264)) dichloroacetylene (3:5010) in the form of its mol cpd. (1:1) with ether, for earlier work in which $\bar{C}$ alone over solid granular KOH at 130° gives (65% yield (265)) dichloroacetylene (266) see indic. refs.]

[$\bar{C}$ with EtOH/NaOEt at 60–75° condenses with elimination of NaCl giving (yields: 81% (267), 70% (268)) (269) (204) α,β-dichlorovinyl ethyl ether (3:5540). — Note that reaction of $\bar{C}$ with alc. NaOEt has been accompanied by spontaneous explosions or ignition (270) (271) (272), presumably because of some formn of either chloroacetylene (3:7000) or dichloroacetylene (3.5010) or both cf. (273).]

[For study of stability of $\bar{C}$ toward water under various conditions see (9); note that carefully purified $\bar{C}$ is more stable toward aq. than ord. tech. product (274).]

Behavior with metals. [For study of corrosive actn of $\bar{C}$ on soft steel, copper, brass, lead, aluminum, etc , at temps. 50–150° under various conditions see (9) (275) (276) (277) (278) (279) (280) (281). — For study of sensitivity to mechanical shock of $\bar{C}$ with Li, Na, K, Ca, Sr, Ba see (282).]

Behavior with inorganic metal salts. *With* $AlCl_3$. [$\bar{C}$ with $AlCl_3$ (4–5%) on refluxing several hours (249) or $\bar{C}$ at 225–230° under press. in pres. of Fe cpds. (284) undergoes bimolecular condensation with elimination of HCl and formn. of pentachlorobutadienes; see also comments above on reaction of $\bar{C}$ with HCl and remarks below on reaction of $\bar{C}$ with other org. chlorine cpds.]

With $AlBr_3$. [$\bar{C}$ with $AlBr_3$ as directed (283) undergoes halogen interchange giving 1,1,2-tribromoethylene [Beil. I-191, I_1-(81), I_2-(164)], b p. 163–164°.]

With $FeCl_3$ [$\bar{C}$ with anhydr. $FeCl_3$ in s.t. at 85° yields (215) pentachloroethane (3:5880), but various side reactions result also in some hexachloroethane (3:4835) and tetrachloroethylene (3:5460).]

Behavior with other miscellaneous inorganic reactants. [$\bar{C}$ with excess Cl_2O in CCl_4 at −20° gives (285) pentachloroethane (3:5880), chloral (3:5210), and octachlorodiethyl ether (3:0738). — $\bar{C}$ with nitryl chloride ($ClNO_2$) in s.t. at 100° for 3 hrs. gives (286) by addn. 1,1,1,2-tetrachloro-2-nitroethane, colorless oil, b.p. 76° at 18 mm (286). — $\bar{C}$ with S_2Cl_2 in s.t. at 140–150° for some hours (no reaction in open tube) gives mainly (287) pentachloroethane (3:5880).]

[For an attempt to react $\bar{C}$ with hydrazine hydrate in pres. of solid KOH see (288).]

BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

(See also above under $\bar{C}$ with alkali.)

Behavior with hydrocarbons. [$\bar{C}$ with C_6H_6 in pres. of Al/Hg yields (289) both 1,1-diphenylethane [Beil. V-605, V_1-(285), V_2-(511)] and 1,1,2,2-tetraphenylethane [Beil. V-739, V_1-(371), V_2-(673)]. — $\bar{C}$ (1 mole) with cyclopentadiene (2 moles) at 175–185° under press. yields (309) a Diels-Alder type adduct, b p. 158–160° at 11 mm., which with phenyl azide gives (309) a hydrotriazole, m.p. 225–226°.]

Behavior with other halogenated hydrocarbons (for reaction of $\bar{C}$ with itself see above under polymerization).

With $CHCl_3$ (3:5050). [$\bar{C}$ in the pres. of $AlCl_3$ at 20° adds $CHCl_3$ to its unsatd. linkage yielding (290) (291) 1,1,1,2,3,3-hexachloropropane (3:6460); note that at higher temp., e.g., 50–60°, yield is greatly diminished and several other prods. (290) are formed.]

With CCl_4 (3:5100). [$\bar{C}$ in the pres. of $AlCl_3$ adds CCl_4 to its unsatd. linkage giving at 20–30° for 48 hrs. (49% yield (292)) (290) (291) 1,1,1,2,3,3,3-heptachloropropane (3:6860).]

With 1,1,2-trichloroethane (3:5330). [$\bar{C}$ in the pres. of $AlCl_3$ adds 1,1,2-trichloroethane to its unsatd. linkage, then loses HCl, giving after 7 days at 40° a small yield (293) of 1,1,1,4,4-pentachlorobutene-2 (3:9054) accompanied by much resin.]

With hexachloropropene (3:6370). [$\bar{C}$ (1 mole) with $AlCl_3$ + hexachloropropene (1 mole) in CH_2Cl_2 (3:5020) or $CHCl_3$ (3:5050) at 30–37° gives (82% yield (294)) 1,1,2,3,3,-4,5,5,5-nonachloropentene-1, colorless liq. with cedar-like odor, b.p. 128° at 2–3 mm., 86° at 0.2 mm., $D_{20}^{20} = 1.812$, $n_D^{20} = 1.5703$ (294): $\bar{C}$ (2 moles) with $AlCl_3$ + hexachloropropene (1 mole) as directed gives in 5 hrs. at 20° a mixt. of two dodecachloroheptenes ($C_7H_2Cl_{12}$), one m.p. 94–96°, the other m.p. 58–62° (294).]

Behavior with paraformaldehyde (1:0080). [$\bar{C}$ with paraformaldehyde in the pres. of conc. H_2SO_4 at 20–25°, followed by treatment with aq., yields (295) $O{=}(CH_2.CHCl.COOH)_2$; note, however, that $\bar{C}$ with paraformaldehyde + conc. H_2SO_4 + an alkyl hydrogen sulfate (296) or an alcohol (297) (to yield the alkyl hydrogen sulfate) gives the corresp. alkyl esters of α-chloroacrylic acid (3:1445).]

Behavior with organic OH or SH cpds. [$\bar{C}$ with alc. NaOEt (see above under behavior of $\bar{C}$ with alkali) at 60–75° gives (yields: 81% (267), 70% (268)) (269) (204) α,β-dichlorovinyl ethyl ether (3:5540).]

[$\bar{C}$ (1 mole) with sodium salt of C_2H_5SH (1 mole) in abs. alc. refluxed 2 hrs. gives (298) *both* α,β-dichlorovinyl ethyl thioether, b.p. 77–80° at 30 mm., and $C_2H_5S.CH{=}C(SC_2H_5)_2$, b.p. 135–140° at 20 mm.]

[$\bar{C}$ (1 mole) with sodium salt of C_6H_5SH (either 1 mole or excess) in abs. alc. refluxed 24 hrs. gives α,β-dichlorovinyl phenyl thioether, b.p. 145–150° at 22 mm. (298).]

Behavior of $\bar{C}$ with aromatic amines. *With aniline.* $\bar{C}$ (1 mole) with aniline (3 moles) + aq. 15% NaOH (3 moles) refluxed for 40 hrs., and any unreacted components then removed by steam distn., gives (crude yield 64% (288)) N-phenylglycine-(N,N-diphenylamidine), $C_6H_5NH.CH_2.C({=}N.C_6H_5).NHC_6H_5$ [Beil. XII-557] (also known as "Sabanejev's base"), colorless cryst. from AcOEt or by rapid crystn. from hot alc., m.p. 189–190° (288). — [Note that this Sabanejev's base may be hydrolyzed in two distinct stages: e g., on protracted refluxing with EtOH (288) it splits off 1 mole aniline leaving N-phenylglycine anilide = $C_6H_5NH.CH_2.CO.NHC_6H_5$ [Beil. XII-556], cryst. from dil. alc., m.p. 112–113° (288); on the other hand the Sabanejev's base (or the N-phenylglycine anilide) on more vigorous treatment, e.g. with boiling aq. $Ca(OH)_2$, etc., hydrolyzes further yielding N-phenylglycine (N-phenylaminoacetic acid) [Beil. XII-468, XII_1-(263)], m.p. 127–128° (an important starting point for prepn. of indigo). — For patents on the prepn. of N-phenylglycine from $\bar{C}$ by reactn. with aniline in the pres. of aq. $Ca(OH)_2$ at 170–180° under press. see (299) (300).]

[The reactn. of $\bar{C}$ with aniline + aq. alk. to form Sabanejev's base (above) is also accompanied by various side reactions, including formn. (29% yield (301)) of 1,1,2-tri-(anilino)ethylene, m.p. 147° dec. (301); for further details on this and other by-products see (301) (302).]

With other aromatic amines. [For analogous behavior of $\bar{C}$ with other aromatic prim. amines in the pres. of aq. alk., e.g., with p-toluidine (288) (302) (303) (note that o-toluidine behaves abnormally while m-toluidine does *not* react (288)), β-naphthylamine (302) cf.

(288), p-anisidine (288), p-phenetidine (288), p-aminobiphenyl (288), and many others (288) see indic. refs.]

COLOR TESTS FOR Č

Ⓟ **Color test with α-naphthol (1:1500).** Č with a few drops 2% alc. α-naphthol + conc. H_2SO_4 (2 ml.), shaken, diluted with aq. (1–2 ml.), gives red-peach color (304). [This test was devised especially for detection of Č in oils or melted fats (2-ml. samples); in olive oil Č can be detected in 1/2000, and can also be noted in presence of castor oil, grapeseed oil, raw linseed oil, lard, etc. Note, however, that test fails with oils which have been subjected to oxidn., e.g., boiled linseed oil, and its sensitivity is *improved* by the pres. of reducing agts., e.g., by a trace of Zn dust (304).]

Ⓟ **Color test with cyclopentanol (1:6412).** Č (1 drop) with cyclopentanol (2 ml.) + *trace solid NaOH, boiled 25 secs., cooled, acidified with AcOH or 85% H_2SO_4, stood* 1 min., and shaken gives (305) green color. [Note that this same response is also *shown by* 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) but *not* by methylene dichloride (3:5020), $CHCl_3$ (3:5050), CCl_4 (3:5100), ethylene dichloride (3:5130), pentachloroethane (3:5880), *cis* (3:5042) or *trans* (3:5028)-1,2-dichloroethylene, or tetrachloroethylene (3:5460); for sensitivity for Č see (305).]

Ⓟ **Color test with pyridine and aq. alk. (Fujiwara reaction).** See above *under detn. of* Č.

Comment on behavior of Č with $NH_4OH/CuCl$. Note that Č with $NH_4OH/CuCl$ does *not* give blue color within 5 min. (306) (diff. from pentachloroethane (3:5880) q.v.

Ⓓ **Mercury** ***bis*-(trichloroethylenide), $Hg(-CCl{=}CCl_2)_2$** (see also above under detn. of Č). — Č with aq. KOH soln. of $Hg(CN)_2$ on shaking 24 hrs. at room temp. (169), or Č with HgO + NaOEt + KCN in alc. shaken 1 hr. at 40–60° (not higher) (307) (308) cf. (273), gives (yields. 100% (169), 90% (307)) mercury *bis*-(trichloroethylenide), cryst. from ether or $CHCl_3$, m.p. 83° (169) (273), 82–83° (242) (note that after recrystn. from alc. a m.p. of 141° (307) has been reported). [For behavior of ordinary 1,2-dichloroethylene with aq. alk. $Hg(CN)_2$ solns. yielding mercury *bis*-(chloroacetylide) $Hg(-C{\equiv}CCl)_2$, m.p. 185°, see text of that cpd. (3:5030).]

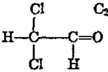
3:5180 DICHLOROACETALDEHYDE



$C_2H_2OCl_2$

Beil. I - 613
I_1-(328)
I_2-(677)

B.P. 89.5–90.5° (1)
88–90° (2) (3)
88.4–89.6° (4)
87–88° (5)

Anhydrous C̄ is strongly lachrymatory liq.; in s.t. C̄ can be kept but in open containers it gradually changes to an amorphous polymer, insol. alc. but from which C̄ can be regenerated at 120° (2) cf. (6).

[For prepn. of C̄ from dichloroacetaldehyde diethylacetal (3:6110) by distn. with conc. H_2SO_4 (1) (2) (7) or with benzoic anhydride (1:0595) + a little conc. H_2SO_4 (3) (yield: 81% (5), 78% (8)) see indic. refs.; for prepn. of C̄ from chloral hydrate (3:1270) with Al/Hg see (9); for manufacture of C̄ from chloroform + formaldehyde with SO_2Cl_2 at 300° (10) or with heat, pressure, and cat. (11) see indic. refs.]

[For formn. of C̄ from α,β,β-trichloroethyl ethyl ether (1), β,β-dichlorovinyl methyl (12) or ethyl (1) ethers on htg. with acids; from β,β,β-trichlorolactic acid or its sodium salt by htg. in CO_2 (13) or warming aq. soln. (14) (22), or from its acetate with ethereal Et_3N followed by warming with aq. (13) (15); from ethyl α-ethoxy-β,β-dichloroacrylate on warming with aq. (16); from dichloropyruvic acid by htg. with aq. (15) see indic. refs.]

[For formn. of C̄ from acetylene with HOCl (17) or from chloroacetylene (3:7000) with NaOCl (18) see indic refs.]

C̄ in pres. of conc. H_2SO_4 polymerizes (19) to a cryst. tri (?) mer paradichloroacetaldehyde, m p. 129–130° (19), and eas. sol. alc.; this prod. on htg. in a s.t. at 240–245° or with conc. H_2SO_4 at 120–130° regenerates C̄. [For use of C̄ and this polymer as insecticides see (20).]

C̄ with 1 mole aq. and cooling yields (1) dichloroacetaldehyde hydrate (3:1085), m.p. 56°.

C̄ with abs. EtOH yields (1) dichloroacetaldehyde monoethylacetal (dichloroacetaldehyde ethyl alcoholate) (3:5310). [For dichloroacetaldehyde diethylacetal, b.p. 184° see 3.6110.]

C̄ reduces $NH_4OH/AgNO_3$. — C̄ on oxidn. with fumg. HNO_3 yields (21) dichloroacetic acid (3:6208).

[C̄ with PCl_5 yields (22) 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) (which if much HCl is present may be accompanied by $\alpha,\beta,\beta,\alpha',\beta',\beta'$-hexachlorodiethyl ether (22)).]

C̄ with 1 mole $NH_2OH.HCl$ in aq. soln. yields (23) a liquid oxime, b.p. 67–69° at 17 mm., 40–44° at 2–3 mm dec ; however, with excess $NH_2OH.HCl + Na_2CO_3$ C̄ yields (14) (16) glyoxal dioxime [Beil I-761, I_1-(394), I_2-(818), m p. 177–178° (16), 173° (14).

C̄ with excess phenylhydrazine yields (24) (25) glyoxal *bis*-phenylosazone, pale yel. pl. from boilg. alc., m.p. 169–171° (25), 170° (24).

C̄ with 1 mole semicarbazide in alc. yields (26) dichloroacetaldehyde semicarbazone, m p. 155–156° (26); C̄ with 2 moles semicarbazide in aq. soln. gives on boilg. (26) glyoxal *bis*-semicarbazone, insol. in usual solvents and not melting below 270° (27).

3:5190 2,3-DICHLOROPROPENE-1 (β-Chloroallyl chloride)

$C_3H_4Cl_2$ Beil. I-199, I_1—, I_2—

B.P. 94–94.5° (1) (6)
94° (2) (3)
92.5° (4)

$D^{25}_{25} = 1.204$ (3) $n^{21}_D = 1.4600$ (5)

Colorless oil, insol. aq., sol. alc., ether.

[For prepn. of C̄ from 1,2,3-trichloropropane (3:5840) + aq. alk. (yield 80% (5), 87% (4), 70% (1)) or alc. alk. (4) see indic. refs.; for other misc. methods of formn. see Beil. I-199.]

C̄ shaken with 6–7 pts. conc. H_2SO_4, poured into aq., and distd. yields (7) chloroacetone (3:5425), b.p. 118°.

C̄ adds Br_2 giving (3) 2,3-dichloro-1,2-dibromopropane [Beil. I-112], b.p. 205° (3).

C̄ htd. with fumg. HCl in s.t. at 100° yields (3) 1,2,2-trichloropropane (3:5475), b.p. 123°.

[For study of addn. of HF see (4).]

[For use of C̄ in prepn. of cellulose ethers with unsatd. linkages see (8).]

3:5190 (1) Bon, *Uchenye Zapiski Leningrad. Gosudarst. Univ., Ser. Khim. Nauk.* **3**, 3–37 (1938); *Cent.* **1939**, II 366. (2) Kirmann, *Bull. soc. chim.* (5) **6**, 846 (1939). 3:5200 *d,l*-1,2-DICHLOROPROPANE (Propylene (di)chloride)

$C_3H_6Cl_2$ Beil. I-105, I_1—, I_2-(73)

B.P. 96.8° at 760 mm. (1) (2)
96.4–96.6° (3) (4) (5)
96.4° at 760 mm. (6)
95.2–96.0° at 760 mm. (7) (8)

$D^{20}_4 = 1.1545$ (6) $n^{20}_D = 1.4388$ (9)

Colorless oil. — For b.p.'s at various pressures from 33–847 mm. see (6) (10). — Almost insol. in aq.; for precise data see (3) (4) (5). — [For use as technical solvent see (11); for use in concn. of AcOH by formn. with aq. of const.-boilg. mixt., b.p. 96° see (12).]

[For prepn. of C̄ from corresp. alc., propanediol-1,2 (propylene glycol) (1:6455), with $PCl_3 + ZnCl_2$ (13% yield (13)), or $PCl_5 + ZnCl_2$ (11% yield (13)), or $SOCl_2$ (15% yield (13)), or $SOCl_2$ + pyridine (28% yield (13)), see (13); for prepn. of C̄ from propylene by addn. of Cl_2 (88% yield (9)) see (9) (14) (30); for formn. of C̄ (35.6% (15)) together with other products by chlorination of propane (15) (16) (17) see indic. refs.; for formn. of C̄ (60% (18)) together with 1,3-dichloropropane (3:5450) (40% (18)) from 1-chloropropane (3:7040) with SO_2Cl_2 see (18); for other misc. methods see Beil. I-105.]

[For study of limits of inflammability (3.4%–14.5% by volume) of C̄ in air see (19); for study of thermal conductivity of C̄ see (20); for adsorption of C̄ by activated carbon at various temps. see (31).]

C̄ on further chlorination with SO_2Cl_2 yields (18) cf. (32) 48% 1,2,2-trichloropropane (3:5475), 37% 1,2,3-trichloropropane (3:5840) cf. (21), and 15% 1,1,2-trichloropropane (3:5630).

$\bar{C}$ on htg. at 540–750°C. loses HCl yielding (15) (22) a mixt. of 3-chloropropene-1 (allyl chloride) (3:7035) and 1-chloropropene-1 (3:7030). — $\bar{C}$ with aq. alk. under pressure and above b.p. of $\bar{C}$ yields (23) 2-chloropropene-1 (isopropenyl chloride) (3:7020). — $\bar{C}$ with alc. KOH (but not NaOH (9)) at 60–75° gives (95% yield (9)) mixt. of 2-chloropropene-1 (3:7020) and 1-chloropropene-1 (3:7030) cf. (21) (28).

[For reactn. of $\bar{C}$ with salts of lower aliphatic acids yielding esters of *d,l*-propylene glycol (1:6455) see (24); with conc. aq. NH_4OH at 78–80° giving (92% yield (25)) propylenediamine dihydrochloride and other products (26) see indic. refs.]

$\bar{C}$ htd. with aq. + PbO in s t. at 150° is said [Beil. I-105] to yield *d,l*-propylene glycol (1.6455), but $\bar{C}$ htd. with 20 vols. aq. in s.t. at 210–220° yields (2) from the glycol a mixt. of propionaldehyde (1:0110) and acetone (1:5400). — [For behavior of $\bar{C}$ with boilg. aq. + trace of $NaHCO_3$, or with boilg. aq. + Fe, see (15).]

—— **1,2-Diphenoxypropane:** m.p. 32°, b.p. 175–178° at 12 mm. (27). [From 1-bromo-2-phenoxypropane with 25% alc. $NaOC_6H_5$ (27); it has not, however, been reported direct from $\bar{C}$.]

—— **1,2-Di(α-naphthoxy)propane:** unrecorded.

—— **1,2-Di-(β-naphthoxy)propane:** m.p. 152° (29). [From $\bar{C}$ with β-naphthol (1:1540) + aq NaOH in s.t. at 120° (29).]

Note 2. For D_4^t over range 25–85° see (15).

[*See also chloral hydrate* (3:1270) *and chloral ethylalcoholate* (3:0860).]

Important note: The chemistry of anhydrous chloral on one hand and that of chloral hydrate on the other is so closely interwoven that the division of material between them in this book is necessarily arbitrary. For instance, there are many reactions actually employing chloral hydrate as the starting point, which by virtue of the simultaneous use of conc. H_2SO_4 are undoubtedly in effect reactions of anhydrous chloral. In such cases the allocation of text between the two entries has been influenced by the nature and magnitude of the context. Although cross references have been liberally employed, the texts of both anhydrous chloral and of chloral hydrate should be compared.

MISCELLANEOUS PHYSICAL PROPERTIES

Binary systems contg. C̄. C̄ with H_2O combines to give chloral hydrate (3:1270) q.v. (for use in this reaction of C̄ in effecting drying of halogen compounds used in fire extinguishers see (20)); for extensive study of system C̄ + aq. see (9).

C̄ with EtOH (1:6130) combines to give chloral ethylalcoholate (3:0860) q.v.— For analogous reactions of C̄ with other alcs. see below under chemical behavior of C̄.

Azeotropic mixtures containing C̄. A few such systems are known including the following: C̄ with methylcyclohexane (hexahydrotoluene) (1:8410) gives a const.-boilg. mixt., b.p. 94.45° at 760 mm., contg. 57% C̄ (2); C̄ with isobutyl formate (1:3065) gives a const.-boilg. mixt., b.p. 100.1° at 760 mm., contg. 60% C̄ (21); C̄ with *n*-propyl acetate (1:3075) gives a const.-boilg. mixt., b.p. 102.55° at 760 mm., contg. 50.5% C̄ (21); C̄ with nitromethane gives a const.-boilg. mixt., b.p. 93° at 760 mm., contg. 65% C̄ (20).

PREPARATION OF C̄

From Halogen-Free Starting Points

From ethyl alcohol. [C̄ was first prepared (22) from EtOH (1:6130) by action of Cl_2; for discussion of mechanism of reaction see (23) (24); note that various by-products (25) (26) such as 1,1-dichloroethane (3:5035), 1,2-dichloroethane (3:5130), 1,1,2-trichloroethane (3:5330), β,β,β-trichloroethanol (3:5775), ethyl dichloroacetate (3:5850), and chloroform

(3:5050) have been detected; for patents on prepn. of C̄ (or its hydrate) from EtOH with Cl_2 see (27) (28); for use of Cl_2 in pres. of $FeCl_3$ see (29).]

From acetaldehyde. [For prepn. of C̄ from acetaldehyde (1:0100) with Cl_2 see (30) (31).]

From other non-halogenated materials. [For formation of C̄ from ethyl formate (1:3000) with SO_2Cl_2 in s t. at 170° (32) or from starch or sucrose by distn. with MnO_2 + HCl (33) see indic. refs.]

FROM HALOGENATED STARTING MATERIALS

From chloro-unsaturates. [For formn. of C̄ from 1,1,2-trichloroethylene (3:5170) with large excess Cl_2O in CCl_4 at −20° (34) or on oxidn. in pres. of $FeCl_3$, $AlCl_3$, $TiCl_4$, or $SbCl_3$ as directed (35) see indic. refs.; from chloroacetylene (3:7000) with aq. 30% NaOCl + H_3BO_3 see (36).]

From carbon tetrachloride. [For prepn. of C̄ from CCl_4 (3·5100) with formaldehyde + SO_2Cl_2 + cat. at high temp. (200–500°) and high press. (20–200 atm.) see (401).]

From various chloral derivatives. [For prepn of C̄ from chloral hydrate (3:1270) by dehydration with conc. H_2SO_4 (note that C̄ is appreciably soluble in conc. H_2SO_4 (9)) or with CaC_2 slowly in cold but rapidly at 100° (37); from chloral ethylalcoholate (3:0860) (or other chloral alcoholates) with conc. H_2SO_4, from chloral polymers such as "metachloral" by htg at 180–200° (38); from trichloroacetaldehyde diethylacetal ("trichloroacetal") (3:6317) above 200° (39) or on distn with conc. H_2SO_4 (39) (40); from dichloroacetaldehyde diethylacetal ("dichloroacetal") (3:6110) with Cl_2 at 60–70° (41) see indic. refs.]

CHEMICAL BEHAVIOR OF C̄ WITH INORGANIC REACTANTS

GENERAL

[For review of chemistry of C̄ and its hydrate (3:1270) see (42).]

REDUCTION OF C̄

According to the nature of the reagent and the conditions, C̄ (or its hydrate) may undergo reduction either at its $-CCl_3$ group or at its —CHO group.

Reduction at $-CCl_3$ group [C̄ with H_2 + Pd in alc. KOH (43) or with H_2 + Ni + aq. alk. (44) splits off all its halogen as HCl. — C̄ with Zn + AcOH (45) (46), with Al + AcOH (75), with Zn + strong HCl (47) (48), with Zn + dil. H_2SO_4 (49) (50), reduces to acetaldehyde (1:0100); because of easy volatility of this product the reaction may be used for the identification and detection of C̄ (47) (49) (50), or for detection of C̄ in presence of $CHCl_3$ (3·5050) or of α,α,β-trichloro-n-butyraldehyde ("butyrchloral") (3:5910) (49). — Note that C̄ with aq. Zn or Fe powder especially on warming gives (51) CH_4 + MeCl (3:7005) + CH_2Cl_2 (3:5020).]

[C̄ in aq. with Al/Hg gives (52) dichloroacetaldehyde hydrate (3:1085), while C (as hydrate) on electrolytic reduction (53) gives dichloroacetaldehyde (3:5180) + chloroacetaldehyde (3:7212) + acetaldehyde (1:0100).]

Reduction at —CHO group. [C̄ with $Al(OEt)_3$ in abs. EtOH gives (yields: 85% (54), 84% (55), 80% (56)) (57) (58) (59) cf. (60) 2,2,2-trichloroethanol-1 (3:5775); for reduction of C̄ to this same product using Al isopropylate in isopropyl alc. (61) in pres. of acetaldehyde (yield 72–87% (62)), C_2H_5OMgBr (63), $(CH_3)_2CHOMgBr$ (63), or other metallic isopropylates (64), $ZnEt_2$ (65) (66), $AlEt_3$ compd. with ether (88 5% yield (67)) (note, however, that $SnEt_4$ is not effective (67)), or fermenting yeast (68) (69), see indic. refs. — For formn. of 2,2,2-trichloroethanol-1 (3:5775) during reaction of C̄ with various RMgX compounds see below under behavior of C̄ with RMgX cpds.]

CHEMICAL BEHAVIOR OF $\bar{C}$ WITH INORGANIC REACTANTS

General

[For review of chemistry of $\bar{C}$ and its hydrate (3·1270) see (42).]

Reduction of $\bar{C}$

According to the nature of the reagent and the conditions, $\bar{C}$ (or its hydrate) may undergo reduction either at its —CCl_3 group or at its —CHO group.

Reduction at —CCl_3 group [$\bar{C}$ with H_2 + Pd in alc. KOH (43) or with H_2 + Ni + aq. alk. (44) splits off all its halogen as HCl. — $\bar{C}$ with Zn + AcOH (45) (46), with Al + AcOH (75), with Zn + strong HCl (47) (48), with Zn + dil. H_2SO_4 (49) (50), reduces to acetaldehyde (1:0100); because of easy volati[illegible] for the identification and detection of $\bar{C}$ (47) [illegible] $CHCl_3$ (3:5050) or of α,α,β-trichloro-n-buty[illegible]. — Note that $\bar{C}$ with aq. Zn or Fe powder especially on warming gives (51) CH_4 + MeCl (3:7005) + CH_2Cl_2 (3.5020).]

[$\bar{C}$ in aq. with Al/Hg gives (52) dichloroacetaldehyde hydrate (3:1085), while C (as hydrate) on electrolytic reduction (53) gives dichloroacetaldehyde (3:5180) + chloroacetaldehyde (3:7212) + acetaldehyde (1:0100).]

Reduction at —CHO group. [$\bar{C}$ with $Al(OEt)_3$ in abs. EtOH gives (yields: 85% (54), 84% (55), 80% (56)) (57) (58) (59) cf. (60) 2,2,2-trichloroethanol-1 (3:5775); for reduction of $\bar{C}$ to this same product using Al isopropylate in isopropyl alc. (61) in pres of acetaldehyde (yield 72–87% (62)), C_2H_5OMgBr (63), $(CH_3)_2CHOMgBr$ (63), or other metallic isopropylates (64), $ZnEt_2$ (65) (66), $AlEt_3$ compd. with ether (88.5% yield (67)) (note, however, that $SnEt_4$ is not effective (67)), or fermenting yeast (68) (69), see indic. refs. — For formn. of 2,2,2-trichloroethanol-1 (3:5775) during reaction of $\bar{C}$ with various RMgX compounds see below under behavior of $\bar{C}$ with RMgX cpds.]

Oxidation of $\bar{C}$

$\bar{C}$ or its hydrate (3:1270) on oxidation under appropriate conditions gives trichloroacetic acid (3:1150); under some circumstances extensive decompn. also occurs (see below).

[$\bar{C}$ on oxidn. with fumg. HNO_3 (70) cf. (71), with HNO_2 (72), with NO_2 at 40–60° (70% yield (73)) or with aq. chlorates + cat. (74) gives trichloroacetic acid (3:1150); for formn. of latter as by-product of action of $\bar{C}$ with O_2 including comments on inhibitors, etc., see (38) (75).]

[Chloral hydrate (3:1270) on oxidn. with fumg. HNO_3 (63% yield (76)) cf. (72), with $KMnO_4$ (77) (80), with $KClO_3$ (78), with aq. chlorates + cat. (74), or with $Ca(OCl)_2$ (79) gives trichloroacetic acid (3:1150).]

Chloral hydrate (3:1270) reduces $NH_4OH/AgNO_3$ (81) or Fehling's soln. (for study of sensitivity of this reaction see (82) [for oxidn. of chloral hydrate by HgO, $KMnO_4$, or CrO_3 see (83); for reduction by chloral hydrate of AgCl, AgBr, AgI, or AgSCN to metallic silver (84) or of alkaline solns. of Au, Ag, Bi, and Cu salts (85) see indic. refs.].

[$\bar{C}$ in dry C_6H_6 is but slowly attached by silver oxide (86).]

Reactions Involving Decomposition of $\bar{C}$

(See also below under behavior of $\bar{C}$ with alkalies.)

[$\bar{C}$ with aq. HIO_3 at 100° decomposes yielding (87) $CHCl_3$ (3:5050) + CO_2 + ICl_3 + I_2. — $\bar{C}$ on chlorine-sensitized (88) or bromine-sensitized (12) photochemical oxidn. with O_2 at 70–90° decomposes yielding (88) (12) $COCl_2$ (3:5000) + CO + HCl.]

[$\bar{C}$ on thermal decompn. at about 440°C. especially if catalyzed by I_2 (89) or NO (89) (90) gives $CHCl_3$ (3:5050) + CO.]

[$\bar{C}$ with $AlCl_3$ on htg. gives various products according to conditions; these include tetrachloroethylene (3:5460) (91) (92), pentachloroethane (3:5880) (93), $\alpha,\alpha,\beta,\beta,\gamma,\gamma,\gamma$-heptachloro-*n*-butyraldehyde ("perchlorobutanal") (94), chloral polymers (especially metachloral (91) (92) (95)), chloralide (3:3510) (92) (94), and others.]

Behavior of $\bar{C}$ with Halogens

With chlorine. [$\bar{C}$ with Cl_2 in sunlight decomposes giving (96) CCl_4 (3:5100) + $COCl_2$ (3:5000) + HCl; for extensive study of photochem. reaction of $\bar{C}$ with Cl_2 at 70–90° giving CCl_4 (3:5100) + CO + HCl see (97). — Note that $\bar{C}$ with Cl_2, Br_2, or I_2 in pres. of $AlCl_3$ gives (98) hexachloroethane (3:4835).]

With bromine. [$\bar{C}$ with Br_2 at 150° gives (99) trichloroacetyl bromide + bromotrichloromethane + CO + HBr; for extensive study of photochem. reaction of $\bar{C}$ with Br_2 at 70–90° giving bromotrichloromethane, $CHCl_3$ (3:5050), $COBr_2$, CO + HBr see (13).]

Behavior of $\bar{C}$ with Inorganic Acids

$\bar{C}$ with inorganic acids reacts in various ways according to circumstances; e.g., by formn. of addn. products, by decomposition, by formation of chloralide, by polymerization (see also its own heading below), or by combinations of these reactions.

With HCl. [$\bar{C}$ with HCl gas at −15 to −75° yields (100) (113) an addn. product $\bar{C}$.HCl commonly designated as chloral hydrochloride; this crystn. product with aq. dissociates giving $\bar{C}$ (as hydrate) + HCl; note that little, if any, polymerization occurs (100).]

With HBr. [$\bar{C}$ with HBr gas at −15° yields (100) an addn. prod.; C.HBr, similar in behavior to that of the preceding HCl addn. product.]

With HNO_3. [$\bar{C}$ with HNO_3 at 20° yields (101) an addition prod., $C.HNO_3$.]

With H_2SO_4. [$\bar{C}$ with fumg. H_2SO_4 contg. 2% SO_3 gives on warming substantially 100% yields (102) of chloralide (3:3510); note, however, that $\bar{C}$ with fumg. H_2SO_4 contg.

10% SO_3 gives at 0° an addn. prod. of the type $C_m\ (SO_3)_n.(H_2O)_p$ which on warming dec. giving $COCl_2$ (3:5000) + SO_2Cl_2 + SO_2 + CO_2 + CO + HCl (102); for other (older) refs. on conversion of C̄ with fumg. H_2SO_4 to chloralide (3:3510) see (61) (81) (103) (104); for conversion of chloral hydrate (3:1270) with fumg. H_2SO_4 to chloralide (3:3510) (yields 61% (105), 44–51% (106)) see indic. refs. — Note, however, that within a narrow range of strength (best about 79.8%) H_2SO_4 appears to give with C̄ or its hydrate certain unstable addition products of type $CCl_3.CH(OH).SO_2OH.H_2O$ (148).]

With $ClSO_3H$. [C̄ with chlorosulfonic acid at 50° for several days gives (65% yield (107)) *bis*-(α,β,β,β-tetrachloroethyl) ether (3:0738); note that even at −50° for 10–12 hrs. yield of this prod. may be as high as 50%; also that various other products including chloralide (3:3510) are also formed; and finally that C̄ with FSO_3H behaves similarly (107).]

Polymerization of C̄

C̄ is known to give at least three polymers; the oldest and most common polymer is that designated as "metachloral"; in addition two isomeric α- and β-"parachlorals" (possibly comprising a pair of *cis-trans* stereomers) have also been reported (108).

Metachloral. [C̄ in presence of H_2SO_4 below 0° (108) (sometimes suddenly cf. (109)), fumg. H_2SO_4 (18), pyridine (18), or $AlCl_3$ as directed (18) (92) (110) gives metachloral [Beil. I-618, I_1-(329), I_2-(680)], a white amorphous polymer of unknown mol. wt. or structure. This polymer is insol. aq , alc., ether, or acids but dissolves in aq. Na_2CO_3 forming chloral hydrate (3:1270), on distn. at 180° regenerates C̄, oxidizes with HNO_3 to trichloroacetic acid, with alkalies behaves like C̄ (see also below), and with $ClSO_3H$ at 50° gives (107) *bis*-(α,β,β,β-tetrachloroethyl) ether (3·0738).]

Parachloral. [C̄ with a large excess conc. H_2SO_4 at 15–20°, carefully dissolved and stood 3 days at 15–20°, gives in addn. to metachloral (above) and chloralide (3:3510) small amts. of two isomeric trimers, viz., α-parachloral, rhombs from hot alc , m.p. 116°, b.p. 223° at 760 mm., and β-parachloral, pr. from alc., m.p. 152°, b.p. 250°. Note that yield of parachloral is only about 1% of original C̄, that both are more sol. in hot alc. than the main prod. metachloral, that neither form is convertible to the other or to metachloral, and that both on distn. at ord. press. dissociate to C̄.]

Mixed polymers. [C̄ (1 mole) with acetaldehyde (3 moles) + HCl gas at 0° for 15–20 hrs. gives (78% yield (111)) 2,4-dimethyl-6-(trichloromethyl)-1,3,5-trioxane, b.p. 97° at 13 mm., $D_4^{15} = 1.3915$, $n_D^{18} = 1.4708$. Similar mixed polymers (presumably analogous to the preceding case) are similarly formed (112) from C̄ with trimethylacetaldehyde (1:0133), C̄ with propionaldehyde (1:0110), and C̄ with isobutyraldehyde (1:0120).]

Behavior of C̄ with alkalies. C̄ with conc. aq. alkalies (even in cold (22)), or C̄ on distn. with aq. alkalies or alk. earths (22) (114) (115), undergoes cleavage into $CHCl_3$ (3:5050) + the corresp. salt of formic acid (1:1005); this cleavage is claimed to occur also even with conc. NH_4OH (114) or aq. amines (114) and may also produce some CO (114) and chloride ion. — [For extensive studies of kinetics of this cleavage see (116) (117) (118) (119) (120) (121) (122) (126).]

Note that C̄ is very stable toward hydrolysis by aq. (126) (even in s.t. at 190–200° for 2 hrs. (118)) or by dilute acid (even in s.t. at 150° (118)); however, C̄ with aq. in sunlight is claimed (123) to give formaldehyde (1:0145) + CO_2 + HCl (presumably by formn. and decompn. of $OCH.C(OH)_3$), and C with aq. is claimed (124) to undergo slight formn. of dichloroacetic acid (3:6208) + HCl.

C̄ with alc. KOH gives (125) $CHCl_3$ (3:5050) + ethyl formate (1:3000).

[Note that chloral deuterate, $CCl_3CH(OD)_2$ (from C̄ + D_2O), with NaOD (17) or $Ca(OD)_2$ (127) in D_2O gives deuteriochloroform, $CDCl_3$, b.p. 0.5° higher than ord. $CHCl_3$

Oxidation of $\bar{C}$

$\bar{C}$ or its hydrate (3:1270) on oxidation under appropriate conditions gives trichloroacetic acid (3:1150); under some circumstances extensive decompn. also occurs (see below).

[$\bar{C}$ on oxidn. with fumg. HNO_3 (70) cf. (71), with HNO_2 (72), with NO_2 at 40-60° (70% yield (73)) or with aq. chlorates + cat. (74) gives trichloroacetic acid (3:1150); for formn. of latter as by-product of action of $\bar{C}$ with O_2 including comments on inhibitors, etc., see (38) (75).]

[Chloral hydrate (3:1270) on oxidn. with fumg. HNO_3 (63% yield (76)) cf. (72), with $KMnO_4$ (77) (80), with $KClO_3$ (78), with aq. chlorates + cat. (74), or with $Ca(OCl)_2$ (79) gives trichloroacetic acid (3:1150).]

Chloral hydrate (3:1270) reduces $NH_4OH/AgNO_3$ (81) or Fehling's soln. (for study of sensitivity of this reaction see (82) [for oxidn. of chloral hydrate by HgO, $KMnO_4$, or CrO_3 see (83); for reduction by chloral hydrate of AgCl, AgBr, AgI, or AgSCN to metallic silver (84) or of alkaline solns. of Au, Ag, Bi, and Cu salts (85) see indic. refs.].

[$\bar{C}$ in dry C_6H_6 is but slowly attached by silver oxide (86).]

Reactions Involving Decomposition of $\bar{C}$

(See also below under behavior of $\bar{C}$ with alkalies.)

[$\bar{C}$ with aq. HIO_3 at 100° decomposes yielding (87) $CHCl_3$ (3:5050) + CO_2 + ICl_3 + I_2. – $\bar{C}$ on chlorine-sensitized (88) or bromine-sensitized (12) photochemical oxidn. with O_2 at 70-90° decomposes yielding (88) (12) $COCl_2$ (3:5000) + CO + HCl.]

[$\bar{C}$ on thermal decompn. at about 440°C. especially if catalyzed by I_2 (89) or NO (89) (90) gives $CHCl_3$ (3:5050) + CO.]

[$\bar{C}$ with $AlCl_3$ on htg. gives various products according to conditions; these include tetrachloroethylene (3:5460) (91) (92), pentachloroethane (3:5880) (93), $\alpha,\alpha,\beta,\beta,\gamma,\gamma,\gamma$-heptachloro-$n$-butyraldehyde ("perchlorobutanal") (94), chloral polymers (especially metachloral (91) (92) (95)), chloralide (3:3510) (92) (94), and others.]

Behavior of $\bar{C}$ with Halogens

With chlorine. [$\bar{C}$ with Cl_2 in sunlight decomposes giving (96) CCl_4 (3:5100) + $COCl_2$ (3:5000) + HCl; for extensive study of photochem. reaction of $\bar{C}$ with Cl_2 at 70-90° giving CCl_4 (3:5100) + CO + HCl see (97). — Note that $\bar{C}$ with Cl_2, Br_2, or I_2 in pres. of $AlCl_3$ gives (98) hexachloroethane (3:4835).]

With bromine. [$\bar{C}$ with Br_2 at 150° gives (99) trichloroacetyl bromide + bromotrichloromethane + CO + HBr; for extensive study of photochem. reaction of $\bar{C}$ with Br_2 at 70-90° giving bromotrichloromethane, $CHCl_3$ (3:5050), $COBr_2$, CO + HBr see (13).]

Behavior of $\bar{C}$ with Inorganic Acids

$\bar{C}$ with inorganic acids reacts in various ways according to circumstances; e g., by formn. of addn. products, by decomposition, by formation of chloralide, by polymerization (see also its own heading below), or by combinations of these reactions.

With HCl. [$\bar{C}$ with HCl gas at –15 to –75° yields (100) (113) an addn. product $\bar{C}$.HCl commonly designated as chloral hydrochloride; this crystn. product with aq. dissociates giving $\bar{C}$ (as hydrate) + HCl; note that little, if any, polymerization occurs (100).]

With HBr. [$\bar{C}$ with HBr gas at –15° yields (100) an addn. prod.; C.HBr, similar in behavior to that of the preceding HCl addn. product.]

With HNO_3. [$\bar{C}$ with HNO_3 at 20° yields (101) an addition prod., $C.HNO_3$.]

With H_2SO_4. [$\bar{C}$ with fumg. H_2SO_4 contg. 2% SO_3 gives on warming substantially 100% yields (102) of chloralide (3:3510); note, however, that $\bar{C}$ with fumg. H_2SO_4 contg.

10% SO_3 gives at 0° an addn. prod. of the type $C_m(SO_3)_n.(H_2O)_p$ which on warming dec. giving $COCl_2$ (3.5000) + SO_2Cl_2 + SO_2 + CO_2 + CO + HCl (102); for other (older) refs. on conversion of $\bar{C}$ with fumg. H_2SO_4 to chloralide (3:3510) see (61) (81) (103) (104); for conversion of chloral hydrate (3:1270) with fumg. H_2SO_4 to chloralide (3:3510) (yields: 61% (105), 44–51% (106)) see indic. refs. — Note, however, that within a narrow range of strength (best about 79.8%) H_2SO_4 appears to give with $\bar{C}$ or its hydrate certain unstable addition products of type CCl_3 CH(OH).SO_2OH.H_2O (148).]

With $ClSO_3H$. [$\bar{C}$ with chlorosulfonic acid at 50° for several days gives (65% yield (107)) *bis*-(α,β,β,β-tetrachloroethyl) ether (3:0738); note that even at −50° for 10–12 hrs. yield of this prod. may be as high as 50%; also that various other products including chloralide (3:3510) are also formed; and finally that $\bar{C}$ with FSO_3H behaves similarly (107).]

Polymerization of $\bar{C}$

$\bar{C}$ is known to give at least three polymers; the oldest and most common polymer is that designated as "metachloral"; in addition two isomeric α- and β-"parachlorals" (possibly comprising a pair of *cis-trans* stereomers) have also been reported (108).

Metachloral. [$\bar{C}$ in presence of H_2SO_4 below 0° (108) (sometimes suddenly cf. (109)), fumg. H_2SO_4 (18), pyridine (18), or $AlCl_3$ as directed (18) (92) (110) gives metachloral [Beil. I-618, I_1-(329), I_2-(680)], a white amorphous polymer of unknown mol. wt. or structure. This polymer is insol. aq., alc., ether, or acids but dissolves in aq. Na_2CO_3 forming chloral hydrate (3:1270), on distn. at 180° regenerates $\bar{C}$, oxidizes with HNO_3 to trichloroacetic acid, with alkalies behaves like $\bar{C}$ (see also below), and with $ClSO_3H$ at 50° gives (107) *bis*-(α,β,β,β-tetrachloroethyl) ether (3:0738).]

Parachloral. [$\bar{C}$ with a large excess conc. H_2SO_4 at 15–20°, carefully dissolved and stood 3 days at 15–20°, gives in addn. to metachloral (above) and chloralide (3:3510) small amts. of two isomeric trimers, viz., α-parachloral, rhombs from hot alc., m.p. 116°, b.p. 223° at 760 mm., and β-parachloral, pr. from alc., m.p. 152°, b.p. 250°. Note that yield of parachloral is only about 1% of original $\bar{C}$, that both are more sol. in hot alc. than the main prod. metachloral, that neither form is convertible to the other or to metachloral, and that both on distn. at ord. press. dissociate to $\bar{C}$.]

Mixed polymers. [$\bar{C}$ (1 mole) with acetaldehyde (3 moles) + HCl gas at 0° for 15–20 hrs. gives (78% yield (111)) 2,4-dimethyl-6-(trichloromethyl)-1,3,5-trioxane, b.p. 97° at 13 mm., $D_4^{16} = 1.3915$, $n_D^{15} = 1.4708$. Similar mixed polymers (presumably analogous to the preceding case) are similarly formed (112) from $\bar{C}$ with trimethylacetaldehyde (1:0133), $\bar{C}$ with propionaldehyde (1:0110), and $\bar{C}$ with isobutyraldehyde (1:0120).]

Behavior of $\bar{C}$ with alkalies. $\bar{C}$ with conc. aq. alkalies (even in cold (22)), or $\bar{C}$ on distn. with aq. alkalies or alk. earths (22) (114) (115), undergoes cleavage into $CHCl_3$ (3:5050) + the corresp. salt of formic acid (1:1005); this cleavage is claimed to occur also even with conc. NH_4OH (114) or aq. amines (114) and may also produce some CO (114) and chloride ion. — [For extensive studies of kinetics of this cleavage see (116) (117) (118) (119) (120) (121) (122) (126).]

Note that $\bar{C}$ is very stable toward hydrolysis by aq. (126) (even in s.t. at 190–200° for 2 hrs. (118)) or by dilute acid (even in s.t. at 150° (118)); however, $\bar{C}$ with aq. in sunlight is claimed (123) to give formaldehyde (1:0145) + CO_2 + HCl (presumably by formn. and decompn. of OCH C(OH)$_3$), and $\bar{C}$ with aq. is claimed (124) to undergo slight formn. of dichloroacetic acid (3:6208) + HCl.

$\bar{C}$ with alc. KOH gives (125) $CHCl_3$ (3:5050) + ethyl formate (1:3000).

[Note that chloral deuterate, $CCl_3CH(OD)_2$ (from $\bar{C}$ + D_2O), with NaOD (17) or Ca-$(OD)_2$ (127) in D_2O gives deuteriochloroform, $CDCl_3$, b.p. 0.5° higher than ord. $CHCl_3$

(3:5050), m.p. −64.69 to −64.15°, D_4^{20} = 1.5004 (higher than 1.4888 for $CHCl_3$), n_D^{20} = 1.4450 (same as $CHCl_3$) (17).]

Behavior of C̄ with Ammonia, Hydroxylamine, Hydrazine, etc.

With NH_3. [C̄ with dry NH_3 gas (81) (48) in dry $CHCl_3$ (128) (129) or chloral hydrate (3:1270) with NH_3 in dry ether (129) gives a white solid, m.p. *72–74° (129), 62–64° (128)*, originally (81) (48) (128) regarded as chloralammonia $CCl_3.CH(OH).NH_2$ but later (on discovery of double the expected mol. wt. (129) cf. (130)) thought to have structure $CCl_3.CH(OH).NH.CH(NH_2).CCl_3.H_2O$. — The prod. with KCN in conc. aq. NH_4OH gives (93% yield (131)) dichloroacetamide, m.p. 98.5–99.0° (131).]

[Note that chloral hydrate (3:1270) with NH_4OAc at 100° gives (132) a prod., cryst. from alc., m.p. 97°, regarded as a dimeric form [Beil. XXIII-15] of chloralimide, $CCl_3{-}CH{=}NH$; this dimer is also accompanied (132) cf. (133) by two stereoisomeric trimers [Beil. XXVI-9–10] of chloralimide.]

With hydroxylamine. The behavior of C̄ with hydroxylamine differs according to the circumstances employed.

[C̄ as chloral hydrate (3:1270) with large excess $NH_2OH.HCl$ (4 moles) in a little aq. *(134) or with $NH_2OH.HCl$ (1 mole) in pres. of conc. aq. $CaCl_2$ (2 moles) at 50–60° (135)* gives trichloroacetaldoxime, m.p. 56° (135), 39–40° (134), b.p. 85° at 20 mm. (135).]

[C̄ as chloral hydrate (3:1270) with $NH_2OH.HCl$ (3 moles) in aq. Na_2CO_3/aq. NaOH as directed (136) (137) gives (yields: 50% (137), 40% (136) (138)) the alkali-stable form of chloro-oximino-acetaldehyde oxime ("chloroamphiglyoxime") [Beil. III-605, III_1-(216), III_2-(393)], ndls. of monohydrate from boilg. aq., m.p. 114° (136) (138) cf. (137); note that this prod. in dry ether with HCl gas (136) or with fumg. HCl (138) isomerizes to the acid-stable form ("chloroantiglyoxime") [Beil. III-606, III_1-(216), III_2-(393)], m.p. 161° (138), 161° dec. (136).]

[Note, however, that chloral hydrate (3:1270) (1 mole) with $NH_2OH.HCl$ (2 moles) powdered with dry Na_2CO_3 (1 mole), allowed to stand in a desiccator some hours, then dissolved in aq. and extracted with ether gives (139) an addition product, cryst. from ether, $CHCl_3$, or C_6H_6, m.p. 98°, regarded as chloralhydroxylamine, $CCl_3.CH(OH).NH.OH$.]

[For behavior of C̄ with $NH_2OH.HCl$ + aniline giving isatin see below under reaction of C̄ with primary aromatic amines.]

With Hydrazine

[C̄ as chloral hydrate (3:1270) with hydrazine hydrate in aq. (140), ether (141), or AcOH (142), or merely fused with hydrazine hydrochloride or sulfate (143), appears to give first the expected addition product, viz., chloralhydrazine, $CCl_3.CH(OH).NH.NH_2$, ndls. from alc., m.p. 100° (141), 85° dec. (140); note, however, that this structure is not certain and that the material readily changes to a compound $C_4H_2ON_2Cl_6$, m.p. 187° cf. (140) (141) (142) (143).]

Behavior of C̄ with Miscellaneous Inorganic Reactants

With various compounds of phosphorus. [C̄ with PCl_5 in acetone gives a product regarded (144) cf. (145) as $CCl_3.CH\Big\langle{O \atop O}\Big\rangle PCl_3$, b.p. 238–242°, accompanied by tetrachloroethylene (3:5460) and pentachloroethane (3:5880).]

[C̄ with PCl_3Br_2 is claimed (146) to give 1,1-dibromo-2,2,2-trichloroethane [Beil. I-93, I_1-(65)], b.p. 93–95° at 14–15 mm., $D_4^{19.5}$ = 2.295, $n_D^{25.7}$ = 1.52991 (146).]

[$\bar{C}$ with P_2S_5 in s.t. at 160–170° gives (147) a complicated reaction mixture from which only trichloroethylene (3:5170) has been identified.]

With various salts of inorganic acids (for KCN see further below).

With alkali bisulfites (or sulfites) [$\bar{C}$ or its hydrate (3:1270) with aq. alk. bisulfites (81) (149) reacts readily; for discussion of products see (81) (150) (151).]

With hydrogen peroxide. [$\bar{C}$ with H_2O_2 in ether (151), or $\bar{C}$ with $K_2S_2O_8 + H_2SO_4$ at ord. temp., gives (152) "dichloralperoxide hydrate," viz., $CCl_3.CH(OH)—O.O.CH(OH).CCl_3$, cryst. from C_6H_6 or $CHCl_3$, m.p. 122° dec.]

CHEMICAL BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

BEHAVIOR OF $\bar{C}$ WITH HYDROCARBONS

With alkanes. [$\bar{C}$ with aliphatic hydrocarbons in presence of $AlCl_3$ reacts violently, but no definite products have been isolated (153).]

With aromatic hydrocarbons. $\bar{C}$ with aromatic hydrocarbons in presence of H_2SO_4 or other condensing agent (note that, when H_2SO_4 is present in large excess, chloral hydrate (3:1270) is frequently substituted for $\bar{C}$) reacts in either or both of two modes: $\bar{C}$ with 1 mole of hydrocarbon giving trichloromethyl-aryl-carbinols, $\bar{C}$ with 2 moles of hydrocarbon giving 1,1,1-trichloro-2,2-diarylethanes. Although reaction of $\bar{C}$ with hydrocarbons cannot here be summarized for all possible cases, yet the following examples will exemplify both modes of reaction.

[$\bar{C}$ with $C_6H_6 + AlCl_3$ (154) (156) or chloral hydrate (3:1270) with $C_6H_6 + AlCl_3$ (153) cf. (158) (162) or with C_6H_6 + conc. H_2SO_4 (155) gives trichloromethyl-phenyl-carbinol [Beil. VI-476, VI_1-(237)], m.p. 37° (155), b.p. 145° at 15 mm. (155) (corresp. acetate, m.p. 87.5° (155); corresp. benzoate, m.p. 97.5° (155); corresp. *p*-nitrobenzoate, m.p. 109° (156)) accompanied (155) by 1,1,1-trichloro-2,2-diphenylethane (3:1420), the latter also obtainable from $\bar{C} + C_6H_6$ with conc. H_2SO_4 (157) or with $AlCl_3$ in CS_2 (80% yield (162)).]

[$\bar{C}$ with toluene + $AlCl_3$ (154) or chloral hydrate (3:1270) (3 moles) with toluene (1 mole) + conc. H_2SO_4 (155) gives trichloromethyl-*p*-tolylcarbinol [Beil. VI-508, VI_1-(255)], m.p. 63–64° (154), 63° (155), 61.5–62.5° (159), 58–59° (160); b.p. 155° at 13.5 mm. (155), 154–156° at 13.5 mm. (154) (corresp. acetate, m.p. 107.5° (155), 105–106° (160); corresp. benzoate, m.p. 100.5° (155), 94–95° (160)). — On the other hand $\bar{C}$ with toluene (2 moles) in pres. of H_2SO_4 (161), or $AlCl_3$ (153) in CS_2 at 0° (162) gives (80% yield (162)) 1,1,1-trichloro-2,2-*bis*-(*p*-tolyl)ethane [Beil. V-619, V_1-(292), V_2-(522)], m.p. 89° (161) (162) (155), also obtained as by-product of the above carbinol (155); for study of loss of HCl with alc. KOH yielding 1,1-dichloro-2,2-di-(*p*-tolyl)ethylene [Beil. V-648, V_2-(559)], m.p. 92° (161), 85° (162) see (161) (162) (163).]

[For generally analogous behavior of $\bar{C}$ with other aromatic hydrocarbons such as *ter*-butylbenzene (405), *m*-xylene (153) (163), ethylbenzene (155), naphthalene (164), anthracene (164), or phenanthrene (164) in presence of condensing agents see indic. refs.]

BEHAVIOR OF $\bar{C}$ WITH ARYL HALIDES

With chlorobenzene. [That $\bar{C}$ with chlorobenzene (3:7903) (1 mole) + conc. H_2SO_4 gives the expected trichloromethyl-*p*-chlorophenyl-carbinol, b.p. 187–188° at 26 mm. (165) (corresp. acetate, m.p. 120–121° (165); corresp. benzoate, m.p. 128–129° (165)), has never been reported, this prod. having been obtd. only by condensation of *p*-chlorobenzaldehyde (3:0765) with $CHCl_3$ (3:5050) in pres. of KOH (23.5% yield (165)).

However, $\bar{C}$ or chloral hydrate with chlorobenzene (2 moles) + conc. H_2SO_4 gives the

extremely important 1,1,1-trichloro-2,2-*bis*-(*p*-chlorophenyl)ethane ("DDT") (3:3298) whose text should be consulted for further details.

With bromobenzene. [That C̄ with bromobenzene (1 mole) + conc. H_2SO_4 gives the expected trichloromethyl-*p*-bromophenyl-carbinol, b.p. 183–187° at 18 mm. (166) (corresp. acetate, m.p. 145–147° (166)), has never been reported, this product having been obtd. (29% yield (166)) only by reaction of C̄ with *p*-$Br.C_6H_4.MgCl$.]

[However, C̄ or chloral hydrate (3:1270) with bromobenzene (2 moles) + conc. H_2SO_4 + fumg. H_2SO_4 gives (167) (168) 1,1,1-trichloro-2,2-*bis*-(*p*-bromophenyl)ethane, m.p. 144° (167), 139–141° (168); note that this prod. with alc. KOH loses HCl, giving (82% yield (167) (168)) 1,1-dichloro-2,2-*bis*-(*p*-bromophenyl)ethylene, m.p. 123.5° (167), 119–120° (168).]

With iodobenzene. [The carbinol to be expected from C̄ with iodobenzene (1 mole) + conc. H_2SO_4 has not been reported.]

[However, C̄ with iodobenzene (2 moles) + conc. H_2SO_4 gives (155) 1,1,1-trichloro-2,2-*bis*-(*p*-iodophenyl)ethane, m.p. 172° (155).]

Behavior of C̄ with Organic Hydroxy Compounds

With Alcohols

General. Since C̄ is an aldehyde, it may be expected (at least with the assistance of a condensing agent such as dry HCl) to react with 1 mole of an alcohol to yield the corresponding hemiacetal, $CCl_3.CH(OH)R$, with 2 moles of an alcohol to give the corresponding acetal, $CCl_3.CH(OR)_2$, particularly since both these types of products are well known.

However, the special influence of the $-CCl_3$ group becomes apparent in this reaction and only the first type (hemiacetals) are usually obtained by direct condensation, the latter (acetals) being obtained indirectly. Moreover, members of the first group (hemiacetals) are formed with extreme ease (even in absence of condensing agents) so that, by analogy to the combination of chloral with water to give chloral hydrate (3:1270), they are generically designated as chloral alcoholates; e.g., chloral methylalcoholate, chloral ethylalcoholate, etc. Corresponding reaction of several molecules of chloral with multihydric alcohols can also occur as illustrated below.

The formation of these chloralalcoholates is profoundly influenced by conditions (especially the solvent (169)); furthermore, they readily dissociate into their original components on heating and, therefore, on heating in other alcohols (170) (171) or orthoformate esters of other alcohols (170) suffer reactions involving redistribution of the various alkyl radicals.

With monohydric alcohols. Although reaction of C̄ with all possible monohydric alcohols obviously cannot be included here, the following examples will serve to exemplify the reaction.

With methyl alcohol. [C̄ with MeOH (1:6120) (1 mole) gives (171) (172) (173) (174), trichloroacetaldehyde monomethylacetal (chloral methylalcoholate), hygroscopic ndls., m.p. abt. 50° (172), 38° (171), b.p. 116° (173), 106° (172), 98° (174) (corresp. carbamate, m.p. 121° (175)). — Note that trichloroacetaldehyde dimethylacetal, $CCl_3.CH(OCH_3)_2$ [Beil. I-621, I_1-(681)], b.p. 183.2° cor. (176), 68–69° at 10 mm. (177), is obtd. by indirect means; note incidentally that this acetal is isomeric with butyrchloral hydrate (3:1905) and with chloral ethylalcoholate (3:0860).]

With ethyl alcohol. [C̄ with EtOH (1:6130) gives trichloroacetaldehyde monoethylacetal (chloral ethylalcoholate) (3:0860), q.v. for details. For the corresp. acetal, viz., trichloroacetaldehyde diethylacetal, $CCl_3.CH(OC_2H_5)_2$, b.p. 204°, see its own text as 3:6317.

With n-propyl alcohol. [$\bar{C}$ with n-PrOH (1:6150) (178) (171) (170), or with NaO-n-Pr (179) or chloral hydrate (3:1270) with n-PrOH (1:6150) (170) gives (yields: 90% (178), 77–90% (170)) trichloroacetaldehyde n-propylhemiacetal (chloral n-propylalcoholate), liquid, b.p. 119–121° at 742.4 mm. (170), 120–122° (178), $D_4^{25.7}$ = 1.2996 (170), n_D^{25} = 1.4622. (Note that the corresp. trichloroacetaldehyde di-n-propylacetal is unreported.)]

With isopropyl alcohol. [$\bar{C}$ with iso-PrOH (1:6135) (178) (171) gives trichloroacetaldehyde isopropylhemiacetal (chloral isopropylalcoholate), m.p. 47° (178), 45° (171); b.p. 108° (178) (note that the corresp trichloroacetaldehyde di-isopropylacetal is unreported).]

With n-butyl alcohol. [$\bar{C}$ with n-BuOH (1:6180) gives (171) (179) (170) trichloroacetaldehyde n-butylhemiacetal (chloroal n-butylalcoholate) (3:0843), m.p. 49–50° (180), 49° (171) (170), b.p. 129–130° at 742 mm. (170) (note that corresp. trichloroacetaldehyde di-n-butylacetal is unreported).]

With isobutyl alcohol. [$\bar{C}$ with iso-BuOH (1:6165) gives (180) trichloroacetaldehyde isobutylhemiacetal (chloral isobutylalcoholate), liquid, b.p. 122° without decompn. (180); note that trichloroacetaldehyde di-isobutylacetal, b.p. 241.8° at 760 mm. (181), has been prepared indirectly).]

With sec-butyl alcohol. [$\bar{C}$ with butanol-2 (1:6155) gives (180) (171) trichloroacetaldehyde *sec*-butylhemiacetal (chloral *sec*-butylalcoholate), m.p. 12° (171), b.p. 120–121° (180), note that the corresp. trichloroacetaldehyde di-*sec*-butylacetal is unreported.]

With ter-butyl alcohol. [$\bar{C}$ with *ter*-butyl alc. (1:6140) gives (171) trichloroacetaldehyde *ter*-butylhemiacetal (chloral *ter*-butylalcoholate), m.p. 43° (171) (note that the corresp. trichloroacetaldehyde di-*ter*-butylacetal is unreported).]

With other monohydric alcohols. [For analogous formn. of hemiacetals from $\bar{C}$ with isoamyl alc. (1:6200) (180), with *ter*-AmOH (1:6160) (171), with allyl alc. (1:6145) (99), with n-octyl alc. (1:6255) (171), with benzyl alc. (1:6480) (171), with cinnamyl alc. (1:5920) (171), with methyl-neopentyl-carbinol (182), or with β,β,β-trichloro-*ter*-butyl alcohol ("Chloretone") (3:2662) (183) see indic. refs.]

With dihydric alcohols. *With ethylene glycol.* [$\bar{C}$ (1 mole) with ethylene glycol (1:6465) (1 mole) at 0° for 2 weeks gives (184) cf. (185) trichloroacetaldehyde (β-hydroxyethyl)-hemiacetal ("chloral ethyleneglycolate"), m.p. 50–51° (184), 42° (185); note that this product with conc. H_2SO_4 on stdg. or htg. loses 1 H_2O with ring closure to the cyclic acetal, 2-(trichloromethyl)-1,3-dioxolane, m.p. 40° (184). — However, $\bar{C}$ (2 moles) with ethylene glycol (1:6465) (1 mole) gives (186) cf. (185) ethylene glycol 1,2-*bis*-(β,β,β-trichloro-α-hydroxyethyl) ether, which on distn. at ord. press. also gives (186) the above 2-(trichloromethyl)-1,3-dioxolane, m.p. 42° (186).]

With polyhydric alcohols. *With glycerol.* [For behavior of $\bar{C}$ with glycerol (1:6540) see (186) (184).]

With erythritol. [For behavior of $\bar{C}$ with erythritol (1:5825) see (186).]

With various carbohydrates. $\bar{C}$ combines with various polyhydroxy compounds of the carbohydrate type to give products collectively designated as chloraloses. Such combinations can be effected with pentoses or hexoses, with various stereoisomers within any such group, and more than one molecule of chloral per mole of carbohydrate is sometimes involved. In the light of modern work these chloraloses are probably cyclic acetals. Although space cannot here be taken for an extensive record, the following comments will serve as starting points for further exploration.

The most important chloralose is that derived from d-glucose and often indexed as glucochloralose. Two forms of this compound are known, viz., α-glucochloralose and β-glucochloralose; for important studies of their structures see (187) (188). *For study of β-xylochloralose see* (189)

For important (but older) factual data on chloraloses see (190) (191) (192).

Behavior with Organic Acids

With Acids Containing No Other Functional Group

[For behavior of C̄ with AcOH in pres. of $AlCl_3$ see (153); with $Hg(OAc)_2$ + ethylene in alc. soln. giving a prod. possibly having the structure $CCl_3.CH(OC_2H_5)$ (OCH_2CH_2-HgOAc) see (215).]

[Note that C̄ is able to add to its carbonyl group a reactive H atom derived from certain acids [e.g., C̄ with malonic acid (1:0480) in AcOH at 100° for 40 hrs. (216) cf. (217), or in pyridine at 100° for 2 hrs. (67.5% yield (218)) cf. (219), or chloral hydrate (3:1270) + malonic acid (1:0480) + pyridine at 100° (220) gives (note loss of CO_2) γ,γ,γ-trichloro-β-hydroxy-*n*-butyric acid [Beil. III-310, III_1-(117), III_2-(221)], m.p. 118–119° (217) (218), 118.5° (216) (note hydrate, m.p. 52–54° (218)); note also that by further elimination of H_2O (e.g., with Ac_2O + NaOAc (217)) this prod. yields γ,γ,γ-trichlorocrotonic acid [Beil. II-418, II_1-(190), II_2-(397)], m.p. 113–114° (217).]

[Similarly, C̄ adds one of the α H atoms from succinic acid (1:0530): e.g., C̄ with disodium succinate + Ac_2O yields an intangible intermediate which suffers two types of further change, on one hand losing H_2O to give trichloromethylparaconic acid (β-carboxy-γ-trichloromethyl-γ-butyrolactone) [Beil. XVIII-372], and on the other suffering hydrolysis of its $-CCl_3$ group to give isocitric acid (α-hydroxypropane-α,β,γ-tricarboxylic acid) [Beil. III-555, III_2-(359)]; for details of execution of these reactions see (221).]

With α-Hydroxy Acids

Condensation of C̄ (or its hydrate) with acids containing an α-hydroxy group leads to the formation of products generically designated as "chloralides"; these are ether-esters comprising position-5 substitution products of the true parent 2-(trichloromethyl)-1,3-dioxolanone-4 (from α-hydroxyacetic acid) and are not to be confused with the specific compound "chloralide" (3:3510) obtd. from C̄ with H_2SO_4. With true chloralides above the initial parent, two geometrically isomeric forms are possible.

With α-hydroxyacetic acid. [C̄ with glycolic acid (1:0430) in s.t. at 120–130° for 2 days gives (224) 2-(trichloromethyl)-1,3-dioxolanone-4 ("glycolic acid chloralide") [Beil. XIX-103], m.p. 41–42°.]

(228), 70–71° (231), 59–60° (227); note that this disagreement of m.p.'s may be due to mixtures of possible *cis-trans* stereoisomers.]

With benzilic acid. [$\bar{C}$ with benzilic acid (1:0770) in s.t. at 160–165° for 5 hrs. gives (231) 2-(trichloromethyl)-5,5-diphenyl-1,3-dioxolanone-4 ("benzilic acid chloralide"), m.p. 70°. Note that an analogous prod. has been reported (232) from chloral hydrate (3:1270) with thiobenzilic acid, $(C_6H_5)_2C(SH)COOH$ in AcOH + HCl gas.]

With tartaric acid. [Since this acid is twice an α-hydroxy acid it reacts with 2 moles of $\bar{C}$ forming a dichloralide of compn. $C_8H_4O_6Cl_6$: e g., $\bar{C}$ with *d*-tartaric acid (1·0525) at 150° (224), or chloral hydrate (3:1270) with *d*-tartaric acid (1:0525) (227) (228) (229) (230) (231) or *d,l*-tartaric acid (1:0550) (227) (228) gives "tartaric acid dichloralide" [Beil. XIX-449], m.p. 213–215° (229); 164–166° (227), 161–162° (231), 161° (229), 160° (228), 159–161° (227); 128–130° (228), 122–124° (224), 116–118° (227). Note that this product should exist in three stereoisomeric forms (230), and the three groups of m.p.'s above given may represent this expectation]

With mucic acid. This acid combines with 3 moles of chloral hydrate to give a prod. commonly called a "trichloralide", note, however, that it is undoubtedly a dichloralide which has further condensed at its two free OH groups with a third molecule of chloral [e.g., chloral hydrate (3:1270) with mucic acid (1·0845) + H_2SO_4 gives (228) (229) a "trichloralide," m.p. 200–201° (228), 198° (229), 174–175° (229); doubtless these represent at least two stereoisomeric forms].

With Phenolic Acids (or Their Ethers)

In condensation of $\bar{C}$ (or its hydrate) with phenolic acids, the latter behave like carboxy-substituted phenols; two series of products result according to whether *one* or *two* moles of carboxy-phenol are involved per mole of chloral. To assist in recognizing this analogy, the several products are here named as substituted carbinols or ethanes just as was done above in the behavior of $\bar{C}$ with phenols (q.v.). Since the methyl ethers of these phenolic acids in general behave similarly, they are associated below with the corresponding phenolic acids.

With o-phenolic acids. *With o-hydroxybenzoic acid.* [Chloral hydrate (3:1270) with salicylic acid (1:0780) + conc. H_2SO_4 gives (233) cf. (234) some 1,1,1-trichloromethyl-(4-hydroxy-3-carboxyphenyl)-carbinol, m p. 180–182° (233), but main prod. is 1,1,1-trichloro-2,2-*bis*-(4-hydroxy-3-carboxyphenyl)ethane, m.p. 290–292° (corresp. diacetate, m.p. 207–209° (233)).]

With o-methoxybenzoic acid. [Chloral hydrate (3:1270) with *o*-methoxybenzoic acid (1:0685) + conc. H_2SO_4 gives (yields: 45% (234), 25% (235)) 1,1,1-trichloro-(4-methoxy-3-carboxyphenyl)-carbinol, m p. 224° (234), 216° (235), some sulfonation also occurring (235).]

With 2-hydroxy-3-methylbenzoic acid. [Chloral hydrate (3:1270) with *o*-cresotic acid [Beil. X-220, X_1-(96)] + conc. H_2SO_4 gives (236) 1,1,1-trichloro-2,2-*bis*-(4-hydroxy-3-methyl-5-carboxyphenyl)ethane, m.p. 283–285° (236): note that the *corresp. carbinol* to be expected from chloral hydrate + 1 mole *o*-cresotic acid is *unreported*.]

With 2-hydroxy-4-methylbenzoic acid. [Chloral hydrate (3:1270) with *m*-cresotic acid [Beil. X-233, X_1-(100)] is complex and disputed; for discussion see (236) (237) (238) (239). — For behavior of $\bar{C}$ with 2-methoxy-4-methylbenzoic acid see also (241).]

With 2-hydroxy-5-methylbenzoic acid. [Chloral hydrate (3:1270) with *p*-cresotic acid [Beil. X-227, X_1-(98)] + conc. H_2SO_4 gives (236) a prod. of compn. $C_{12}H_8O_4Cl_6$ (2,4-*bis*-(trichloromethyl)-6-methyl-1,3-benzdioxin-8-carboxylic acid), m.p. 285–286° dec., derived from 2 moles chloral hydrate + 1 mole *p*-cresotic acid.]

With 2-hydroxy-3-naphthoic acid. [For behavior of chloral hydrate (3:1270) with 2-hydroxy-3-naphthoic acid (1:0850) + conc. H_2SO_4 see (242).]

With *m*-phenolic acids (or their ethers). Condensation of $\bar{C}$ or its hydrate with *m*-phenolic acids leads generally to substituted phthalides.

With m-hydroxybenzoic acid. [Chloral hydrate (3:1270) with *m*-hydroxybenzoic acid (1:0825) + conc. H_2SO_4 gives (243) (244) 3-(trichloromethyl)-6-hydroxyphthalide [Beil. XVIII-20], m.p. 199–200° (244), 197–198° (243). — Note that chloral hydrate (3:1270) with ethyl *m*-methoxybenzoate (1:4131) + conc. H_2SO_4 gives (243) (245) 3-(trichloromethyl)-6-methoxyphthalide [Beil. XVIII-20], m.p. 135° (243) (245), which by alk. hydrol. of the —CCl_3 group gives (243) (245) 6-methoxyphthalide-3-carboxylic acid [Beil. XVIII-525], m.p. 170° (245), 169-170° (243).]

With 2-chloro-3-hydroxybenzoic acid. [Chloral hydrate (3:1270) with 2-chloro-3-hydroxybenzoic acid (3:4395) + conc. H_2SO_4 gives (246) 3-(trichloromethyl)-7-chloro-6-hydroxyphthalide, m.p. 195.5–196°.]

With 4-methyl-3-hydroxybenzoic acid. [Chloral hydrate (3:1270) with 4-methyl-3-hydroxybenzoic acid [Beil. X-237] + conc. H_2SO_4 gives (247) 3-(trichloromethyl)-5-methyl-6-hydroxyphthalide, m.p. 232° (247). — Similarly, chloral hydrate (3:1270) with 4-methyl-3-methoxybenzoic acid + conc. H_2SO_4 gives (247) 3-(trichloromethyl)-5-methyl-6-methoxyphthalide, m.p. 132° (247).]

With 3,4,5-trihydroxybenzoic acid. [Chloral hydrate (3:1270) with gallic acid (1:0875) + conc. H_2SO_4 gives (236) according to conditions three different products: with excess of gallic acid prod. is 3-(trichloromethyl)-4,5,6-trihydroxyphthalide, m.p. 210–212° (236), for further reactions of which see (236) (248); with excess chloral, however, the reaction gives two other materials (236). — Note that chloral hydrate (3:1270) with 3,4,5-trimethoxybenzoic acid (gallic acid trimethyl ether) [Beil. X-481, X_1-(240)] + conc. H_2SO_4 (249) (250) (251), or with methyl 3,4,5-trimethoxybenzoate (methyl gallate trimethyl ether) [Beil. X-484, X_1-(242)] (252), gives (56% yield (249)) 3-(trichloromethyl)-4,5,6-trimethoxyphthalide [Beil. $XVIII_1$-(389)], m.p. 76–77° (249), 71–72° (250), 70–71° (252) (note also that during condensation some demethylation may occur (253), avoided by (251)); this prod. by hydrolysis of the trichloromethyl group yields 4,5,6-trimethoxyphthalide-3-carboxylic acid [Beil. $XVIII_1$-(544)], m.p. 147–149° (249), 147–148° (250), 147° (251), 146–149° (254), 142–143° (252).]

With *p*-phenolic acids (or their ethers). *With p-hydroxybenzoic acid.* [Chloral hydrate (3:1270) (3 moles) with *p*-hydroxybenzoic acid (1:0840) (1 mole) + conc. H_2SO_4 at room temp. for 3 days condenses giving (31% yield on the acid (255)) 2,4-*bis*-(trichloromethyl)benzodioxin-1,3-carboxylic acid-6, m.p. 225.5–226.5° (255); for further related reactions of this prod. see (256); for further generally similar work in benzodioxin series see (257) (258); note that neither the substituted carbinol nor the substituted ethane corresp. to the behavior of *o*-hydroxybenzoic acid (see above) under similar conditions is reported.]

With p-methoxybenzoic acid. [Chloral hydrate (3:1270) with *p*-anisic acid (1:0805) + conc. H_2SO_4 reacts in a 1:1 ratio (note difference from 2:1 ratio in preceding paragraph) giving (259) cf. (235) trichloromethyl-(2-methoxy-5-carboxyphenyl)-carbinol, m.p. 198–199° (259); note that the earlier product (235) was impure.]

With 4-hydroxy-3,5-dimethoxybenzoic acid. [Chloral hydrate (3:1270) with syringic acid (1:0830) + conc. H_2SO_4 gives (86% yield (253)) 3-(trichloromethyl)-5-hydroxy-4,6-dimethoxyphthalide, m.p. 172–173° (253).]

With keto acids (see also below under behavior with esters of organic acids).

With levulinic acid. [$\bar{C}$ (1 mole) with β-acetopropionic acid (levulinic acid) (1:0405)

(312) (corresp. acetate, b.p. 156–157° at 685 mm.; corresp. benzoate m. (312)), but whether the material still unaccounted for represents (3:5775) from reduction of C̄ has not been reported.]

with n-BuMgBr in ether gives (34–36% yield (312)) the carbinol ,1-trichlorohexanol-2 [Beil. I_2-(438)], b.p. 108° at 673 mm., D_{20} = etate, b.p 157–158° at 684 mm.; corresp. benzoate, b.p. 182–183° whether the material still unaccounted for represents 2,2,2-trichloro- reduction of C̄ has never been reported.]

X *cpds* [C̄ with n-AmMgBr (313) or with n-HexMgBr (313) in ectively 50–61% and 56–69%) the reduction product, 2,2,2-tri-); the corresponding carbinols to be expected by addition are

compounds. *With C_6H_5MgX.* [C̄ with C_6H_5MgBr in ether)) (315) the expected trichloromethyl-phenyl-carbinol [Beil. 37° (155), b.p 145° at 15 mm. (155) (corresp. acetate, m p. 87.5° m p. 97.5° (155); corresp. p-nitrobenzoate, m.p. 109° (156)).]

npounds. *With $C_6H_5CH_2MgX$ cpds.* [C̄ with $C_6H_5CH_2MgCl$ IgBr (166) gives both addition (309) (310) (166) and reduction ormer trichloromethyl-benzyl-carbinol, b p. 158–160° at 18 mm. p. 110–111° (166), 109–110° (309)), together with a very small hloroethanol-1 (3:5775).]

ds. [C̄ with cyclohexyl MgBr (314) (316) in ether is claimed trichloromethyl-cyclohexyl-carbinol, b p. 119–121° at 15 mm., 0 (*corresp. acetate, b p. 173° at 680 mm., corresp. benzoate,* nd also (42% yield (314)) 2,2,2-trichloroethanol-1 (3:5775).]

[For behavior of C̄ with the RMgX cpds. from β-phenylethyl omide, and δ-phenylbutyl bromide where the reaction appears see (317).]

EHAVIOR WITH HCN (OR ITS SALTS)

with strong aq. HCN refluxed several days (318) or chloral 0–12% HCN (319) (320) or with aq. 15% HCN in s.t. at 100° s (71% yield (321)) β,β,β-trichloro-α-hydroxypropionitrile = al cyanohydrin [Beil. III-288, III_1-(111), III_2-(210)], m.p. orresp. benzoate, m.p. 40–41° (323)); this prod. upon partial gives (324) trichlorolactamide [Beil. III-288, III_1-(111),), or on complete hydrolysis with conc. HCl (321) (318) (320) l. III-286, III_1-(111), III_2-(210)], very sol. aq., but cryst. 21).]

ith MeOH/KCN gives within 1 min. (84% yield (131)) 5); C̄ with EtOH/KCN similarly gives (88% yield (131))); C̄ with n-propyl alc./KCN similarly gives (70% yield te (3:6000); for extensive discussion of this reaction see

f chloral hydrate (3:1270) with KCN in C_6H_6 see (326): 70) with NaCN + $CaCO_3$ as directed (328) is an important d) of dichloroacetic acid (3:6208) q.v.: note also that H_4OH + KCN in ether as directed (329) gives (65–78% nder the acid (3:6208).]

Behavior with Diazomethane

[$\bar{C}$ (309) (330) (331) or chloral hydrate (3:1270) (332) gives (yields: 64% (330), 48% (309), 47.5% (332)) 3,3,3-trichloro-1,2-epoxypropane (3:5760) q.v.]

Behavior with Amines

With primary aromatic amines. *With aniline.* [$\bar{C}$ with aniline (333) (334), or chloral hydrate (3:1270) with aniline in aq. (334), gives 1,1,1-trichloro-2,2-dianilinoethane (β,β,β-trichloroethylidene)di-aniline [Beil. XII-187, XII_1-(168)], pr. from ether/alc., m.p. 107–108° (335), 107.5° (334), 100–101° (333). — Note that the addition product to be expected from 1 mole $\bar{C}$ with 1 mole aniline has not itself been isolated (except as a molecular compound with chloral hydrate (336)) since it appears to react immediately with a second mole of aniline to give the above-indicated prod.]

With aniline + hydroxylamine. [Chloral hydrate (3:1270) (1 mole) with aniline (1 mole) + $NH_2OH.HCl$ (3 moles) + HCl + Na_2SO_4 in aq. soln. as directed gives (80–91% yield (337)) cf. (338) (339) isonitrosoacetanilide [Beil. XII_1-(275)], m.p. 175° dec. (337) (338) (339). — Note that this product with conc. H_2SO_4 (337) (340) gives (71–78% yield (337)) indigo; for extension of the method to use of other amines (and ultimately substituted indigos) see (338) (341) (345).]

With other primary aromatic amines. The condensation of $\bar{C}$ or of chloral hydrate (3:1270) with many other primary aromatic amines and diamines has been studied but cannot be detailed here [for extensive review and discussion see (336) (334) (335) (342) (343) (344) (403)].

With secondary aromatic amines. *With N-alkylanilines.* [Chloral hydrate (3:1270) with *N*-methylaniline on warming gives (346) trichloromethyl-(*p*-methylaminophenyl)-carbinol [Beil. XIII-628], m.p. 112° dec.; similarly, chloral hydrate (3:1270) with *N*-ethylaniline on warming gives (346) trichloromethyl-(*p*-ethylaminophenyl)-carbinol [Beil. XIII-628], m.p. 98°.]

With N-alkyl-o-toluidines. [Chloral hydrate (3:1270) with *N*-methyl-*o*-toluidine + $ZnCl_2$ gives (347) trichloromethyl-(4-methylamino-3-methylphenyl)-carbinol, m.p. 104–105°; similarly, chloral hydrate (3:1270) with *N*-ethyl-*o*-toluidine + $ZnCl_2$ gives (349) trichloromethyl-(4-ethylamino-3-methylphenyl)-carbinol, m.p. 107° (for studies of nitration (348) and bromination (349) of these two products see indic. refs.).]

With tertiary aromatic amines. *With N,N-dialkylanilines.* [$\bar{C}$ with *N*,*N*-dimethylaniline in phenol at room temp. (350) or chloral hydrate with *N*,*N*-dimethylaniline + $ZnCl_2$ on stdg. (351) (352) gives trichloromethyl-(*p*-dimethylaminophenyl)-carbinol [Beil. XIII-628], m.p. 111° dec. (352) (corresp. carbinyl acetate, m.p. 84–85° (352)) (for study of nitration of this prod. see (348)).]

Behavior with Arylhydrazines

With phenylhydrazine. [$\bar{C}$ with phenylhydrazine or chloral hydrate (3:1270) with aq. phenylhydrazine salts reacts (353) vigorously, but the products formed have not been unambiguously characterized (see also below).]

With *p*-nitrophenylhydrazine. [Chloral hydrate (3:1270) (large excess) with *p*-nitrophenylhydrazine in AcOH at 100° for 10 min. undergoes a series of reactions resulting (354) in a chlorine-free prod., m.p. 228°, regarded (354) as 1-(*p*-nitrophenyl)-3,5-dihydroxypyrazolone-4-(*p*-nitrophenylhydrazone).]

With 2,4-dinitrophenylhydrazine. [Chloral hydrate (3:1270) with 2,4-dinitrophenylhydrazine gives according to conditions either or both (355) glyoxylic acid *p*-nitrophenyl-

hydrazone, dihydrate from aq., m.p. 191° (355); anhydrous, m.p. 194–195° (355), 190° (356), or chloroglyoxal *bis*-(2,4-dinitrophenylhydrazone), m.p. 278° (355).]

With various halogenated hydrazines. Owing to the violence with which the product initially formed decomposes, the behavior of Č with phenylhydrazine (see also above) has been little studied. With halogenated phenylhydrazines the decomposition is more moderate and has been extensively examined. The nature of the products has been found to depend mainly upon the solvent medium: thus in alcohols the principal product is the corresponding substituted phenylhydrazone of the appropriate alkyl glyoxylate; in water or AcOH, however, loss of both H_2O and HCl occurs leading to formation of the corresponding α,α-dichloro-β-arylazoethylenes.

[Chloral hydrate (1 mole) (3:1270) with 2,4-dichlorophenylhydrazine in ethyl alc. at 60° gives (100% yield (357)) ethyl glyoxylate 2,4-dichlorophenylhydrazone, yellow pr., m.p. 121.5°, note that other alcs. (357) give corresp. esters. — However, chloral hydrate (1 mole) (3:1270) with 2,4-dichlorophenylhydrazine (1 mole) in AcOH at 80° (or in presence of NaOAc at 60°) gives (357) α,α-dichloro-β-(2,4-dichlorobenzeneazo)ethylene, red pr. from alc., m.p. 84.5°.]

[For completely analogous behavior of chloral hydrate (3:1270) with other halogenated phenylhydrazines, such as 2,5-dichlorophenylhydrazine (358), 2,4,5-trichlorophenylhydrazine (358), 2,4,6-trichlorophenylhydrazine (359), 2,4,6-tribromophenylhydrazine (359), 3-bromo-4-methylphenylhydrazine (360), or 3,5-dibromo-4-methylphenylhydrazine (360), see indic. refs. — Note that a generally analogous behavior toward halogenated arylhydrazines is shown by butyrchloral (3:5910) q.v. and by tribromoacetaldehyde (bromal).]

Behavior with Amides

Č with compounds of the amide type readily undergoes an addition reaction leading to products of the general form CCl_3 CH(OH).NH.CO.R.

With Aliphatic Monamides

With formamide. [Č (1 mole) with formamide (1 mole) on stdg. gives (361) (362) an addition prod., chloralformamide, CCl_3 CH(OH).NH.CHO [Beil. II-27, II_1-(21), II_2-(37)], m.p. 124–126° (363), 118° (362), 115–116° (361); note that this product has in the literature often been confused with the isomeric β,β,β-trichloroethyl carbamate, CCl_3.-CH_2O.CO.NH_2 ("Voluntal") [see also under β,β,β-trichloroethyl alcohol (3:5775)] Note also that chloralformamide with aq. NaOH + Ac_2O (362) or with aq. NaOH + BzCl (364) cf. (362) undergoes bimolecular condensation with loss of H_2O giving anhydrochloralformamide [CCl_3.CH(NH.CHO)$]_2$O, m.p. 194.5–195° (362), 193° (364).]

With acetamide. [Č (1 mole) with acetamide (1 mole) (72) (172), or chloral hydrate (3:1270) (1 mole) with acetamide (1 mole), or chloralammonia with AcCl or Ac_2O (128) gives chloralacetamide [Beil. II-179, II_1-(81)], m.p. 158–159° (362), 158° (172), 156°–157° (72), 156° (128); this prod. with aq. NaOH + Ac_2O undergoes bimolecular loss of aq. yielding (362) cf (369) anhydrochloralacetamide, [CCl_3 CH(NH.CO.CH_3)$]_2$O, m.p. 212–213° (362), 207° (364). — For study of reduction of chloralacetamide see (365) (366).]

With higher monoamides. [For analogous condensation of Č with propionamide, isobutyramide, *n*-valeramide, *n*-caproamide, *n*-caprylamide, and phenylacetamide together with study of reduction of the several products see (367) cf. (369).]

With Aromatic Monoamides

With benzamide. [Č (1 mole) with benzamide (1 mole) (172) (362) cf. (369), or chloral hydrate (3:1270) with benzonitrile + dry HCl (368) gives chloralbenzamide [Beil. IX-

209, IX_1-(101)], m.p. 150–151° (72), 150° (362), 146° (172) (368); this product with aq NaOH + BzCl or Ac_2O gives (362) by dehydrative bimolecular condensation anhydrochloralbenzamide, known (362) in two forms, higher-melting form, m.p. 199–200°, and lower-melting form, m.p. 137–138°. — For study of reduction of chloralbenzamide see (366) cf. (369).]

With toluamides. [For condensation of $\bar{C}$ with *o*-, *m*-, and *p*-toluamides see (370); for the behavior of the products with PCl_5 see (371).]

With salicylamide. [$\bar{C}$ with salicylamide on warming directly (372) or in $CHCl_3$ (373) gives chloralsalicylamide, sintering at 117° and melting about 10° higher (372); for the corresp. anhydro compound (cf. above), m.p. 174–175°, see (369); for studies of chloralsalicylamide on chlorination (374), bromination (375), or nitration (375) see indic. refs.]

With amides of various substituted salicylic acids. [For behavior of $\bar{C}$ with the amides of 3-chlorosalicylic acid (3:4745), 5-chlorosalicylic acid (3:4705), and 3,5-dichlorosalicylic acid (3:4935) see (374) (376) (377); for behavior of $\bar{C}$ with amides of various nitrosalicylic acids (378) or various aminosalicylic acids (379) see indic. refs.]

With *o*-aminobenzamide (anthranilamide). [For behavior of $\bar{C}$ with anthranilamide and its relatives see (380).]

With Amides of Dibasic Acids

Note that two series of products are formed.

With urea. [Chloral hydrate (3:1270) (1 mole) with urea (2 moles) in aq. soln. on stdg. 3 days at room temp. gives (66% yield (381)) (382) cf. (172) chloralurea, *N*-(β,β,β-trichloro-α-hydroxyethyl)urea [Beil. III-59, III_1-(27)], cryst. from $MeOH/C_6H_6$ (381) or $EtOH/C_6H_6$ 1:3 (382), m.p. 150° dec. (381) (382). — However, chloral hydrate (3:1270) (2 moles) with urea (1 mole) in aq. HCl at room temp. for 3 days gives (71% yield (381)) (382) cf. (383) dichloralurea [Beil. III-60, III_1-(27), III_2-(49)], cryst. from aq. alc., m.p. 196° (381), 194° dec. (382), 190° (172).]

With thiourea. [For behavior of $\bar{C}$ with thiourea see (383).]

With various substituted ureas. *With monosubstituted ureas.* [Chloral hydrate (3:1270) (2 moles) with *N*-methylurea (1 mole) in aq. soln. at room temp. gives (384) *N*-methyl-*N'*-(β,β,β-trichloro-α-hydroxyethyl) urea, m.p. 140° dec. (384). — Chloral hydrate (3:1270) with *N*-ethylurea behaves in analogous fashion (384). — Chloral hydrate (3:1270) (2½ moles) with *N*-phenylurea in aq. HCl gives (84% yield (382)) *N*-phenyl-*N'*-(β,β,β-trichloro-α-hydroxyethyl)urea, m.p. 142° dec. (382). — For corresp. behavior of chloral hydrate (3:1270) with *N*-*o*-tolylurea, *N*-*p*-tolylurea, *N*-*m*-nitrophenylurea, and *N*-*p*-nitrophenylurea see (385).]

With disubstituted ureas. [Chloral hydrate (3:1270) with *N,N*-dimethylurea gives (384) cf. (386) *N,N*-dimethyl-*N'*-(β,β,β-trichloro-α-hydroxyethyl)urea, cryst. from aq as monohydrate, m.p. 74° dec. (384) (386), which becomes anhydrous on stdg., cryst. from alc., m.p. 157° dec. (384), 156° (386). — For analogous behavior of $\bar{C}$ with *N,N*-diethylurea giving prod., m.p. 146° dec. (384), 142° (386), see indic. refs. — $\bar{C}$ with *N,N*-diphenylurea gives analogous prod., m.p. 170° dec. (384).]

With amides of other dibasic acids. [For generally analogous behavior of $\bar{C}$ with oxamide (384), malonamide (384) (369), succinamide (369), and their relatives see indic. refs.]

With Urethanes

With ethyl carbamate. [$\bar{C}$ with ethyl carbamate ("urethane") in conc. HCl gives (387) (388) ethyl *N*-(β,β,β-trichloro-α-hydroxyethyl)carbamate ("chloralurethane") [Beil. III-24, III_1-(12), III_2-(22)], m.p. 103° (362) (388). — This product on htg. alone or

in aq. at 100° regenerates (388) chloral and ethyl carbamate. — With AcCl under reflux it gives (80% yield (387)) the corresp. acetate, m.p. 47–49°, b.p. 165° at 15 mm. (387). — With aq. NaOH + Ac_2O (362) (387) or with aq. KOH + BzCl (364) chloralurethane undergoes dehydrative bimolecular condensation yielding anhydro-chloralurethane [Beil. III_1-12], which exists in both high-melting (161–162°) and low-melting (149–150°) forms (362).]

With other alkyl carbamates. [For generally analogous behavior of $\bar{C}$ with methyl carbamate (362), *n*-propyl carbamate (389), isobutyl carbamate (389), isoamyl carbamate (362), and menthyl carbamate (362) see indic. refs.]

Ⓟ Preliminary tests for $\bar{C}$: Owing to the length of the text of this compound, a brief summary of the tests most significant as preliminary indications is given here; for details refer back as indicated and also see chloral hydrate (3:1270).

$\bar{C}$ reduces $NH_3/AgNO_3$ and Fehling's soln. but only on warming (see above under oxidn of $\bar{C}$). — $\bar{C}$ gives fuchsin-aldehyde test with Schiff's reagent (but chloral hydrate (3 1270) does not). — $\bar{C}$ with conc. H_2SO_4 readily polymerizes (see above under polymerization of $\bar{C}$). — $\bar{C}$ with aq. or alc. alkali on warming undergoes hydrolytic cleavage to $CHCl_3$ (3·5050) + alkali formate (see above under behavior of $\bar{C}$ with alkalies); therefore, $\bar{C}$ with alc. alkali + aniline gives characteristic odor of phenyl isocyanide.

—— **Trichloroacetaldioxime:** m.p. 56° (135). [See above under behavior of $\bar{C}$ with hydroxylamine.]

—— **Trichloroacetaldehyde phenylhydrazone:** unreported. [See above under behavior of $\bar{C}$ with arylhydrazines.]

—— **Trichloroacetaldehyde *p*-nitrophenylhydrazone:** unreported. [See above under behavior of $\bar{C}$ with arylhydrazines]

—— **Trichloroacetaldehyde 2,4-dinitrophenylhydrazone:** a prod. of m.p. 131° has been claimed (390) but could not be confirmed (391). [See also above under behavior of $\bar{C}$ with arylhydrazines.]

—— **Trichloroacetaldehyde semicarbazone:** unreported. [Note that chloral hydrate (3:1270) with semicarbazide in aq. (392) (394) cf. (393) or chloral ethylalcoholate (3:0860) with semicarbazide in alc. (392) gives an addn. prod., m p. 90°, which on boilg. with aq. yields (392) glyoxylic acid semicarbazone [Beil. III-600, III_1-(209) III_2-(389)], m.p. 235–236° (392), 235–238° (393), 207° (395), 206–208° dec. (396), 202–203° (397), 202° dec. (394) (note that these results may represent two stereoisomeric forms (397)).]

$D_4^{20} = 1.1829$ (1)

$n_D^{20} = 1.4890$ (1)

[For prepn. of C̄ (86% yield (1)) from 1,2,3-trichlorobutene-3 (2,3,4-trichlorobutene-1) (3:9064) with excess MeOH/KOH at 10–15° see (1) (2); for formn. (together with other products) from 1,2,3,4-tetrachlorobutane (3:1760) with MeOH/KOH at 10–18° see (1) (2); from chloroprene (3:7080) by addn. of ICl followed by treatment with alc. KOH (3).]

C̄ polymerizes completely within 24 hrs. at room temp., in about 40 min. at 85–90°; this is about 10 times as fast as chloroprene (3:7080) and 7000 times as fast as isoprene (1:8020). The polymer is a white opaque tough hard mass, non-plastic and lacking extensibility. It is insol. in and separates from liquid C̄ but is partly soluble in $CHCl_3$ (1). The polymerization is inhibited by hydroquinone and accelerated by benzoyl peroxide (2).

C̄ does *not* (1) react with maleic anhydride (1:0625) or with 1,4-naphthoquinone (1:9040).

Case (to d
du Pont), U.S. 2. (2)
41, 1101 (1932) Arkel,

[For prepn. of $\bar{C}$ from chloroacetic acid (3:1370) with PCl_3 (5) (40), or in HCl atm. under press. at 150° (6), or with $ZnCl_2$ (67% yield (7)) see indic. refs.; with P_2O_5 + HCl gas at 200° see (8); with $SOCl_2$ (yields: 95% (9), 55% (10), 50% (7)) (11) see indic. refs.; with benzoyl chloride (3:6240) (yield 71–76%) see (12); with oxalyl dichloride (3:5060) (80% yield) see (3); with phosgene (3:5000) over activated carbon at 200° see (13); with benzotrichloride (3:6540) + $ZnCl_2$ at 80–90° (80% yield) see (14); with Cl_2 + S_2Cl_2 (95% yield (15)) or Cl_2 + lower chlorides of sulfur + $FeCl_3$, $SnCl_4$, etc., at 50–60° (82% yield (16)) see indic. refs.]

[For prepn. of $\bar{C}$ from chloroacetic acid anhydride (3:0730) with oxalyl dichloride (3:5060) see (3); from ketene with NOCl see (17); from α,β-dichlorovinyl ethyl ether (3:5540) + HCl gas see (18); from α,β-dichloroethylene + O_2 in pres. of Br_2 or conc. H_2SO_4 see (19); from acetyl chloride (3:7065) with Cl_2 in sunlight (20) or in CCl_4 in u.v. light (21) or in pres. of I_2 (22) see indic. refs.; from α-chloroethyl chloroacetate on htg. with 0.02% $ZnCl_2$ see (23); from 2-(chloroacetoxy)hexene-1 with HCl gas see (24), from CH_2Cl_2 (3:5020) + $AlCl_3$ + CO gas at 200° and 900 atm. see (41).]

$\bar{C}$ on htg. with Na_2CO_3 (25) or with KNO_3 (81% yield (26)) gives chloroacetic acid anhydride (3:0730) q.v., m.p. 46°. — $\bar{C}$ treated at −5° with HI gas gives (68% yield (27)) chloroacetyl iodide, b.p. 36.5° at 4 mm. (27). [For behavior of $\bar{C}$ with HBr gas see (40).]

$\bar{C}$ with MeOH yields (28) methyl chloroacetate (3:5585), b.p. 131°; $\bar{C}$ with EtOH (29) or with triethyl orthoformate (1:3241) at 100–110° (90% yield (30)) gives ethyl chloroacetate (3:5700), b.p. 144°.

[$\bar{C}$ with ethylene + $AlCl_3$ gives (small yield (31)) 1,4-dichlorobutanone-2, b.p. 63–65° at 3 mm. (31). — $\bar{C}$ with C_6H_6 + $AlCl_3$ gives (32) ω-chloroacetophenone (phenacyl chloride) (3:1212); $\bar{C}$ with m-dichlorobenzene (3:5960) + $AlCl_3$ gives (33) 2,4-dichlorophenacyl chloride [Beil. VII-283], m.p. 57° (33); $\bar{C}$ with biphenyl + $AlCl_3$ gives (77% yield (34)) p-phenylphenacyl chloride (3:3934), m.p. 122–123° (34); $\bar{C}$ with naphthalene + $AlCl_3$ in CS_2 gives (35) cf. (36) chloromethyl β-naphthyl ketone.]

[$\bar{C}$ with large excess (4 moles) MeMgBr or MeMgI gives (48–51% yield (37)) (38) 2-methylbutanol-3 (1:6170); $\bar{C}$ with large excess C_6H_5MgBr in ether gives (31% yield (39)) 1,2,2-triphenylethanol-1 [Beil. VI-721], m.p. 87.5–88.5° (39); note that the isomeric 1,1,2-triphenylethanol-1 [Beil. VI_1-(354)] has almost same m.p., viz., 89°.]

$\bar{C}$ hydrolyzes with aq. yielding chloroacetic acid (3:1370) q.v. — For the amide, anilide, p-toluidide, and other derivs. corresp. to $\bar{C}$ see chloroacetic acid (3:1370).

See also text.

[*See also dichloromethyl chloroformate* (3:5315).]

Colorless lachrymatory oil. — Note that C̄ cannot by distillation be completely separated from dichloromethyl chloroformate (3:5315); the constants listed above are on samples contg. (1) about 9% of the latter, or (3) about 7% of dichloromethyl chloroformate + 2% dimethyl carbonate.

A mixt. of C̄ with dichloromethyl chloroformate (3:5315) has been employed as a chem. warfare agent under the names "K-Stoff," "Palite" (6). — [For studies of physiological action see (4) (5); for action on plant tissue see (7).]

[For prepn. of C̄ from methyl chloroformate (3:5075) or from methyl formate (1:1000) with Cl_2 under various conditions see (1) (2) cf. (6) (8) (9).]

C̄ with aq. at ord. temp. or more rapidly on boilg. or C̄ with aq. alk. in cold undergoes hydrolysis (1) yielding formaldehyde (1:0145) + 2 HCl + CO_2; by detn. via oxidn. with I_2 + NaOH of the formaldehyde so produced C̄ may be quant. estimated cf. (10) (6); note also that this hydrolysis to formaldehyde distinguishes C̄ from various other closely related compounds, e.g., methyl chloroformate (3:5075), dichloromethyl chloroformate (3:5315), trichloromethyl chloroformate ("Diphosgene") (3:5515), trichloromethyl trichloroacetate (3:0290), *bis*-(trichloromethyl) carbonate ("Triphosgene") (3:1915), or phosgene (3:5000).

C̄ (1 mole) with NaI (2 moles) in dry acetone at 20° (11) liberates I_2 also yielding formaldehyde (1:0145) + CO, but the reaction is *not* quantitative proceeding only to about 70% theoretical (11); but C̄ with dry NaI at 90–100° gives (1) CO + CO_2. Note that C̄ with LiBr in dry acetone does *not* (11) liberate bromine; in this respect C̄ is like methyl chloroformate (3:5075) but different from dichloromethyl chloroformate (3:5315) and trichloromethyl chloroformate ("Diphosgene") (3:5515).

[C̄ with $FeCl_3$ or $AlCl_3$ dec. rapidly at 70° (1) (12) yielding phosgene (3:5000) and formaldehyde (1:0145).]

[C̄ with methyl hydrogen sulfate gives (13) methyl chlorosulfonate, formaldehyde, CO_2 + HCl; C̄ with chlorosulfonic acid at 100° for 4 hrs. gives (13) chloromethyl chlorosulfonate + CO_2 + HCl; C̄ with dimethyl sulfate gives (78% yield (13)) methyl chlorosulfonate.]

[C̄ with alcohols or C̄ with alkali salts of phenols reacts as an acid chlorine yielding (6) the corresp. alkyl or aryl chloromethyl carbonates (1).]

[C̄ with K phenylcyanamide also reacts as an acid chloride giving (14) chloromethyl *N*-cyano-*N*-phenylcarbamate, m.p. 48°.]

3:5275 (1) Kling, Florentin, Lassieur, Schmutz, *Compt. rend.* **169**, 1046–1047 (1919); *Ann. chim.* (9) **13**, 44–59 (1920). (2) Grignard, Rivat, Urbain, *Compt. rend.* **169**, 1074–1077 (1919); *Ann. chim.* (9) **13**, 246–248 (1920). (3) Herbst, *Kolloidchem. Beihefte*, **23**, 330–331 (1927). (4) van Nieuwenberg, *Chem. Weekblad* **19**, 328 (1922). (5) Fegler, *Compt. rend. soc. biol.* **100**, 222–224

[For use as soil disinfectant of the mixt. of C̄ with 1,2-dichloropropene obtd. in manufacture of allyl chloride by chlorination of propylene see (15); for use of C̄ in prepn. of cellulose ethers see (16).]

Reactions involving unsaturated linkage of C̄. [C̄ with Cl_2 adds 1 mole halogen yielding (14) 1,1,2,3-tetrachloropropane (3:6035), b.p. 179–180° cor. at 756.6 mm. (14).] — C̄ with Br_2 adds 1 mole halogen giving (72.7% yield (9)) (5) (3) (17) 1,2-dibromo-1,3-dichloropropane [Beil. I-112], b.p. 212° (3), 215–217° (9), 220–221° (17), 220–225° (5).

[C̄ with fumg. HCl in s.t. at 150° blackens but does not add HCl (5).]

Reactions involving the one reactive chlorine atom of C̄. Note that the 2 chlorine atoms in C̄ possess very different reactivities; that attached to the carbon directly connected with the double bond is inert, while the chlorine attached to the carbon in β-relationship to the unsaturated linkage is extremely reactive.

[C̄ with aq. KOH (1 mole) boiled for 30 hrs. (14), or boiled with 10% aq. Na_2CO_3 (slight excess) for 2 hrs. (1), or shaken with aq. silver oxide at room temp. for 24 hrs. (small yield (12)) gives 3-chloropropen-2-ol-1 (1-chloropropen-1-ol-3) (γ-chloroallyl alcohol) (3:5820); note that the high-boilg. stereoisomer of C̄ gives (76% yield (1)) the high-boilg. stereoisomer of the resultant alc., while the low-boilg. stereoisomer of C̄ gives (81% yield (1)) the low-boilg. stereoisomer of the resultant alc.; note also that aq. NaOH effects from the resultant γ-chloroallyl alc. the removal of HCl and also causes polymerization (1) so that use of hydrolytic conditions as mild as possible is desirable.] — [For reactn. of C̄ with NaSH or Na_2S see (18).]

[C̄ with Na alcoholates, NaOR, replaces the reactive chlorine atom by the alkoxy residue yielding ω-chloroallyl alkyl ethers of general formula RO—CH_2—CH=CHCl: e.g., C̄ with NaOMe refluxed 4 hrs. gives (12) 1-chloro-3-methoxypropene-1, b.p. 107–108°, $D^{27}_{-} = 1.032$, $n^{27}_{-} = 1.431$ (12) (note proximity of b.p. to that of ord. C̄) (for study of kinetics of this reactn. see (19)); C̄ with NaOEt refluxed for 4 hrs. (12) or C̄ with alc. KOH (5) yields 1-chloro-3-ethoxypropene-1 [Beil. I-439], b.p. 126–127°, $D^{16}_{-} = 1.018$, $n^{16}_{-} = 1.438$ (12); for corresp. reactns. of C̄ with Na derivs. of benzyl alc. (1:6480), β-phenylethyl alc. (1:6505), γ-phenyl-*n*-propyl alc. (1:6520), and cinnamyl alc. (1:5920) together with physical consts. of prods. see (20).]

[C̄ with alkali metal phenolates replaces the reactive chlorine atom by the aryloxy residue yielding ω-chloroallyl aryl ethers of general formula $RO.CH_2.CH=CHCl$: e.g., C̄ with Na phenolate in abs. alc. refluxed ½ hr. (21), or C̄ with phenol (1:1420) + dry K_2CO_3 in boilg. acetone (8), gives (yields: 75% (21), 72% (8)) ω-chloroallyl phenyl ether, b.p. 120–121° at 20 mm. (21), 122–127° at 27 mm. (8), $D^{15}_{4} = 1.146$ (21), $n^{20}_{D} = 1.5421$ (8), $n^{15}_{D} = 1.5447$ (21); for corresp. reactn. with salts of *o*-cresol (1:1400) (21), *m*-cresol (1:1730) (21), *p*-cresol (1:1410) (21) (8), carvacrol (1:1760) (21), thymol (1:1430) (21), β-naphthol (1:1540) (21), hydroquinone (1:1590) (21), and several other phenols (21) see indic. refs. — Note that these ω-chloroallyl aryl ethers upon treatment with Br_2 do *not* add halogen to the unsatd. linkage but instead undergo cleavage: e.g., ω-chloroallyl phenyl ether (above) in $CHCl_3$ with Br_2 (1 mole) at 0° yields (22) phenol (1:1420) + *p*-bromophenol + 3-bromo-1-chloropropene-1 (see below) + ω-chloroallyl *p*-bromophenyl ether, b.p. 153° at 13 mm., $D^{11}_{4} = 1.521$, $n^{11}_{D} = 1.5785$ (22). — Note furthermore that these ω-chloroallyl aryl ethers with HBr or HI do *not* add hydrogen halide to the unsaturated side chain but instead undergo cleavage similar to that with halogens: e g., ω-chloroallyl phenyl ether in AcOH with HBr gas (1 mole) gives (70% yield (23)) 3-bromo-1-chloropropene-1, lachrymatory oil, b.p. 130° at 760 mm., $D^{9.5}_{4} = 1.670$, $n^{9.5}_{D} = 1.5255$ (23); similarly action of HI yields (23) 1-chloro-3-iodopropene-1, lachrymatory oil, b.p. 162° at 760 mm. sl. dec., 58° at 19 mm., $D^{9.5}_{4} = 2.029$, $n^{9.5}_{D} = 1.5993$ (23).]

[C̄ with phenols under suitable conditions can also react to effect direct nuclear alkenyla-

tion: e.g., $\bar{C}$ with phenol (1:1420) + Na in C_6H_6 refluxed for 17 hrs. gives (17% yield (8)) o-(γ-chloroallyl)phenol, b.p. 151–156° at 31 mm., $n_D^{23} = 1.5638$ (8) (soluble in alk.), accompanied by some ω-chloroallyl phenyl ether (insol. alk.) (see above).]

[$\bar{C}$ with phenol ethers undergoes Friedel-Crafts reactn. of the reactive halogen atom with resultant introduction of the ω-chloroallyl group into the aromatic nucleus: e.g., $\bar{C}$ (1 mole) with anisole (1:7445) (10 moles) + $AlCl_3$ gives (70% yield (24)) 1-(ω-chloroallyl)-4-methoxybenzene, b.p. 126° at 15 mm. (24); $\bar{C}$ (1 mole) with pyrocatechol dimethyl ether (veratrole) (1:7560) (2 moles) + Zn dust (1 g.) ($AlCl_3$ unsuitable) gives 1-(ω-chloroallyl)-3,4-dimethoxybenzene, b.p. 162° at 15 mm., $D_4^{14} = 1.168$, $n_D^{14} = 1.551$ (24); $\bar{C}$ with pyrogallol trimethyl ether (1:7145) similarly yields 1-(ω-chloroallyl)3,4,5-trimethoxybenzene, b.p. 174° at 15 mm., $D_4^{18} = 1.176$, $n_D^{18} = 1.539$ (24). — Note that such ω-chloroallyl aryl ethers (1 mole) upon treatment with KOH (3 moles) in an alcohol R′.OH (5 moles) give (by reactn. of the ω-chlorine and rearr. or vice versa) substituted cinnamyl ethers of the type $RO.C_6H_4.CH=CH.CH_2OR'$, used for prepn. of various natural prods. (24).]

[$\bar{C}$ with aromatic hydrocarbons undergoes Friedel-Crafts reactn. of the reactive halogen atom with resultant introduction of the ω-chloroallyl group into the aromatic nucleus e.g., $\bar{C}$ with C_6H_6 + $AlCl_3$ yields (25) γ-chloroallylbenzene (1-chloro-3-phenylpropene-1) (3:8737) (see below); for analogous reactions of $\bar{C}$ with toluene (1:7405), o-xylene (1:7430), m-xylene (1:7420), p-xylene (1:7415), ethylbenzene (1:7410), cumene (1:7440), pseudocumene (1:7470), mesitylene (1:7455), p-cymene (1:7505), etc., see (25). — Note that the resultant γ-chloroallyl hydrocarbons add Br_2 normally (26) to the unsatd. linkage (diff. from ω-chloroallyl aryl ethers (above) which undergo cleavage); e.g., γ-chloroallylbenzene (above) with Br_2 gives γ-chloro-β,γ-dibromo-n-propylbenzene, b.p. 160° at 12 mm., $D_4^{10} = 1.727$, $n_D^{10} = 1.611$ (26) (for use of this prod. in prepn. of hydrocinnamaldehyde (1:0225) see (35).)]

[The direct actn of $\bar{C}$ with NH_3 appears to be unreported; however, $\bar{C}$ with KSCN followed by alk. hydrolytic cleavage is claimed (27) to yield the expected γ-chloroallylamine. — $\bar{C}$ with methylamine (3 moles) in C_6H_6 gives (53% yield (28)) N-methyl-γ-chloroallylamine [Beil. IV₂-(668)], b.p. 125° ($\bar{B}$.PkOH, m.p. 91° (28)), accompanied by a little N-methyl-bis-(γ-chloroallyl)amine [Beil. IV₂-(668)], b.p. 88° at 16 mm. (28). — $\bar{C}$ with diethylamine reacts vigorously and on making alkaline gives (75% yield (29)) (12) N,N-diethyl-γ-chloroallylamine [Beil. IV₂-(668)], b.p. 57–58° at 17 mm. (12), 55° at 9 mm. (29) ($\bar{B}$.HCl, pl. from acetone, m.p. 221° (29); $\bar{B}$ PkOH, ndls. from aq., m.p. 78° (29), 91° (12); $\bar{B}.H_2PtCl_6$, m p 169–170° (12)). — For reactns. of $\bar{C}$ with tertiary amines, e.g., with Me_3N (29), Et_3N (29), or pyridine (19), see indic. refs.]

[$\bar{C}$ (1 mole) with aniline (2 moles) in C_6H_6 under reflux ppts. aniline hydrochloride and from the solvent gives (68% yield (30)) N-phenyl-γ-chloroallylamine, b.p. 137° at 13 mm., $D_4^{13} = 1.1456$, $n_D^{13} = 1.590$ (30); for analogous reactns. of $\bar{C}$ with o-toluidine and m-toluidine see (30).]

[$\bar{C}$ with excess $CaBr_2$ refluxed for 40 hrs. (12) or actn. of HBr on ω-chloroallyl aryl ethers (23) (discussed above) gives (58% yield (12)) 3-bromo-1-chloropropene-1 (consts. given above); similarly $\bar{C}$ with excess powdered CaI_2 shaken at room temp. for 20 hrs. gives (65% yield (12)) (14) 1-chloro-3-iodopropene-1 (consts. given above).]

[$\bar{C}$ with NaOAc in AcOH at 110° for 16 hrs. ppts. NaCl (70% theory (12)) and gives (50% yield (12)) γ-chloroallyl acetate [Beil. II-136], b.p. 156–159° (10), b.p. 57° at 15 mm., $D_-^{17} = 1.140$, $n_-^{17} = 1.444$ (12).]

$\bar{C}$ reacts very slowly if at all with most metals: e.g., $\bar{C}$ with Zn dust in boilg. acetone or C with Mg in dry ether (even in pres. of I_2, EtBr, or $HgCl_2$) is inert (12); however, $\bar{C}$ with Na in tetralin (1:7550) reacts violently giving only gaseous products (12), possibly including allene (propadiene-1,2) cf. (3) (31).

[$\bar{C}$ reacts readily with aryl MgBr cpds., with replacement of its active halogen atom by the aryl radical: e.g., $\bar{C}$ with C_6H_5MgBr in toluene (26) or ether (32) gives (alm. 100% yield (26)) γ-chloroallylbenzene (1-chloro-3-phenyl-propene-1 (3:8737), b.p. 76° at 13 mm. (32), D_4^{14} = 1.073 (26), n_D^{14} = 1.545 (26). — For analogous reactns. of $\bar{C}$ with *o*-tolyl-, *p*-tolyl-, *p*-cumyl-, 2-cymyl-, *p*-bromophenyl-, and *p*-methoxyphenyl-MgX cpds. see (26); for corresp. reactn. of $\bar{C}$ with α-naphthyl MgBr see (34). — For reactn. of $\bar{C}$ with *n*-propyl MgBr see (2).]

[For reactn. of $\bar{C}$ with diethyl sodiomalonate giving (26% yield (4)) diethyl γ-chloroallylmalonate, with diethyl disodiomalonate giving (32% yield (4)) diethyl *bis*-(γ-chloroallyl)malonate, or with diethyl sodio-ethyl-malonate giving (20% yield (4)) diethyl γ-chloroallyl-ethyl-malonate see indic. refs.]

B.P.	108°	(1)
	107–108°	(2)
	105–107°	(3) (4)
	106.1–107.1° at 739 mm.	(5)

Oil with penetrating odor; fumes in moist air.

[For prepn. of $\bar{C}$ from dichloroacetic acid (3:6208) with PCl_3 (2), with HCl gas + P_2O_5 (7), with $SOCl_2$ (poor yield apparently because of much formation (9) of dichloro-acetic anhydride (3:6430)) (8) (9) (10) (11), with benzoyl chloride (3:6240) (73% yield (4)), or with benzotrichloride (3:6540) (12) (13) see indic. refs.; for prepn. of $\bar{C}$ from trichloroethylene (3:5170) by photochemical oxidn. (14) (15) (16) (3) (17) see indic. refs.; for prepn. of $\bar{C}$ from pentachloroethane (3:5880) with fumg. H_2SO_4 at 50–60° see (18); for prepn. of $\bar{C}$ from α,β-dichlorovinyl ethyl ether (3:5540) by actn. of Cl_2 see (19) (20).]

[$\bar{C}$ with alcohols gives corresp. esters (for studies of rate of alcoholysis see (1) (21)); for reactn. of $\bar{C}$ with various carbohydrates (22) and with cellulose (23) see indic. refs.; $\bar{C}$ + phenol yields (20) phenyl dichloroacetate, m.p. 48°, b.p. 247.5° cor. (20); $\bar{C}$ with β-naphthol yields (20) β-naphthyl dichloroacetate, m.p. 92–93° (20).]

[$\bar{C}$ on warming with $AlCl_3$ yields (24) (25) 1,1,1,2,2,3,3-heptachloropropane (3:0200) + chloroform (3:5050) + CO + HCl]

[$\bar{C}$ treated with dry HI gas at −5° gives (58% yield (5)) dichloroacetyl iodide, b.p. 54–54.5° at 15 mm. (5).]

$\bar{C}$ with aq. hydrolyzes very rapidly yielding dichloroacetic acid (3:6208) q.v.; for the amide, anilide, p-toluidide, and other derivs. corresp. to $\bar{C}$ see dichloroacetic acid (3:6208).

Care must be taken to avoid confusion of C̄ with the isomeric *1,1,1-trichloroethane* (3:5085). C̄ is now comml. prod. in U.S. (14).

MISCELLANEOUS PHYSICAL PROPERTIES

[illegible] sol. aq.: e.g., 100 g. aq. at 0° dis. 0.460 g. [illegible] g. C̄ (15). — [For soly. of aq. in C̄ at 0°, [illegible] (16).] [illegible] d press. see (10).] [For soly. of I_2 in C̄ see (17).]

Binary systems contg. C̄. (See also below under uses of C̄.) C̄ + 1,2-dichloroethane (ethylene dichloride) (3:5130): for f.p./compn. data, eutectic f.p. −70° (11), and for D and vapor/liq. equil. (13), see indic. refs.

Azeotropes contg. C̄. C̄ with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 77.8° (4), 77.3° (6) at 760 mm., contg. 35 (6), 30 (4) wt. % C̄.

Other physical props. [For study of thermal conductivity of C̄ see (18).]

USES OF C̄

C̄ is now widely used as industrial solvent and in other ways [e.g., for use of C̄ (10%) 1,1,1-trichloroethane (3:5085) + 20% pet. hydrocarbons as dry-cleaners' solv. see (19); for use of C̄ + ethylene dichloride (3:5130) as hair wash see (20); for use of C̄ + n-heptane (1:8575), C̄ + cyclohexane (1:8405), or C̄ + C_6H_6 (1:7400) as test mixts. for detn. of number of theoret. pl. in fractionating columns see (21); for use of C̄ in dewaxing of oils see (22)].

PHYSIOLOGICAL ACTION AND TOXICITY

Full treatment of this topic is beyond the scope of this work [however, for lead references see (23) (24) (25) (26) (27) (67). — For study of C̄ as anthelmintic see (28)].

PREPARATION OF C̄

From vinyl chloride (3:7010). (See also below under acetylene.) [For prepn. of C̄ from vinyl chloride with Cl_2 at 0-80° in light or at 180-250° in absence of light or solv. see (29) (30) (31) cf. (32); for study of photochemical addn. of Cl_2 to vinyl chloride yielding C̄ see (33).]

From 1,2-dichloroethylene (3:5030). [For prepn. of C̄ from 1,2-dichloroethylene by addn. of HCl gas at 30-40° in pres. of $AlCl_3$ (88% yield) see (34) (37) (note that 1,1,2,3,4-pentachlorobutane (3:0750) is also obtd. as a by-product (35)).]

From 1,1-dichloroethane (ethylidene (di)chloride) (3:5035). [For formn. of C̄ from ethylidene (di)chloride with $SbCl_5$ (3 wt. parts) on refluxing see (36).]

From 1,2-dichloroethane (ethylene (di)chloride) (3:5130). [For prepn. of C̄ from ethylene (di)chloride with Cl_2 in ultra-violet light at 50° (38) (39) or 25° (40), or with Cl_2 + suitable cat. at not above 60° (41), or C̄ (as liquid) with Cl_2 (7), or with Cl_2 in pres. of $AlCl_3/NaCl/FeCl_3$ at 300–425° as directed (42), or with SO_2Cl_2 + trace dibenzoyl peroxide refluxed 2 hrs in dark (12) (yields: 80% (41), 70% (40) (12), 50% (42)), see indic. refs.]

From ethylene. [For prepn. or formn. of C̄ from ethylene with Cl_2 + cat. see (43) (44) (45) (46) (47).]

From acetylene. [For prepn. of C̄ from acetylene with HCl + Cl_2 + cat. (doubtless via formn. of vinyl chloride (and subsequent addn. of Cl_2 as above) see (48) (30).]

From other sources. [For formn. of C̄ as by-prod. of prepn. of chloral (3:5210) see (49); for prepn. of C̄ from 2,2-dichloroethanol-1 (3:5745) with PCl_5 (50), or from α,β-dichloroethyl chloroformate by loss of CO under influence of $AlCl_3$ (51), see indic. refs.; for formn. of C̄ from trichloroethylene (3:5170) with HI for 2 weeks in sunlight see (68).]

CHEMICAL BEHAVIOR OF C̄

Dehydrochlorination. C̄ under suitable conditions may lose HCl in either or both of two modes yielding either or both 1,1-dichloroethylene (vinylidene (di)chloride) (3:5005) *or a mixt. of the stereoisomeric 1,2-dichloroethylenes* (3:5030). — [E.g., C̄ with alc. KOH (52) (53) (54), or with excess aq. $Ca(OH)_2$ at 70–80° (55) (56), or with aq. or alc. NH_3 (57), or even with Na in ether (58) gives (yields 100% (57), 90% (55) (56)) 1,1-dichloroethylene (3:5005). — On the other hand, C̄ pyrolyzed at 400° over pumice contg. $CuCl_2$ (59) is claimed to give mainly 1,2-dichloroethylene (3:5030). — Note also that C̄ with MeOH over Al_2O_3 at 290° gives (60) a mixt. of both prods. together with MeCl (3:7005).]

[Note in this connection that C̄ with aq. + Zn, Fe, or Al at 100–120° under press. yields (61) vinyl chloride (3:7010); perhaps this occurs by way of the above dichloroethylenes as intermediate.]

Halogenation of C̄. *Chlorination.* [C̄ with Cl_2 + $AlCl_3$ at 70–80° yields (62) 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750).]

Fluorination. [C̄ with HgF_2 under press. at 140° gives (63) 50% 1,2-dichloro-1-fluoroethane + 10% 2-chloro-1,1-difluoroethane; for behavior of C̄ with SbF_3 + Br_2 at 160°, with SbF_3 + $SbCl_5$, or with SbF_3Cl_2 see (63).]

Behavior of C̄ with other inorganic reactants. [C̄ with alkali hydroxide on fusion at 250–300° yields (64) salts of glycolic acid (1:0430).]

Behavior of C̄ with organic reactants. [C̄ with 1,2-dichloroethylene (3:5030) + 1% $AlCl_3$ at 35–40° for 5 days yields (37) a mixt. of two stereoisomeric 1,1,2,3,4-pentachlorobutanes, viz., the liq. isomer (3:9068) and the solid isomer (3:0750). — C̄ + trichloroethylene (3:5170) + 1–2% $AlCl_3$ at 40° for 7 days yields (37) 1,1,1,4,4-pentachlorobutene-2 (3:9054).]

[C̄ with C_6H_6 + $AlCl_3$ gives (31% yield (65)) 1,1,2-triphenylethane, b.p. 211° at 14 mm., accompanied by diphenylmethane and 1,2-diphenylethylene (stilbene).]

[*C̄ with C_6H_5MgBr in toluene does* ***not*** react even at 100° (66).]

Comment on Fujiwara reaction. C̄ does *not* respond to Fujiwara reactn. (pyridine + NaOH) (23).

3:5345 3,3,3-TRICHLOROPROPENE-1 $Cl_3C{-}CH{=}CH_2$ $C_3H_3Cl_3$ **Beil. I-200**
(1,1,1-Trichloropropene-2) I_1— I_2—

B.P.	M.P.		
114–115° at 760 mm. (1)	**−30°** (2)	D_{20}^{20} = **1.369** (1)	n_D^{20} = **1.4827** (3)
114–115° at 757 mm. (2)	**−55– −50°** (1) (5)		(5)
57° at 103 mm. (3)		D_{13}^{13} = **1.359** (2)	

Liquid with penetrating odor suggesting aldehydes. [For use in dewaxing of mineral oil see (4).]

[For prepn. of C̄ from 1,1,1-trichloropropanol-2 (3·0846) (84% yield (3)) with P_2O_5 (3) (2) (1), with PCl_3 (5) (1), or with PCl_5 (5) (1) see indic. refs.]

C̄ in cold and in diffused light adds Cl_2 yielding (2) 1,1,1,2,3-pentachloropropane (3:4740), m.p. 179–180° (2). — C̄ adds Br_2 readily yielding (2) 1,1,1-trichloro-2,3-dibromopropane [Beil. I-112], cryst. from alc., m.p. 210° (2)

C̄ with HCl + $FeCl_3$ at 50° for 50–100 hrs. gives (20% yield (3)) 1,1,1,2-tetrachloropropane (3:5785). — [For study of addn. to C̄ of HBr see (3).]

3:5345 (1) Henry, *Bull acad roy Belg.* **1905**, 101–121; *Cent.* **1905**, I 1697. (2) Victoria, *Rec. trav. chim* **24**, 280–283 (1905). (3) Kharasch, Rossin, Fields, *J. Am. Chem. Soc.* **63**, 2558–2560 (1941) (4) Standard Oil Development Co , French 790,852, Nov. 28, 1935, *Cent.* **1936**, I 2672, *C.A.* **30**, 3223 (1936). (5) Henry, *Rec. trav. chim.* **24**, 336–344 (1905).

3:5350 3,4-DICHLOROBUTENE-1 $C_4H_6Cl_2$ **Beil. S.N. 12**
(1,2-Dichlorobutene-3)

B.P. 115° (1)	$n_D^{30.5}$ = **1.4550** (1)
45–45.5° at 40 mm. (1)	

[For prepn. of C̄ (together with other products) from butadiene-1,3 with Cl_2, either directly or in $CHCl_3$, CS_2 or lgr. soln., see (1) (2), the process can be controlled so as to yield little or no 1,2,3,4-tetrachlorobutane but rather a mixt. of C̄ and 1,4-dichlorobutene-2 (3:5725) in the ratio 2:1 (1) (2).]

C̄ does *not* (1) rearr. to 1,4-dichlorobutene-2 (3.5725) even on htg at 90° in a s.t. — However, C̄ in the presence of a metal halide cat. (3) such as $AlCl_3$ (4) rearr. by allylic transposition to 1,4-dichlorobutene-2.

C̄ on htg. at 90° with 2 pts. solid KOH loses HCl yielding (1) (2) 1-chlorobutadiene-1,3 (3:7210), b.p. 85° (1) (2); under certain conditions, however, C̄ with KOH loses HCl to yield (5) 2-chlorobutadiene-1,3 (chloroprene) (3:7080).

C̄ on htg. in alc. with Zn dust yields (1) butadiene-1,3.

C̄ with Cl_2 yields *solely* (1) the *liq.* isomer of 1,2,3,4-tetrachlorobutane (3:9082).

C̄ treated directly with O_3 at 0°, then with aq., yields (1) α,β-dichloropropionaldehyde (3:9034), b.p. 73° at 50 mm. (1), + formaldehyde (1:0145). — C̄ on oxidn. with dil. alc. $KMnO_4$ gives (1) α,β-dichloropropionic acid (3:0555), m.p. 50° (1).

3:5350 (1) Muskat, Northrup, *J. Am. Chem. Soc.* **52**, 4043–4055 (1930). (2) Muskat (to du Pont), U.S. 2,038,593, Apr. 28, 1936; *Cent.* **1936**, II 3358; *C.A.* **30**, 3912 (1936). (3) I.G. 3:5356 CHLOROMETHYL ACETATE $CH_3.CO.O.CH_2Cl$ $C_3H_5O_2Cl$ Beil. II - 152
II_1—
II_2-(166)

B.P. 115–116°	at 757 mm.	(1)	$D^{14.3}_{14.3}$ = 1.1953 (1) (13)
115°	at 757 mm.	(13)	
115°		(5)	
113–115°		(2) (12)	
110–112°		(3)	
58–62°	at 290 mm.	(4)	

Colorless liq. with penetrating odor. — Insol. cold aq.; sol. alc., ether. — Sol. in cold conc. H_2SO_4 with evoln. of HCl (1) (13).

[For prepn. of $\bar{C}$ from methyl acetate (1:3005) with Cl_2 in cold (1) (5) and in sunlight (2) (6), or with SO_2Cl_2 in sunlight (6), see indic. refs.; from polyoxymethylene with AcCl (3:7065) in s.t. at 100° (6) or by htg. in pres. of $ZnCl_2$ (61% yield on AcCl (4)) cf. (7) (8) (note that crude $\bar{C}$ may be more or less contaminated with *bis*-(chloromethyl ether) (3:5245), b.p. 105°, and Ac_2O (1:1015), b.p. 140°, apparently produced by disproportionation of $\bar{C}$ itself during the htg. (7).]

$\bar{C}$ on slight warming with aq. readily dissolves by virtue of hydrolysis, yielding (1) (5) (3) formaldehyde (1:0145), AcOH (1:1010), and HCl.

[$\bar{C}$ with alcs. or Na alcoholates (10) presumably first yields alkoxymethylacetates: e g., $\bar{C}$ with Na benzylate in C_6H_6 refluxed for 4 hrs. gives (15% yield (4)) benzyloxymethyl acetate, b.p. 152–155° at 29 mm. (4); however, the usual type of prod. consists of a mixture of formaldehyde dialkylacetal and alkyl acetate (perhaps formed by interchange of radicals between the initial product and the alcohol (9)): e.g., $\bar{C}$ with benzyl alc. (1:6480) gives (9) (10) (13) formaldehyde dibenzylacetal, b.p. 188–190° at 13 mm., + benzyl acetate (1:3751), b.p. 217°; $\bar{C}$ with *n*-propyl alc. (1:6150) gives (9) (13) formaldehyde di-*n*-propylacetal [Beil. I-575, I_1-(301), I_2-(639)], b.p. 137° at 760 mm., + *n*-propyl acetate (1:3075), b.p. 101.6°; for analogous behavior of $\bar{C}$ with MeOH (1:6120) and EtOH (1:6130) see (10).]

[$\bar{C}$ with Na phenolate does *not* yield phenoxymethyl acetate but instead (45% yield (11)) phenyl acetate (1:3571); this may be accounted for in a fashion completely analogous to that suggested above in the case of alcs., but no attempt was made (11) to verify the pres. of formaldehyde diphenylacetal (diphenoxymethane) although the latter [Beil. VI-150] is well known.]

$\bar{C}$ with NH_3 in dry ether gives (12) (13) acetamide, NH_4Cl + formaldehyde (often in the form of hexamethylenetetramine (13)). — $\bar{C}$ with aniline (1.5 moles) in dry ether gives (80% yield (12)) acetanilide, m.p. 114–115°, + 1,3,5-triphenyltrimethylenetriamine ("anhydroformaldehydeaniline") [Beil. XXVI-3], yel. pr., m.p. 140–141° (produced by actn. of the liberated formaldehyde upon the excess of aniline). — [$\bar{C}$ (1 mole) with *N,N*-dimethylaniline (2 moles) + $ZnCl_2$ at 110–120° gives (5) salt of 4,4'-*bis*-(dimethylamino)-diphenylmethane [Beil. XIII-239, $XIII_1$-(71)], m.p. 91°.]

$\bar{C}$ with pyridine forms an unstable addn. cpd. (12); $\bar{C}$ with quinoline forms (12) an addn. cpd., m.p. 214–216° dec., eas. sol. in abs. alc. but easily pptd. with dry ether (12).

[$\bar{C}$ with *N*-potassiopyrrole in dry ether gives (18% yield (14)) *N*-pyrrylmethyl acetate, b.p. 59–63.5° at 3 mm., D^{20}_4 = 1.0916, n^{20}_D = 1.4907 (14).]

[For study of rate of reactn. of $\bar{C}$ with KI in acetone at 20° and 25° see (2).]

C̄ is also sometimes designated as "α-epichlorohydrin" to distinguish it from the less common "β-epichlorohydrin" = β-chlorotrimethylene oxide.

C̄ is liq. with odor suggesting chloroform. — C̄ is spar. sol. aq (see also below) but misc. with alc. or ether.

MISCELLANEOUS PHYSICAL PROPERTIES

Solubility relations. C̄ with aq. forms two layers: the lower layer conts. the following no. of g.'s C̄ per 100 g. satd. soln.: at 25° 98.48 g., at 45° 97.43 g., at 70° 95.82 g., at 80.4° 94.17 g; the upper layer conts. per 100 g. satd. soln.: at 30.2° 6.60 g., at 52.0° 7.53 g., at 65.0° 8.45 g., at 72.0° 9.34 g, at 80.2° 10.43 g. (5).

Binary azeotropes contg. C̄. C̄ with aq. *forms* a homogeneous const. boilg. mixt., b.p. 88°, contg. 75% C̄; at 25° this azeotrope seps. into two layers contg. respectively 98% C̄ and 7% C̄ (17).

[C̄ with AcOH (1:1010) *forms* (9*a*) a *const.-boilg. mixt.*, b.p. 115.05° at 760 mm., contg. 65.5 wt. % C̄; C̄ with tetrachloroethylene (3:5460) forms (9*b*) a const.-boilg. mixt, b.p. 110.12° at 760 mm., contg. 51.5 wt. % C̄.]

[Note that $\bar{C}$ with EtOH (1:6130) (9c) or with formic acid (1:1005) (9d) forms no azeotropes.]

Ternary systems contg. $\bar{C}$. [For extensive study of system $\bar{C}$ + AcOH + aq. see (5).]

MISCELLANEOUS PHYSIOLOGICAL AND BIOCHEMICAL BEHAVIOR OF $\bar{C}$

[For study of toxicity of $\bar{C}$ see (27); for effect on proteins see (28); for effect on wire worms see (29).]

USES OF $\bar{C}$

The uses of $\bar{C}$ both as solvent and as chemical intermediate (see below) are manifold and cannot here be reviewed in detail [however, for use of $\bar{C}$ in stabilization of nitrate esters (30), in refining of mineral oil (31), or in treatment of cellulose fibers to improve dyeing with acid dyes (32) see indic. refs.].

PREPARATION OF $\bar{C}$

[For prepn. of $\bar{C}$ from 1,3-dichloropropanol-2 ("α-dichlorohydrin") (3:5985) with aq. $Ca(OH)_2$ (22) (16) (33), with aq. NaOH (4) (13) (17) (34) (37) cf. (35), with alc. NaOH (36), with ether + NaOH (38), with solid NaOH (39), or with aq. KOH (2) (1) (yields: 95% (33), 92.5% (36), 90% (13) (16) (34), 85% (17), 79% (2), 76–81% (38), 67–72% (22), 70% (17), 60% (4)) see indic. refs.; for patents on prepn. of $\bar{C}$ from this source by use of various alk. materials see (40) (41) (33) (37); note that during this type of prepn. of $\bar{C}$ some glycerol (1:6540) is also formed (38) (44).]

[For prepn. of $\bar{C}$ from 2,3-dichloropropanol-1 ("β-dichlorohydrin") (3:6060) with aq. alk. see (42) (for studies of kinetics of this loss of HCl see (43)).]

[For formn. of $\bar{C}$ from glycerol (1:6540) with PCl_3 (45), with HCl (1) (50), or S_2Cl_2 (50) see indic. refs.]

[For formn. of $\bar{C}$ from sodium salt of γ-chloro-β-hydroxy-*n*-propyl hydrogen sulfite (itself obtd. from $\bar{C}$ + $NaHSO_3$) on treatment with NaOH see (46).]

[For formn. of $\bar{C}$ from 1-bromo-3-chloropropanol-2 (see below) by loss of HBr by actn. of conc. KOH see (1).]

CHEMICAL BEHAVIOR OF $\bar{C}$ WITH INORGANIC REACTANTS

Reduction of $\bar{C}$. [$\bar{C}$ with Na/Hg in moist ether is very slowly attacked and some allyl alc. (1:6145) (together with other prods.) is formed (47). — Note, however, that reactn. of $\bar{C}$ with Na in ether is very complicated and the prods. and mode of their formn. are disputed (48) (49) (44) (50) (51).] — (For behavior of $\bar{C}$ with HI see below.)

Oxidation of $\bar{C}$. [$\bar{C}$ on oxidn. with HNO_3 ($D = 1.38$) gives (52) β-chloro-α-hydroxypropionic acid (β-chlorolactic acid) [Beil. III-286, III_1-(110), III_2-(209)], eas. sol. aq., alc., ether, cryst. from C_6H_6 (53), m.p. 77° (53), 77–78° (52) (for resolution of this prod. into opt. act. forms, *d*-form, m.p. 91.5°, see (54)). — Note that this prod. is also obtd. by oxidn. of 3-chloropropanediol-1,2 ("α-monochlorohydrin") (3:9038) q.v.]

Halogenation of $\bar{C}$. [$\bar{C}$ with Cl_2 in diffuse light gives (55) γ,γ-dichloropropylene oxide [Beil. XVII-9], oil, b.p. 170°. — $\bar{C}$ with Br_2 at 100° gives (56) (57) *x,x,x*-tribromo-γ-chloropropylene oxide [Beil. XVII-9], oil, which on shaking with aq. forms a crystn. tetrahydrate, m.p. 55° (56).]

Behavior of $\bar{C}$ with water (or dil. acids). [$\bar{C}$ with aq. at 100° (6) in s.t. (1) cf. (60) or on boilg. for 14 hrs. (58) adds H_2O giving (80% yield (58)) 3-chloropropanediol-1,2 (α-

monochlorohydrin) (3:9038). This process is greatly facilitated by the pres. of dil. acids: e.g., for use of dil. H_2SO_4 (yields: 85–90% (34) cf. (59), 80% (36)) or formic acid (66% yield (212)) *see* indic. *refs.*; for study of kinetics of this reactn. incl. influence of various acids and salts see (6) (19) (61) (62); for patent on use of dil. acids or acid-reacting salts see (63). — Note, however, that $\bar{C}$ with aq. contg. 3–20% H_2SO_4 at 100–250° under press. gives (72) acrolein (1·0115).]

Behavior of $\bar{C}$ with halogen hydracids (HX). *With HF.* [$\bar{C}$ with 30% HF soln. reacts vigorously yielding (64a) 3-chloropropanediol-1,2 ("α-monochlorohydrin") (3:9038) and other prods; note that $\bar{C}$ with HF under some circumstances appears to yield (64b) polymers.]

With HCl. [$\bar{C}$ with conc. HCl shaken several hrs. at room temp. (3) (4) cf. (19) (65), or $\bar{C}$ with HCl gas (51) in AcOH (11), gives (80% yield (4)) 1,3-dichloropropanol-2 ("α-dichlorohydrin") (3:5985).]

With HBr. [$\bar{C}$ with const.-boilg. HBr (D = 1.48) as directed (66) cf. (1) gives alm. quant. yield 1-bromo-3-chloropropanol-2 [Beil. I-365, I_1-(185), I_2-(385)], b.p. 197° at 760 mm. (66), 92° at 20 mm. (66), D_4^{20} = 1.726 (67), n_D^{25} = 1.5140 (67) (corresp. *bis-(N-phenylcarbamate)*, m.p. 73° (68))] (See below under reactn. of $\bar{C}$ with metal bromides.)

With HI. [$\bar{C}$ with 66% HI (69) cf. (66) (1) gives 3-chloro-1-iodopropanol-2 [Beil. I-366, I_1-(186), I_2-(386)], b.p. 226° (1), 107° at 19 mm. (66), 110° at 9 mm (69).] (See also below under behavior of $\bar{C}$ with metal iodides.)

Behavior of $\bar{C}$ with oxygenated inorganic acids. [$\bar{C}$ with conc H_2SO_4 (70) or 84% H_2SO_4 in cold (71) gives a corresp mono (acid sulfate) ester [Beil. I-474, I_2-(538)], but whether this HSO_4 group is attached through oxygen to the first or second carbon atoms *of $\bar{C}$ is unknown.*]

[$\bar{C}$ with HNO_3 at not above 20° as directed (73) gives 42% yield of a mononitrate ester of 3-chloropropanediol-1,2 ("α-monochlorohydrin"); $\bar{C}$ with fumg. HNO_3 at 0° gives (74) γ-chloropropylene glycol dinitrate [Beil. I-474]; $\bar{C}$ with mixed $HNO_3 + H_2SO_4$ gives (75) a mixed nitrous/nitric ester [Beil. I-474] of 3-chloropropanediol-1,2 (3·9038).]

[For analogous reactns. of $\bar{C}$ with H_3PO_4 (71) (89) or with $HClO_4$ in ether (76) see indic. refs.; for behavior of $\bar{C}$ toward HOCl see (77).]

Behavior of $\bar{C}$ with salts of inorganic acids. (For behavior with NaCN, etc., see below under *organic reactants.*)

With metal chlorides. [$\bar{C}$ in dry ether adds anhydrous $ZnCl_2$ giving (78) $ClCH_2CH(OZnCl).CH_2Cl$; $\bar{C}$ in dry ether adds anhydrous $MgCl_2$ giving (78) $ClCH_2CH(OMgCl)CH_2Cl$; *both these cpds. on hydrolysis yield (78) 1,3-dichloropropanol-2 ("α-dichlorohydrin")* (3:5985). — Note also that $\bar{C}$ (2 g.) with $MgCl_2$ (1 g.) + aq. (2 ml.) + abs. alc. (5 ml.) in s.t. at 125° for 6 hrs. (79) cf. (11) gives $Mg(OH)_2$ + 1,3-dichloropropanol (above); $\bar{C}$ with alc. $FeCl_3$ gives (11) $Fe(OH)_3$ + 1,3-dichloropropanol-2 (above).] (See also below under reactn. of $\bar{C}$ with RMgX cpds.)

With metal bromides. [$\bar{C}$ *(1 mole) with $MgBr_2$ (1 mole) in dry ether gives* (80) *similarly* $ClCH_2CH(OMgBr).CH_2Br$ which on hydrolysis yields (80) 1-bromo-3-chloropropanol-2 (props. given above under reactn of $\bar{C}$ with HBr).] (See also below under reactn. of $\bar{C}$ with RMgX cpds.)

With metal iodides. [$\bar{C}$ with dry KI in s.t. at 100° for several days (1), or $\bar{C}$ with KI (2 moles) in abs. alc. at 80–85° for 11 hrs. (81), or $\bar{C}$ with NaI (1 mole) in acetone refluxed 21 hrs. (82), gives (40% yield (82)) 3-iodo-1,2-epoxypropane ("α-epiiodohydrin") [Beil. XVII-10], b.p. 167° (1), 64° at 24 mm. (82), 62° at 24 mm. (81).]

[$\bar{C}$ with conc. aq. MgI_2 soln. gives alm. quant. *yield* (170) 3-chloro-1-iodopropanol-2 for whose constants see above under behavior of $\bar{C}$ with HI.]

With alkali sulfides. [For patents on behavior of $\bar{C}$ with aq. Na_2S see (83) (84).] (See also below.)

With alkali sulfites. [$\bar{C}$ with $NaHSO_3$ in s.t. at 100° (11) or htd. under reflux (85) (46) (86) or in cold (87) gives sodium salt of 3-chloro-2-hydroxy-*n*-propyl hydrogen sulfite [Beil. I-474, I_2-(538)].]

[$\bar{C}$ (1 mole) with conc. aq. Na_2SO_3 (2 moles) htd. under reflux 1½–2 hrs. (46) or $\bar{C}$ with conc. aq. K_2SO_3 (85) gives corresp. salts of "glycerol disulfonic acid."]

[For behavior of $\bar{C}$ with Na_3PO_4 (15), with Na_2HPO_4 (88), or with Na_3AsO_3 (90) see indic. refs.]

Behavior of $\bar{C}$ with other non-nitrogenous inorganic reactants. [$\bar{C}$ with PCl_3 gives an addition prod. (91) which with aq. regenerates $\bar{C}$ and also forms H_3PO_3. — $\bar{C}$ with PCl_5 yields (1) 1,2,3-trichloropropane (3:5840) + $POCl_3$.]

[$\bar{C}$ with S_2Cl_2 gives (92) 67% 1,3-dichloropropanol-2 ("α-dichlorohydrin") (3:5985) + 33% α,α′-dichloroacetone (3:0563). — $\bar{C}$ with SO_2Cl_2 + $AlCl_3$ in CCl_4 gives (93) β,β′-dichloroisopropyl chlorosulfonate.]

[$\bar{C}$ in alk. soln. treated with H_2S at 0° gives (94) β-chloro-α-hydroxy-*n*-propyl mercaptan, b.p. 60° at 1.3 mm., D_{-}^{20} = 1.2981, n_D^{20} = 1.5257 (94); at 50°, however, further loss of HCl occurs yielding by ring closure (94) β-hydroxytrimethylene sulfide, b.p. 57° at 1.3 mm., D_{-}^{20} = 1.2130, n_D^{20} = 1.5433 (94). — Note, however, that $\bar{C}$ treated directly at 125° with H_2S gives (95) *bis*-(β-chloro-α-hydroxy-*n*-propyl) sulfide, oil, undistillable without decn. even at 2 mm. (95).]

[$\bar{C}$ with $AsCl_3$ gives (96) *tris*-(β,β′-dichloroisopropyl)arsine, b.p. 88–93° at 10 mm., D_4^{10} = 2.145 (96).]

Behavior of $\bar{C}$ with NH_3 and other inorganic nitrogen cpds. [$\bar{C}$ satd. repeatedly with NH_3 gas as directed (97) gives *tris*-(β-chloro-α-hydroxy-*n*-propyl)amine [Beil. IV-291], m.p. 92–93° (corresp. B.HCl, m.p. 173° (97)); note that from the reactn. prod. of $\bar{C}$ with ethyl acetoacetate treatment with excess alc. NH_3 gives (98) 3-chloro-2-(1?)-aminopropanol-1(2?) [Beil. IV-291].]

[$\bar{C}$ in alc. with NH_3 gas or $\bar{C}$ in alc. with $NaNH_2$, or $\bar{C}$ with aq. NH_4OH (11) (99) gives a reactn. prod. of undetermined constitution, useful in productn. (100) of vat dye printing pastes.]

[$\bar{C}$ with hydrazine hydrate at 100° for 30 min. or in alc. under reflux for 5 hrs. gives (101) γ-hydrazinoepihydrin which with $ZnCl_2$ at 100° gives (101) pyrazole [Beil. XXIII-39, $XXIII_1$-(15)], *m.p.* 69.5–70° (101).]

[For behavior of $\bar{C}$ with basic potassium iminodisulfonate, $KN(SO_3K)_2$, leading to dipotassium epihydrin-*N,N*-disulfonate (102) (103), or with basic potassium hydroxylaminedisulfonate, $KON(SO_3K)_2$, leading to dipotassium epihydrinhydroxylamine-*N,N*-disulfonate (104), see indic. refs.]

CHEMICAL BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

Behavior of $\bar{C}$ with Hydroxy and Mercapto Compounds

With monohydric alcohols. $\bar{C}$ with alcohols reacts to give by opening of the oxide ring the corresp. primary ethers of 3-chloropropanediol-1,2("α-monochlorohydrin") (3:9038).

[$\bar{C}$ with MeOH (1:6120) in pres. of H_2SO_4 (105) (66) (106) (107), or $\bar{C}$ with MeOH at elev. temp. under press. (108), or $\bar{C}$ with MeOH + BF_3 (109), gives (yields: 88–90% (105), 89% (106), 74.5% (109)) γ-chloro-β-hydroxy-*n*-propyl methyl ether ("chloromethylin") [Beil. I_2-(538)], b.p. 173° at 752 mm. (105), 172° (106), 170.5–171.5° (109), 95° at 20 mm. (106), D_4^{20} = 1.1618 (109), n_D^{20} = 1.4474 (109). — Note, however, that $\bar{C}$ with MeOH in pres. of KOH gives (110) (111) glycerol α,α′-dimethyl ether (β,β′-dimethoxy-isopropyl alc.)

[Beil. I-512, I_1-(590)], b.p. 167–168° at 760 mm., 65.5–66.0° cor. at 9 mm. (113), D_4^{20} = 1.0085 (113), D_4^{25} = 1.012 (111), n_D^{25} = 1.4183 (111), n_D^{20} = 1.4192 (113) (corresp. p-nitrobenzoate, m.p. 43° (112)).]

[C̄ with EtOH (1:6130) in pres. of H_2SO_4 refluxed 6 hrs. (17) or 20 hrs. (106) gives (yields 80% (106), 76% (17)) γ-chloro-β-hydroxy-n-propyl ethyl ether ("chloroethylin") [Beil. I-474, I_1-(538)], b.p. 183–184° (106), 104–106° at 60 mm. (17), 95–100° at 20 mm. (106), D_4^{25} = 1.107 (17), n_D^{25} = 1.442 (17). — Note, however, that C̄ with EtOH + KOH gives (110) glycerol α,α′-diethyl ether (β,β′-diethoxyisopropyl alc.) [Beil I-512], b.p. 191° at 760 mm. (13) (111), 108–109° at 60 mm. (111), 61.5–62.0° cor. at 2 mm. (113), D_4^{25} = 0.952 (111) (13), D_4^{20} = 0.9514 (113), n_D^{25} = 1.419 (111) (13), n_D^{20} = 1.4200 (113).]

[For corresp. behavior of C̄ with n-butyl alc. (1:6180) + H_2SO_4 (106), with isoamyl alc. (1:6200) + H_2SO_4 (106), see indic. refs. — C̄ with dodecanol-1 (lauryl alc.) (1:5900) + $FeCl_3$ in s.t. at 160° for 18 hrs. (39% yield (114)) or with H_2SO_4 (115) gives γ-chloro-β-hydroxy-n-propyl n-dodecyl ether, b.p. 157° at 1 mm. (114), n_D^{25} = 1.4525 (114). — (For attempts to effect analogous reactn. between C̄ and ter-butyl alcohol (1:6140) in pres. of H_2SO_4 and for physical constants on higher members of di(alkoxy)isopropyl alc. series see (113))]

[C̄ with ethylene chlorohydrin (3:5552) + H_2SO_4 gives (70% yield (116)) γ-chloro-β-hydroxy-n-propyl β-chloroethyl ether, b.p. 123–125° at 18 mm. (116).]

With polyhydric alcohols. [C̄ with ethylene glycol (1:6465) + H_2SO_4 gives (56% yield (117)) γ-chloro-β-hydroxy-n-propyl β-hydroxyethyl ether, b.p. 135–139° (117).]

[For presumably analogous behavior of C̄ with glycerol + H_2SO_4 see (118); for behavior of C̄ with cellulose + 50% NaOH see (119).]

With mercaptans. C̄ with mercaptans behaves in general analogously to C̄ with monohydric alcs. + H_2SO_4.

[E g., C̄ with MeSH is unreported. — C̄ with EtSH at 50° for 4 hrs. gives (90% yield (95)) γ-chloro-β-hydroxy-n-propyl ethyl sulfide, b.p. 114–115° at 16 mm.; note, however, that C̄ with EtSH in aq. KOH (i.e., KSEt) reacts differently yielding (95) 1,2-epoxy-n-propyl ethyl sulfide, b.p. 67–68° at 15 mm., D_4^{22} = 1.0196, n_D^{22} = 1.4789. — C̄ with n-PrSH + activated carbon at 90° for 7 hrs. gives (95) γ-chloro-β-hydroxy-n-propyl n-propyl sulfide, b.p. 95° at 4 mm.]

[C̄ (1 mole) with benzyl mercaptan (1 mole) at 130° for 7 hrs. gives (95) γ-chloro-β-hydroxy-n-propyl benzyl sulfide, b.p. 154–156° at 4 mm.; note, however, that C̄ (1 mole) with benzyl mercaptan (2 moles) in alc. NaOH gives (46) bis-(β,β′-dibenzylmercapto)-isopropyl alc., m.p. 59°.]

[C̄ with thiophenol at 130° for 5 hrs. gives (95) γ-chloro-β-hydroxy-n-propyl phenyl sulfide, b.p. 141° at 4 mm.]

With monohydric phenols. C̄ with monohydric phenols reacts to give by opening of the oxide ring the corresp. primary aryl ethers of 3-chloropropanediol-1,2 ("α-monochlorohydrin") (3:9038).

[C̄ with phenol (1:1420) (2 moles) at 110° for 10 hrs. (17), or at 150–160° under press. (120) (121) cf (122), gives (86% yield (17)) γ-chloro-β-hydroxy-n-propyl phenyl ether ("α-monochlorohydrin γ-phenyl ether") [Beil. VI-147, VI_1-(85)], b.p. 155–156° at 16 mm. (123), 152–153° at 12 mm. (121), 125–126° at 2 mm. (17), D_4^{25} = 1.209 (17), n_D^{25} = 1.540 (17) (this prod. is also formed even in pres. of a very little NaOH (123)). — C̄ (1 mole) with phenol (1:1420) (1 mole) + aq NaOH (1¼ moles) at ord. temp. for 24 hrs. gives (40% yield (17) (125)) (124) 3-phenoxy-1,2-epoxypropane (glycidol phenyl ether) [Beil. XVII-105, $XVII_1$-(50)], b.p. 243–244° cor. (124), 133° at 23 mm. (121), 115–116° at 3–4 mm. (17), D_4^{25} = 1.10 (17), this reactn. occurs so readily that this prod. has formerly been mistaken for glycerol α,γ-diphenyl ether (see following). — C̄ with phenol (1:1420) +

alc. NaOEt under reflux (120) cf. (124) (127) yields glycerol α,α'-di(phenyl) ether (β,β'-diphenoxyisopropyl alc.) [Beil. VI-149, VI_1-(86)], lfts. from alc., m.p. 82° (120) (127), 81–82° (124), 80–81° (17).]

C̄ (1 mole) with *p*-nitrophenol (1 mole) + aq. NaOH (1½ moles) at ord. temp. for some days gives (126) 3-(*p*-nitrophenoxy)-1,2-epoxypropane (glycidol *p*-nitrophenyl ether) [Beil. $XVII_1$-(51)], m.p. 67° cor. (126), 69° (127). — C̄ (1 mole) with 2,4-dinitrophenol (1 mole) in aq. KOH (1 mole) refluxed several days, or C̄ with Ag 2,4-dinitrophenolate in alc., gives (42–47% yield) (note that C̄ is in excess (128)) glycerol α,α'-*bis*-(2,4-dinitrophenyl)ether, m.p. 79° (128).]

[C̄ (1 mole) with *o*-cresol (1:1400) (1 mole) + very dil. aq. NaOH at ord. temp. 9 days gives (30% yield (123)) γ-chloro-β-hydroxy-*n*-propyl *o*-tolyl ether ("α-monochlorohydrin γ-(*o*-tolyl) ether) [Beil. VI_1-(201)], oil, b.p. 165° at 14 mm. (corresp. *N*-phenylcarbamate, m.p. 113–114°); C̄ (1 mole) with *o*-cresol (1 mole) + excess aq. NaOH at ord. temp. 4 days gives (131) 3-(*o*-toloxy)-1,2-epoxypropane (glycidol *o*-cresyl ether) [Beil. XVII-105], oil, b.p. 134.5° at 14 mm. (131); note, however, that C̄ (1 mole) with Na *o*-cresolate (2 moles) in alc. refluxed 24 hrs. gives (37% yield (129)) cf. (130) glycerol α,α'-*bis*-(*o*-tolyl)ether [Beil. VI-354], m.p. 36–37°, b.p. 226° at 13 mm. (129) (130). — C̄ (1 mole) with *m*-cresol (1:1730) (1 mole) + 20% aq. NaOH (1/40 mole) at ord. temp. for 56 days gives (67.5% yield (126)) γ-chloro-β-hydroxy-*n*-propyl *m*-tolyl ether ("α-monochlorohydrin" γ-(*m*-tolyl) ether) [Beil. VI_1-(186)], b.p. 167.5° cor. at 13 mm. (corresp. *N*-phenylcarbamate, m.p. 108–108.5° cor.); C̄ (1 mole) with *m*-cresol (1 mole) + excess aq. NaOH at ord. temp. gives (126) 3-(*m*-toloxy)-1,2-epoxypropane (glycidol *m*-tolyl ether) [Beil. $XVII_1$-(51)], b.p. 139.5–140° cor. at 15 mm.; note, however, that C̄ (1 mole) with Na *m*-cresolate (2 moles) in alc. refluxed several days gives (23% yield (129)) (130) glycerol α,α'-*bis*-(*m*-tolyl) ether [Beil. VI-378], b.p. 232° at 13 mm. (129) (130). — C̄ (1 mole) with *p*-cresol (1:1410 (1 mole) + 20% aq. NaOH (1/20 mole) at ord. temp. for 8 days gives (47% yield (123)) γ-chloro-β-hydroxy-*n*-propyl *p*-tolyl ether ("α-monochlorohydrin" γ-(*p*-tolyl) ether) [Beil. VI_1-(201)], oil, b.p. 165° at 14 mm. (corresp. *N*-phenylcarbamate, m.p. 113–114°); C̄ (1 mole) with *p*-cresol (1 mole) + excess aq. NaOH at ord. temp. gives (124) cf. (120) 3-(*p*-toloxy)-1,2-epoxypropane, (glycidol *p*-cresyl ether) [Beil. XVII-105, $XVII_1$-(51)], b.p. 136° at 17 mm. (124); note, however, that C̄ (1 mole) with Na *p*-cresolate in alc. under reflux gives (120) (124) glycerol α,α'-*bis*-(*p*-tolyl) ether [Beil. VI-395], m.p. 88° (120) (124).]

[The analogous behavior of C̄ with other monohydric phenols cannot be detailed here; however, for C̄ with α-naphthol (1:1500) (120) (126) (132), β-naphthol (1:1540) (126) (127) (132), carvacrol (1:1760) (126), thymol (1:1430) (126), guaiacol (1:1405) (126) (127) see indic. refs.]

With dihydric phenols. [C̄ (1 mole) with pyrocatechol (1:1520) (1 mole) + KOH (1 mole) condenses with ring closure yielding (133) (134) 5-(hydroxymethyl)-2,3-benzodioxane-1,4, m.p. 96°, b.p. 160° at 17 mm. (133) (134).]

[For behavior of C̄ with 4-acetylresorcinol (resacetophenone) see (135).]

Behavior of C̄ with Ethers

[C̄ with dimethyl ether + BF_3 at −35° after reactn. and distn. gives (86.6% yield (136)) *tris*-(β-chloro-β'-methoxy-isopropyl) borate, accompanied by a little γ-chloro-β-hydroxy-*n*-propyl methyl ether (for constants see above under behavior of C̄ with monohydric alcs.). — C̄ with diethyl ether + BF_3 at 20–25° overnight followed by treatment with aq. 2*N* Na_2CO_3 gives mainly (136) γ-chloro-β-hydroxy-*n*-propyl ethyl ether (for constants see above under behavior of C̄ with monohydric alcs.) accompanied by ethyl alcohol (1:6130); direct distillation of the reaction mixt. without Na_2CO_3 treatment, however,

gives (136) *tris*-(β-chloro-β-ethoxyisopropyl) borate, b.p. 210–216° at 12 mm., D_4^{22} = 1.148 (126).]

[C̄ with α-halogen-methyl alkyl ethers in pres. of $HgCl_2$ gives (137) (105) (by ring opening and addn.) mixed formals; e.g., C̄ with chloromethyl methyl ether (3:7085) + $HgCl_2$ gives formaldehyde β,β'-dichloroisopropyl methyl acetal, etc.]

Behavior of C̄ with Carbonyl Compounds

With aldehydes. [C̄ with aldehydes condenses to yield the corresp. 2-alkyl-4-(chloromethyl)-1,3-dioxolanes; (however, the prod. to be expected from C̄ with formaldehyde (1:0145), viz., 4-(chloromethyl)-1,3-dioxolane [Beil. XIX-8, XIX_1-(610)], b.p. 126° at 750 mm. (138), has not been so reported, but rather from 3-chloropropanediol-1,2 ("α-monochlorohydrin")(3:9038)); for behavior of this prod. with solid KOH at 110° involving loss of HCl and formn. (94% yield (139)) (140) of the formal of propen-1-diol-2,3, b.p. 93–95° at 758 mm. (139), n_D^{20} = 1.4336 (139), see indic. refs.]

[C̄ with acetaldehyde (1:0100) + $SnCl_4$ in CCl_4 at 18–25° gives (45% yield (141)) *4-(chloromethyl)-2-methyl-1,3-dioxolane* ("acetaldehyde γ-chloropropylene acetal") [Beil. XIX_1-(610)], b.p. 158–162° at 760 mm. (141). — C̄ with propionaldehyde (1:0110) + $SnCl_4$ in CCl_4 gives (64% yield (141)) (142) 4-(chloromethyl)-2-ethyl-1,3-dioxolane, b.p. 65–70° at 18 mm. (142). — For analogous reactions of C̄ with *n*-butyraldehyde, octanal-1, decanal-1, and dodecanal-1 see (142); with crotonaldehyde see (141).]

With ketones. C̄ with ketones condenses in completely analogous fashion to yield the corresp. 2,2-dialkyl-1,3-dioxolanes. [E.g., C̄ (converted to 3-chloropropanediol-1,2 ("α-monochlorohydrin") (3:9038) although this may be unnecessary) gives (60% yield (58)) 4-(chloromethyl)-2,2-dimethyl-1,3-dioxolane ("acetone-glycerol α-chlorohydrin"), b.p. 157° at 767 mm., D_4^{20} = 1.1079, n_D^{15} = 1.43750 (58). — C̄ with benzophenone (1:5150) + $SnCl_4$ in CCl_4 at 13–25° gives (73% yield (141)) 4-(chloromethyl)-2,2-diphenyl-1,3-dioxolane, m.p. 44.5°, b.p. 159–167° at 2–3 mm. (141). — For analogous behavior of C̄ with phenacyl bromide, camphor, and cyclopentadecanone see (141).]

Behavior of C̄ with Organic Acids

(For salts, acid chlorides, acid anhydrides, see below.)

With aliphatic monobasic acids. [C̄ with AcOH (1:1010) in s.t. at 180° for 24 hrs. (143) cf. (1) gives a mixt. of both glycerol α-chlorohydrin α'-acetate (3:6775) and glycerol α-chlorohydrin β-acetate (3:6517); C̄ with AcOH + a little $FeCl_3$ at room temp. for 24 hrs. gives (90% yield (144)) a prod. supposed originally (144) to be glycerol α-chlorohydrin α'-acetate (3:6775); note, however, that later workers (36) could obtain only 25% yield unless mixt. stood 15 days at room temp. or 2 days at 80° and regarded the product as glycerol α-chlorohydrin β-acetate (3:6517). — C̄ with aliphatic monobasic acids contg. at least 4 carbon atoms + $AlCl_3$ (145) or C̄ with aliphatic, alicyclic, or aromatic acids (contg. no sulfonic acid groups) + pyridine (146) gives corresp. mono esters (probably mixt. of α- and β-) of 3-chloropropanediol-1,2 (3:9038).]

[C̄ with trichloroacetic acid (3:1150) undergoes ring closure (similar to that of C̄ with carbonyl cpds. above) giving (147) 4-(chloromethyl)-2-hydroxy-2-(trichloromethyl)-1,3-dioxolane, b.p. 99–101° at 0.11 mm., n_D^{23} = 1.4892.]

[C̄ with thiolacetic acid ($CH_3.CO.SH$) at 60° for 12 hrs. gives (76% yield (148)) γ-chloro-β-hydroxy-*n*-propyl thiolacetate, b.p. 100–101° at 1 mm., D_{-}^{20} = 1.2806, n_D^{20} = 1.5186; on longer htg., e.g., 35 hrs. at 60°, *or even at ord. temp.* on 2 weeks stgd. in diffuse light, largely rearr. to β-chloro-β'-mercapto-isopropyl acetate, b.p. 69–70° at 1 mm., D_{-}^{20} = 1.2308, n_D^{20} = 1.4855 (148).]

With HCN (or its salts). [C̄ with excess anhydrous HCN in s.t. at 75–85° for 90 hrs. (149) (150) cf. (151) (152), or C̄ with anhydrous HCN + some solid KCN in s.t. at ord. temp. for 3–4 days (153), or C̄ with aq. $Ca(CN)_2$ (154), gives (yields: 85% (153), 72% (150), 70% (151), 65% (149)) γ-chloro-β-hydroxy-n-butyronitrile [Beil. III-310], b.p. 250° dec. (151), 140° at 20 mm. (151), 134–135° at 15 mm. (153), 110–111° at 2 mm. (151), D_{-}^{15} = 1.233 (153), n_D^{15} = 1.4735 (153). — Note, however, that C̄ with aq. or alc. KCN splits out KCl giving (155) (85) 3-cyano-1,2-epoxypropane ("epicyanhydrin") [Beil. XVIII-261], m.p. 162°.]

Behavior of C̄ with Salts of Organic Acids

[C̄ with dry KOAc first at 110°, later at 150° (156) cf. (157), or at 120–135°, later 150° (18) (158), gives 3-acetoxy-1,2-epoxypropane (glycidyl acetate) [Beil. XVII-106], b.p. 168–169° (157), 167–168° (143), 162–164° at 750 mm. (158), accompanied by other prods. (for study of polymerization of this prod. see (18) (158)).]

C̄ with aq. K cyanate on boilg. (159) (160) or C̄ with free isocyanic acid (from htg. cyanuric acid) in cold (160) adds yielding 5-(chloromethyl)oxazolidone-2 [Beil. XXVII-145, $XXVII_1$-(260)], pr. from aq., C_6H_6, or Ac_2O, m.p. 106° (161) (159), 105° (159).

[For behavior of C̄ with disodium methyl phosphate (162) or with disodium glycerophosphate (163) see indic. refs.]

Behavior of C̄ with Acid Chlorides

C̄ with acid chlorides yields corresp. esters of β,β′-dichloroisopropyl alc. ("glycerol α-dichlorohydrin") (3:5985) as exemplified by the following illustrations.

With aliphatic acid chlorides. [C̄ with AcCl (3:7065) (164) in s.t. at 100° for 2 hrs. (165) or 30 hrs. (166) gives (73% yield (164)) *β,β′-dichloroisopropylacetate (3:6318)*. — C̄ with propionyl chloride (3:7170) in s.t. at 135° for 3 hrs. gives (167) β,β′-dichloroisopropyl propionate [Beil. II_2-(221)], b.p. 208°, D_{20}^{20} = 1.2222 (167). — C̄ with n-butyryl chloride (3:7370) in s.t. at 100° (166) or with exclusion of aq. in flask at 75° for 8 hrs. (167) gives β,β′-dichloroisopropyl n-butyrate [Beil II-271, II_2-(246)], b.p. 226–227° at 738 mm. (166), 223.5° (167), D_{20}^{20} = 1.1792 (167), n_D^{20} = 1.4540 (167). — C̄ with isovaleryl chloride (3:7560) gives (166) (168) β,β′-dichloroisopropyl isovalerate [Beil. II-312, II_2-(275)], b.p. 245° at 737 mm. (166), 127–140° at 36 mm. (168), D_{-}^{20} = 1.444 (168), n_D^{20} = 1.450 (168). — C̄ with stearoyl chloride (3.9960) in s.t. at 130° for 3½ hrs. gives (167) β,β′-dichloroisopropyl stearate [Beil. II_2-(352)], m.p. 39.5°.]

Behavior of C̄ with Acid Anhydrides

With anhydrides of aliphatic acids. [C̄ with Ac_2O (1:1015) in s.t. at 180° for 4 hrs. (166) or C̄ with Ac_2O + $FeCl_3$ at ord. temp. for 24 hrs. (144) gives (90% yield (144)) β,β′-dichloroisopropyl acetate (3:6318).]

With anhydrides of aromatic acids. [C̄ with phthalic anhydride (1:0725) + dimethylaniline at 100° is claimed (169) to give the monomolecular neutral phthalate [Beil. XIX-165] of 3-chloropropanediol-1,2.]

Behavior of C̄ with Organometallic Compounds (or Their Equivalents)

Behavior with Grignard compounds. *With RMgX cpds. from alkyl or alkaryl halides* [C̄ with MeMgI in dry ether evolves gas (CH_4?) and after acidification yields (171) 3-chloro-1-iodopropanol-2 (for constants see above under behavior of C̄ with HI).]

[The reactn. of C̄ with EtMgBr may give three different prods. (or mixtures of them) according to circumstances: the first of these is 1-bromo-3-chloropropanol-2 (for constants

see above under behavior of $\bar{C}$ with HBr); the second is the expected 1-chloropentanol-2 (3:8225); the third is cyclopropanol, b.p. 100–103° (80) (172), $D_{20}^{20} = 0.9110$ (80), $n_D^{20} = 1.4129$ (80) (corresp. p-nitrobenzoate, m.p. 72.0–72.5°; 3,5-dinitrobenzoate, m.p. 108–109°; *N*-phenylcarbamate, m.p. 101.5–102.0°; *N*-(p-nitrophenyl)carbamate, m.p. 159–160°; *N*-(α-naphthyl)carbamate, m.p. 100.5–101.5° (172)). — Note that $\bar{C}$ with EtMgBr gives (16–19% yield (67) (173)) 1-chloropentanol-2 (3:8225), while $\bar{C}$ with $MgEt_2$ gives 70–83% yield (80). — For review of earlier work on this rather complex system see (80) (173) (67).]

[For behavior of $\bar{C}$ with 15 other RMgX cpds. leading in general to chlorohydrins of type $RCH_2CH(OH)CH_2Cl$ see (173).]

With RMgX cpds. from aryl halides. [$\bar{C}$ with C_6H_5MgBr gives (18% yield (173)) (132) (174) (175) 3-chloro-1-phenyl-propanol-2 [Beil. VI-503], b.p. 254–257° (174), 153–154° at 28 mm. (174) (175), 142–144° at 23 mm. (173), $D_{25}^{25} = 1.1528$ (173), $n_D^{25} = 1.5470$ (173) (corresp. 3,5-dinitrobenzoate, m.p. 120–121° (173)). — For analogous behavior of $\bar{C}$ with RMgX cpds. from α-bromonaphthalene and from *p*-bromanisole (*p*-bromophenyl methyl ether) see (132).]

Behavior with various sodio derivatives. [$\bar{C}$ with diethyl sodiomalonate in abs. alc. at 50° does *not* split out NaCl but rather by ring opening, addn. of reactant, and elimination of EtOH ppts. (176) (177) cf. (178) the monosodium enolate (m.p. 172° dec. (176)) of *α-carbethoxy-δ-chloro-n-valero-γ-lactone* [Beil. XVIII-373, $XVIII_1$-(478)], set free (yields: 78% (177), 50% (176)) by acidification as an oil, b.p. 180–182° at 12 mm. (176), 175–180° at 12 mm. (177). — Note that this lactone with excess alc. NH_3 gives on evapn. (176) (179) γ-chloro-β-hydroxy-*n*-propylmalondiamide [Beil. III-450], m.p. 117–118°.]

[$\bar{C}$ with ethyl sodioacetoacetate in abs. alc. at 50° does *not* split out NaCl but rather by ring opening, etc., as in preceding case gives after acidification (yields: 80% (176), 74% (177)) *α-aceto-δ-chloro-n-valero-γ-lactone* [Beil. XVII-421, $XVII_1$-(230)], b.p. 168° at 16 mm. (177), 163° at 12 mm. (176).]

[$\bar{C}$ with ethyl sodio-benzoylacetate in abs. alc. behaves in analogous fashion yielding after acidification (180) *α-benzoyl-δ-chloro-n-valero-γ-lactone* [Beil. XVII-497], m.p. 103–106°.]

Behavior of $\bar{C}$ with Amines

With primary amines. *With aliphatic primary amines.* This reactn. appears not to to have been thoroughly studied [however, for reactn. of $\bar{C}$ with $MeNH_2$ (181) and use of prod. in prepn. of vat dye printing pastes (182) see indic. refs.].

With alicyclic primary amines. [$\bar{C}$ (1 mole) with cyclohexylamine (3½ moles) under reflux gives (18% yield (82)) *β,β′-bis*-(cyclohexylamino)isopropyl alc., m.p. 72–73°.]

With aromatic primary amines. [$\bar{C}$ (1 mole) with aniline (2 moles) in toluene refluxed 95 hrs. gives (yield not stated (71)) 3-(phenylamino)-1,2-epoxypropane ("glycidanilide"). — $\bar{C}$ (1 mole) with aniline (3 moles) at 140° is claimed (183) to yield *β,β′-bis*-(phenylamino)isopropyl alc. [Beil. XII-553], m.p. 53–54°, but later workers could obtain only viscid oils (181) or a further reactn. prod. supposed (185) to be *β*-(phenylamino)-*β′*-(diphenylamino)isopropyl alc., m.p. 350° dec. (185).]

[$\bar{C}$ (1 mole) with *p*-toluidine (2 moles) might be expected to yield 3-(*p*-tolylamino)-1,2-epoxypropane, but no such cpd. appears to have been recorded. — However, $\bar{C}$ (1 mole) with *p-toluidine (1 mole) in dil. alc.* (186) (184) (82) (but *not* in C_6H_6 (184)) opens ring to yield by addn. *β*-chloro-*β′*-(*p*-tolylamino)isopropyl alc., m.p. 85° (184), 81–82° (186); this prod. on htg. with *p*-toluidine (184) or $\bar{C}$ (1 mole) with *p*-toluidine (2 moles) at 155° (186) gives *β,β′-bis*-(*p*-tolylamino)isopropyl alc., m.p. 116° (184), 113.5° (186).]

[$\bar{C}$ with *p*-phenetidine hydrochloride in aq. soln. at ord. temp. especially in sunlight gives (40% yield (187)) cf. (188) *N,N-bis*-(γ-chloro-β-hydroxy-*n*-propyl)phenetidine.]

[For behavior of C̄ with β-naphthylamine in xylene under reflux (189), with arsanilic acid (190), or with p-aminophenol (or its ethers) (191) see indic. refs.]

With heterocyclic primary amines. [C̄ with α-aminopyridine gives (63% yield (192)) by addn. to oxide ring and subsequent ring closure a prod., m.p. 190°, regarded as "1,2-divinylene-5-hydroxytetrahydropyrimidine."]

With phenylhydrazine. [C̄ with 1½ pts. phenylhydrazine in ether at not above 15° for 10 days ppts. phenylhydrazine hydrochloride and leaves in the other 4-hydroxy-1-phenylpyrazolidine [Beil. XXIII-348], m.p. 103–104° (193); this prod. with phenylhydrazine hydrochloride on warming in C_6H_6 (193) or C̄ with 2 pts. phenylhydrazine in C_6H_6 refluxed 8–9 hrs. (194) gives (58% yield (194)) 1-phenylpyrazole (Beil. XXIII-40, XXIII$_1$-(15)], b.p. 246.5° cor. at 765.4 mm. (194), m.p. 11–11.5° (194), D_4^{20} = 1.1127 (195), n_D^{20} = 1.5966 (195).]

With secondary amines. *With aliphatic secondary amines.* [C̄ with Me_2NH presumably gives (196) β-chloro-β′-(dimethylamino)isopropyl alc., but no constants are reported in the literature, either for it or for its ring-closure derivative, 3-(dimethylamino)-1,2-epoxypropane, cf. (196); note further that the prod. to be expected from C̄ + 2 Me_2NH, viz., β,β′-*bis*-(dimethylamino)isopropyl alc. [Beil. IV-290] (197), although known, has not been prepd. from C̄, but only by other means.]

[C̄ with aq. Et_2NH gives (196) (198) cf. (199) 3-(diethylamino)-1,2-epoxypropane [Beil. XVIII-583], b.p. 155–159 at 760 mm. (198), 55–60° at 15 mm. (196), 40–50° at 8 mm. (198), D_4^{15} = 0.8876 (196). — C̄ (1 vol.) with Et_2NH (3½ vols.) refluxed 2–3 hrs. gives (82% yield (200)) β,β′-*bis*-(diethylamino)isopropyl alc., b.p. 114° at 9 mm. (corresp. B̄.2PkOH, m.p. 163° (200).]

[C̄ with di-n-propylamine (2 moles) gives (70% yield (215)) 1,3-*bis*-(di-n-propylamino)-propanol-2, b.p. 99–101° at 3 mm., D_4^{20} = 0.8624, n_D^{20} = 1.4483 (215).]

With aromatic secondary amines. [C̄ with N-methylaniline gives (198) cf. (199) 3-(N-methylanilino)-1,2-epoxypropane, b.p. 160–162° at 30 mm. (198), 132–135° at 8 mm. (198); note, however, that C̄ (1 mole) with N-methylaniline (1 mole) at 100° for 4 hrs. (82) gave none of the preceding cpd. but a very small yield (2%) of β,β′-*bis*-(N-methylanilino)isopropyl alc., m.p. 82°, accompanied by other prods.]

[C̄ with diphenylamine at 160–170° under press. splits out HCl and ring-closes with loss of H_2O yielding (201) 1-phenyl-3-hydroxy-1,2,3,4-tetrahydroquinoline [Beil. XXI$_1$-(205)], m.p. 79°, b.p. 200° at 5 mm.]

With heterocyclic secondary amines. [C̄ with piperidine gives (196) (198) by elimination of HCl 3-(piperidino)-1,2-epoxypropane, b.p. 86.5–88° at 15 mm. (196), 72–77° at 8 mm. (198), D_4^{16} = 0.9669 (196).]

With tertiary amines. C̄ with tertiary amines gives quaternary salts, but this reactn. is often followed by opening of the oxide ring and addn. of reactant.

With aliphatic tertiary amines. [C̄ with alc. Et_3N (1 mole) in s.t. at 100° gives (202) a little of the corresp. quat. salt, viz., triethyl-(β,γ-epoxy-n-propyl)ammonium chloride [Beil. XVIII-583]; note, however, that C̄ with alc. Et_3N (1 mole) in s.t. at 100° for 6 hrs. gives also (202) (203) 2-hydroxytrimethylene-1,3-*bis*-(triethyl-ammonium chloride) [Beil. IV-290] together with other prods.]

[For behavior of C̄ with N,N-dimethyl-"stenyl" amine see (204).]

With heterocyclic tertiary amines. [For study of behavior of C̄ with pyridine see (205) (206); with quinoline see (207).]

Behavior of C̄ with Other Nitrogenous Reactants

(Note that in the following examples reaction occurs by opening of the oxide ring and that elimination of chlorine, if it occurs at all, is effected only in a subsequent ring closure.)

[C̄ (1 mole) with disodium cyanamide (1 mole) in aq. soln. at ord. temp. for 24 hrs. presumably first yields the sodium deriv. of *N*-(γ-chloro-β-hydroxy-*n*-propyl)cyanamide, but this immediately ring-closes giving (33% yield (208)) 5-(chloromethyl)-2-amino-oxazoline, m.p. 142°.]

C̄ (1 mole) with *p*-toluenesulfonanilide (1 mole) + a few drops pyridine at 120° reacts vigorously giving (86% yield (209)) *N*-(γ-chloro-β-hydroxy-*n*-propyl)-*N*-phenyl-*p*-toluenesulfonamide, m.p. 96–97°; note that this prod. in boilg. alc. on treatment with NaOH loses HCl and ring-closes (92% yield (209)) to the corresp. *N*-(β,γ-epoxy-*n*-propyl)-*N*-phenyl-*p*-toluenesulfonamide, m.p. 77°.

[C̄ (1 wt. pt.) with phthalimide (1 wt. pt.) at 140–150° for 3 hrs. gives (35% yield on phthalimide (210)) cf. (211) (212) *N*-(γ-chloro-β-hydroxy-*n*-propyl)phthalimide [Beil. XXI₁-(369)], m.p. 95.0–96.5° (210), 96–97° (213). — Note that *N*-[(β,γ-epoxy)-*n*-propyl] phthalimide ("phthalimidoepihydrin"), m.p. 93–94° (213), has been prepd. (75% yield (213)) from 3-bromo-1,2-epoxypropane ("epibromohydrin") with K phthalimide, and in $CHCl_3$ with HCl gas or even directly with conc. HCl opens the oxide ring to give (213) the above *N*-(γ-chloro-β-hydroxy-*n*-propyl)-phthalimide, m.p. 96–97° (213).]

COLOR REACTION OF C̄

Color reaction with pyridine (and pyridine bases). C̄ in MeOH with pyridine and/or various "pyridine bases" gives specific color reactions; these can be used for detection of "pyridine bases," e.g., in denatured alcohol and probably vice versa; for detailed study see (214).

3:5360 1,2-DICHLOROBUTENE-2 (low-boilg. stereoisomer)

$C_4H_6Cl_2$ Beil. S.N. 11

B.P.	**116–118°** at 765 mm. (2)	D_4^{20} = **1.1544** (2)	n_D^{20} = **1.4642** (2)
	111.5–112.5° at 742 mm. (1)	D_4^{18} = **1.1550** (2)	n_C^{18} = **1.4576** (2)
		D_4^{16} = **1.1488** (1)	n_C^{16} = **1.45513** (1)

[*See also high-boilg. stereoisomer* (3:5615).]

[For prepn. of $\bar{C}$ (together with its stereoisomer (3:5615)) from 1,2,3-trichlorobutane (3:5935) with KOH at 150° (2), or from 2,2-dichlorobutane (3:7415) or 2,3-dichlorobutane (3:7615) with alc. KOH (5), see indic. refs.; for formn. of $\bar{C}$ (together with its stereoisomer and also 2,4-dichlorobutene-2 (3:5550)) from 2-chlorobutene-2 (3:7105) by actn. of Cl_2 at 350° see (3).]

$\bar{C}$ with 1 mole Cl_2 + 1.5 moles $NaHCO_3$ at 0° gives (100% yield (4)) 1,2,2,3-tetrachlorobutane (3:9078).

$\bar{C}$ on hydrolysis by htg. with 2 pts. aq. + 1 mole powdered $CaCO_3$ at 70° for 4 hrs. gives (1) a mixt. of about equal parts of 2-chlorobuten-2-ol-1 (3:8240) and (by allylic transposition) 3-chlorobuten-3-ol-2 (3:9115).

$\bar{C}$ on oxidn. with $KMnO_4$ in acetone gives (1) chloroacetic acid (3:1370) + AcOH (1:1010) + HCl. — $\bar{C}$ in CCl_4 at −17° treated with O_3 followed by aq. gives acetaldehyde (1:0100).

3:5360 (1) Tishchenko, *J. Gen. Chem.* (*U.S.S.R.*) **7**, 658–662 (1937); *Cent.* **1937**, II 371; *C.A.* **31**, 5754 (1937). (2) Tishchenko, Churbakov, *J. Gen. 3:5372 α,α-**DICHLOROPROPIONYL CHLORIDE** $C_3H_3OCl_3$ Beil. II - 251
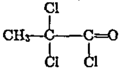
II_1—
II_2-(228)



B.P. **117.4–117.8°** at 753 mm. (1) D_4^{20} = **1.4062** (1) n_D^{20} = **1.45240** (1)
110–115° (2)
68–73° at 88–90 mm. (3)

Colorless lachrymatory liq with penetrating odor.

[For prepn. of $\bar{C}$ from α,α-dichloropropionic acid (3:6162) with $SOCl_2$ under reflux for 10 hrs. (1) or with PCl_3 (2) see indic. refs., from pyruvic acid ($CH_3CO.COOH$) (1:1040) with PCl_5 see (2) (4).]

[For study of rate of reaction of $\bar{C}$ in dioxane with β-chloroethanol (3:5552) see (1).]

$\bar{C}$ with aq. readily hydrolyzes to α,α-dichloropropionic acid (3:6162) q.v.

Ⓓ α,α-**Dichloropropionamide:** lfts. from dil. alc., m.p. 117–118° (3) (5), 116–117° (2), 116° (4) [From $\bar{C}$ with conc. aq. NH_4OH (2); for other ways see under α,α-dichloropropionic acid (3:6162).]

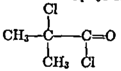
Ⓓ α,α-**Dichloropropion-*N*-ethylamide:** m.p. 51–52° (3). [From $\bar{C}$ with $EtNH_2$ (3).]

—— α,α-**Dichloropropionanilide:** m.p. 101° (3). [Reported only by indirect means (3).]

—— α,α-**Dichloropropion-*p*-toluidide:** m.p. 84–86° (6). [Reported only by indirect means (6).]

3:5372 (1) Leimu, *Ber.* **70**, 1046, 1050 (1937). (2) Beckurts, Otto, *Ber.* **11**, 386–391 (1878). (3) von Braun, Jostes, Münch, *Ann.* **453**, 126, 135 (1927). (4) Klimenko, *Ber.* **3**, 465–468 (1870). (5) Otto, *Ann.* **132**, 183 (1864). (6) Bischoff, Walden, *Ann.* **279**, 93 (1894).

3:5385 α-**CHLORO-ISOBUTYRYL CHLORIDE** $C_4H_6OCl_2$ Beil. II - 295
II_1—
II_2-(263)



B.P. **117–118°** (1) n_D^{20} = **1.4369** (1)
113–114° (2)

The b.p. of 125–126° given by (3) is incorrect (1).

[For prepn. of $\bar{C}$ from isobutyryl chloride (3:7270) with Cl_2 (3) (4) (5) or with SO_2Cl_2 + dibenzoyl peroxide in CCl_4 (20% $\bar{C}$ + 80% β-chloro isomer (1)) see indic. refs.; for prepn. of $\bar{C}$ from α-hydroxyisobutyric acid (1:0431) with $SOCl_2$ (together with other products) see (2).]

[For reactn. of $\bar{C}$ with MeOH yielding methyl α-chloro-isobutyrate (3:7918) see (5).]

$\bar{C}$ on hydrolysis with aq. yields α-chloro-isobutyric acid (3:0235) q.v.

3:5420 TRICHLOROACETYL CHLORIDE

$Cl_3C—C(Cl)=O$ C_2OCl_4 Beil. II - 210 / II_1-(94) / II_2-(200)

B.P. 118° cor.		(1) (8)	$D^{20}_4 = 1.6202$ (3); $n^{20}_D = 1.4701$ (5);
117–118°	at 760 mm.	(2)	1.6179 (5) 1.46949 (3)
117.9°	at 754 mm.	(3)	
116.3–118.5°		(4)	
116.4°	at 755 mm.	(5)	
116–117°	at 726 mm.	(6)	

[For prepn. of $\bar{C}$ from trichloroacetic acid (3:1150) with PCl_3 (1) (7) (8), with PCl_3 + $ZnCl_2$ (25% yield (9)), with $SOCl_2$ (yield: 12% (9), 30% (23)) in C_6H_6 (60% yield (3)) or in pyridine (90% yield (10)), with P_2O_5 + HCl gas (11), with benzotrichloride (3:6540) + $ZnCl_2$ at 100° (77% yield (12)), with benzoyl chloride (3:6240) (51–56% yield (13)) see indic. refs.]

[For formn. of $\bar{C}$ from trichloroacetic acid at 300° (together with CO, CO_2 + HCl) see (14); from acetyl chloride (3:7065) with 3 moles PCl_5 see (11); from hexachloroethane (3:4835) with SO_3 at 150° see (15); from pentachloroethane (3:5880) or *sym.*-tetrachloroethane (3:5750) in ultra-violet light and O_2 see (16); from tetrachloroethylene (3:5460) with SO_3 (15), with H_2SO_4 + HNO_3 (together with other products) (17), with ozone (18) (19), with oxygen in pres. of Br_2 or conc. HNO_3 (20), with oxygen by chlorine sensitized photo-oxidation (21) cf. (30) (31), or with oxygen in ultra-violet light (16) see indic. refs.; from diethyl ether on protracted chlorination in sunlight, from decachlorodiethyl ether (3:1676) on distn. see (22), or from distn. of pentachloroethyl trichloroacetate see (22), from CCl_4 (3:5100) + $AlCl_3$ + CO gas at 200° and 250 atm. (37% yield) see (32).]

[$\bar{C}$ on htg. (13) or on htg. with $AlCl_3$ (23) yields carbon tetrachloride (3:5100) + CO; $\bar{C}$ on htg. at 600° yields (24) carbon tetrachloride (3:5100) + hexachloroethane (3:4835) + CO + phosgene (3:5000).]

[$\bar{C}$ on treatment at −5° with dry HBr gas gives (70% yield (24)) trichloroacetyl bromide, b.p. 143°; $\bar{C}$ similarly treated with dry HI gas gives (71.5% yield (6)) trichloroacetyl iodide, b.p. 74–74.2° at 30 mm. (6).]

[C̄ with MeOH should yield readily methyl trichloroacetate (3:5800), b.p. 153.8°; C̄ with EtOH yields (1) ethyl trichloroacetate (3:5950), b.p. 168°. (For study of rate of reactn. see (2)).]

[C̄ with pure freshly distilled $AlCl_3$ + C_6H_6 yields (25) (26) triphenylvinyl alcohol (ω,ω-diphenylacetophenone) [Beil. VII-522, VII_1-(291)], m.p. 137°; with moist $AlCl_3$ + C_6H_6, however, C̄ gives instead (25) (27) (28) ω,ω,ω-trichloroacetophenone (3:6874), b.p. 256–257° (25). — C̄ with Me_2Zn yields (29) pentamethylethyl alcohol [Beil. I-418, I_1-(207), I_2-(447)]. — C̄ with EtMgBr in ether at 10° gives (33) 1,1,1-trichlorobutanol-2 (3:5955).]

C̄ hydrolyzes readily with aq. yielding trichloroacetic acid (3:1150); for the amide, anilide, p-toluidide, and other derivs. corresp. to C̄ see trichloroacetic acid (3:1150).

3:5425 1-CHLOROPROPANONE-2 (Chloroacetone; acetonyl chloride) $CH_3-\underset{\underset{O}{\|}}{C}-\underset{\underset{Cl}{|}}{CH_2}$ C_3H_5OCl Beil. I - 653, I_1-(344), I_2-(718)

B.P.		B.P. (contd)		
119–120°	(1) (20)	60–62° at 60 mm.	(10)	D_4^{25} = 1.123 (189)
119.7° at 760 mm.	(2)	46° at 46 mm.	(3)	D_-^{20} = 1.170 (11)
119.5° (3)		35° at 29 mm.	(6)	D_{15}^{17} = 1.164 (12)
119.3°	(4)	20° at 12 mm.	(6)	
118.8–119.4°	(5)			D_{16}^{16} = 1.162 (7) cf. (189)
119° at 760 mm.	(6)			
119° at 736 mm.	(7)			D_{13}^{13} = 1.158 (9) cf. (189)
118° at 723 mm.	(8)			
117–118°	(9)			D_4^{15} = 1.135 (189)

C̄ when pure is colorless liq. — C̄ turns dark on exposure to light. — C̄ on long exposure to light, acids, or metals resinifies to a dark mass, m.p. above 350°, which fumes in air and dis. in fumg. HNO_3, but does not react with fumg. H_2SO_4, NH_2OH, or phenylhydrazine

nor hydrolyze with 50% KOH (13). — [For stabilization of C̄ by means of addn. of 1% $CaCO_3$ (14) or 0.1% aq. (15) see indic. refs.]

C̄ is sol. in 10 pts. aq. (7) but does *not* form crystn. hydrates with it (9) (for prepn. of anhydrous C̄ using $CaSO_4$ see (16)); C̄ is volatile with steam (9); sol. in alc., ether, $CHCl_3$. C̄ has very pronounced lachrymatory properties; for studies of this property see (17) (18).

C̄ forms azeotropes with several org. liqs. (19); e.g., C̄ with toluene (1:7405) forms a const.-boilg. mixt., b.p. 109.2° at 760 mm., contg. 28.5% C̄; C̄ with isobutyl alc. (1:6165) forms a const.-boilg. mixt., b.p. 105.8° at 760 mm., contg. 36% C̄; C̄ with ethyl *n*-butyrate (1:3127) forms a const.-boilg. mixt., b.p. 117.2° at 760 mm., contg. 53% C̄; C̄ with isobutyl acetate (1:3115) forms a const.-boilg. mixt., b.p. 116.7°, contg. 30% C̄.

[For prepn. of C̄ from acetone (1:5400) with Cl_2 (188) (9) (20) (21) (22) (23) (24) (25) (yield is poor and contaminated with higher chlorination prods. especially 1,1-dichloropropanone-2 (*unsym.*-dichloroacetone) (3:5430) whose b.p. is very close to that of C̄); with Cl_2 in pres. of $CaCO_3$ (yield 82% (3)) (26) (27) (28); with Cl_2 in vapor-phase chlorination (29) (30) (21) in pres. of $NiCl_2$ (38); by electrolysis in HCl (97% yield (32)) (36) using Pt electrodes (with graphite or lead electrodes resultant C̄ is reduced) even using alternating current (35% yield (33)); with Cl_2O (34); with HOCl (22) (27) (35); with EtOCl (3:7022) (1); with *N*-chlorourea in aq. soln. (37); or with SO_2Cl_2 (72% yield (189)) see indic. refs.]

[For prepn. of C̄ from acetone (1:5400) with benzenediazonium chloride (solid) in pres. of $CaCO_3$ (39) (40), or with aq. solns. of other diazonium chlorides (especially those with negative substituents such as those from *p*-nitroaniline, *p*-chloroaniline, or 2,4-dichloroaniline) in pres. of $CuCl_2$ + NaOAc (41), see indic. refs.]

[For prepn. of C̄ from 1-chloropropanol-2 (propylene α-chlorohydrin) (3:7747) by oxidn with $K_2Cr_2O_7 + H_2SO_4$ (42) (43) (44) (45), CrO_3 + dil. H_2SO_4 (43), CrO_3/AcOH (43), HNO_3 (43) (44) (45), HOCl (42), or $Ca(OCl)_2$ (46) see indic. refs.; from 3-chloro-2-methylpropene-1 (methallylchloride) (3:7145) (10), or from 1-chloro-2-methylbutene-2 (3:7485) (47), or from 1,3-dichloro-2-methylpropene-1 (3:5590) (48), or from 1,4-dichloro-2-methylbutene-2 (3:9204) (49) with O_3 see indic. refs.]

[For prepn. of C̄ from ethyl γ-chloroacetoacetate (3:6375) (50) or from α-chloroacetoacetanilide (51) by hydrolytic cleavage with HCl see indic. refs.; from 1,3-dichloropropene-2 (3:5280) by soln. in conc. H_2SO_4 and distn. with aq. see (52); from allyl chloride (3:7035) with HgO + HOCl see (53); from 1,2-epoxypropane (propylene oxide) (1:6115) with Cl_2 at 0° see (54); from diketene + Cl_2 in cold followed by treatment with aq. see (55).]

[For use of C̄ in refining of mineral oils see (56); in prepn. of photosensitizing cyanine dyes see (57).]

Pyrolysis. [C̄ passed through tube at 450° pyrolyzes into acetaldehyde (1:0100), acetone (1:5400), crotonaldehyde (1:0150) + HCl (58).]

Reduction. [C̄ on reduction with Zn + HCl (7) or on electrolysis in HCl soln. using graphite or lead electrodes (32) yields acetone (1:5400); C̄ on reduction with $AlEt_3$ etherate as directed (59) gives (70% yield) 1-chloropropanol-2 (3:7747), b.p. 78–81° at 80 mm. (59); C̄ on phytochemical reduction using yeast (60) gives (25% yield) 1-chloropropanol-2 (3:7747); for polarographic study of oxidn.-reductn. potential of C̄ see (61).]

Oxidation. C̄ on oxidn. with $KMnO_4$ (49) (62), HNO_3, CrO_3, etc. (62), yields chloroacetic acid (3:1370) and AcOH (1:1010). — C̄ with moist silver oxide yields (7) glycolic acid (1:0430), acetic acid (1:1010), and formic acid (1:1005).

Halogenation. [C̄ with Cl_2 even in cold gives (26) more highly chlorinated acetones; e.g., C̄ with Cl_2 at 30–40° yields (63) 1,1,3-trichloropropanone-2 (3:5957) and 1,1,1-trichloropropanone-2 (3:5620); C̄ with Cl_2 at 50–70° yields (63) cf. (64) *sym.*-tetrachloro-

acetone (3:6050), *unsym.*-tetrachloroacetone (3:6085), and pentachloroacetone (3:6205); C̄ with Cl_2 at 50–100° in light (63) (65) or under press. (66) yields hexachloroacetone (3:6312). — Note that C̄ with $Ca(OCl)_2$ undergoes both chlorination and subsequent cleavage yielding (46) $CHCl_3$ (3:5050).]

[C̄ with Br_2 (3 moles) at 100° yields (67) 3,3,3-tribromo-1-chloropropanone-2 [Beil. I-658], b.p. 215°, 13.0° at 25 mm.]

Reactions of the halogen atom of C̄ (see also further below under formn. of heterocyclic systems). C̄ with excess aq. alkali presumably yields propanone-2-ol-1 (acetol) (1:5455) and therefore reduces Fehling's soln.; the halogen atom of C̄ is so reactive that C̄ slowly neutralizes 1 equiv. alk. (68); C̄ with NaOEt in abs. alc. yields acetol ethyl ether (ethoxyacetone) [Beil. I-822, I_1-(418), I_2-(867)], b.p. 128° at 760 mm. (for study of rate of reaction see (69)).

[C̄ with phenol (1:1420) + anhydrous K_2CO_3 in acetone stirred 24 hrs. at room temp. *or refluxed 3 hrs.* (70) (*note that in pres of KI yield jumps to 92.5%* (191)), *or* C̄ *with* sodium phenolate in phenol (71) (72) or in toluene (73), gives (yields: 21–23% (70), 16% (73)) phenoxyacetone (1:5534), b.p. 117–124° at 19 mm. (70) (note that C̄ + phenol + aq. NaOH gives only black resin (73)) (for application of this type of reactn. to other monohydric phenols such as tetralol-2 (5,6,7,8-tetrahydronaphthol-2) (74) (75) or *p-ter*-butyl)phenol (1:1510) (75) or β-naphthol (1:1540) (191) see indic. refs.). — Note that C̄ with phenol (3 moles) + fumg. HCl at 100° reacts in a dif. sense to give (50% yield (76)) a *tris*-(hydroxyphenyl)propane of undetd. struct.; for formn. of resins from C̄ + phenol see (77) (78).]

[C̄ with KI in aq. MeOH (79) (80) or in acetone (5) gives (75% yield (80)) iodoacetone [Beil. I-660, I_1-(345), I_2-(719)], oil, b.p. 58.4° at 11 mm. (79) (oxime, pr. from pet. eth., *m.p.* 64.5° (79)); *for study of rate of this reactn. in acetone at* 0° *and* 10° *see* (5). — C̄ with K_2SO_3 (or Na_2SO_3) yields (81) salts of acetonesulfonic acid [Beil. IV-19, IV_2-(530)]. — For study of rate of reactn. of C̄ with aq. $Na_2S_2O_3$ see (82). — C̄ with Na_2S in acetone yields (83) (84) *bis*-(acetonyl) sulfide, m.p. 49° (83), b.p. 126° at 14 mm. (83), 125° at 18 mm. (84) (earlier work (85) using alc. as solvent could not be checked (83) (84).)]

[C̄ with aq. NaSCN stirred 10 hrs. at 25° (86), or C̄ with $Ba(SCN)_2$ directly (87) or in alc. (88) (89) cf. (90), gives (95% yield (86)) thiocyanoacetone (acetonyl thiocyanate) [Beil. III-179, III_1-(72), III_2-(125)], oil, b.p. 73.5–74.5° at 1 mm. (86), $D_{15}^{15} = 1.1892$ (86) (for use of this prod. as anti-oxidant for rubber (91), as stabilizer for cellulose (92), or as 1% soln. in petroleum as insecticide (93) see indic. refs.); note that thiocyanacetone, although insensitive to dil. aq. HCl (87), with HCl gas in cold (86) or conc. HCl on boilg (89) adds 1 mole HCl and ring-closes to 2-chloro-4-methylthiazole, oil, b.p. 167–167.5° at 754 4 mm., 69° at 14 mm. (86); note also that thiocyanoacetone with aq. $NaHCO_3$ (94) (or C̄ + aq. KSCN + $NaHCO_3$ (86)) yields 2-hydroxy-4-methylthiazole (4-methylthiazolone-2) ("α-methylrhodime") [Beil. XXVII-158, $XXVII_1$-(264)], ndls. from aq. or ether, m p. 105–106° (94), 102–103° (86).]

[C̄ with Na salts of sulfinic acids gives the corresp. alkyl- (or aryl)sulfonylacetones: e.g., C̄ with Na methanesulfinate gives (95) methanesulfonylacetone, m.p. 64° (95) (96); C̄ with Na benzensulfinate in alc. gives on refluxing (95% yield (97)) benzenesulfonylacetone [Beil. VI-307, VI_1-(145)], lfts. from alc., m p. 57° (97); C̄ with Na *p*-toluenesulfinate yields (97) *p*-toluenesulfonylacetone [Beil. VI-421, VI_1-(210)], m p. 51° (97) (98); many other analogous cases are known.]

[C̄ with tertiary amines gives the corresp. quaternary ammonium chloride salts: e.g., C̄ with dry Me_3N in abs. ether (99) or abs. alc. (100) (101) yields trimethyl-acetonylammonium chloride [Beil. IV-315, IV_2-(763)], very hygroscopic white solid; C̄ with pyridine gives corresp. salt (for study of rate in abs. alc. at 55.6° see (102)). — C̄ with triphenyl-

phosphine in C_6H_6 at 75–80° for 15 hrs. yields (103) triphenyl-acetonyl-phosphonium chloride, m.p. 234° dec. (103). — $\bar{C}$ with hexamethylenetetramine in $CHCl_3$ grad. ppts. an addn. prod. (poor yield (104)), ndls., m.p. 122° (104).]

[$\bar{C}$ with dry NH_3 may yield (9) a little aminoacetone (acetonylamine) [Beil. IV-314, IV_1-(450), IV_2-(763)], but the reactn. is unsatisfactory and other methods (105) are preferred for prepn. of the latter; $\bar{C}$ (in excess) with aq. soln. (30%) of Me_2NH yields (106) dimethylaminoacetone [Beil. IV-314], misc. with aq., alc., ether, b.p. 123° (106); $\bar{C}$ (1 mole) with Et_2NH (2 moles) in ether yields (106) diethylaminoacetone [Beil. IV-316], b.p. 155–156° (106). — Many analogous cases are recorded.]

Reactions of $\bar{C}$ involving the H atoms of its $-CH_2Cl$ grouping. $\bar{C}$ with salicylaldehyde (1:0205) in alc. KOH refluxed for 15 min. (107) (108), or in alc. NaOH refluxed 2 hrs. (109), or $\bar{C}$ + Na salt of salicylaldehyde in dry C_6H_6 under reflux (110), gives (yields: 60–85% (107), 75% (109), 60% (108)) 2-(acetyl)coumarone (2-acetobenzofuran) [Beil. XVII-338], colorless lfts. from alc., m.p. 76° (107), 75–76° (109), 74–75° (108) (110) (corresp. oxime, ndls. from dil. alc., m.p. 150° (111), phenylhydrazone, cryst. from alc., m.p. 153–154° (107), semicarbazone, ndls. from dil. alc., m.p. 217° (107)). — $\bar{C}$ with *p*-dimethylaminobenzaldehyde in AcOH with HCl gas yields (112) α-chloro-α-(*p*-dimethylaminobenzal)acetone, yel. lfts. from alc., m.p. 115° (112) (corresp. phenylhydrazone, m.p. 206–208° (112), semicarbazone, m.p. 202–203° (112)), accompanied by a little α-chloro-α,α'-*bis*-(*p*-dimethylaminobenzal)acetone, cryst. from 1:1 abs. alc. + C_6H_6, m.p. 225° (112). — $\bar{C}$ with diazotized aniline in pres. of NaOAc at 0° yields (113) (49) cf. (114) 1-(benzeneazo)-1-chloroacetone [Beil. XV-342], yel. ndls. from boilg. alc., m.p. 136–137° (113), 135–136° (49).

Reactions of $\bar{C}$ involving the keto group. $\bar{C}$ with satd. aq. $NaHSO_3$ soln. yields (51) a crystn. $NaHSO_3$ cpd. cf. (7).

[$\bar{C}$ with HCN as directed gives (yields: 94% (119), 87–90% (192)) (21) (115) (116) β-chloro-α-hydroxyisobutyronitrile (chloroacetone cyanohydrin) [Beil. III-317], oil, b.p. 110° at 22 mm. (117) 108–110° at 20 mm. (192), 103–104° at 16 mm. (115), $D^{15}_{-} = 1.2027$ (117), $n^{20}_D = 1.4520$ (192), $n^{11}_D = 1.45362$ (117); this prod. on distillation at ord. press. or even on stdg. in the air readily dissociates into the original components; on saponification with HCl, however, it gives (62% yield (192)) (5) (115) β-chloro-α-hydroxyisobutyric acid [Beil. III-317, III_1-(120), III_2-(224)], ndls. from C_6H_6, m.p. 110° (118) 109–110° (192). — $\bar{C}$ (1 mole) with aq. KCN (1 mole) gives 43% yield (119) of a cpd., $C_8H_{10}O_2N_2$, m.p. 183°, formerly supposed to be α-aceto-β-hydroxy-β-methylglutaro(di)nitrile [Beil. III-883] but now (119) regarded as 2,4-dicyano-2,5-dimethyl-5-hydroxytetrahydrofuran (for mechanism of its formn. and review of earlier literature see (119)).]

[$\bar{C}$ forms acetals or similar cpds.: e.g., $\bar{C}$ with triethyl orthoformate (1:3241) in EtOH + a drop of H_2SO_4 gives (yields: 90% (120), 87% (80)) cf. (190) chloroacetone diethylacetal [Beil. I-654, I_2-(718)], b.p. 161–162° u.c. (120) 81–82° at 50 mm. (190), 52–53° at 14 mm. (80), $D^{14}_0 = 1.002$ (120); for acetals from $\bar{C}$ with glycerol (1:6540) (121) or pyrocatechol (1:1520) (122) see indic. refs.]

[$\bar{C}$ with phenyl isocyanide + AcOH in ether gives (123) α-acetoxy-β-chloroisobutyranilide; $\bar{C}$ with phenyl isocyanide + BzOH in ether gives (123) α-benzoyloxy-β-chloro-isobutyranilide.]

[$\bar{C}$ with RMgX cpds. (1 mole) in ether in general reacts normally with the ketonic group to give addn. prods. which with aq. yields the corresp. tertiary alcs.: e.g., $\bar{C}$ with MeMgBr gives (38% yield (124)) (125) 1-chloro-2-methylpropanol-2 (α-isobutylene chlorohydrin) (3:7752) (accompanied as a result of reactn. of a second MeMgBr and rearr. (126) (127) by some 2-methylbutanol-2 (1:6160)); for corresp. reactn. of $\bar{C}$ with EtMgBr yielding

1-chloro-2-methylbutanol-2 (3:8175) see (128); for corresp. reactn. of C̄ with n-C_3H_7MgBr, n-C_4H_9MgBr, iso-C_4H_9MgBr, iso-$C_5H_{11}MgBr$, n-$C_6H_{13}MgBr$, and n-$C_7H_{15}MgBr$ see (129); for corresp. reactn. of C̄ with *ter*-butylethynyl MgBr (130), with n-amylethynyl MgBr (131), or with ethynyl *bis*-(MgBr) (132) see indic. refs. — C̄ with C_6H_5MgBr yields (133) 1-chloro-2-phenylpropanol-2 [Beil. VI-507]; note, however, that if the initial addn. cpd. is htd. at 130–140° prior to hydrolysis rearr. occurs and the prod. then (134) is phenylacetone (1:5118). — For reactn. of C̄ with o-xenyl MgI see (70).]

[C̄ with abs. diazomethane (free from MeOH) in dry ether yields (135) 1-chloro-2-methyl-2,3-epoxybutane, b.p. 124° (135).]

Condensation reactions of C (usually yielding heterocyclic compounds). [C̄ with acetaldehyde (1:0100) + NH_4OH in pres. of $Cu(OAc)_2$ gives (49% yield (136)) 2,4-(or 5)-dimethylimidazole [Beil. XXIII-79, $XXIII_1$-(25)], b.p. 266° at 733 mm., m.p. 92° (136) (B̄.HCl, m.p. 205, B̄.PkOH, m.p. 142–143° (136)).]

[C̄ with methyl acetoacetate (1:1705) + NH_4OH at −1° gives (16% yield (137)) 3-carbomethoxy-2,5-dimethylpyrrole [Beil. XXII-29], cryst. from alc., m.p. 119.5°; C̄ with ethyl acetoacetate (1:1710) + excess conc. aq. NH_4OH (138) (140) or in ether with NH_3 gas (139) gives (yields: 44% (139), 20% (138)) 3-carbethoxy-2,5-dimethylpyrrole [Beil XXII-29, $XXII_1$-(496)], m.p. 116–117° (138) (other by-prods. also being formed (139)); C̄ with ethyl acetoacetate (1:1710) + prim. amines similarly gives N-substituted analogs; e.g., use of aq. $MeNH_2$ gives (141) 3-carbethoxy-1,2,5-trimethylpyrrole [Beil. XXII-29, $XXII_1$-(496)], m.p. 48° (141); use of aniline gives (139) (141) 3-carbethoxy-2,5-dimethyl-1-phenylpyrrole [Beil. XXII-30, $XXII_1$-(496)], m.p. 43°, b.p. 225° at 40 mm.; for corresp. use of p-toluidine see (141).]

[C̄ with ethyl oxaloacetate [Beil. III-780, III_1-(273), III_2-(479)] in ether treated with NH_3 *gas yields (139) 4-carbethoxy-5,6-dihydroxy-2(or 3)-methylpyridine* [Beil. XXII-259], m.p. 223° (139) (much oxamide and other by-prods. also being formed).]

[C̄ with diethyl acetonedicarboxylate (1:1772) in ether (142) (143) (139) or C_6H_6 (144) with dry NH_3 gas gives (yields: 49% (143), 38% (142)) ethyl (3-carbethoxy-4-methylfuryl-2)acetate [Beil. XVIII-333], oil, b.p. 168° at 20 mm. (139).]

[C̄ htd. with amides yields corresp. oxazoles: e.g., C̄ with acetamide htd. 8–10 hrs. at 120° under reflux gives (7% yield (145)) (146) 2,4-dimethyloxazole [Beil. XXVII-17], liq. with odor like pyridine, very sol. aq., b.p. 108° (145) (146); C̄ with benzamide + powdered $CaCO_3$ at 115–120° for 8 hrs. gives (15% yield (147)) (148) 2-phenyl-4-methyloxazole [Beil. XXVII-58], b.p. 238–241° (148), 92–95° at 5 mm. (147) (B̄.HCl, m.p. 72°, B̄.PkOH, m.p. 111° (147)); for corresp. reactn. of C̄ with m-nitrobenzamide see (147).]

[C̄ with thioamides yields corresp. thiazoles: e.g., C̄ with thioformamide in abs. alc. refluxed for 1 hr. (149) or C̄ with formamide + P_2S_5 (150) gives (35–47% yield (149)) 4-methylthiazole [Beil. XXVII-16], b.p. 131° (150), 130° (149), 70–71° at 59 mm. (151) (B̄.PkOH, m.p. 181° (151); B̄.EtI, m.p. 144.5° (149)); C̄ with thioacetamide without solvent (152) (153) in aq. or alc. (152) (149) or C̄ with acetamide + P_2S_5 (150) yields 2,4-dimethylthiazole [Beil. XXVII-18], b.p. 144–145.5° cor. at 719 mm. (152), 143–144° at 762 mm. (153), 143° (150) (154), D_4^{20} = 1.0562 (B̄.PkOH, m.p. 137–138° (152), B̄.EtI, m.p. 212° dec. (149)); C̄ with thiobenzamide in alc. gives (155) (147) 4-methyl-2-phenylthiazole [Beil. XXVII-58], m.p. 29.5° (156), b.p. 282° at 762 mm. (156), 275–277° at 750 mm. (147), 111° at 6 mm. (147); many other analogous cases are recorded.]

[C̄ with aq. thiourea (157) (158) (159) or C̄ with NH_4SCN (160) (161) or C̄ with NH_4SCN + NH_4OH (162) (86) gives (70–75% yield (157)) 2-amino-4-methylthiazole [Beil. XXVII-159], m.p. 44–45° (157), 42° (159), b.p. 231–232° sl. dec. (162), 130–133° at 18 mm. (157), 117–120° at 8 mm. (157); C̄ with N-methylthiourea gives (163) (164) (158) 2-(methyl-

amino)-4-methyl-thiazole [Beil. XXVII-159], pr. from alc., m.p. 71.5–72.5° cor. (163), 64° (164) (B̄.HCl, m.p. 228° cor. (163)); C̄ with phenylthiourea gives (158) (164) 2-(anilino)-4-methylthiazole [Beil. XXVII-159], ndls. from alc., m.p. 117–118° (164), 115° (158).]

[C̄ with *O*-methyl thiocarbamate on warming gives (89) 2-methoxy-4-methylthiazole, b.p. 59–60° at 18 mm. (89) (B̄.HCl, m.p. 78°; B̄.$HgCl_2$, m.p. 123–124° (89)) (accompanied by its dimer); C̄ with *O*-ethyl thiocarbamate + KOAc yields (89) 2-ethoxy-4-ethylthiazole, b.p. 71–72° at 15 mm. (89).]

[C̄ with solid ammonium dithiocarbamate in abs. alc. stood at room temp. for 12 hrs. then refluxed 1 hr. gives (85% yield (151)) 2-mercapto-4-methylthiazole [Beil. XXVII-161], cryst. from isopropyl ether/alc. or dil. alc., m.p. 89–90° (165), 88.0–88.5° (151); note that in ether these reactants yield (166) an intermediate *S*-acetonyl dithiocarbamate, m.p. 80–82° (166), which on stdg. changes to the above 2-mercapto-4-methyl-thiazole; for use of the latter (or its metal salts) as vulcanization accelerators see (167).]

[C̄ with 1-phenylthiosemicarbazide in abs. alc. readily dis. at room temp. yielding on addn. of pyridine (168) 2-(phenylhydrazino)-4-methylthiazole, m.p. 170° (acetyl deriv., m.p. 170° (168)); for analogous reactions of C̄ with the three 1-(tolyl)thiosemicarbazides (169), the three 1-(nitrophenyl)thiosemicarbazides (170), see indic. refs.]

[C̄ with acetone thiosemicarbazone in $CHCl_3$ gives on warming (171) the corresp. deriv. of 4 methylthiazolone 2, viz., 2-keto-4-methyl-2,3-dihydrothiazole-2-isopropylidenehydrazone; for analogous reactn. of C̄ with acetophenone thiosemicarbazone and benzaldehyde thiosemicarbazone see (171).]

Ⓟ **Color reactn. with KOH:** C̄ with excess very conc. aq. KOH gives crimson red color (5) (22).

—— **Acetonyl acetate** (acetol acetate) (acetoxyacetone) [Beil. II-155, II_1-(72), II_2-(168)]: b.p. 174–175° at 760 mm. (172), 137–138° at 230 mm. (172), D_4^{20} = 1.0749, n_D^{20} = 1.4150 (Beil.). [From C̄ + KOAc in MeOH (173) or abs. EtOH (172) after 2 hrs. reflux (82% yield (173)).]

—— **Acetonyl benzoate** (acetol benzoate) (benzoyloxyacetone) [Beil. IX-148]: m.p. 23.5–24° (174), 25° (175); b.p. 188–190° at 60 mm. (176). [From C̄ with KOBz on htg. together (54% yield (176)) or in alc. soln. (174).]

Ⓓ **1-(β-Naphthoxy)acetone** (acetonyl β-naphthyl ether): cryst. from alc., m.p. 78.4° cor. (177), 78° (178), 69–73° (191), 69–72° (70). [From C̄ + Na β-naphtholate on htg. in β-naphthol (178) or from C̄ + β-naphthol (1:1540) + dry K_2CO_3 refluxed in acetone (21% yield (70)) (note that by addn. of KI yield jumps to 85% (191)).]

Ⓓ **1-(*N*-phthalimido)acetone** (*N*-acetonylphthalimide) [Beil. XXI-477, XXI_1-(371)]: lfts or ndls. from aq., m.p. 124° (105). [From C̄ + K phthalimide at 120° for 20 min. (179) or refluxed 1 hr. in xylene (67% yield (180)).]

Ⓓ **1-(*N*-3-nitrophthalimido)acetone** (*N*-(acetonyl)-3-nitrophthalimide: ndls. from alc., m.p. 152–153° (181). [From C̄ with K 3-nitrophthalimide on htg. (181).]

Ⓓ **Methylglyoxal dioxime** (methylglyoxime) [Beil. I-764, I_1-(396), I_2-(822)]: pr. from alc., m.p. 156° (182). [From C̄ with aq. soln. contg. $NH_2OH.HCl$ (3 moles) + Na_2CO_3 (2 moles) followed by acidification and ether extraction (182); note that by careful regulation of conditions chloroacetone oxime has been obtd. (82% yield (183)), but since it is an oil, b.p. 171° at 727 mm. with slight decompn., it has no value as a Ⓓ for C̄.]

Ⓓ **1-(β-Phenylhydrazino)acetone phenylhydrazone** [Beil. XV-412]: yel. cryst. from MeOH, m.p. 162.5° (184). [From C̄ with phenylhydrazine (3 moles) in abs. alc. at −10 to −18° (184).]

Ⓓ **Chloroacetone *o*-nitrophenylhydrazone:** m.p. 83° (135).

Ⓓ **Chloroacetone 2,4-dinitrophenylhydrazone:** yel. ndls. from alc., m.p. 124.0–125.5° (185) (51), 124° (39). [From $\bar{C}$ (0.5 g.) with 2,4-dinitrophenylhydrazine (1.0 g.) in alc. (12 ml.) + conc. HCl (1.5 g.) under reflux (185); note that this prod. on protracted (13 hrs.) boilg. in alc. disproportionates yielding (185) $\bar{C}$ + 2,4-dinitrophenylhydrazine (both sol. hot alc) accompanied by the spar. sol. methylglyoxal-*bis*-(2,4-dinitrophenyl)-osazone, cryst. from pyridine, m.p. 298° (185), for various other reactans. see (185).]

Ⓓ **Chloroacetone semicarbazone:** m.p. 147–148° dec. (39), 141–142° (47), 136–137° (48), 165° (50), 163–165° (44). [From $\bar{C}$ with aq. semicarbazide HCl on addn. of solid $NaHCO_3$ at room temp. (186); note that this prod. is reactive and on boilg. with aq. dissolves to a bright yel. soln. which soon becomes colorless and ppts. hydrazine dicarboxylic acid diamide leaving in the filtrate hydroxypropanone semicarbazone, m.p. abt. 192° dec. (186); these changes (which doubtless occur slowly even on standing in water at room temp.) probably account for the divergent values of m.p. reported above.]

Ⓓ **Condensation prod.** ($C_{17}H_{20}O_4N_3SCl$) of $\bar{C}$ with *N*-methyl-β-carbohydrazidopyridinium *p*-toluenesulfonate: cryst. from 1.1 alc./ether, m.p. 135° cor. (187). [From $\bar{C}$ + indicated react. in abs. alc. on refluxing 15 min. (187).]

(other prods. are also formed) or by electrolysis in HCl (9) see indic. refs.; from ethyl α,α-dichloroacetoacetate [Beil. III-663, III_1-(233), III_2-(427)] by ketonic cleavage with dil. HCl in s.t. at 170–180° for 4–6 hrs. (14) or by refluxing 4–5 hrs. with HCl (15) cf. (4) see indic. refs.; for formn. of C̄ from isopropyl alc. (1:6135) with Cl_2 see (16); from methylacetylene with HOCl (42% yield) see (17); from 1,1-dichloro-2-methylpropene-2 (3:7480) with O_3 see (18); from homoaspartic acid [Beil. IV-494, IV_1-(541), IV_2-(912)] by oxidn. with sodium *N*-chloro-*p*-toluenesulfonamide see (19).

[C̄ on reduction with $Al(OEt)_3$ + anhydrous acetaldehyde in dry ether gives (45% yield (20)) 1,1-dichloropropanol-2 (3:5755), b.p. 146–148°. — C̄ on reduction by yeast gives (54% yield (21)) levorotatory 1,1-dichloropropanol-2.]

C̄ on oxidn. with conc. HNO_3, CrO_3, or $KMnO_4$ yields (22) dichloroacetic acid (3:6208).

[C̄ with Br_2 (1 mole) (1) yields 3-bromo-1,1-dichloropropanone-2 [Beil. I-657], b.p. 111° at 25 mm. (1); C̄ with excess Br_2 at 100° yields (1) 3,3-dibromo-1,1-dichloropropanone-2 [Beil. I-658], b.p. 120° at 25 mm. (1); for study of rate of bromination of C̄ and influence of catalysts thereon see (4).]

[C̄ with PCl_5 htd. at b.p. of mixt. for 2 days yields (2) 1,1,2,2-tetrachloropropane (3:5825), b.p. 153°.]

[C̄ with aq. in s.t. at 200° for 6 hrs. yields (23) lactic acid (1:0400). — C̄ with aq. alk. yields (presumably via cleavage of the expected methylglyoxal) acetic acid (1:1010) and formic acid (1:1005); by virtue of this result C̄ readily reduces Fehling's soln. (24). — C̄ with aq. 10% K_2CO_3 on boilg. loses HCl yielding (25) acrylic acid (1:1020).]

C̄ with satd. aq. $NaHSO_3$ soln. readily yields (1) (5) an addn. prod. crystg. as a trihydrate.

[C̄ with conc. aq. HCN slowly dis. on protracted refluxing yielding (10) the corresp. cyanohydrin (β,β-dichloro-α-hydroxy-isobutyronitrile) [Beil. III-318], an oil, which on htg. dissociates into its components; this prod., however, on hydrolysis with strong HCl yields (10) the corresp. acid, β,β-dichloro-α-hydroxyisobutyric acid (3:2145), pr. from alc./ether or cryst. from C_6H_6, m.p. 82–83° (10) (26). — Note also that C̄ with phenylisocyanide + aq. on stdg. yields (26) β,β-dichloro-α-hydroxy-isobutyranilide, pr. from $CHCl_3$, m.p. 132–133° (26).]

[C̄ in excess MeOH (5 moles) with ethyl iminoformate hydrochloride (1¼ moles) 4–8 days at room temp. yields (27) *unsym.*-dichloroacetone dimethylacetal, b.p. 170–171° at 767 mm., 63° at 9 mm. — C̄ in excess EtOH with ethyl iminoformate as above yields (27) *unsym.*-dichloroacetone diethylacetal, b.p. 183–184° at 767 mm., 76° at 8 mm.]

[C̄ with *o*-nitrobenzaldehyde in alc. treated dropwise with aq. 5% NaOH condenses yielding (28) ω,ω-dichloro-*o*-nitrobenzalacetone, pptd. as oil by addn. of aq., colorless pr. from C_6H_6, m.p. 106–107° (28). — By similar procedure C̄ with *m*-nitrobenzaldehyde gives (28) ω,ω-dichloro-*m*-nitrobenzalacetone, colorless pr. from C_6H_6, m.p. 116–117°; C̄ with *p*-nitrobenzaldehyde similarly gives (30% yield (28)) ω,ω-dichloro-*p*-nitrobenzalacetone, colorless pr. from C_6H_6 or ether, m.p. 125°.]

[C̄ with diazotized aniline in pres. of NaOAc yields (29) dichloro-*bis*-(benzeneazo)-methane, yel.-or. cryst. from hot alc., m.p. 81–82°; C̄ with diazotized *p*-toluidine in pres. of NaOAc yields (29) dichloro-*bis*-(*p*-tolueneazo)methane, or. cryst. from C_6H_6, m.p. 159–160°.]

C̄ (1 mole) treated with aq. soln. of excess $NH_2OH.HCl$ (6 moles) + Na_2CO_3 (3 moles), stood 24 hrs., and acidified yields (15) methylglyoxal dioxime (methylglyoxime) [Beil. I-764, I_1-(396), I_2-(822)], pr. from alc. or aq., m.p. 157°, 153° (15) (30); the same prod. also results if a satd. soln. hydroxylamine sulfate is used (30) in place of free hydroxylamine.

C̄ (1 g.) in abs. alc. (20 g.) with phenylhydrazine (2.5 g.) stood for 1½ days, then warmed with aq. (100 ml.), yields (31) as insol. residue (1 g.) methylglyoxal *bis*-(phenyl)osazone [Beil. XV-156, XV_1-(38)], yel. ndls. from dil. alc., m.p. 148° (31).

Ⓓ **1,1-Dichloropropanone-2 semicarbazone:** m.p. 163° (32). [From C̄ in alc. with aq. semicarbazide.HCl (1 mole) without addn. of NaOAc, the semicarbazone pptg. immediately; note, however, that on stdg. the filtrate ppts. a small amt. of methylglyoxal *bis*-semicarbazone, m.p. 254°, also formed (together with equiv. C̄) on boilg. the semicarbazone with aq. (32).]

Colorless oil. — Note that b.p. of 125° given in I.C.T. is too high (4). — Almost insol. in aq. [for precise data see (1) (2) (3) (4)].

[For prepn. from propanediol-1,3 (trimethylene glycol) (1:6490) with fumg. HCl in s.t. at 100° (13) (10) (20–25% yield (14)) but always accompanied by 3-chloropropanol-1 (trimethylene chlorohydrin) (3:8285) see indic. refs.; with $PCl_3 + ZnCl_2$ (21% yield (15)), or $PCl_5 + ZnCl_2$ (31% yield (15)), or $SOCl_2$ (50% yield (15)) see (15): for prepn. of C̄ from 1,3-dibromopropane (trimethylene dibromide) + $HgCl_2$ (8) (10) or 1,3-diiodopropane + AgCl (16) see indic. refs.: for prepn. of C̄ from γ-chloropropyl *p*-toluenesulfonate with various RMgX cpds see (12); for formn. of C̄ (19.3% (7) together with other products) by chlorination of propane (17) (18) (19) or *n*-propyl chloride (3:7040) (17) (18) see indic. refs.]

[C̄ with Zn dust in aq. alc. (20) (21) or better in a high-boilg. solvent (7) (22) yields cyclopropane, b.p. −34°.]

C̄ with alc. KOH yields allyl chloride (3:7035), b.p. 46°, which then reacts with the KOEt yielding (10) allyl ethyl ether (1:7850), b.p. 66–67° at 742 mm.

- Ⓓ **1,3-Diphenoxypropane** (1:7170) q.v.: lfts. from alc., m.p. 61° (23), 60–61° (24), 59–60° (25); b.p. 338–340° cor. at 762 mm. (26). [From C̄ (26) (or trimethylene dibromide (24) or trimethylene diiodide (25)) with sodium phenolate.]
- Ⓓ **1,3-Di-(α-naphthoxy)propane** [Beil. VI-607]: ndls. from alc., m.p. 103–104° (27).
- Ⓓ **1,3-Di-(β-naphthoxy)propane** [Beil. VI-642]: lfts. from AcOH, m.p. 148–149° (27).

See also Note 1.							

Note 1. For vap. press. of C̄ from 33–118° see (14). Note 2. For D_4^t over range t = 15–90° see (14).

Colorless liq. widely used as solvent, etc. (see also below). — $\bar{C}$ is pract. insol. aq., but detailed studies do not appear to be recorded. — $\bar{C}$ is miscible with alc., ether, $CHCl_3$, C_6H_6, and many other org. solvents.

GENERAL

[For study of $\bar{C}$ as solvent for detn. of mol. wts. by raising of b.p. (ebullioscopic const. = 55.0° per mole solute/100 g. $\bar{C}$) see (23). — For study of thermal conductivity see (24). — For soly. in $\bar{C}$ of gaseous HCl, H_2S, or NH_3 see (11). — For study of influence of $\bar{C}$ upon inflammability of mixts. of air with CH_4 (25) (10) (26) (27), with CO (10) (28), with H_2 (10), or acetylene (10) see indic refs.]

Binary systems contg. $\bar{C}$. [*System $\bar{C}$ + CCl_4*: for f.p./compn. data see (18); for n_D^{25}/compn. and use in anal. of the system see (22); for vap. press. and liq./vapor compn. of system see (29). — *System $\bar{C}$ + 1,1,2,2-tetrachloroethane* (3:5750): for f.p./compn. data see (17). — *System $\bar{C}$ + pentachloroethane* (3.5880): for f.p./compn. data (eutectic, f.p. −54 8° contg. 58.4 wt. % $\bar{C}$) see (18). — *System $\bar{C}$ + isopropyl alc.* (1:6135); for D_{25}^{25}/compn. and n_D^{25}/compn. data see (30)]

$\bar{C}$ forms binary azeotropes with many alcohols [e.g., *$\bar{C}$ with MeOH* (1:6120) forms a const-boilg. mixt, b.p 63.75° at 760 mm., contg. 36.5 wt. % $\bar{C}$ (3); *$\bar{C}$ with EtOH* (1:6130) forms a const.-boilg. mixt., b p. 76.75° at 760 mm., contg. 37 wt. % $\bar{C}$ (3); *$\bar{C}$ with n-propyl alc.* (1:6150) forms a const.-boilg. mixt., b.p. 94.05° at 760 mm., contg. 52 wt. % $\bar{C}$ (31); *$\bar{C}$ with isopropyl alc.* (1:6135) forms a const.-boilg. mixt., b.p. 81.7° at 760 mm., contg. 30 wt. % $\bar{C}$ (31), *$\bar{C}$ with n-butyl alc.* (1:6180) forms a const.-boilg. mixt., b.p. 108.95° at 760 mm., contg 71 wt. % $\bar{C}$ (3); *$\bar{C}$ with isoamyl alc.* (1:6200) forms a const.-boilg. mixt., b.p. 116.1° at 760 mm., contg. 80 wt. % $\bar{C}$ (31); *$\bar{C}$ with ethylene glycol* (1:6465) forms a const.-boilg mixt., b.p. 119.1° at 760 mm., contg. 94 wt. % $\bar{C}$].

$\bar{C}$ forms binary azeotropes with many other org. cpds. [e.g., *$\bar{C}$ with formic acid* (1:1005) forms a const-boilg. mixt., b.p. 88.15° at 760 mm., contg. 50 wt. % $\bar{C}$ (32); *$\bar{C}$ with AcOH* (1:1010) forms a const.-boilg. mixt., b p. 107.35° at 760 mm, contg. 61 5 wt. % $\bar{C}$ (218); *$\bar{C}$ with propionic acid* (1:1025) forms a const.-boilg. mixt., b.p. 119 15° at 760 mm., contg. 91.5 wt % $\bar{C}$ (4); *$\bar{C}$ with isobutyric acid* (1:1030) forms a const.-boilg. mixt., b.p. 120.5°, contg. 97 wt. % $\bar{C}$ (33)]

Uses of $\bar{C}$. $\bar{C}$ because of its solvent properties, b.p., uninflammability, and immiscibility with aq., etc., finds wide use. — [Other examples of its utility include the following: for use as dry-cleaning solvent see (34), cf. (35) (36) (222); for use with lower aliph. alcs. as solv. for cellulose ethers see (37); for use in dewaxing of lubricating oil see (38); for use in liq. HCN to diminish inflammability and explosiveness see (39); for use as a component of comml. tear-gas mixts. see (40).]

[For study of use of $\bar{C}$ as an anesthetic (41), as fumigation agt. (with CCl_4) for grain or flour (42), for sterilization of surgical catgut (43), of antiseptic action (compared with $CHCl_3$ (44)) (45) see indic. refs.]

[For examples of studies of use of $\bar{C}$ as anthelmintic especially with reference to hookworm and similar parasites see (46)-(57) incl.; for comparison of anthelmintic action of $\bar{C}$ with that of CCl_4 (58) (59) or of chenopodium oil (60) see indic. refs.; for patent prepn. of $\bar{C}$ for use as anthelmintic see (61).] (For toxicity see below.)

[For use of $\bar{C}$ as the "booster" liquid in detn. of aq. by distn. especially in molasses and other sugar industry products see (62) (63) (64) (65) (66) (67). — For use of $\bar{C}$ in prepn. of anhydrous Na_2O_2 by removal of moisture by distn. see (68).]

[For brief general surveys of $\bar{C}$ see (69) (70).]

Physiological actn. and/or toxicity of $\bar{C}$. [For studies from various viewpoints on toxicity of $\bar{C}$ see (57), (71)-(82) incl., also especially (219) (220) (224).]

Determination of $\bar{C}$. $\bar{C}$ is usually detd. by some form of decn. followed by volumetric or gravimetric detn. of resultant chloride ion [e.g., for methods involving decn. of $\bar{C}$ with Na + AmOH in xylene (83) (84), with Na + ethanolamine in dioxane soln. (85) (223), or with Na in liq. NH_3 (86) (note that some cyanide formn. occurs) see indic. refs.; for methods involving thermal decn. see (87) (215)].

[For detn. of $\bar{C}$ by means of a recording ultra-violet photometer (the R. + H. Tri-Per Analyzer) see (88).]

PREPARATION OF $\bar{C}$

From various polychloroethanes or polychloroethylenes. [For prepn. of $\bar{C}$ from hexachloroethane (3:4835) by pyrolysis at 565° (89–94% conversion (89)), by passing over porcelain chips in hot tube (90) (note that CCl_4 (3:5100) is also formed), or by passing with H_2 over Ni at 270° (91) see indic. refs.; for prepn. of $\bar{C}$ from hexachloroethane (3:4835) by treatment with granulated Zn in boilg. alc. (7), with Zn + dil. H_2SO_4 at room temp. for several days (100% yield (5)) (92) (116), or even with Zn + aq. above 80° (93), with alc. KSH (94), with molecular Ag at 280° in s.t. (95), with SbF_3 at 300–325° under press. (96), with acetylene over activated carbon at 200–400° (97) cf. (123), with aniline at 170° at ord. press. (7), with N/10 abs. EtOH/NaOH at 25° (216), or with alc. free NaOEt in ether under press. at 140° (217) see indic. refs.]

[For prepn. of $\bar{C}$ from pentachloroethane (3:5880) by elimination of 1 HCl in various ways: e.g., by passing over bone char at 280° (98), or over $NiCl_2$ at 330° (99), by htg. with $AlCl_3$ at 70–100° (100% yield (101)) (100) or under reflux (102), with liq. NH_3 at −18 to −34° under reduced press. (103) (104), with MeOH over Al_2O_3 at 290° (MeCl (3:7005) is also formed) (105), with acetylene over cat. at 200–300° (vinyl chloride (3:7010) is also formed) (106), with alc. KOH (107) (108), or in alc. with 2 N aq. NaOH in cold (98% yield) (109) see indic. refs.]

[For prepn. of $\bar{C}$ from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) (see also below under prepn. of $\bar{C}$ from acetylene) on pyrolysis at 700° (110), with air over pumice + $CuCl_2$ at 430–450° (111), or with Cl_2 over activated carbon contg. 80% $CuCl_2$ at 300–320° (112) see indic. refs.]

[For prepn. of $\bar{C}$ from 1,2-dichloroethane (ethylene dichloride) (3:5130) with Cl_2 over cat. at 300–500° see (113); from ethane or its chloro derivs. with Cl_2 + fused metal chlorides such as $AlCl_3$, etc., at 250–500° see (114).]

[For formn. of $\bar{C}$ from trichloroethylene (3:5170) on pyrolysis at 700° (110) or with anhyd. $FeCl_3$ on htg. see (115).]

From various polychloromethanes. [For prepn. of $\bar{C}$ from CCl_4 (3:5100) through tube at 1300–1400° see (116) (117); for formn. of $\bar{C}$ (together with other prods.) from CCl_4 + H_2 through hot tube over pumice at low red heat (118) or through tube at 600–650° (119), or in dark electric discharge (120), see indic. refs. — Note also that $\bar{C}$ has been found (121) as a by-prod. of prepn. of CCl_4 (3:5100) by actn. of Cl_2 on CS_2.]

[For formn. of $\bar{C}$ from $CHCl_3$ (3:5050) + H_2 in dark electric discharge see (120).]

From acetylene with Cl_2 (see also above under prepn. of $\bar{C}$ from 1,1,2,2-tetrachloroethane (acetylene tetrachloride)). [For prepn. of $\bar{C}$ from acetylene with Cl_2 + inert gas over cat. at 250–400° see (122) (123) (124) (125); from acetylene with Cl_2 at 700–900° in absence of extraneous substances (126); from acetylene with Cl_2 see (127) (128); from acetylene with Cl_2 in halogenated solv. at 175–260° + $AlCl_3$, etc., see (129).]

From miscellaneous sources. [For prepn. of $\bar{C}$ from CO + HCl over cat. at 230–240° under high press. ($CHCl_3$ is also formed) see (130); from *unsym.*-heptachloropropane (3:0200) by dissociation into $\bar{C}$ + $CHCl_3$ over Cu_2Cl_2 at 250° see (131); from chloral (3:5210) by long boilg. with $AlCl_3$ see (132) cf. (133) (134); from tetrachloroethyl chloro-

formate with $AlCl_3$ see (135); from trichloroacetic acid (3:1150) over ThO_2 + kaolin at 230–250° see (136); from pentachloropropionic acid (3:4895) on htg. in aq. (137), or from its ferric salt in light (139) cf. (140), or from pentachloropropionyl chloride (3:0470) with $AlCl_3$ (1 mole) at 60° (138) see indic. refs.]

PURIFICATION OF $\bar{C}$

Comml. $\bar{C}$ conts. some impurity which readily chlorinates (15); note also that $\bar{C}$, especially if exposed to light and air, may contain phosgene (3:5000), trichloroacetyl chloride (3:5420), trichloroacetic acid (3:1150), and other prods.; cf. below under oxidation of $\bar{C}$. — [For purification of $\bar{C}$ by treatment with Cl_2 followed by illumination (15), by treatment with aq. alk. at elev. temp. (for removal of 1,1,2-trichloroethane (3:5330) or 1,1,1,2-tetrachloroethane (3:5555)) (141), by refluxing with finely divided metals + dil. acid (142) or with 1% Al or $AlCl_3$ (143), or by passing vapor over kaolin at 250° (144), see indic. refs.]

STABILIZATION OF $\bar{C}$

To increase the resistance of $\bar{C}$ to photooxidation (see below) and other changes, the addition of very small amts. of various stabilizers has been recommended. — [For example, for study of control of photooxidation of $\bar{C}$ by use of inhibitors such as thymol (1:1430), ether, alcohol, thiourea, etc., see (145). — For stabilization of $\bar{C}$ by addn. of small amts. of paraffin hydrocarbons (e.g., gasoline) (146), various phenols (such as hydroquinone monomethyl or monobenzyl ether) (147), oil-sol. azo dyes contg. phenolic groups (148), mercaptans (such as n-butyl mercaptan) (149), various org. tertiary amines such as triethylamine (150) or picoline (151), various phenols, amines, and aminophenols (152), or a wide variety of org. N cpds. (221) see indic. refs.]

CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis. [$\bar{C}$ on pyrolysis over heated Pt wire gives (153) (154) hexachloroethane (3:4835) + hexachlorobenzene (3:4939) + Cl_2.]

Hydrogenation. [Note that $\bar{C}$ does not add H_2 even in pres. of Ni at 300–350° (99); $\bar{C}$ with excess H_2 over Ni at 220° dec. (163) to carbon + HCl.]

Oxidation. $\bar{C}$ can be oxidized especially in the presence of light and moisture giving according to conditions trichloroacetyl chloride (3:5420), phosgene (3:5000), trichloroacetic acid (3:1150), or various mixtures of these prods.; for inhibition of this oxidation see above under stabilization of $\bar{C}$

[For extensive studies of photochem. oxidn. of $\bar{C}$ giving 87% trichloroacetyl chloride accompanied by phosgene see (15) (155) (156); for oxidn. of $\bar{C}$ on stdg. with aq. in light for 4 months yielding trichloroacetic acid see (157) cf. (158); for oxidn. of $\bar{C}$ to trichloroacetyl chloride with O_3 (159) (160), with peracetic acid (acetyl hydrogen peroxide) (161), with conc. HNO_3 + conc. H_2SO_4 in freezing mixt. (162), with SO_3 at 150° (164), or with N_2O_5 (194) see indic. refs.; for patents on photochem. oxidn. of $\bar{C}$ to trichloroacetyl chloride (3:5420) see (165) (166).]

[$\bar{C}$ on oxidn. with $K_2Cr_2O_7/H_2SO_4$ is completely converted to CO_2 + H_2O + HCl (167); $\bar{C}$ passed with air over CuO at 450° gives only traces (168) of phosgene.]

Reaction with halogens. [$\bar{C}$ dislvd. in dichlorodifluoromethane ("Freon") with F_2 at −80° (169), or $\bar{C}$ with F_2 at 0° directly (170) but *not* in CCl_4 soln. (169) cf. (172), or $\bar{C}$ in vapor phase at 130° with F_2 diluted with N_2 (171), gives (20% yield (171)) 1,2-difluoro-1,1,2,2-tetrachloroethane, m.p. 26.5° (96) (169), accompanied by various other prods. such as fluoropentachloroethane, m.p. 99.0–99.5° (in s.t.), b.p. 136–138° (170), and 1,4-difluoro-octachlorobutane (170) (169), m.p. 4–5° (170), b.p. 152.2° at 20 mm., D_4^{20} = 1.9272, n_D^{20} = 1.5256 (170).]

[$\bar{C}$ with dry Cl_2 in direct sunlight (90), or $\bar{C}$ in CCl_4 at 22° (173) or in vapor phase at 40° and low press. (155) in light and absence of O_2, or $\bar{C}$ with SO_2Cl_2 in pres. of dibenzoyl peroxide (174) *adds* Cl_2 yielding hexachloroethane (3:4835) q.v.; note, however, that $\bar{C}$ + Cl_2 + light in pres. of O_2 undergoes photooxidation to trichloroacetyl chloride (see above under oxidation of $\bar{C}$). — $\bar{C}$ with Cl_2 at 700–800° (175), or $\bar{C}$ with Cl_2 over act. carbon at 600–650° (176), undergoes cleavage of C—C bond yielding CCl_4 (3:5100); for study of this reactn. see (177).]

[$\bar{C}$ with Br_2 in sunlight adds 1 mole Br_2 yielding (178) (179) (110) 1,2-dibromo-1,1,2,2-tetrachloroethane, m.p. 197.5° dec. (in s. cap. tube) (180), 200–205° dec. (110), 190° dec. (138). — Note, however, that this photochem. addn. is inhibited by its reactn. prod. (181), that, although accelerated by *small* amts. O_2, pres. of large amts. O_2 lead to a halogen catalyzed photooxidation (181), that in CCl_4 soln. resultant equilibrium mixt. conts. only 30% addn. prod. (182). — For extensive study of this reactn. see (181); for studies of its rate see (183) (184); for extensive study of photochem. dissoc. of prod. see (179). — For study of reactn. of $\bar{C}$ with radio-bromine see (185).]

[$\bar{C}$ does not add I_2. — For soly. of I_2 in $\bar{C}$ see (186); for use of such solns. in detn. of iodine number of unsatd. oils and fats see (187) (188).]

Behavior of $\bar{C}$ with other inorganic materials. [$\bar{C}$ with Cl_2O in CCl_4 at −20° gives (189) hexachloroethane (3:4835).]

[$\bar{C}$ with NO_2 in s.t. at 100–120° for 3 hrs. (190), or at 100–110° for 3 hrs. (5), or at 80° for 3 hrs. or 60° for 6 hrs. (191), or at 10–12 atm. press. at 60–80° for 3–6 hrs. (191), or $\bar{C}$ with fumg. HNO_3 at ord. temp. stood several days (5) cf. (192), adds 2 moles NO_2 yielding 1,2-dinitro-1,1,2,2-tetrachloroethane [Beil. I-102, I_1-(33)], cryst. from alc., m.p. 142–143° (s. cap. tube) (5).]

[$\bar{C}$ with nitryl chloride ($ClNO_2$) yields (193) 1-nitro-1,1,2,2,2-pentachloroethane, lfts. from alc., m.p. 192° (s. cap. tube) (193).]

[$\bar{C}$ with N_2O_5 undergoes vigorous oxidn. (presumably to trichloroacetyl chloride) (194).]

[$\bar{C}$ with NH_3 at 700–800° splits off all its halogen as NH_4Cl (195) cf. (196).]

[For behavior of $\bar{C}$ with various common metals see (197); note that $\bar{C}$ is not attacked by molecular Ag even at 300° (95); note that $\bar{C}$ with Na or K or their mixture may (like many other polychloro compds.) explode under certain conditions (for an extensive study see (198)).]

Behavior of $\bar{C}$ with organic reactants. [$\bar{C}$ (1 mole) with $CHCl_3$ (2 moles) + $AlCl_3$ (0.2 mole) refluxed 15–20 hrs. gives (85–93% yield (199)) (101) (16) (200) (201) (202) (214) *unsym.*-heptachloropropane (3:0200); for study of equilibrium of system $\bar{C}$ + $CHCl_3$ + *unsym.*-heptachloropropane see (131).]

[$\bar{C}$ with 1,1,2,3,3-pentachloropropene-1 (3:6075) + $AlCl_3$ gives (201) cf. (214) 1,1,3,4,5,5,6,6,6-nonachloropentene-1.]

[$\bar{C}$ with NaOEt at 100–120° yields (203) ethyl dichloroacetate (3:5850) + Na diethoxyacetate + other prods., presumably via ethyl α,β,β-trichlorovinyl ether, α,α-dichloro-β,β-diethoxyethylene, triethyl dichloroorthoacetate, etc., cf. (204).]

[$\bar{C}$ (1 mole) with $NaSC_6H_5$ (2 moles) in alc., refluxed 48 hrs., gives (yield not stated (205)) α,β-dichloro-α,β-*bis*-(thiophenyl)ethylene, ndls. from alc., m.p. 71–72° (205). — $\bar{C}$ with disodium salt of dithiopyrocatechol in alc. at 110–120° in s.t. for 7 hrs. gives small yield (206) of , golden ndls., m.p. 234° (206).]

[$\bar{C}$ with paraformaldehyde (1:0080) + conc. H_2SO_4 as directed (207) gives α,α-dichloro-β-hydroxypropionic acid, m.p. 88–89° (s. cap. tube).]

[$\bar{C}$ with dibenzoyl peroxide on refluxing either with or without $AlCl_3$ gives (40% yield

(208)) α,α,β-trichloro-β-phenylethylene (α,α,β-trichlorostyrene) [Beil. V-477, V_2-(367)], b.p. 87–89° at 3 mm., $D_-^{25} = 1.40$, $n_D^{25} = 1.5758$ (208), accompanied by chlorobenzene (3:7903), CO_2, and under certain conditions by hexachloroethane (3:4835).]

[$\bar{C}$ with large excess EtMgBr in boilg. ether evolves ethylene and on subsequent treatment with aq. gives a mixt. of ethylene + acetylene; for explanation see (209). — $\bar{C}$ with n-butyllithium in pet. eth. gives violent explosion (210).]

[For study of reactn. of $\bar{C}$ with pyridine or piperidine at 16–18° see (211).]

Ⓟ Color test with NH_4OH/Cu_2Cl_2: $\bar{C}$ (1–2 drops) in small glass-stoppered bottle filled with conc. aq. NH_4OH, treated with powdered Cu_2Cl_2, stopper quickly inserted (to force out air and excess liquid), shaken, and allowed to stand, gives in 3 days a pale amethyst color (212); note, however, that $\bar{C}$ on stdg. with metallic Cu + conc. aq. NH_4OH develops rich port-wine red color in aq. layer and brown coating on the copper (213). — Note also that neither of these tests should be regarded as conclusive (see (212) (213)).

CH_3—C=C—CH_3

B.P. 124–126° at 758 mm. (1)	D_4^{20} = 1.1618 (1)	n_D^{20} = 1.4590 (1)
	D_4^{18} = 1.1620 (1)	n_C^{18} = 1.4616 (1)

[*See also trans stereoisomer* (3·7395).]

[For prepn. of $\bar{C}$ (accompanied by its *trans* stereoisomer (3:7395)) from 2,2,3-trichlorobutane (3:5680) with solid KOH (1 mole) at 135–140° see (1).]

$\bar{C}$ on oxidn. with 3% aq. $KMnO_4$ yields (1) acetic acid (1:1010).

$\bar{C}$ in CCl_4 at −20° treated with 7% O_3, then hydrolyzed, yields (1) acetic acid (1:1010) + acetaldehyde (1:0100).

3:5500 (1) Tishchenko, Churbakov, *J. Gen. Chem.* (*U.S.S.R.*) 6, 1553–1558 (1936); *Cent.* 1937, I 3785; *C.A.* 31, 2165 (1937).

3:5515 TRICHLOROMETHYL CHLOROFORMATE $C_2O_2Cl_4$ Beil. III - 18

[illegible].O.CO.Cl III₁-(8)

[illegible] III_2-(16)

B.P.			M.P.

127°	at 760 mm.	(3)			
126–127°	at 745 mm.	(4)		D_{15}^{15} = 1.655 (3)	n_D^{22} = 1.45664 (8)
		(5)			
127.2°	at 725 mm.	(6)			
49°	at 50 mm.	(3)			
45°	at 26 mm.	(7)			
20°	at 10.3 mm.	(1)			
0°	at 2–4 mm.	(1)			

Colorless oily liq. with irritating and suffocating odor, but (when pure) not especially lachrymatory. — Ord. samples may cont. triphosgene (3:1915).

[For prepn. from methyl formate (1:1000) or methyl chloroformate (3:5075) by chlorination see (8) (3) (9) (2) (1); for prepn. from *bis*-(trichloromethyl) carbonate (triphosgene) (3:1915) see (1); for German prepn. in World War I see (10).]

$\bar{C}$ (when pure) boils with no decompn. (1); however, above 300° (2) or on contact with activated carbon, charcoal, or iron oxide at ord. temp. (1) $\bar{C}$ decomposes to phosgene

(3:5000). — $\bar{C}$ on contact with alumina (1), $AlCl_3$ (5), or $FeCl_3$ (3) decomposes in a different mode yielding CCl_4 (3:5100) + CO_2.

$\bar{C}$ with aq. hydrolyzes slowly in the cold but rapidly at 100° yielding only HCl + CO_2 (1) (3); $\bar{C}$ on warming with aq. Na_2CO_3 yields NaCl + CO_2 (3).

$\bar{C}$ on treatment at 20° for 5 min. with NaI in acetone evolves CO and separates I_2 to 98.8% of amt. expressed by reaction: $Cl_3C.O.CO.Cl + 2NaI \rightarrow 2CO + 4NaCl + I_2$ (11) [cf. chloromethyl chloroformate (3:5275), dichloromethyl chloroformate (3:5315), and triphosgene (3:1915)].

$\bar{C}$ with aq. NH_4OH reacts vigorously yielding urea + NH_4Cl. — $\bar{C}$ with excess aniline in either aq. or non.-aq. soln. is converted to *N,N'*-diphenylurea (carbanilide), m.p. 233°, + aniline hydrochloride (3). [Note that with insufficient aniline a mixt. of phenyl isocyanate + *N*-phenylcarbamyl chloride may form (3).]

$\bar{C}$ on addn. in cold to conc. soln. of phenol (1 mole) in aq. NaOH separates an oil (which soon solidifies) of phenyl trichloromethyl carbonate [Beil. VI_1-(88)], ndls. from ether, m.p. 70.5° (12), 66° (3); this product upon warming with aq. sodium phenolate (or $\bar{C}$ warmed with excess sodium phenolate in one operation) yields diphenyl carbonate (1:2335), cryst. from alc., m.p. 78° (12). [For corresponding reactions with *p*-cresol (1:1410), *β*-naphthol (1:1540), *p*-chlorophenol (3:0475), and *p*-nitrophenol see (13).]

$\bar{C}$ with pyridine yields a yel. double quaternary ammonium salt $C_5H_5N(Cl).CO(Cl)$-$N.C_5H_5$ which by aq. is decomposed to pyridine hydrochloride + CO_2 (14).

[For use of $\bar{C}$ in prepn. of acid chlorides of carboxylic or sulfonic acids see (15); similarly $\bar{C}$ htd. with anhydrous NaOAc gives Ac_2O + NaCl + CO_2 (2); for actn. on methyl hydrogen sulfate yielding methyl chlorosulfonate + phosgene + CO_2 see (16).]

[For use of $\bar{C}$ for introduction of a second —CO.Cl group into acid chlorides see (17).]

3:5540 **α,β-DICHLOROVINYL ETHYL ETHER** $C_4H_6OCl_2$ **Beil. I - 724**
(α,β-Dichloro-α-ethoxyethylene) **I_1-(377)**
I_2-(780)

$$\underset{Cl}{CH}=\underset{Cl}{CH}—O—CH_2CH_3$$

B.P. **128.2°** cor. (1)	D_4^{25} = **1.1972** (3)
125–127° (4)	D_4^{20} = **1.2037** (3)
122–126° (2)	$n_D^{16.5}$ = **1.45584** (3)

$\bar{C}$ has the possibility of existing in two geometrically isomeric forms, but only this one has as yet been recognized.

[For prepn. of $\bar{C}$ from trichloroethylene (3:5170) with alc. KOH (4), with alc. NaOEt (yield: 81% (5), 70% (2)), or with alc. NaOH + CaO (6) see indic. refs.; from 1,1,1,2-tetrachloroethane (3:5555) with NaOEt see (1).]

[$\bar{C}$ with calcd. amt. aq. (7), or with conc. HCl (8) yields ethyl chloroacetate (3:5700);

$\bar{C}$ on boilg. with aq. to complete soln. yields (9) chloroacetic acid (3:1370); $\bar{C}$ on htg. with aq. in s.t. at 180° yields (1) glycolic acid (1:0430), EtCl (3:7015) + HCl.]

[$\bar{C}$ with HCl gas yields (10) an addn. prod. which on htg. decomposes to chloroacetyl chloride (3:5235) + EtCl (3:7015); $\bar{C}$ with monobasic org. acids yields (2) on htg. ethyl chloroacetate (3:5700) + corresp. acid chloride; with succinic acid the products are (2) ethyl chloroacetate (3:5700) + succinic anhydride (1:0710).]

[$\bar{C}$ with alcohols yields mainly (2) (11) the corresp. alkyl chloroacetate + EtCl (some ethyl chloroacetate + alkyl chloride are also formed (2)); $\bar{C}$ htd. with excess NaOEt yields (1) sodium salt of ethoxyacetic acid (1:1070).]

[$\bar{C}$ with phenols yields exclusively (2) the corresp. aryl chloroacetate + EtCl; e g., $\bar{C}$ with β-naphthol (1:1540) yields (2) β-naphthyl chloroacetate, m.p. 95° (2).]

$\bar{C}$ with aniline in aq. or aq. alc. soln. yields (12) ethyl N-phenylaminoacetate (90%) [Beil. XII-470, XII_1-(263)], m.p. 58°, and phenylaminoacetanilide (10%) [Beil. XII-556, XII_1-(285)], m.p. 112°

[$\bar{C}$ readily absorbs Cl_2 at ord. temp.; if moisture is carefully excluded, the prod. breaks up (13) (14) *on keeping or on htg. into dichloroacetyl chloride* (3:5290) + EtCl (3:7015); if, however, moisture is given access or aq. added, then on keeping or htg. the prod. breaks up (13) (14) and on distn. gives alm. theoretical yield of ethyl dichloroacetate (3:5850) + HCl.]

[$\bar{C}$ readily absorbs Br_2; with complete exclusion of aq. the products are (13) (14) bromo-chloro-acetyl chloride, b.p. 138–139° (13), and EtBr; in pres. of aq. the products are ethyl chloro-bromo-acetate, b.p. 174°, D_4^{22} = 1.5890 (13), + HCl + HBr; some bromo-chloro-acetyl *bromide*, b.p. 158–160°, 47–49° at 15 mm. (15), and C_2H_5Cl (3:7015) are also (15) formed. — $\bar{C}$ on treatment with Br_2 in the cold, then immediately followed by alc. KOH, gives good yield (3) of β-bromo-α,β-dichlorovinyl ethyl ether, b.p. 177° at 754 mm., D_4^{20} = 1.6565, n_D^{17} = 1.50427 (3).]

[$\bar{C}$ treated with ICl, stood 30 min. (17), filtered from I_2, then htd. to 50° to expel C_2H_5Cl gives (16) (17) chloro-iodo-acetyl chloride; addn. of aq. to latter yields by hydrolysis (16) (17) chloro-iodo-acetic acid, colorless lfts from lt. pet., m.p. 90° (16).]

n_D^{25} see (10). — $\bar{C}$ with *di-n-butyl ether* (1:7350): for b.p., vapor-liq. equil. [illegible] — $\bar{C}$ with *β,β'-dichloro-diethyl ether* (3:6225): for b.p., vapor-liq. equil. [illegible] (see below under azeotropes).

$\bar{C}$ with chlorinated hydrocarbons. $\bar{C}$ with *1,2-dichloroethane* [illegible] (3:5130): for b.p., vapor-liq. equil., and *D* see (31) (see also [illegible]) (For use of ethylene dichloride in dehydration of $\bar{C}$ see (32).)

Azeotropes Containing $\bar{C}$

Binary azeotropes. $\bar{C}$ with water forms a const.-boil. mixt. b.p. [illegible] (26) (8), 97.8° at 760 mm. (23) (32), contg. 45.8 wt. % [illegible] (32) $\bar{C}$: constants for this azeotropic mixt. at other press. include the following: b.p. 96–96.2° (26); at 735 mm., b.p. = 95.8° (33) (11), [illegible] at 504 mm., b.p. = 86.4° (23); at 400 mm., b.p. = 80.35°, [illegible] Note that compn. changes only slightly (23) with press. — For study [illegible] (11) (23) or of HCl (11) see indiv. refs.

$\bar{C}$ with *toluene* (1:7405) gives a const.-boil. mixt., b.p. [illegible] (10). — $\bar{C}$ with *di-n-butyl ether* (1:7350) gives a const.-boil. mixt., b.p. [illegible] 68 mole % $\bar{C}$ (10). — $\bar{C}$ with *β,β'-dichlorodiethyl ether* (3:6225) gives a mixt. b.p. 128.2°, contg. 91.8 mole % $\bar{C}$ (10).

Ternary azeotropes: $\bar{C}$ with aq. + C_6H_6 (1:7400) gives a const.-boil. [illegible] 67.0–67.3° (29). — $\bar{C}$ with aq. + ethylene dichloride (3:5130) gives a [illegible] b.p. 69.6° (29). — $\bar{C}$ with aq. + 1,1,2-trichloroethylene (3:5170) gives [illegible] mixt., b.p. 70.8–71.5° (29).

Miscellaneous Physical Properties of $\bar{C}$

[For sepn. of $\bar{C}$ from gas mixts. by adsorption (?) on $Mg(ClO_4)_2$ [illegible] see (34).]

Uses of $\bar{C}$

The manifold uses of $\bar{C}$, based upon both its physical and its chemical [illegible] cannot here be reviewed in detail; however, some examples include the following:

[For use in sepn. of butadiene from hydrocarbon mixts. (35), in [illegible] naphthenes from mineral lubricating oils (36), in refining of rosin (37) [illegible] pine lignin (38) (39), as solv. for various resins (40), as solv. for cellulose [illegible] cellulose ethers (42), for addn. to rayon spinning baths (43) see indiv. refs.]

Physiological and Biochem. Behavior of $\bar{C}$

[For study of pharmacol. of $\bar{C}$ (or its phosphoric esters, etc.) see (44); [illegible] poisoning by $\bar{C}$ see (45) (46); for study of toxicity of vapor of $\bar{C}$ see (46).]

[For effect of $\bar{C}$ upon amylase (47) (48) or lipase (49) see indiv. refs.; for [illegible] of yeast of depressed enzymatic activity see (50).]

Determination of $\bar{C}$

[For colorimetric detn. of $\bar{C}$ by reactn. with diazotized sulfanilic acid [illegible] 25° see (103) (note that method involves oxidn. of $\bar{C}$ by the reagt. to chloro[illegible] (3:7212) and color formn. with latter); for detn. of $\bar{C}$ in aq. solns. by [illegible] (11) (23) (8) (25).]

3:5552 2-CHLOROETHANOL-1 (Ethylene chlorohydrin, β-chloroethanol, β-chloroethyl alcohol, " glycol chlorohydrin ") $\underset{Cl}{\underset{|}{CH_2}}—CH_2OH$ C_2H_5OCl Beil. I - 337, I_1-(170), I_2-(333)

Colorless liq. — miscible with aq. (see also below) and most org. solv.

MISCELLANEOUS PHYSICAL PROPERTIES

Binary Systems Containing $\bar{C}$

$\bar{C}$ + water. For values of D_4^{20} and n_D^{20} (also n_C^{20}, n_F^{20}, n_G^{20}) over whole range 0–100% $\bar{C}$ see (6) cf (22) (23); for thermal anal. of systems see (26). — For study of salting-out of $\bar{C}$ from its aq. solns. (11) or its isolation by ether extraction of aq. solns. satd. with NaCl or Na_2CO_3 (27) see indic. refs. — For concn. of $\bar{C}$, i.e., dehydration of its aq. solns. by distn. of the water with C_6H_6 (28), with 1,2-dichloroethane (ethylene dichloride) (3:5130) (29), or with cyclohexanol (1:6415) (30) see indic. refs. — See also below under azeotropes.

Note that boilg. aq. solns. of $\bar{C}$ undergo slow decompn., e g , about 10% in 8 hrs. (23), 50% in 5 hrs. (107) cf. (11) (presumably by loss of HCl and evoln. of ethylene oxide (1:6105), b.p. 10.7°, and/or (38) acetaldehyde (1:0100), b.p. 20.2°.

$\bar{C}$ with hydrocarbons. *$\bar{C}$ with C_6H_6 (1:7400):* for b.p., vapor-liq. equil., and n_D^{25} see (10). — *$\bar{C}$ with toluene (1:7405):* for b.p., vapor-liq. equil., and n_D^{25} see (10) (see also below under azeotropes).

$\bar{C}$ with alcohols. *$\bar{C}$ with butanol-1 (1:6180):* for b.p, vapor-liq. equil., and n_D^{25} see (10). — *$\bar{C}$ with isobutyl alc. (1:6165):* for b.p , vapor-liq. equil., and n_D^{25} see (10).

$\bar{C}$ with ethers. *$\bar{C}$ with di-isopropyl ether (1:6125):* for b.p., vapor-liq. equil., and

3:5550 1,3-DICHLOROBUTENE-2 (2,4-Dichlorobutene-2) $C_4H_6Cl_2$ Beil. S.N. 11

$$CH_3-\underset{Cl}{C}=CH-\underset{Cl}{CH_2}$$

B.P. 127–129° at 756 mm. (1)	D_4^{20} = 1.1591 (1) (3)	n_D^{20} = 1.47239 (1)
127–128.5° at 753 mm. (2)	1.1582 (2)	1.4695 (2)
61–63° at 70 mm. (1)		
56–57° at 55 mm. (3)		n_C^{20} = 1.46988 (1)
53–54° at 55 mm. (2)		1.4694 (3)
53–54° at 50 mm. (1)		

Colorless liq. with characteristic odor (1). — $\bar{C}$ is formed (5–10% (4) (5) (1)) cf. (10) in synthesis of chloroprene (3:7080). — [For use in mfg. of unsatd. cellulose ethers see (6); in mfg. of unsatd. ethers of alcohols and phenols for use as solvents, disinfectants, etc., see (7) (8).]

[For prepn. of $\bar{C}$ readily and in quantity (1) from vinylacetylene by shaking with an excess (4 moles) of HCl contg. CuCl see (1): from methyl vinyl ketone in 33% yield (together with other products) with PCl_5 at −10° see (2), from 2-chlorobutene-2 (3:7105) (together with other products) by actn. of Cl_2 at 350° see (9); for formn. of $\bar{C}$ (together with other products) from trimethylethylene + Cl_2 see (11).]

$\bar{C}$ passed over silica gel or clay at 245–275° loses HCl yielding (4) 17–18% 3-chlorobutadiene-1,3 ("Chloroprene") (3:7080).

$\bar{C}$ on hydrolysis with steam (12), or *aq.* alk. (5) (12), or *aq.* K_2CO_3 (2), aq. Na_2CO_3 (70–80% yield (4)) or $CaCO_3$ (3) gives 3-chlorobuten-2-ol-1 (3:8207) q.v., b.p. 161–162°. — [Note that $\bar{C}$ with alc. alk. does not hydrolyze or lose HCl but instead gives the corresp. ethers (see details under 3-chlorobuten-2-ol-1 (3:8207)).]

$\bar{C}$ with Cl_2 yields (13) (14) (15) a mixt. of 2,3,4-trichlorobutene-1 (3:9064), 1,2,3,3-tetrachlorobutane (3:9080), and 1,2,2,3,4-pentachlorobutane (3:9070).

MISCELLANEOUS PHYSICAL PROPERTIES

Binary Systems Containing C̄

C̄ + water. For values of D_4^{20} and n_D^{20} (also n_C^{20}, n_F^{20}, n_G^{20}) over whole range 0–100% C̄ see (6) cf (22) (23); for thermal anal. of systems see (26). — For study of salting-out of C̄ from its aq. solns. (11) or its isolation by ether extraction of aq. solns. satd. with NaCl or Na_2CO_3 (27) see indic. refs. — For concn. of C̄, i.e., dehydration of its aq. solns. by distn. of the water with C_6H_6 (28), with 1,2-dichloroethane (ethylene dichloride) (3:5130) (29), or with cyclohexanol (1:6415) (30) see indic. refs. — See also below under azeotropes.

Note that boilg. aq. solns. of C̄ undergo slow decompn., e.g., about 10% in 8 hrs. (23), 50% in 5 hrs. (107) cf (11) (presumably by loss of HCl and evoln. of ethylene oxide (1:6105), b.p. 10.7°, and/or (38) acetaldehyde (1:0100), b.p. 20.2°.

C̄ with hydrocarbons. *C̄ with C_6H_6 (1:7400):* for b.p., vapor-liq. equil., and n_D^{25} see (10). — *C̄ with toluene (1:7405):* for b.p., vapor-liq. equil., and n_D^{25} see (10) (see also below under azeotropes).

C̄ with alcohols. *C̄ with butanol-1 (1:6180):* for b.p., vapor-liq. equil., and n_D^{25} see (10). — *C̄ with isobutyl alc. (1:6165):* for b.p., vapor-liq. equil., and n_D^{25} see (10).

C̄ with ethers. *C̄ with di-isopropyl ether (1:6125):* for b.p., vapor-liq. equil., and

n_D^{25} see (10). — *C̄ with di-n-butyl ether (1:7950):* for b.p., vapor-liq. equil., and n_D^{25} see (10). — *C̄ with β,β'-dichloro-diethyl ether (3:6025):* for b.p., vapor-liq. equil., and n_D^{25} see (10) (see below under azeotropes).

C̄ with chlorinated hydrocarbons. *C̄ with 1,2-dichloroethane (ethylene dichloride (3:5130):* for b.p., vapor-liq. equil., and *D* see (31) (see also below under azeotropes). (For use of ethylene dichloride in dehydration of C̄ see (30).)

Azeotropes Containing C̄

Binary azeotropes. C̄ with *water* forms a const.-boilg. mixt., b.p. 97.85° at 760 mm. (26) (8), 97.8° at 760 mm. (23) (32), contg. 45.8 wt. % (8), 43.5 wt. % = 14.7 mole % (32) C̄: constants for this azeotropic mixt. at other press. include the following: at 771 mm., b.p. 96–96.2° (26); at 735 mm., b.p. = 95 8° (33) (11), contg. 42.5 wt. % C̄ (33) (11); at 504 mm., b.p. = 86.4° (23); at 400 mm., b.p. = 80.55°, contg. 40.5 wt. % C̄ (23). — Note that compn. changes only slightly (23) with press. — For study of influence of NaCl (11) (23) or of HCl (11) see indic. refs.

C̄ with *toluene (1:7405)* gives a const.-boilg. mixt., b.p. 106.9°, contg. 27 mole % C̄ (10). — C̄ with *di-n-butyl ether* (1:7950) gives a const.-boilg. mixt., b.p. 123.0°, contg. 68 mole % C̄ (10). — C̄ with *β,β'-dichlorodiethyl* ether (3:6025) gives a const.-boilg. mixt., b.p. 128.2°, contg. 91.8 mole % C̄ (10).

Ternary azeotropes: C̄ with aq. + C_6H_6 (1:7400) gives a const.-boilg. mixt., b.p. 67.0–67.3° (29). — C̄ with aq. + ethylene dichloride (3:5130) gives a const.-boilg. mixt., b.p. 69.6° (29). — C̄ with aq. + 1,1,2-trichloroethylene (3:5170) gives a const.-boilg. mixt., b.p. 70.8–71.5° (29).

Miscellaneous Physical Properties of C̄

[For sepn. of C̄ from gas mixts. by adsorption (?) on $Mg(ClO_4)_2$ or other perchlorates see (34).]

USES OF C̄

The manifold uses of C̄, based upon both its physical and its chemical characteristics, cannot here be reviewed in detail; however, some examples include the following.

[For use in sepn. of butadiene from hydrocarbon mixts. (35), in dewaxing and removing naphthenes from mineral lubricating oils (36), in refining of rosin (37), in extraction of pine lignin (38) (39), as solv. for various resins (40), as solv. for cellulose acetate (41) or cellulose ethers (42), for addn. to rayon spinning baths (43) see indic. refs.]

PHYSIOLOGICAL AND BIOCHEM. BEHAVIOR OF C̄

[For study of pharmacol. of C̄ (or its phosphoric esters, etc.) see (44); for reports of poisoning by C̄ see (45) (46); for study of toxicity of vapor of C̄ see (403).]

[For effect of C̄ upon amylase (47) (48) or lipase (49) see indic. refs.; for use of C̄ in prod. of yeast of depressed enzymatic activity see (50).]

DETERMINATION OF C̄

[For colorimetric detn. of C̄ by reactn. with diazotized sulfanilic acid in alk. soln. at 25° see (106) (note that method involves oxidn. of C̄ by the reagt. to chloroacetaldehyde (3:7212) and color formn. with latter); for detn. of C̄ in aq. solns. by refractometry see (11) (25) (6) (23).]

PREPARATION OF $\bar{C}$

From ethylene. *With hypochlorous acid, e.g., from Cl_2 + aq.* — $\bar{C}$ is usually prepd. from ethylene by addn of HOCl; the HOCl may be obtained by use of Cl_2 + aq. (sometimes in the pres. of alk. acceptors for the simultaneously formed HCl), by use of organic hypochlorites, or other org. cpds which hydrolyze to give HOCl.

[For scientific papers discussing prepn. of $\bar{C}$ from ethylene + HOCl (Cl_2 + aq.) see (401) (11) (51) (52) (53) (54) (55) (56) (57) (58) (59); for very old work see (60); for examples of patents employing this method see citations (61)-(82) cf. (402), inclusive; for study of metal-corrosion problems involved in this method of prepn. of $\bar{C}$ see (83).]

With organic hypochlorites (e.g., ter-butyl hypochlorite (3:7165)). [For patents on prepn. of $\bar{C}$ from ethylene + *ter*-butyl hypochlorite see (84) (85).]

With N-chlorourea. [For prepn. of $\bar{C}$ from ethylene with *N*-chlorourea in 5% H_2SO_4 contg. $CuCl_2$ at 0° (yield: 60-70% $\bar{C}$ accompanied by 2% ethylene dichloride (3:5130)) see (86).]

From ethylene glycol (1:6465). [For prepn. of $\bar{C}$ from ethylene glycol satd. with HCl gas and htd. in s.t. (12) (90), or treated at 160° (87) (4) or 180° (88) with stream of HCl (yields: 70-80% (88), 60% (87)), see indic. refs.; note that ethylene glycol with excess conc. HCl in s.t. at 100° gives no $\bar{C}$ (89) but only ethylene dichloride (3:5130), while mere distn. with conc. HCl (9 moles) gives (15) only 12% $\bar{C}$.)]

[For prepn. of $\bar{C}$ from ethylene glycol with S_2Cl_2 (2.5 wt. pts. (91)) on refluxing (yields: 82.5% (92), 72.8% (91)) (93) (94) (95) see indic. refs.: for formn. of $\bar{C}$ from glycol with $SiCl_4$ see (96).]

From ethylene glycol esters. [For patents on prepn. of $\bar{C}$ from ethylene glycol diformate (1:3402) with HCl gas at 100° via formn. of β-chloroethyl formate and subsequent alcoholysis of latter with MeOH/HCl (97), or from ethylene glycol diacetate (1:3511) with EtOH + HCl at 125-135° under press. (EtOAc is also formed) (98), see indic. refs.]

From ethylene oxide (1:6105). [For formn. of $\bar{C}$ from ethylene oxide with liq. HCl (99) or with S_2Cl_2 (100) (other prods. are also formed) see indic. refs.]

From other miscellaneous sources. [For formn. of $\bar{C}$ from 1,2-dichloroethane (ethylene dichloride) (3:5130) by conversion with SO_3 below 45° to β-chloroethyl chlorosulfonate (see below) and subsequent hydrolysis to $\bar{C}$ (101); from *bis*-(β-chloroethyl) sulfate (see below) by refluxing with aq (102); from β-chloroethyl trichloroacetate (3.6410) by shaking with aq. (103); from β-chloroethyl vinyl ether (3:7464) on distn. with aq. + trace of HCl (acetaldehyde is also formed) (104); from chloroacetaldehyde (3:7212) by reduction of carbonyl group with EtOMgBr (105) see indic. refs.]

CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis of $\bar{C}$. [$\bar{C}$ in s.t. at 184° for 10 hrs yields (107) 1,2-dichloroethane (ethylene dichloride) (3:5130) and acetaldehyde (1:0100) (the latter partially as aldehyde resin); for study of rate of decompn. of $\bar{C}$ at 368° see (108).]

Behavior with Inorganic Reactants

Reduction of $\bar{C}$. [$\bar{C}$ with Na/Hg + aq. (109), or $\bar{C}$ in aq. soln. in pres. of alk. with H_2 at atm. press. + cat. (110), yields ethyl alcohol (1:6130); in latter method reduction is facilitated by NaOH, less so by $Ca(OH)_2$ or $CaCO_3$; using Pd/$CaCO_3$ yield of EtOH is 91%; using Ni yield of EtOH is 80% accompanied by 20% ethylene glycol (1:6465) (110).]

Oxidation of $\bar{C}$. $\bar{C}$ on oxidn. with CrO_3 yields (111) chloroacetic acid (3:1370).

Behavior with H_2O. $\bar{C}$ on boilg. with aq. undergoes gradual decomposition: e.g., 10% in 8 hrs. (23), 50% in 5 hrs. (107) cf. (11), presumably by loss of HCl and formation of ethylene oxide (1:6105), acetaldehyde (1:0100) etc. — [Note that $\bar{C}$ with aq. vapor over $ZnCl_2$ + ZnO at 250–255° yields (112) acetaldehyde (1:0100).]

Behavior with inorganic acids. (See also below under behavior with salts of inorganic acids.)

With H_2SO_4 $\bar{C}$ with conc. H_2SO_4 readily dissolves and according to conditions yields either β-chloroethyl hydrogen sulfate or *bis*-(β-chloroethyl) ether. (Note that $\bar{C}$ with SO_2Cl_2 (see below) gives *bis*-(β-chloroethyl) sulfate.)

[For study of rate and extent of formn. of β-chloroethyl HSO_4 with conc. or fumg. H_2SO_4 at 25° see (14); for reactn. of barium salt of this prod. with aniline see (113).]

$\bar{C}$ with conc. H_2SO_4 (17% by wt. of $\bar{C}$) refluxed 6 hrs. gives (114) *bis*-(β-chloroethyl) ether (3:6025).

With HNO_3. [$\bar{C}$ with HNO_3/H_2SO_4 (115) (116) gives (92% yield (115)) β-chloroethyl nitrate, $ClCH_2CH_2ONO_2$, b.p. 149–150°; for use of this prod. in explosives see (115) (117); for use as ignition accelerator in Diesel engine fuels see (118) (119) (120).]

With HNO_2. [$\bar{C}$ with HNO_2 (from $NaNO_2$ + HCl) at −5° gives (70% yield (121)) (122) (123) β-chloroethyl nitrite $ClCH_2CH_2ONO$, b.p. 90–91° (121), 89–89.5° (122), D_-^{20} = 1.212 (122), n_D^{20} = 1.4125 (122). (This prod. is not to be confused with the isomeric chloro-nitro-ethanes Beil. I-101.)]

Behavior with salts of inorganic acids. (For behavior with NaCN, anhyd. Na_2CO_3, NaSCN, etc., see further below under organic reactants; for behavior with NaSH see further below under alkali reactants.)

With alkali iodides. $\bar{C}$ with NaI in hot alc. (124) (125) or boiling acetone (126) for 16 hrs. (127) (better 4 hrs. (20)), or with KI in alc. at room temp. for 24 hrs. (128) gives (95% yield (127)) β-iodoethanol (ethylene glycol iodohydrin), b.p. 176–177° dec. (124), 86–87° at 25 mm. (20), 85–88° at 25 mm. (127), 85° at 25 mm. (124), 61° at 7 mm. (4), D_4^{20} = 2.1968 (4), n_D^{20} = 1.57134 (24). [For study of rate of reaction of $\bar{C}$ with KI in dry acetone at 50° and 60° see (16).]

With alkali sulfides (for alkali sulfhydrates, e.g., NaSH, see below). — [$\bar{C}$ with aq. K_2S (129) or with aq. Na_2S (11) (130) (131) (132) at 30–35° for 1 hr. (33) splits out 2 NaCl giving (yields: 90–95% (11), 79–86% (33)) *bis*-(β-hydroxyethyl) sulfide ("thiodiglycol") [Beil. I-470, I_1-(244), I_2-(525)], b.p. 164–166° at 20 mm (33), 130° at 2 mm. (131), 104° at 0.005 mm. (132), f p. = −16° (132), D_4^{20} = 1.1821 (132), 1.1819 (132), n_D^{20} = 1.52031 (132), misc. with aq., readily sol. alc., acetone, EtOAc, or $CHCl_3$, but spar. sol. ether, C_6H_6, or CCl_4 (131) (corresp. dibenzoate, m.p. 65° (133), di-(p-nitrobenzoate), m.p. 107.7° (134), *bis*-(N-phenylcarbamate), m.p. 128.5–129.5° (131)). — Note that this prod. ("thiodiglycol") with $\bar{C}$ at 100° for 13 hrs. (131) adds to form *tris*-(β-hydroxyethyl)sulfonium chloride $(HOCH_2CH_2)_3SCl$, non-hygroscopic ndls., m.p. 126–127° (132), 125–126° (131). Note also that $\bar{C}$ (1 mole) + Na_2S + 1-chloropropanol-2 (propylene chlorohydrin) (3:7747) yields (135) a mixed deriv., viz., β-hydroxyethyl β-hydroxy-n-propyl sulfide.]

With alkali selenide. [$\bar{C}$ with aq. Na_2Se yields (136) *bis*-(β-hydroxyethyl) selenide.]

With alkali disulfide. [$\bar{C}$ with aq. Na_2S + S gives (46% yield (137)) (138) *bis*-(β-hydroxyethyl) disulfide [Beil. I-471, I_2-(528)], b.p. 155° at 30 mm., D_4^{20} = 1.3375 (137).]

With $NaHSO_3$. [$\bar{C}$ with solid $NaHSO_3$ in s.t. at 170–180° for several hrs. gives (139) the salt of 2-hydroxyethanesulfonic acid-1 ("isethionic acid").]

With Na_3PO_4. [$\bar{C}$ with satd. aq. Na_3PO_4 as directed (140) cf. (3) gives (30% yield (140)) di-sodium β-hydroxyethyl phosphate, cryst. from aq. alc. as hexahydrate, m p. 61° (140).]

With Na_3AsO_3. [$\bar{C}$ with aq. alk. Na_3AsO_3 (from As_2O_3 in aq. alk.) as directed (141) (142) (143) cf. (144) (145) gives β-hydroxyethylarsonic acid (also known as β-hydroxyethylarsinic acid) = $HOCH_2CH_2AsO(OH)_2$, very sol. aq. but forming spar. sol. monohydrated calcium salt (141).]

With Na_2SnO_2. [$\bar{C}$ with aq. alk. Na_2SnO_2 (from $SnCl_2$ + aq. NaOH) gives (146) salt of β-hydroxyethylstannonic acid = $HOCH_2CH_2.SnO(OH)$.]

Behavior with acid halides of inorganic acids. *With thionyl chloride ($SOCl_2$).* [$\bar{C}$ with $SOCl_2$ (small excess) in cold gives (83% yield (147)) β-chloroethylsulfinyl chloride = $ClCH_2CH_2OS(O)Cl$, b.p. 93–95° at 40 mm., 84–85° at 20 mm., D_4^{20} = 1.5010, which upon attempted distn. at ord. press. dec. into SO_2 + ethylene (di)chloride (3:5130) (147). — However, $\bar{C}$ (excess) with $SOCl_2$ at elevated temp. (147) or $\bar{C}$ (1 mole) with $SOCl_2$ (1 mole) in cold (148) gives (75% yield (148)) cf. (156) *bis*- (β-chloroethyl) sulfite = $(ClCH_2CH_2O)_2SO$, b.p. 133° at 12 mm. (148), 117.5–118° at 4 mm. (147), D_0^{20} = 1.422, $n_D^{20.5}$ = 1.481 (148).]

With sulfuryl chloride (SO_2Cl_2) [$\bar{C}$ with SO_2Cl_2 in cold gives (149) (70% yield (122)) β-chloroethyl chlorosulfonate = $ClCH_2CH_2O.SO_2Cl$ [Beil. I_2-(336)], b.p. 101° at 23 mm., $D_-^{20.5}$ = 1.552, $n_D^{18.3}$ = 1.4587 (122). — However, $\bar{C}$ with SO_2Cl_2 under reflux (121) (or β-chloroethyl chlorosulfonate + β-chloroethyl nitrite (above) (122)) gives (50% yield (121)) *bis*-(β-chloroethyl) sulfate = $(ClCH_2CH_2O)_2SO_2$ [Beil. I_2-(336)], b.p. 154–154.5° at 8 mm. (121), 130° at 3.5 mm. (122), m.p. + 11° (121), D_4^{20} = 1.4801 (121), n_D^{20} = 1.4622 (121), 1.4620 (122).]

With phosphoryl chloride ($POCl_3$). [$\bar{C}$ with $POCl_3$ at 0° (150) or in CCl_4 at room temp. (151) gives (46–47% yield (151)) β-chloroethylphosphoryl dichloride = $ClCH_2CH_2OP(O)Cl_2$ [Beil. I_2-(337)], b.p. 108–110° at 15 mm. (151). — $\bar{C}$ with $POCl_3$ in pyridine at −20° gives (140) the salt of mono-(β-chloroethyl)phosphoric acid = $ClCH_2CH_2OP(O)(OH)_2$ [Beil. I_1-(170), I_2-(336)]. — $\bar{C}$ with $POCl_3$ in CCl_4 refluxed 16 hrs. gives (60% yield (152) cf. (140)) tri-(β-chloroethyl) phosphate = $(ClCH_2CH_2O)_3PO$ [Beil. I_2-(337)], b.p. 180–182° at 2–3 mm., D_{20}^{20} = 1.428 (152). — For patent on reaction of $\bar{C}$ with $POCl_3$ see (153).]

With boron trifluoride (BF_3). [$\bar{C}$ with BF_3 forms a molecular compound (154) $BF_3.2\bar{C}$ which can be distilled in vac. without decompn.; b.p. 59° at 2 mm., D_4^{20} = 1.4009, $n_{He}^{17.4}$ = 1.40841 (154).]

With silicon tetrachloride ($SiCl_4$). [$\bar{C}$ (4 moles) with $SiCl_4$ (1 mole) yields (155) (96) tetra-(β-chloroethyl) orthosilicate, $(ClCH_2CH_2O)_4Si$ [Beil. I-337, I_2-(337)], b.p. 195–200° at 15 mm. (156), 170–180° at 8 mm. (96) (also obtd. (156) from $SiCl_4$ + β-chloroethyl nitrite (above)).]

Behavior with alkalies. $\bar{C}$ with alkalies (or appropriate acid acceptors) loses HCl to yield according to conditions either ethylene glycol (1:6465) or ethylene oxide (1:6105).

[E.g., $\bar{C}$ with aq. NaOH on htg. hydrolyzes to ethylene glycol (1:6465), for general articles on this process see (54) (157) (158) (22); for studies of kinetics of the reaction see (404) (18) (159) (160) (161); for examples of patents on hydrolysis of $\bar{C}$ to ethylene glycol by use of aq. alkali or alkaline-earth hydroxides, carbonates, or bicarbonates see (162) (163) (63) (164) (165) (166) (167).]

[$\bar{C}$ added dropwise to 70% aq. NaOH (168) (169) or hot CaO (170) gives ethylene oxide (1:6105), b.p. +10.7°; for patents on this conversion see (171) (172) (173) (174) (175).]

Behavior with alkali sulfhydrate. [$\bar{C}$ with NaSH (from $Na_2S.9H_2O$ satd. with H_2S (137)) at 55–65° (137) (176) or $\bar{C}$ with NaSH in alc. for 36 hrs. at room temp. (177) gives (yields: 55% (176), 50–55% (137), 26–30% (177)) β-hydroxyethyl mercaptan ("monothioethylene glycol") = $HOCH_2CH_2SH$ [Beil. I-470, I_2-(523)], b.p. 157–158° dec. at 742

mm. (178), 61° at 18 mm. (179), 58° at 18 mm. (137), 55° at 13 mm. (178), 52° at 12 mm. (177); D_4^{20} = 1.1143 (178); n_D^{20} = 1.4996 (178) (corresp. *bis*-(*N*-phenyl)carbamate, m.p. 146° (178); corresp. metallic mercaptide derivs. many of which have m.p.'s (178)).]

Behavior with ammonia (*for amines see below under behavior with organic reactants*). [$\bar{C}$ with aq. NH_4OH gives (180) a mixt. of three hydroxyamines, viz., β-hydroxyethylamine (2-aminoethanol-1) [Beil. IV-274, IV_1-(424), IV_2-(717)]; *bis*-(β-hydroxyethyl)amine ("diethanolamine") [Beil. IV-283, IV_2-(729)]; and *tris*-(β-hydroxyethyl)amine ("triethanolamine") [Beil. IV-285, IV_2-(729)]. — Although all three of these products are now extremely important industrial compounds, they are usually manufactured from ethylene oxide with NH_3 and details lie beyond the scope of this text. — However, for a useful monograph see (181).]

Behavior with hydrazine ($NH_2.NH_2$). [$\bar{C}$ with 1 mole hydrazine loses HCl yielding (182) β-hydroxyethylhydrazine + hydrazine hydrochloride; $\bar{C}$ with 2–3 moles hydrazine yields (182) ethylene oxide accompanied by a little *N,N-bis*-(β-hydroxyethyl)hydrazine.]

BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

Behavior with hydrocarbons. [$\bar{C}$ with C_6H_6 + $AlCl_3$ (followed by aq.) is claimed (183) to yield β-phenylethyl alc. (1:6505), but this has subsequently been denied (184) where 1,2-diphenylethane (bibenzyl) (1:7149) and resin were the only prods. obtd. (See also below under behavior of $\bar{C}$ with organometallic cpds.)]

Behavior with organic hydroxyl compounds. *With alcohols* (see also below under carbohydrates). $\bar{C}$ (anhydrous) with sodium alkoxides (from prim. or sec. aliphatic or arom. alcs. + Na) on htg. splits out NaCl giving the corresp. mono ethers of ethylene glycol.

[E.g., $\bar{C}$ with NaOMe gives (35% yield (185)) β-hydroxyethyl methyl ether (1:6405) q.v.; $\bar{C}$ with NaOEt gives (60% yield (185)) β-hydroxyethyl ethyl ether (1:6410) q.v.; $\bar{C}$ with NaOPr gives (40% yield (185)) β-hydroxyethyl *n*-propyl ether (1:6414) q.v.; $\bar{C}$ with NaOisoPr gives (25% yield (185)) β-hydroxyethyl isopropyl ether (1:6413) q.v.; $\bar{C}$ with NaOBu gives (30% yield (185)) β-hydroxyethyl *n*-butyl ether (1:6430) q.v.; $\bar{C}$ with NaOiso-Bu gives (36% yield (185)) β-hydroxyethyl isobutyl ether (1:6235-A); $\bar{C}$ with NaOAm gives (30% yield (185)) β-hydroxyethyl *n*-amyl ether, b.p. 181° at 745 mm. (185).]

[$\bar{C}$ with $NaOCH_2C_6H_5$ similarly gives (186) (187) ethylene glycol monobenzyl ether (1:6533) q.v.]

With carbohydrates (or their relatives). [$\bar{C}$ with *d*-glucose + HCl yields (188) cf. (189) 2-chloroethyl-*d*-glucoside.]

[$\bar{C}$ with "acetobromglucose" + Ag_2CO_3 (190) (193) in C_6H_6 (189) (191) gives (yields: *69% (189), 45–50% (190)) tetra-acetyl-β-d-(β-chloroethyl)glucoside (tetra-acetyl-β-d-*glucosido-ethylene chlorohydrin), m.p. 119–120° (192), 118.5–119.5° (189), 114° cor. (190) (191). — For isomerization of this prod. (in boilg. $CHCl_3$ for 6½ hrs.) to tetra-acetyl-α-*d*-(β-chloroethyl)glucoside, m.p. 82–83°, see (194).]

[$\bar{C}$ with "acetobromogalactose" + Ag_2CO_3 (190) (194) in C_6H_6 (191) gives (77% yield (194)) tetra-acetyl-β-*d*-(β-chloroethyl)galactoside, m.p. 117° cor. (190) (191), 115.5–116.5° (194).]

[For analogous prepn. from $\bar{C}$ of triacetyl-β-*d*-(β-chloroethyl)xyloside, m.p. 137° cor., or of hepta-acetyl-β-*d*-(β-chloroethyl)lactoside, m.p. 78–80°, see (190) (191).]

[For condens. of $\bar{C}$ with mannitol (1:5830) or sorbitol (1:5820) see (195).]

[For use of $\bar{C}$ in degradation ("depolymerization") of cellulose or starch see (196) (197); for use of $\bar{C}$ + NaOH in introduction of β-hydroxyethyl groups into cellulose see (198).]

With aliphatic mercaptans. $\bar{C}$ with salts of alkyl or alkaryl mercaptans gives the corresp. S-monoethers of monothioethylene glycol.

[E g., $\bar{C}$ with NaSMe in abs. alc. (199) (200) or ether (201) (202) or less advantageously

$\bar{C}$ with KSMe in aq. alc. (201) gives (yields 74–82% (199), 78% (201), 40% (199)) β-hydroxyethyl methyl sulfide (β-methylmercaptoethanol) [Beil. I_2-(524)], b.p. 80.5–81° at 30 mm. (201), 68–70° [illegible] with MeI in dry ether [illegible] iodide, hygroscop. cryst. from MeOH/ether, m.p. 60–62° (202). — $\bar{C}$ with EtSH in alc./NaOEt (203), in alc. KOH (132), or even in conc. aq. KOH (204) gives (yield 70–74% (203)) β-hydroxyethyl ethyl sulfide [Beil. I-470, I_2-(525)], b.p. 184° (204) (132), 182–184° u.c. (203), $D_4^{20} = 1.0166$ (132), $n_D^{20} = 1.48669$ (132).]

[$\bar{C}$ with n-BuSH in hot aq. NaOH refluxed 1 hr. gives (81% yield (205)) β-hydroxyethyl n-butyl sulfide [Beil. I_2-(525)], b.p. 92–93° at 3 mm., $D_{25}^{25} = 0.9693$, $n_D^{20} = 1.4800$ (205). — $\bar{C}$ with allyl mercaptan in conc. aq. KOH gives (50% yield (206)) β-hydroxyethyl allyl sulfide [Beil. I_2-(525)], b.p. 91° at 12 mm., $D_{20}^{20} = 1{,}0283$ (206). — $\bar{C}$ with $NaSCH_2C_6H_5$ in aq. soln. gives (100% yield (179)) β-hydroxyethyl benzyl sulfide, b.p. 169° at 18 mm.]

[$\bar{C}$ with ethylene dithioglycol ($HSCH_2CH_2SH$) + powdered NaOH htd. 1 hr. gives (177) ethylene dithioglycol *bis*-(β-hydroxyethyl ether) = $HOCH_2CH_2—S—CH_2CH_2—S—CH_2CH_2OH$ [Beil. I_2-(533)], lfts., m.p. 62–63°.]

With phenols. [$\bar{C}$ with phenol (1:1420) in aq. NaOH (207) or alc. NaOEt (208), or $\bar{C}$ with $NaOC_6H_5$ on htg. (17) (209), or $\bar{C}$ with KOC_6H_5 at 150° for 6 hrs. (210), or $\bar{C}$ with phenol salt refluxed 8 hrs. (211) gives (yields: 84% (17), 79% (207), 55–62% (211), 50% (209)) β-hydroxyethyl phenyl ether (β-phenoxyethanol) (1:6518) q.v., b.p. at 80 mm. = 165° (211), 163–166° (208), 163–167° (210), b.p. 128–130° at 20 mm. (17), 134–135° at 18 mm. (209). — (Note that $\bar{C}$ with $NaOC_6H_5$ in pres. of Et_3N gave only 12.5% yield (212) of β-phenoxyethanol.)]

[Similarly $\bar{C}$ with aq. sodium o-nitrophenolate in s.t. at 125° for 20 hrs. gives (213) β-(o-nitrophenoxy)ethanol, oil, b.p. 180–182° at 4 mm., m.p. 35–36° (215) (corresp. acetate, oil; corresp. benzoate, m.p. 75–76° (213)); $\bar{C}$ with m-nitrophenol with 40% aq. KOH at 100° for 2 hrs. (213), or with 2 *N* NaOH refluxed 4 hrs. (214), gives β-(m-nitrophenoxy)-ethanol, m.p. 90–91° (213), 88° (214), 87–88° (215); $\bar{C}$ with sodium p-nitrophenolate in 50% alc. in s.t. at 120° for 23 hrs. (213), or in boilg. AmOH (216) (217), gives β-(p-nitrophenoxy)ethanol, m.p. 101–102° (213), 94–95° (216), 92–94° (215) (corresp. acetate, m.p. 85–87°, corresp. benzoate, m.p. 116° (213).]

[Analogous condensations of $\bar{C}$ with other monohydric phenols include the following: for $\bar{C}$ with o-cresol (1:1400) (218), with β-naphthol (1:1540) (218), with m-methoxyphenol (1:1765) (219) (220) (221), with methyl p-hydroxybenzoate (1:1549) (222), with p-bromophenol (218), with p-acetylaminophenol (213), with m-diethylaminophenol (212), with 8-hydroxyquinoline (212) see indic. refs.]

[Analogous condensations of $\bar{C}$ with polyhydric phenols include the following: with pyrocatechol (1:1520) (223), resorcinol (1:1530) (224) (218), 4-acetylresorcinol (219), 4-ethylresorcinol (219) see indic. refs.]

With thiophenols. [$\bar{C}$ with thiophenol in alc. NaOEt (225) (203) or in 10% aq. KOH (226) gives (76% yield (203)) β-hydroxyethyl phenyl sulfide, b.p. 245° (203), 144.5° at 26 mm. (203), 134–135° at 7 mm. (225), 115–116° at 2 mm. (226), $D_4^{20} = 1.1431$ (226), $n_D^{25} = 1.5897$ (225), $n_D^{20} = 1.5917$ (226). — $\bar{C}$ with p-toly mercaptan in conc. aq. NaOH at 100° for 2 hrs gives (83% yield (133)) (227) β-hydroxyethyl p-tolyl sulfide, b.p. 282–283° dec., 174° at 30 mm. (133).]

[For analogous condens. of $\bar{C}$ with o-nitrophenyl mercaptan (228), m-nitrophenyl mercaptan (228), p-nitrophenylmercaptan (228) (229), o-carboxythiophenol (230), and many other thiophenols (231) see indic. refs.]

Behavior of $\bar{C}$ with organic ethers (or epoxy cpds.). [$\bar{C}$ with ethylene oxide (1:6105) + conc. H_2SO_4 gives (30–35% yield (232)) 2-(β-chloroethoxy)ethanol-1 (3:9185) accompanied

by other prods.: for behavior of Č with epichlorohydrin (3:5358) or with α-ethyl-α-methylethylene oxide see (232). — Č with α,β′-dichlorodiethyl ether (3:9150) stood 24 hrs. at room temp., then htd. 1 hr., gives (27% yield (233)) acetaldehyde *bis*-(β-chloroethyl) acetal. (see below). — Č with *bis*-(α-chloroethyl) sulfide gives (234) β-trithioacetaldehyde, m.p. 125°. — For behavior of Č with 2,3-dichlorodioxane (3:9105) see (235); with 1,4-dithiane see (131).]

Behavior of Č with carbonyl compounds. *Č with aldehydes or their polymers.* [Č with paraformaldehyde (1:0080) + dry HCl gas gives (yields: 65% (237), 55% (236)) (238) (239) chloromethyl β-chloroethyl ether [Beil. I-581, I_2-(645)], b.p. 145–147° (237), 46° at 10 mm. (236); D_4^{20} = 1.2817 (237), 1.2814 (236); n_D^{20} = 1.4578 (236), 1.4592 (237). — Note that this prod. with Č (239), or Č (8 wt. pts.) + paraformaldehyde (1 wt. pt.) + $CaCl_2$ + HCl gas refluxed 5 min. (38) gives formaldehyde *bis*-(β-chloroethyl)acetal [Beil. I-575], b.p. 218–219° (239), 218.1° at 760 mm. (240), b.p. 93–94° at 11 mm. (38), now an industrial prod. in U.S. because of its use in manufact. of self-sealing gasoline tanks (240).]

[Č with acetaldehyde (1:0100) (241) (20) (233) or paraldehyde (1:0170) (236) + HCl gas gives according to circumstances either α-chloroethyl β-chloroethyl ether (3:9150) q.v. or acetaldehyde *bis*-(β-chloroethyl)acetal, b.p. 194–196° dec. (233), 109–110° at 30 mm. (20), 106° at 17 mm., D_{-}^{19} = 1.1712, $n_D^{18.2}$ = 1.4532 (233).]

[Č with propionaldehyde (1:0110) + HCl gas gives (51% yield (236)) β-chloroethyl α-chloro-*n*-propyl ether, b.p. 60° at 10 mm., D_4^{20} = 1.1399, n_D^{20} = 1.4496 (236).]

[Č with *n*-butyraldehyde (1:0130) + HCl gas gives (70% yield (236)) β-chloroethyl α-chloro-*n*-butyl ether, b.p. 71° at 10 mm., D_4^{20} = 1.1009, n_D^{20} = 1.4471 (236).]

Č with diketene. [Č with diketene (242) gives (243) β-chloroethyl acetoacetate.]

Behavior of Č with organic acids. Č with organic acids under appropriate conditions behaves conventionally as a substituted ethyl alcohol yielding the corresponding β-chloroethyl esters. Since the number of possibilities is enormous, no attempt can be made here to list all such cases; only a few typical examples must suffice. Note, moreover, that, because during ordinary esterification hydrolysis of the chlorine atom of Č may occur, many esters of Č are best made from its reaction with acyl halides q.v.

[Č with anhydrous formic acid (1:1005) in pres. of anhydr. Na_2SO_4 (244) or of HCl gas (245) gives β-chloroethyl formate, b.p. 132° at 764 mm. (245), 127–129° at 768 mm. (244), D_4^{20} = 1.2214 (244); for study of rate of esterification of Č by formic acid under various circumstances see (246).]

[Č with anhydr. oxalic acid (1:0535 on satn. with HCl gas and htg. at 100° gives (245) di-(β-chloroethyl) oxalate (3:0572), m.p. 45°.]

[Č with 2-hydroxy-5-methylbenzoic acid (*p*-cresotinic acid) + conc. H_2SO_4 gives β-chloroethyl *p*-cresotinate, b.p. 136–139° at 10 mm. (247).]

[Č with *p*-aminobenzoic acid + conc. H_2SO_4 gives (248) (249) β-chloroethyl *p*-aminobenzoate.]

Behavior of Č with salts of organic acids. Č with sodium salts of organic acids on htg. eliminates NaCl yielding the corresp. β-hydroxyethyl esters; however, not infrequently secondary reactions of this product then occur or can readily be caused to occur, such as loss of water, ring closure, etc.

[Č with aq. NaCN at 45–50° for 5 hrs. (250) (251), or with alc. NaCN at 100° for 6 hrs. (88) (27), or with KCN in 50% alc. (252) or boilg. alc. (253) (254), gives (yields: 86% (27), 85–95% (251), 79–80% (250), 71% (253)) β-hydroxyethyl cyanide (β-hydroxypropionitrile = hydracrylonitrile = ethylene cyanohydrin) [Beil. III-298, III_1-(113), III_2-(213)], b.p. 116–118° at 20 mm. (250), 110° at 15 mm. (27) (253), 107–109° at 12 mm. (250).]

[Č (1 mole) with $NaHCO_3$ (1 mole solid) or with Na_2CO_3 (½ mole solid) as directed (255) is claimed to give (80% yield) monomeric ethylene glycol carbonate $(CH_2)_2O_2CO$.]

[C̄ (1 mole) with KSCN (1 mole) in excess C̄ (1.5 moles as solv.) on warming does *not* yield the expected β-hydroxyethyl thiocyanate, since this prod. spontaneously undergoes bimolecular self-condensation evolving COS and producing (45% yield (256)) 1-(β-hydroxyethyl)imidazolidthione-2, m.p. 167–168° dec.; for behavior of this prod. with ethereal HCl see (257).]

[C̄ with NaOBz at 145° (258) or C̄ with NaOBz + a little Et_2NH at 130° for 4 hrs. (259), or C̄ with KOBz as directed (260), gives (yields: 85% (259), 33% (260)) ethylene glycol monobenzoate (β-hydroxyethyl benzoate), m.p. 36.5–37.5° (261), 36–37° (260) cf. (259); b.p. 173° at 21 mm. (259), 156° at 14 mm. (260), 150–151° at 10 mm. (261) (corresp. p-toluenesulfonate, m.p. 74–75° (262)).]

[C̄ with Na p-nitrobenzoate + a little Et_2NH at 130° for 4 hrs. (259), or C̄ with K p-nitrobenzoate in C_6H_6 in s t. at 100° (263), gives (yields: 83% (259), 60% (263)) ethylene [illegible]

[illegible] indic. refs.]

Behavior of C̄ with acid chlorides of organic acids. C̄ with acid chlorides of organic acids behaves as a substituted primary alcohol splitting out H from its OH with Cl from the acid chloride to yield the corresp. β-chloroethyl esters. No attempt can be made here to list all possible cases, but the following text will furnish ample illustrative examples.

With acid chlorides of aliphatic acids. [C̄ with acetyl chloride (3:7065) gives (yields: 90% (267), 82% (248)) (268) β-chloroethyl acetate (3:5735) q.v. — C̄ with trichloroacetyl chloride (3:5420) + pyridine in ether gives (45% yield (103)) (275) β-chloroethyl trichloroacetate (3:6510) q.v. — C̄ with sorbyl chloride ($CH_3CH=CH—CH=CH—CO.Cl$) [Beil. I-484, I_1-(453)] gives alm. quant (269) β-chloroethyl sorbate, b.p. 115° at 15 mm. (269). — For studies of rate of reactn. of C̄ with various acyl chlorides in dioxane soln. at 15°, 25°, and 35° see (270). — C̄ with malonyl (di)chloride (3:9030) gives *bis*-(β-chloroethyl) malonate, b p. 164° at 15 mm. (271).]

With various chloroformates. C̄ with carbonyl chloride (phosgene) (3:5000) at room [illegible] β-chloroethyl chloro- [illegible] below) is formed.]

[illegible] gives (61% yield (274)) β-chloroethyl trichloromethyl carbonate = $ClCH_2CH_2O.CO.O.CCl_3$, b.p. 115° at 16 mm., 110° at 12 mm., $D_4^{20} = 1.5664$, $n_D^{20} = 1.4748$ (274).]

[C̄ *with β-chloroethyl chloroformate (3:5780)* gives *(70% yield (121))* di-(β-chloroethyl) carbonate (3:6790) q.v.]

With acid chlorides of aromatic acids. [C̄ with benzoyl chloride on htg. gives (yields: *90% (276), 84.5% (277), 55% (263))* β-*chloroethyl* benzoate (3:8860) q.v.]

Behavior of C̄ with organic esters of inorganic acids. [C̄ with Me_2SO_4 at 120° as directed gives (60% yield (126)) β-chloroethyl methyl ether (β-methoxyethyl chloride) (3:7265) q.v.]

[C̄ with Et_2SO_4 + solid NaOH on htg. gives (278) ethylene glycol monoethyl ether ("Cellosolve") (1:6410); note, however, that C̄ with EtOH + conc. H_2SO_4 at 145° gives (279) β-chloroethyl ethyl ether (3:7463).]

[C̄ (1 mole) with ethyl metaphosphate (1 mole) stood 4 days at room temp. (280) cf. (281) gives β-chloroethyl ethyl hydrogen phosphate (isolated as barium salt); however, C̄ + ethyl metaphosphate in $CHCl_3$ refluxed 3 hrs. gives (140) β-chloroethyl dihydrogen phosphate (isolated as barium salt).]

C̄ with organic hypochlorites (or mixtures which yield them) gives ethers [e.g., C̄ with *ter*-butyl hypochlorite (3:7165) + ethylene gives (60.8% yield (282)) β,β′-dichlorodiethyl

ether (3:6025). — $\bar{C}$ with *N,N*-dichlorobenzenesulfonamide + butene-1 in $CHCl_3$ at −15° gives (283) (probably via formn. and addn. of β-chloroethyl hypochlorite) 1-chloro-2-(β-chloroethoxy)butane, b.p. 195.5°, D_4^{20} = 1.1223, n_D^{20} = 1.453; the use of butene-2 or of 2-methylpropene (isobutylene) gives analogous products (283) cf. (284).]

Behavior of $\bar{C}$ with organometallic compounds (or their equivalents). [$\bar{C}$ with KC_6H_5 splits out KCl yielding (285) β-phenylethyl alc. (1:6505).]

$\bar{C}$ with arom. RMgX cpds. reacts in analogous fashion yielding the corresp. alcohols [e.g., $\bar{C}$ with C_6H_5MgBr (287) (288) or C_6H_5MgCl (289) gives (95% yield (286)) β-phenylethyl alc. (1:6505); $\bar{C}$ with *o*-tolyl MgBr gives (20–24% yield (290)) (287) β-(*o*-tolyl)-ethanol; $\bar{C}$ with *m*-tolyl MgBr gives (20–24% yield (290)) β-(*m*-tolyl)ethanol; $\bar{C}$ with *p*-tolyl MgBr gives (yields: 80% (291), 20–24% (290)) (287) β-(*p*-tolyl) ethanol; many other analogous cases are known].

[Note that $\bar{C}$ with C_2H_5MgBr gives (292) $ClCH_2CH_2OMgBr$ which may then be reacted with RMgBr types as above (292).]

[$\bar{C}$ with diethyl malonate in alc. NaOEt (i.e., diethyl disodiomalonate) might be expected to yield diethyl *bis*-(β-hydroxyethyl)malonate; this compd., however, is unknown since it loses 2 EtOH, ring-closing to (271) the spiro-dilactone of *bis*-(β-hydroxyethyl)malonic acid [Beil. XIX_1-(680)], m.p. 109–110°.] — [Note also that $\bar{C}$ (1 mole) with diethyl malonate (1 mole) + 1% HCl gas undergoes transesterification yielding (405) both β-chloroethyl ethyl malonate, b.p. 105–106° at 3 mm., and *bis*-(β-chloroethyl) malonate, b.p. 142–143° at 3 mm.]

[$\bar{C}$ with ethyl acetoacetate + alc. NaOEt (i.e., ethyl sodio-acetoacetate) boiled 5 hrs. gives a prod. (probably lactone of α-(β-hydroxyethylacetoacetic acid) which with 10% HCl after 5 hrs. boiling gives (40% yield (293)) pentanone-4-ol-1 (γ-aceto-*n*-propyl alc.) [Beil. I-831, I_1-(422), I_2-(873)], b.p. 115–116° at 20 mm. (294), D_4^{20} = 1.0071 (295), n_D^{20} = 1.439 (294) (corresp. semicarbazone, m.p. 167–168° (296)): note that this prod. (which is an important intermediate in the prepn. of the antimalarial "Atabrine" (297)) is best prepd. from ethylene oxide + ethyl sodioacetoacetate which gives first (60% yield (294)) the lactone of α-(β-hydroxyethyl)acetoacetic acid, b.p. 142–143° at 30 mm., n_D^{20} = 1.4562, which with warm HCl ring-opens and splits off AcOH giving (96% yield (294)) desired γ-aceto-*n*-propyl alc. (above).]

[$\bar{C}$ + sodium phenobarbital (Na deriv. of 5-ethyl-5-phenylbarbituric acid) gives (60% yield (298)) 1-(β-hydroxyethyl)phenobarbital, m.p. 145.0–145.5° cor. (note that this prod. is *not* obtd. from $\bar{C}$ + Ag salt of phenobarbital). — $\bar{C}$ with theobromine (3,7-dimethylxanthine) in aq. NaOH in s.t. at 125° for 6 hrs. gives (47–57% yield (366)) (367) 1-(β-hydroxyethyl)theobromine, m.p. 194° (367), 193° (366).]

Behavior of $\bar{C}$ with amines. *With primary aliphatic amines.* [$\bar{C}$ (1 mole) with aq. $MeNH_2$ (1 mole) at 110° for 12–24 hrs gives (80% yield (299)) β-(methylamino)ethanol [Beil. IV-276, IV_2-(718)], b.p. 159° (300) (301), 155–156° at 760 mm. (273) (corresp. 3,5-dinitrobenzoate, m.p. 195–196.5° (302); corresp. B.PkOH, 148° (303); corresp. reaction prod. with α-naphthyl isothiocyanate, viz., *N*-(β-hydroxyethyl)-*N*-methyl-*N'*-(α-naphthyl) thiourea, m.p. 125° (303)). — $\bar{C}$ with excess aq. $MeNH_2$ on standing in s.t. at 100° for several hrs. (304) or $\bar{C}$ with β-(methylamino)ethanol (above) in aq. at 120° (299) gives methyl-*bis*-(β-hydroxyethyl)amine (*N*-methyl-diethanolamine) [Beil. IV-284, IV_2-(729)], b.p. 115° at 5 mm. (240) (note that this prod. is new commercial chem. in U.S. (240)).]

[$\bar{C}$ with $EtNH_2$ as above should give β-(ethylamino)ethanol [Beil. IV-282, IV_2-(727)], b.p. 167–169° cor. at 751 mm., D_4^{20} = 0.914, n_D^{20} = 1.444, and (305) ethyl-*bis*-(β-hydroxyethyl)amine (*N*-ethyldiethanolamine) [Beil. IV-284], although both these prods. are usually prepd. from ethylene oxide.]

[For analogous reactn. of $\bar{C}$ with *n*-heptadecylamine yielding *N*-(β-hydroxyethyl)-*n*-

heptadecylamine see (306) (307); with cyclohexylamine yielding *N*-(β-hydroxyethyl)-cyclohexylamine see (308).]

With primary aromatic amines [C̄ (1 mole) with aniline (1 mole) refluxed a short time (299) (309) (310) (311) (312) (313) gives (yields: 70% (309), 40% (311)) *N*-(β-hydroxy-ethyl)aniline (β-phenylaminoethanol) [Beil. XII-182], b.p. 286° cor. (299), $n_D^{20} = 1.5749$ (317) (note that by reactn. of a second mole of C̄ some *N*,*N*-*bis*-(β-hydroxyethyl)aniline (see below) may also form, and that some *N*,*N'*-diphenylethylenediamine, m.p. 63.4–64.2°, may also appear (311)), note also that *N*-(β-hydroxyethyl)aniline on dehydration, e.g., by htg. in xylene with P_2O_5 (310), reacts bimolecularly giving in small yield *N*,*N'*-diphenylpiperazine, m.p. 160–162° (310) — C̄ (2 moles) with aniline (1 mole) especially in pres. of anhydr. Na_2CO_3 (310) or NaOH (314) or aq. at 110° (299) gives *N*,*N*-*bis*-(β-hydroxyethyl)aniline (*N*-phenyldiethanolamine) [Beil. XII-183, XII_1-(167)], m.p. 58° (315), 53.5–54° (310): note that this prod. on htg. at 200° under reduced press. (314) or htg. with P_2O_5 in xylene (310) or htg. with 70% H_2SO_4 at 160° (316) loses water and ring-closes to *N*-phenylmorpholine [Beil. XXVII-6], m.p. 53° (299), 52° (310).]

[C̄ (1 mole) with *o*-toluidine (2 moles) at 120–130° for several hrs. (318) (313) gives β-(*o*-tolylamino)ethanol, b.p. 172° at 12 mm. (318), 145–150° at 3 mm. (317), $n_D^{20} = 1.5675$ (317); note that in pres. of Na_2CO_3 the main (318) prod. (because of bimolecular condens. of this prod.) is *N*,*N'*-di-*o*-tolylpiperazine [Beil. XXIII-8], m.p. 174°. — C̄ with *p*-toluidine on htg. gives (319) β-(*p*-tolylamino)ethanol [Beil. XII-907], b.p. 177–178° at 14 mm. (319), m.p. 42–43° (317); note, however, that analogous bimolecular ring closure of this prod. readily occurs on htg. yielding (320) *N*,*N'*-di(*p*-tolyl)piperazine [Beil. XXIII-9], m.p. 190°.]

[C̄ with *o*-methoxyaniline (*o*-anisidine) at 100° for 48 hrs. gives (75–80% yield (321)) (299) β-(*o*-methoxyphenylamino)ethanol [Beil. XIII-367], b.p. 305° cor. (299) (corresp. B̄.HCl, m.p. 134°; B̄.PkOH, m.p. 140° (321)), note that this prod. with 5 pts. conc. HCl in s.t. at 160–180° gives by a remarkable elimination of MeOH and monomolecular ring closure (38% yield (321)) (299) "phenmorpholine" [Beil. XXVII-31], b.p. 268° cor. (299), 127–128° at 12 mm. (321). — C̄ with *p*-ethoxyaniline (*p*-phenetidine) gives on htg. (319) β-(*p*-ethoxyphenylamino)ethanol, m.p. 67°, b.p. 190° at 11 mm. (319) cf. (322).]

Many other cases, analogous to the above examples, are also known but cannot be included here.

With secondary aliphatic amines. Because of the great importance of β-(dialkylamino)-ethanols in the prepn. and study of physiologically active compounds, much study has been given to their prepn. from C̄ (and otherwise). From the resulting mass of data, the following examples are cited.

[C̄ with Me_2NH gives (323) β-(dimethylamino)ethanol [Beil. IV-276, IV_1-(425), IV_1-(719)], b.p. 135° cor. at 758 mm., $D_4^{20} = 0.8866$, $n_D^{20} = 1.4300$ (324) (corresp. *p*-nitrobenzoyl ester, m.p. 58° (325)). — C̄ with Et_2NH on htg. (326) under reflux for 8 hrs. (327) or in pres. of NaOH under press. at 160° for 3 hrs. (328) gives (yields: 83% (328), 68–70% (327)) β-(diethylamino)ethanol [Beil. IV-282, IV_1-(727)], b.p. 163° at 760 mm. (329), 160° at 741 mm., 100° at 80 mm., 96° at 73 mm., 55° at 10 mm. (330), 42–41° at 8 mm. (329); $D_{25}^{25} = 0.8801$ (329); $n_D^{25} = 1.4400$ (329), 1.4350 (330) (corresp. *N*-(*p*-nitrophenyl)carbamate, m.p. 59–60° cor. (329)).]

[C̄ with di-*n*-propylamine under reflux gives (70% yield (331)) β-(di-*n*-propylamino)-ethanol [Beil. IV-282], b.p. 90–92° at 22 mm. (331) (corresp. *p*-nitrobenzoyl ester hydrochloride, m.p. 133.5–134.5° (325)). — C̄ with di-*n*-butylamine on htg. gives (332) (333) β-(di-*n*-butylamino)ethanol, b.p. 225–230° at 760 mm., sl. dec. (332), 226–228° at 738 mm. (324), 90–91° at 7 mm. (333); $D_{20}^{20} = 0.8624$ (325); $n_D^{20} = 1.4444$ (325) (corresp. *p*-nitrobenzoyl ester hydrochloride, m.p. 92.5–93.5° (325) (332)). — C̄ with di-(*iso*butyl)amine

isocyanate but always by indirect means; note also that on short boilg. with aq. or alc. alk. it loses HCl and by ring closure yields 3-phenyloxazolidone [Beil. XXVII-136], lfts. from alc., m.p. 124° (272), 122° (309).]

Ⓓ *β*-Chloroethyl *N*-(*p*-bromophenyl)carbamate: pl. from lgr., m.p. 88–89° (400). [From $\bar{C}$ with *p*-bromobenzazide (400).]

Ⓓ *β*-Chloroethyl *N*-(*α*-naphthyl)carbamate [Beil. XII-1236]: m.p. 102–103° (373), 101° (391) (93), 100–101° (309). [From $\bar{C}$ with *α*-naphthyl isocyanate (391) (373); also from *β*-chloroethyl chloroformate (3:5780) with *α*-naphthylamine (309): note also that with dil. KOH (309) this prod. loses HCl ring-closing to 3-(*α*-naphthyl)-oxazolidone-2 [Beil. XXVII-136], m.p. 125° (309), while with conc. KOH it merely undergoes hydrolysis of chlorine yielding *N*-(*β*-hydroxyethyl)-*α*-naphthylamine, m.p. 52° (309).]

—— *β*-Chloroethyl *N*-(*β*-naphthyl)carbamate [Beil. XII-1292]: m.p. 98° (309). [Prepd. indirectly from *β*-chloroethyl chloroformate (3:5780) with *β*-naphthylamine (309); for behavior with dil. and conc. KOH analogous to preceding case see (309).]

Ⓓ *β*-Chloroethyl *N*-carbamidocarbamate (*β*-chloroethyl allophanate) [Beil. III$_2$-(56)]: m.p. 182.5° (392), 181–182° (388). [From $\bar{C}$ with vapors of isocyanic acid (392) or from *β*-chloroethyl chloroformate (3:5780) with urea (388).]

—— *N*-(*β*-hydroxyethyl)phthalimide = (*β*-(*N*-phthalimido)ethanol) [Beil. XXI-469, XXI$_1$-(368)]: m.p. 129.5° cor. (394), 127–128° (395), 126.5–127.5° (357), 126–127° (396), 125–126° (397) (note that m.p. given by (393) is incorrect). [From $\bar{C}$ with K phthalimide in s.t. at 150° for 4 hrs. (393): note that the m.p. of 88–89° reported by the only worker (393) using this method is not far from that (81° (395)) of *N*-(*β*-chloroethyl)phthalimide leaving some question as to which prod. was really obtd.]

Ⓓ *N*-(*β*-hydroxyethyl)tetrachlorophthalimide: m.p. 208–209° (398). [From $\bar{C}$ with K tetrachlorophthalimide in s.t. at 200° for 6 hrs. (398).]

—— *β*-Chloroethyl triphenylmethyl ether: m.p. 132° (399). [From $\bar{C}$ with *α*-bromotriphenylmethane (399).]

40–50° at 10 mm. (2)

$D_{\_}^{15} = 1.268$ (1) $n_{\_}^{15} = 1.475$ (1)

Liquid, insol. aq., sol. alc. or ether. — C̄ readily polymerizes (see below).

PREPARATION OF C̄

[For prepn. of C̄ from acrolein (1:0115) with dry HCl gas at −10 to −15° (yields: 87% (3), 65% (4)) (6) (7) (8) (9) (10) see indic. refs.; note that since HCl is present much of the prod. may appear as the trimer (see below); for prepn. of C̄ from its trimer (see below) by distillation at ord. press. see (1); for prepn. of C̄ from 1,3-dichloropropene-1 (3:5280) by cat. vapor-phase hydration see (20).]

tives) formerly (4) regarded as *cis* and *trans* stereoisomers of $\bar{C}$ may very probably be $\bar{C}$ and its synionic isomer (3:7480).

[For prepn. of $\bar{C}$ from 1,2,3-trichloro-2-methylpropane (3:5885) by dehydrochlorination with quinoline (73–85% yield) see (7).]

[For prepn. of $\bar{C}$ from 1,1-dichloro-2-methylpropene-2 (3:7480) by htg. under reflux see (2): for formn. of $\bar{C}$ (together with other products) from 2-methylpropene-1 (isobutylene) (60% yield (5)) (1) + Cl_2, or from 3-chloro-2-methylpropene-1 (isobutenyl chloride) (3:7145) with Cl_2 (1 mole) + $NaHCO_3$ (1.5 moles) at 0° (2) see indic. refs.; for formn. of $\bar{C}$ (20% yield (6)) (together with other products) from 1,3-dichloro-2-methylpropanol-2 (3:5977) + strong oxygen acids see (6); for formn. of $\bar{C}$ (46% yield (3)) from 1,3-dichloro-2-methylpropanol-2 (3:5977) by htg. with P_2O_5 for 2 hrs. at 110–115° see (3).]

$\bar{C}$ on hydrolysis with aq. + $CaCO_3$ (2) (4) or aq. + MgO (4) gives (2) (3) (46% yield (4)) 1-chloro-2-methylpropen-1-ol-3 (3-chloro-2-methylallyl alc.) (3:8340) q.v.

$\bar{C}$ with O_3 followed by hydrolysis yields (2) (3) (5) chloroacetone (3:5425).

$\bar{C}$ treated with Cl_2 in the dark at 0° for 37 hrs. yields (4) 1,1,2,3-tetrachloro-2-methylpropane (3·6165) + other products.

$\bar{C}$ with cuprous cyanide refluxed 9–10 hrs. gives (67% yield (7)) 4-chloro-3-methylbuten-3-nitrile-1, b.p. 70–73° at 10 mm., $D_4^{20} = 1.0856$, $n_D^{20} = 1.4643$ (7); this product on hydrolysis with hot conc. HCl for 2 hrs. gives (7) 4-chloro-3-methylbuten-3-oic acid-1, m.p. 35° (corresp. phenylhydrazide, m.p. 147–148°).

3:5605 3,3,3-TRICHLORO-2-METHYLPROPENE-1 $C_4H_5Cl_3$ Beil. S.N. 11

(1,1,1-Trichloro-2-methylpropene-2)

$$\begin{array}{c} CH_3 \\ | \\ H_2C{=}C{-}CCl_3 \end{array}$$

B.P. 132° (1) $D_{-}^{20} = \mathbf{1.293}$ **(1)** $n_{-}^{20} = \mathit{1.479}$ *(1)*

Note: $\bar{C}$ readily undergoes allylic transposition so that in reactns. of $\bar{C}$ products derived from the isomeric 1,1,3-trichloro-2-methylpropene-1 (3:5025) may be expected (1) (2) (3) (4).

[For prepn. of $\bar{C}$ (yield: 30–43% (4), 15% (1)) from β,β,β-trichloro-*ter*-butyl alc. ("Chloretone") (3:2662) by htg. to 200° with P_2O_5 and dimethylaniline (1) or quinoline (4) see indic. refs.] [A 57% yield of the isomeric 1,1,3-trichloro-2-methylpropene-1 (3:5025) together with some α-chloroisobutyric acid (3:0235) is separated from $\bar{C}$ by redistillation (1).]

$\bar{C}$ on hydrolysis by boilg. 1 day with aq. Na_3PO_4 gives (60% yield (2)) 3,3-dichloro-2-methylpropen-2-ol-1, b.p. 78–79°, $D_{-}^{20} = 1.298$, $n_{-}^{20} = 1.493$ (*p*-nitrobenzoate, m.p. 91°, *N*-phenylcarbamate, m.p. 64° (2)).

$\bar{C}$ on htg. with NaOAc + AcOH gives (2) 3,3-dichloro-2-methylpropen-2-yl acetate, b.p. 79° at 12 mm., $D_{-}^{20} = 1.257$, $n_{-}^{20} = 1.4718$ (2). [With boilg. NaOH this regenerates the corresp. alc. (2).]

$\bar{C}$ with NaOEt gives in the cold 70% yield (2) of 3,3-dichloro-2-methylpropen-2-yl ethyl ether, b.p. 56° at 12 mm., $D_{-}^{20} = 1.1285$, $n_{-}^{20} = 1.4610$ (2).

C̃ in AcOH treated with O_3, then hydrolyzed, gives (70% yield) α,α,α-trichloroacetone (3:5620), b.p. 133–134° (1).

[For behavior of C̃ with PCl_5, with HF, or with HF + anisole see (4).]

Ⓓ **2,3-Dibromo-1,1,1-trichloro-2-methylpropane:** m.p. 34° (1). [From C̃ + Br_2 without solvent; crude prod. recrystd. from alc. at −10° (1); cf., however, (4).]

Ⓓ **3,3-Dichloro-2-methylpropen-2-yl *p*-nitrobenzoate:** m.p. 91° (2). [From C̃ on boilg. with dil. alc. soln. of K *p*-nitrobenzoate (2).]

3:5605 (1) Jacob, *Bull soc chim.* (5) **7**, 581–586 (1940). (2) Kirrmann, Jacob, *Bull. soc. chim.* (5) **7**, 586–593 (1940). (3) Kirrmann, Jacob, *Compt. rend.* **203**, 1528–1529 (1936). (4) Price, Marshall, *J. Org. Chem.* **8**, 532–535 (1943)

3:5615 1,2-DICHLOROBUTENE-2 (high-boilg. stereoisomer) $C_4H_6Cl_2$ Beil. S.N. 11

B.P. 132–134° at 762 mm.	(1)	D_4^{20} = **1.1597**	(2)	n_D^{20} = **1.4590**	(2)
125–127°	(2)	D_4^{18} = **1.1601**	(2)	n_C^{18} = **1.4635**	(2)
		D_4^{16} = **1.1771**	(1)	n_C^{16} = **1.4710**	(1)

[*See also low-boilg. stereoisomer* (3:5360).]

[For prepn. of C̃ (together with its stereoisomer (3:5360)) from 1,2,3-trichlorobutane (3:5935) with KOH at 150° (2), or from 2,2-dichlorobutane (3:7415) or 2,3-dichlorobutane (3:7615) with alc. KOH (5), see indic. refs.; for formn of C̃ (together with its stereoisomer and also 2,4-dichlorobutene-2 (3:5550)) from 2-chlorobutene-2 (3:7105) by actn. of Cl_2 at 350° see (3).]

C̃ with 1 mole Cl_2 + 1.5 moles $NaHCO_3$ at 0° gives (100% yield (4)) 1,2,2,3-tetrachlorobutane (3:9078).

C̃ on hydrolysis by htg. with 2 pts. aq. + 1 mole powdered $CaCO_3$ at 70° for 4 hrs. gives (1) a mixt. of about equal parts of 2-chlorobuten-2-ol-1 (3:8240) and (by allylic transposition) 3-chlorobuten-3-ol-2 (3:9115).

C̃ on oxidn. with $KMnO_4$ in acetone gives (1) chloroacetic acid (3:1370) + AcOH (1:1010) + HCl. — C̃ in CCl_4 at −17° treated with O_3 followed by aq. gives acetaldehyde (1:0100).

135–136°	(2)	1.2226	(3)
135°	(3)		
134–135°	(4)		
133–135° at 760 mm.	(14)		
30° at 10 mm.	(2)		

Colorless mobile liq. with penetrating odor. — $\bar{C}$ fumes in air and gradually deposits hydrated oxalic acid (1:0445) (17). — $\bar{C}$ as such is insol. in aq. but rapidly hydrolyzes with formn. of HCl and ethyl hydrogen oxalate, the latter in turn being converted to oxalic acid (1:0445) + EtOH.

[For prepn. of $\bar{C}$ from diethyl oxalate (1:1055) with PCl_5 (yields: 80–90% (5), 84% (6), 80% (7)) (8) (9) (10) (11) (34) see indic. refs.; note that this mode of prepn. has been shown (4) to comprise two distinct and successive reactions: first the formn. of ethyl α,α-dichloro-α-ethoxyacetate, $Cl_2C(OEt).COOEt$ [Beil. II-543, II_1-(236)], b.p. abt. 85° at 10 mm., D_4^{20} = 1.23155 (2); and second, the pyrolysis of this product by repeated distillation (13) or increased temp. (especially in the pres. of catalysts such as salts of Fe or Pt (5) (12)) yielding $\bar{C}$ + ethyl chloride (3:7015).]

[For prepn. of $\bar{C}$ from ethyl hydrogen oxalate [Beil. II-535, II_1-(232), II_2-(504)] with $SOCl_2$ (yields: 78% (14), 72% (15)) or with PCl_5 (3) see indic. refs. (note that the initial ethyl hydrogen oxalate is readily obtd. from anhydrous oxalic acid (1:0535) with diethyl oxalate (1:1055) by htg. 3 hrs. (32% yield (15)) (18) or by distn. with EtOH and CCl_4 as directed (61% yield (16))); for prepn. of $\bar{C}$ from K ethyl oxalate with $POCl_3$ or PCl_5 (17) (3) or with $SOCl_2$ (60–70% yield (24)) see indic. refs. (note that K ethyl oxalate can readily be prepd. in 95–97% yield from diethyl oxalate (1:1055) by digestion with aq. KOAc (24)).]

[For prepn. of $\bar{C}$ from oxalyl (di)chloride (3:5060) with EtOH (1:6130) by reactn. of one acid chloride group but not the other (60% yield) see (25).]

[$\bar{C}$ on passing through tube at 200° loses CO yielding (19) ethyl chloroformate (3:7295).]

[$\bar{C}$ with EtOH (1:6130) reacts normally yielding (17) diethyl oxalate (1:1055); for reactn. of $\bar{C}$ with cellulose see (25).]

[$\bar{C}$ with diethyl sodiomalonate in ether gives (20) (12) a mixt. of triethyl oxalomalonate [Beil. III-850, III_1-(292)] and tetraethyl dioxalomalonate [Beil. III_2-(199)]; $\bar{C}$ with ethyl sodio-cyanoacetate in ether gives (21) (22) diethyl oxalo-cyanoacetate [Beil. III-850], m.p. 98° (22), 96° (21); $\bar{C}$ with diethyl methyl sodio-malonate gives (23) diethyl oxalo-methyl-malonate; many other analogous condensations cannot be included here.]

[$\bar{C}$ with aromatic hydrocarbons in the pres. of $AlCl_3$ undergoes reactn. of the Friedel-Crafts type, and this procedure has been widely studied as a means of introduction of the —CO.COOEt group: e.g., $\bar{C}$ with C_6H_6 + $AlCl_3$ in nitrobenzene + CS_2 gives (26) ethyl benzoylformate (ethyl phenylglyoxylate) [Beil. X-657, X_1-(314)], b.p. 256–257°; for corresp. analogous reactn. with toluene (1:7405) (27), *m*-xylene (1:7420) (27), cumene (1:7440) (9), pseudocumene (1:7470) (27), or mesitylene (1:7455) (27) (1) see indic. refs.]

$\bar{C}$ with NH_3 in alc. gives (17) ethyl oxamate, $NH_2.CO.CO.OC_2H_5$ [Beil. II-544, II_1-(236), II_2-(509)], lfts. from hot alc., m.p. 114°. — Similarly $\bar{C}$ with aniline should yield ethyl oxanilate, $C_6H_5.NH.CO.CO.OC_2H_5$ [Beil. XII-282, XII_1-(206)], tbls. or pr. from alc., ndls. from hot aq., m.p. 66–67°; $\bar{C}$ with phenylhydrazine should yield β-(ethoxalyl)-phenylhydrazine, $C_6H_5.NH.NH.CO.CO.OC_2H_5$ [Beil. XV-264], lfts. from alc., m.p. 119°.

$\bar{C}$ with urea (2 moles) reacts vigorously at room temp. as a normal acid chloride yielding (28) ethyl oxalurate, $NH_2.CO.NH.CO.CO.OC_2H_5$ [Beil. III-65, III_2-(54)], ndls. from ether, m.p. 184–185°.— Note, however, that $\bar{C}$ with *N*-phenylurea on htg. evolves CO + C_2H_5Cl (3:7015) and yields (29) a mixt. of ethyl ω-phenylallophanate, $C_6H_5.NH.CO.NH.COOC_2H_5$ [Beil. XII-359, XII_1-(234)], ndls. from boilg. alc., m.p. 106° (30), and *N*-phenyl-parabanic acid (oxalyl *N*-phenylurea) [Beil. XXIV-454, $XXIV_1$-(405)], lfts. from alc., m.p. 208° (29). — $\bar{C}$ with *N,N'*-diphenylurea in C_6H_6 on htg evolves C_2H_5Cl (3:7015) and yields (29) *N,N'*-diphenylparabanic acid (oxalyl *N,N'*-diphenylurea) [Beil. XXIV-455, $XXIV_1$-(405)], ndls. from alc., m.p. 204°. — $\bar{C}$ with *N,N'*-dimethylurea (2 moles)

reacts vigorously giving (80% yield (31)) N,N'-dimethylparabanic acid [Beil. XXIV-453, $XXIV_1$-(404)], m.p. 154°.

[$\bar{C}$ with RMgX cpds. gives (32) disubstituted glycolic acids ($R_2C(OH)COOH$) and/or ethoxalyl esters of disubstituted ethyl glycolates, $R_2C(O.CO.COOC_2H_5)$ $(COOC_2H_5)$; similarly $\bar{C}$ with diethylcadmium gives (63% yields (33)) ethyl α-ethyl-α-hydroxy-*n*-butyrate (ethyl α,α-diethylglycolate).]

Colorless oil with faintly halogen-

[For prepn. of C̄ from *tris*-(chloromethyl)acetic acid (itself obtd. in quant. yield by conc. HNO_3 oxidn. (9) of 3-chloro-2,2-*bis*-(chloromethyl)propanol-1 = pentaerythrityl trichlorohydrin (9)) by combine decarboxylation and dehydrochlorination in boilg. quinoline (75–85% yield) see (9).]

[For formn. of C̄ (*40% yield (2) together with other products (2) (3)) from* 2-methylpropene-1 (isobutylene) with Cl_2 (2) (3) or from 3-chloro-2-methylpropene-1 (isobutenyl chloride) (3:7145) with Cl_2 (1 mole) + $NaHCO_3$ (1.5 moles) at 0° see (2) (4) see indic. refs.; for formn. of C̄ (together with other products) from 1,2,3-trichloro-2-methylpropane (3:5885) by pyrolysis at 450–550° see (5); *for formn. of* C̄ (together with 1,3-dichloro-2-(chloromethyl)propene-1 (3:9066)) from 1,3-dichloro-2-nitro-2-(chloromethyl)propane with Na/Hg see (1); for prepn. of C̄ (80% yield (6) together with 20% yield 1,3-dichloro-2-methylpropene-1 (3:5590)) from 1,3-dichloro-2-methylpropanol-2 (3:5977) by actn. of strong oxygen acids see (6).]

C̄ on cat. hydrogenation using Pt black yields (1) 1,3-dichloro-2-methylpropane (3:7960), but C̄ in alc. on boilg. with Zn dust gives (75% yield (3)) isobutylene, b.p. −6°.

C̄ with O_3 gives (2) α,α'-dichloroacetone (3:0563).

C̄ treated with Cl_2 in the dark at 0° yields (5) *1,2,3-trichloro-2-chloromethylpropane* (3:6335). — C̄ treated with Br_2 in $CHCl_3$ yields (1) 1,2-dibromo-3-chloro-2-(chloromethyl)-propane, colorless odorless oil, b.p. 140° at 10 mm. (1); note, however, failure to react with Br_2 recorded later (9).

C̄ with aq. alk. as specified (7) yields 2,3-epoxy-2-chloromethylpropanol-1, b.p. 85° at 1 mm. (7). [For similar reactns. cf. (8).]

C̄ on hydrolysis with aq. $CaCO_3$ refluxed 2 hrs. gives (36% yield (9)) 2-(hydroxymethyl) propen-2-ol-1, b.p. 125–126° at 18 mm., $D_4^{20} = 1.0791$, $n_D^{20} = 1.4758$ (9).

3:5635 2-CHLOROPROPEN-2-OL-1 (2-Chloropropen-1-ol-3; β-chloroallyl alcohol)

$CH_2{=}C(Cl){-}CH_2OH$ C_3H_5OCl

Beil. I-439
I_1—
I_2—

B.P. 130–140° *cor.* (1)
136° (2)

$D_{\ }^{\ } = $ **1.164 (2)**

Note that C̄ *is the true* β*-chloroallyl alcohol*; care must be taken to avoid confusion with 3-chloropropen-2-ol-1 (γ-chloroallyl alcohol) (3:5820) whose derivatives have often been designated in the literature as β-chloroallyl derivatives; see also the warning note under γ-chloroallyl chloride (3:5280).

[*For prepn. of* C̄ *from 2,3-dichloropropene-1* (3:5190) by hydrolysis of the reactive halogen atom with hot dil. aq. alk. see (2); from 2-chloro-3-iodopropene-1 by hydrolysis of the iodine atom with hot dil. aq. KOH or with silver oxide see (1); from butadiene-1,2-(allene) with HOCl see (3).]

Colorless liq. with faint odor; C̄ does not have the violent vesicant action on skin shown by the isomeric γ-chloroallyl alc. (3:5820).

C̄ readily dissolves in conc. H_2SO_4 with evolution of HCl gas; after pouring onto ice and distilling acetol (hydroxyacetone) (1:5455) is obtd. (2).

[C̄ with PBr_3 yields (2) 3-bromo-2-chloropropene-1 (β-chloroallyl bromide) [Beil. I-201, I_1-(171)], b.p. 121° (2), 119–120° (4).]

[C̄ yields by suitable treatment (no details (2)) β-chloroallyl acetate [Beil. II-136], b.p. 145° (2). — For esters of C̄ with monocarboxylic acids (5), saturated polycarboxylic acids (6), and halogenated acids (7), and for copolymerization of certain esters of C̄ with styrene (8) see indic. refs.]

Colorless liq.; for constant-boilg. mixt. of C̄ with various org cpds. see Beil. II_2-(191) or (4) (15) (16) —[For insecticidal actn. see (17); for use in refining of mineral oil see (18).]

[For prepn. of C̄ from chloroacetic acid (3:1370) with EtOH + dry HCl gas (10) cf. (72.5% yield (22)) or H_2SO_4 (70% yield (23)) (19) or anhydrous $MgCl_2$ (20) see indic. refs.; from chloroacetyl chloride (3:5235) with EtOH (5) or with triethyl orthoformate (1:3241) at 100–110° (90% yield (21)) see indic. refs.; from α,β-dichlorovinyl ethyl ether (3:5540) with org. acids see (24) (25).]

[For formn. of C̄ from ethyl hydroxyacetate (ethyl glycolate) with PCl_5 see (26); from ethyl aminoacetate hydrochloride with $NaNO_2$ + excess HCl see (27); from ethyl diazoacetate with HCl (27) (28) or with $HgCl_2$ (70% yield (11)) see indic. refs.; from dichloroacetaldehyde monoethyl hemiacetal (3:5310) with alc. KCN at 20° (38% yield) see (29); from ethyl α-chloroacetoacetate (3:6207) with diethyl sodiomalonate see (30).]

C̄ refluxed with KF yields KCl + ethyl hydroxyacetate (+ some ethyl fluoroacetate) (31); C̄ with MgI_2 in ether (32) or KI in alc. (3) (34) or in acetone at ord. temp. (35) yields ethyl iodoacetate, b.p. 180°. [For studies on rate of reactn. of C̄ with KI in acetone see (36) (37) (38); with NaI or LiI in acetone see (38).]

[*C̄ with Al/Hg + a trace of alc. (39) or with Mg + trace of I_2 in ether (40) or C̄ with* Mg + trace $HgCl_2$ in ether (41) yields ethyl γ-chloroacetoacetate (3:6375), b.p. 205°; C̄ with NaCN (25) or KCN (42) yields ethyl cyanoacetate, C̄ with ethyl sodioacetoacetate gives (56–62% yield (23)) diethyl acetosuccinate.]

[C̄ with 2 moles MeMgBr (but not MeMgI) in ether gives (yield: 60% (43), 38% (44)) 1-chloro-2-methylpropanol-2 (3:7752) (note, however, that C̄ with a large excess MeMgBr (4 moles) gives (40% yield (45)) 2-methylbutanol-3 (1:6170) (3,5-dinitrobenzoate, m.p. 74–75°)); for reactn. of C̄ with EtMgBr yielding (46) 3-(chloromethyl)-pentanol-3 [Beil. I-412], with isopropyl MgCl (47), or with phenyl MgBr (3 moles) yielding (48) chloromethyl-diphenyl-carbinol [Beil. VI-685] see indic. refs.]

[For use of C̄ with Zn (or Zn + Cu (49)) + ketones to give by Reformatsky reactn. (50) β-hydroxy-esters see indic. refs.]

C̄ treated with aq. benzenediazonium chloride + NaOAc gives (15% yield (6)) ethyl γ-chloro-β-phenylhydrazono-acetoacetate, m.p. 92–93° (6).

C̄ with Me_3N in abs. alc. followed by treatment with 100% hydrazine hydrate as directed (51) (52) gives 83–89% yield (51) betaine hydrazide hydrochloride, $(CH_3)_3N(Cl).CH_2$-

CO.NH.NH_2 (Girard's reagent for ketones), m.p. 192°. [For corresp. reactn. using pyridine instead of Me_3N see (52).]

$\bar{C}$ shaken in cold with 2 vols. conc. aq. NH_4OH gives (53) (54) (28) (29) (78-84% yield (55)) chloroacetamide, cryst. from aq., m.p. 119-120° (55), 120° (28). — $\bar{C}$ htd. at 100° for ½ hr. with 2 moles aniline, cooled, aniline hydrochloride extracted with aq. gives (100% yield (56)) (57) (58) ethyl anilinoacetate (phenylglycine ethyl ester) [Beil. XII-470, XII_1-(203)], cryst. from dil. alc. (56) (57) or lgr. (58), m.p. 58° (58), 57-58° (57), 57° (56). [This prod. on boilg. with excess aniline yields (57) anilinoacetanilide (phenylglycine anilide) [Beil. XII-556], m.p. 110-111° (57).] — $\bar{C}$ htd. with aq. benzylamine yields (59) chloroacet-N-benzylamide, m.p. 93.0-93.C° cor. (59).

[$\bar{C}$ with ethyl carbamate ("urethane") + Na in dry ether as directed gives (51-57% yield (60)) triethyl N-tricarboxylate = $N(COOC_2H_5)_3$ [Beil. III-28], b.p. 146-147° at 12 mm. (60).]

$\bar{C}$ htd. as directed (60) with K tetrachlorophthalimide yields N-(carbethoxymethyl)-tetrachlorophthalimide, ndls. from $CHCl_3$ on pouring into 2 vols. MeOH, m.p. 180-181° (60); $\bar{C}$ with Na phthalimide yields (61) N-(carbethoxymethyl)phthalimide, m.p. 112-113° (61); $\bar{C}$ with K 3-nitrophthalimide yields (62) N-(carbethoxymethyl)-3-nitrophthalimide, ndls. from alc., m.p. 79-80° (62).

$\bar{C}$ on hydrolysis (e.g., by boilg. 10 min. with $N/10$ aq. $Ba(OH)_2$ (14)) yields ethyl alcohol (1:6130) and chloroacetic acid (3:1370). [For studies on the kinetics of hydrolysis of $\bar{C}$ under various conditions see Beil. II_2-(191-192) and (2) (14) (63) (64) (65).]

Note: Care must be taken not to confuse C̄ with tetrachloroethylene (3:5460) or with 1,1,1,2-tetrachloroethane (*unsym.*-acetylene tetrachloride (3:5555)).

Colorless liq. with odor similar to that of chloroform. — [For vapor press. of C̄ at intervals over range 20–145° see (25); for study of thermal conductivity see (26).]

C̄ is very spar. sol. aq.: e.g., 100 g. H_2O at 20° dis. 0.288 g. C̄; at 55–56° dis. 0.336 g. C̄ (27); 1 g. C̄ is sol. at 25° in 350 g. aq. (101); for soly. of H_2O in C̄ at 0°, 25°, and 30° as

detd. by Karl Fischer reagt. see (28). — C̄ is easily volatile with steam (for use in detn. of H_2O see below).

MISCELLANEOUS PHYSICAL PROPERTIES

[For soly. in C̄ of dry gaseous HCl (14) (15), H_2S (14), or O_2 (29) see indic. refs.; for soly. in C̄ at 11–25° of I_2 (30) and use of such solns. in detn. of iodine number (31) see indic. refs.; for adsorption by activated carbon of I_2 from solns. in C̄ see (32).]

[For study of influence of vapors of C̄ on the explosion limits of mixtures of air with hydrogen (33), acetylene (33), methane (33) (34) (35), or carbon monoxide (33) (36) see indic. refs.]

[For prepn. of and comparison with C̄ of *sym.*-dideuteroiotetrachloroethane, $Cl_2C(D)$.-$C(D)Cl_2$, see (9).]

Binary systems contg. C̄. [For f.p./compn. data and/or diagrams on systems C̄ + 1,2-dichloroethane (ethylene dichloride) (3:5130) (18); C̄ + 1,1,2-trichloroethane (3:5330) (18); C̄ + pentachloroethane (3:5880), eutectic, f.p. −73°, contg. 40.1% C̄ (18); C̄ + *cis*-dichloroethylene (3:5042) (37); C̄ + *trans*-dichloroethylene (3:5028) (37); C̄ + *p*-dichlorobenzene (3:0980) (38); C̄ + 1,2-dibromoethane (ethylene dibromide) (18); C̄ + 1,1,2,2-tetrabromoethane (acetylene tetrabromide) (18); C̄ + succinonitrile (18); or C̄ + succinic acid (1:0530) (18) see indic. refs. — For study of system C̄ + naphthalene (1:7200) at 30° under press. up to 1000 atm. see (39).]

C̄ with various org. cpds. forms binary azeotropes [e.g., C̄ with anhydrous formic acid (1:1005) forms a const.-boilg. mixt., b.p. 99.25° at 760 mm., contg. 32 wt. % C̄ (40): note that C̄ with AcOH (1:1010) does *not* form a const.-boilg. mixt. (41) (the data listed by "Int. Crit. Tables" for such an azeotrope is actually for the mixt. AcOH + tetrachloroethylene); C̄ with propionic acid (1:1025) forms a const.-boilg. mixt., b.p. 140.4° at 760 mm., contg. abt. 40 wt. % C̄ (12); for other azeotropes see Beil. II_2-(56). — Note that no record of formn. of azeotropes of C̄ with MeOH or EtOH can be found.]

Ternary systems contg. C̄. [For soly. data and diagrams of system C̄ + acetone (1:5400) + aq. see (43).]

USES OF C̄

C̄ is widely used in industry as a solvent and as an intermediate in the manufacture of various other chlorinated solvents, notably trichloroethylene (3:5170); for additional examples of special uses see also below.

C̄ is frequently employed as solvent in certain types of Friedel-Crafts reactions or phthalic anhydride condensations [for study of use of C̄ as solvent in Friedel-Crafts condensation of phenol with high-mol.-wt. acyl chlorides see (44)].

[For use of C̄ as swelling agent for rubber (45), in prod. of films from rubber hydrochloride (46), in prod. of cellulose acetate by pptn. from C̄ with hydrocarbons (47) (note that acetylcelluloses give with C̄ crystalline addition prods. (48)), together with aliphatic monohydric alcs. as solv. for cellulose alkyl ethers (49), in prepn. of transparent cellulose acetate plastics (50) see indic. refs. — For soly. of various polymers in C̄ see (56).]

[For use of C̄ as catalyst in condensation of phenol with formaldehyde (51) or furfural (52) see indic. refs.]

[For use of C̄ with petroleum naphtha as a dry-cleaning fluid (53), for use of C̄ as a rust remover (54), as means of removing mud barriers in oil wells (55), or as an immersion fluid in opt. crystallog. (21) see indic. refs.]

[For use of C̄ (57) (58) or stable aq. emulsions of C̄ (59) as weed killers see indic. refs.]

[For studies of use of C̄ in detn. of theobromine in cacao see (60) (61) (62) (63).]

[For use of C̄ as anti-moth prod. (64), as a component of insecticides (65), together with

CS_2 and chlorobenzene (3:7903) as insecticide (66), or together with 20% trichloroethylene (3:5170) as a fumigant and insecticide (67) see indic. refs.]

[For studies on antiseptic, bactericidal, and disinfectant action of $\bar{C}$ see (68) (69) (70).]

$\bar{C}$ is also employed for the detn. of H_2O by distillation; note that besides being non-inflammable $\bar{C}$ is also much denser than water which for some applications of this method is advantageous. — [For general discussion and examples of this procedure see (226) (70) (71) (72) (73) (74) (75); for comparison of results with those obtd. by oven drying see (76); for application to detn. of H_2O in liquid and solid fuels (77) (78), in glycerol (79) (80), in liquid glue (81), in cereal (82), in dried apples (83), in cooking salt (84) see indic. refs.]

TOXICITY AND PHYSIOLOGICAL ACTION OF $\bar{C}$

$\bar{C}$ is the most toxic of the group of chlorinated hydrocarbons (85) and produces marked pathological alterations in gastrointestinal tract, liver, and kidneys. — [Detailed discussion of this aspect of $\bar{C}$ is beyond the scope of this treatment except to cite references (229) (227) (232) and (85)–(99), incl. (note that articles on this topic prior to 1930 are omitted).]

[For discussion of fate of $\bar{C}$ in body see (100). — Note also that $\bar{C}$ (in sharp contrast to the closely related tetrachloroethylene (3:5460)) has no efficacy as anthelmintic for hookworms (101).]

[For actn. of $\bar{C}$ on alc. fermentation see (102) (103); for actn. on invertase see (104).]

DETERMINATION OF $\bar{C}$

Some methods for the detn. of $\bar{C}$ involve conversion of all of its halogen to chloride ion and subsequent volumetric or gravimetric detn. of the latter; e.g., for methods based on initial pyrolytic decomposition see (105) (89) (106) (107); for methods based on dehalogenation of $\bar{C}$ with Na + ethanolamine in dioxane see (108) (230) (note that use of Na in liq. NH_3 causes some cyanide formn. (109)). — For detn. of $\bar{C}$ by means of elimination of 1 HCl with cold alc. KOH see (110). — For detn. of $\bar{C}$ by means of the Fujiwara color reactn. with NaOH/pyridine see (111). — Note that $\bar{C}$ does not respond to the R + H "Tri-Per-Analyzer" (a recording ultra-violet photometer) (112). — For further comments on detection of $\bar{C}$ see below under color tests.

PREPARATION OF $\bar{C}$

$\bar{C}$ is one of a large family of "chlorinated solvents" now available from industrial sources. — The most-studied method of prepn. is that from acetylene by controlled addition of chlorine, although variants of this method are employed and other starting prods. (see below) are sometimes used. — $\bar{C}$ is also obtained as a by-prod. of the manufacture of the comml. mixt. (3:5030) of the two stereoisomeric 1,2-dichloroethylenes, *cis* (3:5042) and *trans* (3:5028), 1,1,2-trichloroethane (3:5330), etc.

From acetylene by addition of chlorine. Under suitable controls to avoid explosion and with the assistance of a wide variety of catalysts $\bar{C}$ is manufactured from acetylene by reaction with Cl_2. — [For a concise review of the general nature and difficulties of this general method see (113).]

[For important general articles on this synthesis see (114)–(122) incl. — For examples of patents employing this method see refs. (123)–(138) incl.; for special test of Ger. 204,833 (131) see (118) (120); for test of Ger. 154,677 (133) see (119) (120).]

From acetylene by other means. [For prepn. of $\bar{C}$ from acetylene with excess $SbCl_5$ (139) (234) with $SbCl_3 + SbCl_5$ (140), with NOCl (4 moles) at 350° (141), with aq. NaOCl soln. (142), with S_2Cl_2 + Fe powder in cold (143) (144) see indic. refs.]

From ethylene. [For formn. of $\bar{C}$ from ethylene + Cl_2 (as by-prod. of prepn. of ethylene chlorohydrin (3:5552)) (145), from ethylene + Cl_2 (as by-product of prepn. of 1,1,2-trichloroethane (3:5330)) (146) (147), from ethylene + Cl_2 (as by-prod. of a three-part process for combined prepn. of $\bar{C}$ + ethyl chloride) (198) see indic. refs.

From dichloroethylenes. [For prepn. of $\bar{C}$ from *cis*-dichloroethylene (3:5042) in vapor phase at 95° in light of 4360 Å with Cl_2 (in absence of O_2) (149), or in liq. phase with SO_2Cl_2 (1½ moles) in pres. of trace of dibenzoyl peroxide refluxed 3 hrs. in dark (85% yield (150)), see indic. refs.]

[For prepn. of $\bar{C}$ from *trans*-dichloroethylene (3:5028) in vapor phase at 80–95° in light of 4358 Å with Cl_2 see (151).]

[For prepn. of $\bar{C}$ from ord. mixt. (3:5030) of both stereoisomeric dichloroethylenes with Cl_2 (13) in light of 4360 Å (152) see indic. refs.]

From trichloroethylene. [For formn. of $\bar{C}$ (together with other prods.) from trichloroethylene (3:5170) + $AlCl_3$ + HCl gas at 50° see (153).]

From 1,2-dichloroethane (ethylene (di)chloride). [For prepn. of $\bar{C}$ from ethylene (di)chloride (3:5130) with Cl_2 (148) in u.v. light see (154).]

From miscellaneous starting points. [For formn. of $\bar{C}$ usually together with other prods. from dichloroacetaldehyde (3:5180) with PCl_5 (1), from "β-chlorovinyl iodochloride" ($ClCH{=}CH.ICl_2$) on warming (16), from 1,1,2-trichloro-2-iodoethane on distn. at ord. press. (155), from 1,2-di-iodoethylene with Cl_2 (156), or from 1,1,2-trichloroethane (3:5330) with Cl_2 + $AlCl_3$ at 70–80° (231) see indic. refs.]

STABILIZATION OF $\bar{C}$

[For patents on stabilization of $\bar{C}$ by addition of small amts. of phenols, aminophenols, etc. (157), or by addn. of less than 0.1% alkylamines (158) see indic. refs.]

CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis without catalyst. $\bar{C}$ on protracted reflux (20 days (159)) or techn. $\bar{C}$ on repeated distn. (160) leaves a residual high-boilg. fraction ("Tetranachlauf") consisting mainly of 1,1,2,3,4,4-hexachlorobutane (3:3155), ndls. from alc., m.p. 107° (159) (160), presumably formed by elimination of 1 Cl atom from each of 2 moles of $\bar{C}$. — [$\bar{C}$ htd. in s.t. at 300° for 15 hrs. yields (139) trichloroethylene (3:5170); $\bar{C}$ in s.t. at 360° for 100 hrs. yields (139) hexachlorobenzene (3:4939).]

Pyrolysis in pres. of various catalysts or HCl acceptors. $\bar{C}$ on suitable htg. particularly in the pres. of dehydrohalogenating catalysts or acceptors of the hydrogen chloride formed loses 1 mole HCl yielding trichloroethylene (3:5170). (For elimination of HCl by chemical means such as alk., NH_3, etc., see below.)

[E.g., $\bar{C}$ over pumice at 700° (161), over pumice contg. $Cu_2(PO_4)_3$ at 450–500° (162), over ThO_2 below 390° (163) cf. (164), over $BaCl_2$ at 300° (165), over bone char at 300–310° (166), over activated carbon at 200–300° (167), 260° (168) (note yield diminishes with increasing temp. (233)) or 500° (169), or over suitable cat. (148) loses HCl yielding trichloroethylene (3:5170). — Note also that pure $\bar{C}$ on long exposure to u.v. light loses HCl bimolecularly yielding (159) 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), m.p. 80°.]

[$\bar{C}$ + acetylene over cat. at 250° loses HCl yielding (167) trichloroethylene (3:5170) + vinyl chloride (3:7010); $\bar{C}$ with MeOH over Al_2O_3 at 280° loses HCl yielding (170) trichloroethylene (3:5170) + methyl chloride (3:7005).]

Dehydrogenation. [$\bar{C}$ with air over pumice contg. $CuCl_2$ at 430–450° (171), or with Cl_2 over activated carbon contg. $CuCl_2$ at 300–320° (172), or with hexachloroethane (3:4835) over cat. at 200–400° (173) loses its two hydrogenations yielding tetrachloroethylene (3:5460).]

(Partial) dehalogenation. [$\bar{C}$ with H_2 over Ni at 300–320° (174), or $\bar{C}$ with Fe or Al + aq. (175) (176) or Zn + aq. (176) (177), or $\bar{C}$ with acetylene over hydrogenating cat. (such as Ni) on activated carbon at 350° (178) preferably in pres. of aq. vapor (179) or on electrolytic reductn. in pres. of $ZnCl_2$ (235) (236) loses 1 chlorine from each carbon atom yielding a mixt. (3:5030) of the two stereoisomeric 1,2-dichloroethylenes. — Note that $\bar{C}$ with Zn in alc. yields (180) acetylene.]

Oxidation. [$\bar{C}$ with air in ultra-violet light yields (181) (182) dichloroacetyl chloride (3:5290) (or in pres. of aq. dichloroacetic acid (3:6208)), accompanied by small amts. of oxalic acid and an octachlorobutane, m.p. 81°. (Note also that pure $\bar{C}$ on long exposure to u.v. light loses HCl bimolecularly yielding (159) 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), m.p. 80°.)]

[For behavior of $\bar{C}$ with CrO_3/H_2SO_4 (183) or over hot CuO (184) see indic. refs.]

Behavior with Halogens

Fluorination. [$\bar{C}$ with F_2 gas at 50° for 14 hrs. gives (185) 1-fluoro-1,1,2,2-tetrachloroethane, b.p. 115.5–116.5°, $D_4^{20} = 1.6218$, $n_D^{20} = 1.4487$, and 1,2-difluoro-1,1,2,2-tetrachloroethane, b.p. 92–93°, m.p. 24–25°, together with various other prods. — For fluorination of $\bar{C}$ with $SbF_3 + SbCl_5$ see (186)).]

Chlorination. [$\bar{C}$ with Cl_2 (139) in CCl_4 soln. (187), in u.v. light (188) or X-radiation (189), or over activated carbon at 300–400° (190) (191), or in liq. phase at 60–70° (192), or with Fe at 20–80° (192), or with $AlCl_3$ at 20–100° (192), or under reflux at 120° (80% yield (193)), or $\bar{C}$ with anhydr. $FeCl_3$ on htg. in s.t. (194), or even $\bar{C}$ with aq. bleaching powder (192) yields hexachloroethane (3:4835).]

Behavior with H_2SO_4

$\bar{C}$ with fumg. H_2SO_4 (65% SO_3) in pres. of $HgSO_4$ at 50–60° readily gives (198) (yields: 70–73% (195), 32% (196), 30% (197)) glyoxal sulfate, $O_2SO_2CH—CHO_2SO_2$, [Beil. I_2-(818)], ndls. from $ClSO_3H$, m.p. 176–177° (198), ndls. with 1 AcOH, m.p. 121–122° from AcOH, the solv. of crystn. being lost completely in vac. over NaOH (199).

Behavior with Alkaline Reactants

$\bar{C}$ under influence of many alk. reactants loses 1 mole HCl; this reactn. is used for the manufacture of trichloroethylene (3:5170) (see also above under pyrolysis of $\bar{C}$) and also by titration of the HCl or estimation of chloride ion formed as a diagnostic test for $\bar{C}$ (see below)

$\bar{C}$ on htg. with aq. alk. or alk. carbonates (200) in pres. of tetraethylene glycol as promoter (228) or with aq. $Ca(OH)_2$ or alk. carbonates (200) (201) (234) (114) (for test of Ger. 171,900 (200) see (202) (120)), or $\bar{C}$ with alc. KOH (203) cf. (122) or alc. NaOEt (203), loses 1 mole HCl yielding trichloroethylene (3:5170); note that in use of alc. alkali, distn. gives the const.-boilg. mixt. of EtOH with trichloroethylene, b.p. 70–71°, from which latter is separated by washing with aq. and subsequent drying over $CaCl_2$ (203).

$\bar{C}$ with EtOH/NaOH or EtOH/NaOEt (204) cf. (205), or $\bar{C}$ with 1 *N* EtOH/KOH in xylene (110), instantly and quant. splits out 1 HCl at room temp.; note that this does not occur with *cis*-dichloroethylene (3:5042), *trans*-dichloroethylene (3:5028), trichloroethylene (3:5170) or tetrachloroethylene (3:5460), chloroform (3:5050), or carbon tetrachloride (3:5100), but does occur in analogous fashion with pentachloroethane (3:5880) (110). — [For rate of reactn. of $\bar{C}$ with KOH in 95% EtOH at 90° see (206).]

Note, however, that $\bar{C}$ in acetone with *excess* standard alk. refluxed 3 hrs., then residual alk. titrated back, uses 5 equivalents of alk. (207); this surprising result is presumably to

be attributed to hydrolysis of $\bar{C}$ to glyoxal followed by disproportionation of latter to sodium glycolate; cf. (208).

$\bar{C}$ with solid KOH on htg. yields (203) dichloroethylene (3:5030), trichloroethylene (3:5170), tetrachloroethylene (3:5460), together with a spontaneously inflammable gas which may be chloroacetylene (3:7000). — $\bar{C}$ with anhyd. KOH in xylene at 80° under N_2 gives (209) a little dichloroacetylene (3:5010) (may be carried out as a lecture experiment (209)).

Behavior of $\bar{C}$ with NH_3 and Amines

[$\bar{C}$ with excess NH_3 gas in pres. of aq. (210), or with aq. NH_4OH htd. under press. (210) (120), or with liq. NH_3 at −40° (211) (212), or with dry pyridine on reflux (182) loses HCl giving (yields: 92% (211) 92–96% (210)) trichloroethylene (3:5170).]

[$\bar{C}$ htd. with aniline + aq. $Ca(OH)_2$ at 140–190° under press. yields (213) a mixt. of the calcium salt of *N*-phenylglycine and *N*-phenylglycine anilide, cf. (122); since this reaction really involves conversion of $\bar{C}$ by loss of HCl to 1,1,2-trichloroethylene (3:5170) and reactn. of latter with aniline see 3:5170 for details.]

$\bar{C}$ with excess phenylhydrazine on stdg. at ord. temp. evolves N_2, ppts. phenylhydrazine hydrochloride, and yields C_6H_6 (110); the full mechanism of this behavior seems never to have been established, but the same three prods. are also similarly obtd. from pentachloroethane (3:5880) and hexachloroethane (3.4835).

[For rate of reactn. of $\bar{C}$ with piperidine in 95% EtOH at 90° see (206).]

Behavior of $\bar{C}$ with Metals

[For survey of action of $\bar{C}$ on various common metals (214) (215) in pres. of moisture (223) see indic. refs.]

$\bar{C}$ with Na or K or their alloys may (like many other polychloro compounds) explode under certain conditions [for extensive studies of this behavior including sensitivity to mechanical shock see (216) (217)].

Behavior of $\bar{C}$ with Metal Salts

[$\bar{C}$ with $AlCl_3$ at 110° undergoes partial rearr. (218) to the isomeric 1,1,1,2-tetrachloroethane (3:5555). — $\bar{C}$ with freshly prepared anhyd. $AlBr_3$ on htg. below b.p. of $\bar{C}$ yields (219) 1,1,2,2-tetrabromoethane (acetylene tetrabromide) [Beil. I-94, I_1-(30), I_2-(66)].]

$\bar{C}$ with $N/15$ $AgNO_3$ in 95% EtOH shows no reactn. even after 12 hrs. at 90° (206) cf. (80).

MISCELLANEOUS

[$\bar{C}$ does *not* react with excess Hg di-*p*-tolyl (220). — $\bar{C}$ with excess C_6H_5MgBr yields 1,1,2,2-tetraphenylethane [Beil. V-739, V_1-(371), V_2-(673)] (221) cf. (222).]

COLOR REACTIONS OF $\bar{C}$

Ⓟ With cyclopentanol (1:6412). $\bar{C}$ (1 drop) with cyclopentanol (2 ml.) + trace solid NaOH, boiled 25 secs., cooled, acidified with AcOH or 85% H_2SO_4, stood 1 min., shaken gives (224) green color. [Note that this same response is also shown by 1,1,2-trichloroethylene (3:5170) but not by methylene dichloride (3:5020), $CHCl_3$ (3:5050), CCl_4 (3:5100), ethylene dichloride (3:5130), pentachloroethane (3:5880), *cis*-(3:5042) or *trans*- (3:5028) 1,2-dichloroethylene, or tetrachloroethylene (3:5460); for sensitivity for $\bar{C}$ see (224).]

With pyridine + NaOH (Fujiwara reagt.) [For detn. of $\bar{C}$ with Fujiwara reagt. see (111); for relative sensitivity of Fujiwara reagt. to $\bar{C}$ as compared to $CHCl_3$ (3:5050),

CCl_4 (3:5100), 1,1,2-trichloroethane (3:5330), trichloroethylene (3:5170), and tetrachloroethylene (3:5460) see (100).]

With $NH_4OH/CuCl$. Note that C̄ with $NH_4OH/CuCl$ does *not* give blue color within 5 min. (225) (dif. from pentachloroethane (3:5880) q.v.).

PREPARATION OF C̄

[For prepn. of C̄ from 1-chloro-2-methylpropene-1 (β,β-dimethylvinyl chloride = "isocrotyl chloride") (3:7120) by addn. of HOCl with Cl_2 + aq., aq. HOCl, or even alkyl or alkaryl hypochlorites as directed see (2) cf. (5) (3).]

[For prepn. of C̄ from α,α-dichloroacetone (3:5430) with MeMgBr in ether see (1).]

[For prepn. of C̄ from ethyl dichloroacetate (3:5850) with MeMgBr (74% yield (4)) or MeMgI (63% yield (6)) cf. (4) or from methyl dichloroacetate (3:5655) with MeMgBr (7) see indic. refs.]

CHEMICAL BEHAVIOR OF $\bar{C}$

With inorganic reagents. $\bar{C}$ does *not* (1) react with aq. HCl. — $\bar{C}$ *cannot* (4) be hydrolyzed to the corresp aldehyde, viz., α-hydroxyisobutyraldehyde [Beil. I-829, I_2-(871)], either by aq., aq. Na_2CO_3, aq. $CaCO_3$, or aq. PbO.

[$\bar{C}$ with 5 *N* abs. alc. NH_3 in s.t. at 100° as directed gives (8) 2,2,5,5-tetramethyldihydropyrazine, m.p. 83–84° (8) (9).]

With organic reactants. [For behavior of $\bar{C}$ with $MeNH_2$ yielding a prod. of compn. $C_{16}H_{32}N_4$ see (8).]

[$\bar{C}$ with Me_2NH in C_6H_6 in s.t. at 130° not only introduces the dimethylamino group for one chlorine but also ring-closes with loss of HCl giving (52% yield (8)) 1-(dimethylamino)-2-methyl-1,2-epoxypropane (α,α-dimethyl-α'-(dimethylamino)ethylene oxide), b.p. 28–30° at 13 mm., $D_-^{22.5} = 0.8725$, $n_D^{22.5} = 1.4216$ (8).]

—— α-Hydroxyisobutyraldehyde di-β-naphthylacetal [$(CH_3)_2$-C(OH)CH$(O.C_{10}H_7)_2$]: [This cpd. which might be expected from $\bar{C}$ with sodium β-naphtholate is unreported; note that 1,3-dichloro-2-methylpropanol-2 (3·5977) with sodium β-naphtholate gives the corresp. di-β-naphthyl ether, m.p. 151–152°.]

—— *unsym.*-Dichloro-*ter*-butyl acetate: unreported.

—— *unsym.*-Dichloro-*ter*-butyl benzoate: unreported.

—— *unsym.*-Dichloro-*ter*-butyl *p*-nitrobenzoate: unreported.

—— *unsym.*-Dichloro-*ter*-butyl 3,5-dinitrobenzoate: unreported.

—— *unsym.*-Dichloro-*ter*-butyl carbamate: m.p. 122° (7). [Prepd. from *unsym.*-dichloro-*ter*-butoxy MgBr by treatment with phosgene (3:5000) followed by NH_4OH (7).]

52–51°	at 10 mm.	(10)		

Colorless when pure, but slightly brown if distilled at ord. press. — Sol. in 12 pts. aq., vol. with steam; miscible with alc. or ether. — Solid is very hygroscopic.

$\bar{C}$ is an important pharmaceutical. — [Although full consideration of its pharmacology is beyond the scope of this text, for studies and reviews of this aspect see (11) (12) (13) (14) (40).] — $\bar{C}$ in the organism is in part excreted (15) (16) as urochloralic acid [Beil. I-620].

PREPARATION OF $\bar{C}$

$\bar{C}$ is readily obtd. from trichloroacetaldehyde (chloral) (3:5210) by various types of reducing actions which are able to effect reduction of the aldehyde group without serious interference with the halogen atoms.

By use of various alcoholates. [For prepn. of $\bar{C}$ from chloral (3:5210) with $Al(OEt)_3$ in abs. EtOH (yields: 85% (17), 84% (3), 80% (18)) (6) (10) (19) cf. (23) see indic. refs.; with Al isopropylate in isopropyl alc. (20) in pres. of acetaldehyde (yield 72–87% (21)) see indic. refs.; with C_2H_5OMgBr (9), $(CH_3)_2CHOMgBr$ (9), or other metallic isopropylates (22) see indic. refs.]

By use of RMgX. [For formn. of $\bar{C}$ from chloral (3:5210) during reaction with MeMgBr (24), with EtMgBr (25) (4), with iso-AmMgBr (4), with cyclohexyl MgBr (26), and various other RMgBr cpds. (7) (25) (yields: 65% (25), 50–60% (4), 42–52% (26)) see indic. refs.]

By use of metal alkyls. [For formn. of $\bar{C}$ from chloral (3:5210) by use of $ZnEt_2$ (2) (27) or $AlEt_3$ cpd. with ether (88.5% yield (8)) see indic. refs.; note, however, that $SnEt_4$ is *not* (8) effective.]

By phytochemical agents. [For prepn. of $\bar{C}$ from chloral (3:5210) by reduction with fermenting yeast see (28) (5).]

By misc. methods. [For formn. of $\bar{C}$ from urochloralic acid [Beil. I-620] by hydrolysis with dil. mineral acid see (1); for formn. of $\bar{C}$ in small amts. from EtOH + Cl_2 see (29).]

CHEMICAL BEHAVIOR OF $\bar{C}$

WITH INORGANIC REACTANTS

Oxidation. $\bar{C}$ reduces Fehling's soln. on warming (2). — $\bar{C}$ with fumg. HNO_3 is oxidized to trichloroacetic acid (1) (2).

Behavior with alkalies. [$\bar{C}$ in conc. aq. NaOH first dissolves then gives a white ppt. of Na deriv. (33). — $\bar{C}$ with aq. KOH dissolves and soon afterward reacts vigorously yielding (2) various prods. including chloroacetic acid (3:1370), β,β,β-trichloroethoxyacetic acid [Beil. III-233], m.p. 69.5° (2), and formic acid (1:1005).]

Behavior with inorganic acid chlorides. [$\bar{C}$ with PCl_3 evolves HCl and yields (27) *tris*-(β,β,β-trichloroethyl) phosphite, b.p. 263°, no formation of 1,1,1,2-tetrachloroethane (3:5555) being evident. — $\bar{C}$ with PCl_5 at 140° evolves HCl yielding (27) *tris*-(β,β,β-trichloroethyl) phosphate, m.p. 73–74° (sublimes without decn.) accompanied by a trace of 1,1,1,2-tetrachloroethane (3:5555).]

[$\bar{C}$ with $SOCl_2$ gives (30) *bis*-(β,β,β-trichloroethyl) sulfite, b.p. 139.5–140° at 5 mm., m.p. 6–7°. — $\bar{C}$ with SO_2Cl_2 in pyridine at 100° gives (30) *bis*-(β,β,β-trichloroethyl) sulfate, m.p. 118.5–119.5° cor., also obtd. (30) by oxidn. of the preceding sulfite with acid $KMnO_4$ in acetone.]

Behavior with $AlBr_3$. [$\bar{C}$ with $AlBr_3$ in CS_2 (31) (32) undergoes replacement of chlorine by bromine yielding acc. to conditions β-bromo-β,β-dichloroethanol, m.p. 17.5 (32), m.p. 17.5° (32), or β,β-dibromo-β-chloroethanol, m.p. 50°, b.p. 80° at 8 mm. (32).]

With Organic Reactants

(See also below under derivatives.) — [C̄ with diazomethane in heptane (33), n-BuOH (34), or acetone (33) (but not in ether (33)), yields β,β,β-trichloroethyl methyl ether, b.p. 35–36° at 16 mm. (33).]

[C̄ with 2,3-dichlorodioxane-1,4 (3:9105) gives (50% yield (18)) 2-chloro-3-(β,β,β-trichloroethoxy)dioxane-1,4, m.p. 77–78°.]

[C̄ with BEt_3 at 150° evolves C_2H_6 and gives (44% yield (8)) β,β,β-trichloroethyl diethylborate, $CCl_3CH_2OB(C_2H_5)_2$, b.p. 78–79° at 12 mm. (8).]

—— β,β,β-**Trichloroethyl acetate**: oil, b.p. 167° sl. dec. at 736 mm. (2), 71° at 18.3 mm. (2), 88–91° (35), $D_{-}^{28} = 1.4239$ (35), $n_D^{28} = 1.4691$ (35). [From C̄ with AcCl in s.t. at 130° for several hrs. (2).]

—— β,β,β-**Trichloroethyl benzoate**: oil (29). [Note, however, that no constants are reported in the literature.]

Ⓓ β,β,β-**Trichloroethyl** m-**nitrobenzoate**: m.p. 75° (29) (26). [From C̄ + m-nitrobenzoyl chloride + aq. alk. (29).]

Ⓓ β,β,β-**Trichloroethyl** p-**nitrobenzoate**: m.p. 71° (28) (25). [From C̄ + p-nitrobenzoyl chloride + aq. alk. (28).]

Ⓓ β,β,β-**Trichloroethyl 3,5-dinitrobenzoate**: m.p. 142–143° (25).

Ⓓ β,β,β-**Trichloroethyl carbamate**: m.p. 64–65° (28) (36) (37) (38), 64° (39). [From C̄ (1 mole) with carbamyl chloride (1 mole) in dry ether (28) (note that C̄ with excess of carbamyl chloride gives (28) β,β,β-trichloroethyl allophanate, m.p. 182–183°), or from C̄ by treatment with phosgene (3:5000) followed by NH_3 (37). — Note that this prod. comprises the hypnotic pharmaceutical known as "Voluntal." It also forms molecular cpds. with various other pharmaceuticals; e.g., "Voluntal," m.p. 64–65° + pyramidone (2,3-dimethyl-4-dimethylamino-1-phenyl-pyrazolone-5) [Beil. XXV-452, XXV$_1$-(672)], m.p. 108°, give a 1:1 mol. cpd., m.p. 75–76°, known as "Compral"; for f.p./compn. data and diagrams on this (and similar systems) see (39).]

—— β,β,β-**Trichloroethyl** N-**phenylcarbamate**: m.p. 87° (39). [For f.p./compn. data and diagrams of this prod. (also known as N-phenylvoluntal) with antipyrine, etc., see (39).]

Ⓓ β,β,β-**Trichloroethyl** N-(α-**naphthyl**)**carbamate**: m.p. 120° (7), 119° (26). [From C̄ + α-naphthyl isocyanate at 120–135° for 2 hrs. (7).]

3:5780 β-CHLOROETHYL CHLOROFORMATE $C_3H_4O_2Cl_2$ Beil. III - 11

(β-Chloroethyl chlorocarbonate) $ClCH_2CH_2.O.CO.Cl$ III_1—

III_2-(10)

B.P. 152.5° at 752 mm. (1) D_4^{20} **= 1.3825 (1)** n_D^{20} **= 1.4465 (1)**

Colorless lachrymatory liq. which fumes in air. — Insol. aq., eas. sol. alc., ether.

[For prepn. from β-chloroethanol (ethylene chlorohydrin) (3:5552) + phosgene (3:5000) see (1).]

$\bar{C}$ on slight warming with quinoline dec. at 41–42° into ethylene dichloride (3:5130) + CO_2 (2).

$\bar{C}$ is readily hydrolyzed by warm aq. or dil. alk. to β-chloroethanol (3:5552) + CO_2 + HCl (1).

- Ⓓ β-Chloroethyl carbamate: from $\bar{C}$ + 2 moles conc. aq. NH_4OH; m.p. 76° (3) (4) (5). [The value of 115° given in Beil. III-11 is wrong (5).]
- Ⓓ β-Chloroethyl *N*-phenylcarbamate: from $\bar{C}$ in C_6H_6 added to C_6H_6 soln. of aniline (2 moles); after filtering off the pptd. aniline hydrochloride, the C_6H_6 is evapd. (6); white ndls., m.p. 51° (3). [This deriv. on short boilg. with dil. aq. or alc. alk. loses HCl and by ring closure yields 3-phenyloxazolidone-2 [Beil. XXVII-136], lfts. from alc., m.p. 124° (3), 122° (7).]
- Ⓓ β-Chloroethyl *N*-*p*-tolycarbamate: white ndls. from C_6H_6, m.p. 45° (6). [On treatment with alk. this gives 3-(*p*-tolyl)oxazolidone-2, white ndls. from alc., m.p. 91° (6).]
- Ⓓ β-Chloroethyl phenylcarbazate: from $\bar{C}$ on treatment with 1 mole phenylhydrazine in aq. pyridine; the red oil initially formed soon solidifies and is recrystd. from C_6H_6; white ndls., m p. 89° (8).

3:5820 3-CHLOROPROPEN-2-OL-1 (γ-Chloroallyl alcohol) $CH=CH-CH_2$ (Cl on C-1, OH on C-3) C_3H_5OCl Beil. I-439, I_1—, I_2—

High-boiling stereoisomer	B.P. 153.0° at 756 mm. (1)	$D_4^{15} = 1.1582$ (1)	$n_D^{15} = 1.4600$ (1)
		$D_4^{25} = 1.1681$ (1)	$n_D^{25} = 1.4611$ (1)
		$D_4^{20} = 1.1720$ (1)	$n_D^{20} = 1.4661$ (1)
Low-boiling stereoisomer	B.P. 140.3° at 746 mm. (1)	$D_4^{35} = 1.1623$ (1)	$n_D^{35} = 1.4573$ (1)
		$D_4^{25} = 1.1720$ (1)	$n_D^{25} = 1.4617$ (1)
		$D_4^{20} = 1.1760$ (1)	$n_D^{20} = 1.4638$ (1)

Colorless liquids; both stereoisomers possess a delayed vesicant actn., and care should be taken in handling them.

[For prepn. of Č from 1,3-dichloropropene-1 (γ-chloroallyl chloride) (3:5280) by hydrolysis for 2 hrs. under reflux with aq. 10% Na_2CO_3 (10% excess over 1 equiv.) see (1); note that the high-boiling stereoisomer of γ-chloroallyl chloride gives (76% yield) of the high-*boiling Č, and that the lower-boilg. stereoisomer of γ-chloroallyl chloride gives (81% yield)* the lower-boiling stereoisomer of Č (1).—Note that from γ-chloroallyl acetate (which was presumably a mixture of the acetates of both stereoisomers of Č) by hydrolysis with cold aq. NaOH Č (presumably a mixt. of stereoisomers) has been reported (2).]

The two stereoisomers of Č behave differently with hot aq. NaOH (1): the higher-boilg. stereoisomer fails to give any propargyl alcohol but some acetylene and sodium formate are formed; the lower-boiling stereomer on refluxing with aq. 12.5% NaOH (10% excess) for 3 hrs. gives (by dehydrochlorination) 69% yield of propargyl alcohol (propyne-1-ol-3) [Beil. I-451], b.p. 114-115° (for study of influence of NaOH concn. and time see (1)).

① **γ-Chloroallyl *N*-phenylcarbamate:** ndls. from pet. ether, m.p. 75° (2). [From Č + phenyl isocyanate (note, however, that the Č employed very probably was a mixt. of the two stereoisomers (2)).]

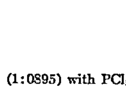
II_1-(302)
II_2-(639)



B.P. 161–164°	(1)	$D_4^{20} = 1.408$ (3)	$n_D^{18.1} = 1.50038$ (3)
160°	(2)		
158–160°	(3)	$D_4^{16.8} = 1.4117$ (3)	
76° at 33 mm.	(4)		
59° at 16 mm.	(5)		
60° at 14 mm.	(6)		
62–64° at 13 mm.	(7)		

[For prepn. of $\bar{C}$ from fumaric acid (1:0895) with PCl_5 (1) (2) (3), with $SOCl_2$ (8) (10) (cf. (9) (11)), with phthalyl dichloride (3:6900) (12) (9) (10), or with benzotrichloride (3:6540) at 170° (27) see indic. refs.; from maleic anhydride (1:0625) by htg. 2 hrs. at

130–135° with phthaloyl dichloride (3:6900) + $ZnCl_2$ (82–95% yield (7)) or with PCl_5 (13) (6)· for formn. of C̄ from succinyl dichloride (3:6200) with Cl_2 see (14), from calcium malate with PCl_5 see (15).]

C̄ on htg. with fumaric acid (1:0895) at 175° (9) (16) or with silver fumarate (13) is largely converted to maleic anhydride (1:0625), b.p. 197–199°, m.p. 52°.

C̄ with Cl_2 in CCl_4 in sunlight adds halogen almost quant. (19) yielding (17) (18) (20) *meso*-α,α′-dichlorosuccinyl dichloride (3:9087). — C̄ adds Br_2 at 150° (2) or in CCl_4 in sunlight (20) yielding alm. quant. (19) *meso*-α,α′-dibromosuccinyl dichloride, b.p. 113° at 18 mm. (20) (this prod. hydrolyzes with aq. to *meso*-α,α′-dibromosuccinic acid, m.p. 257–258° in s.t. (20).

[C̄ with 1,4-diphenylbutadiene-1,3 yields (10) 3,6-diphenyltetrahydrophthaloyl dichloride, colorless ndls from lgr., m.p 143–144° cor. (10), this prod. on long boilg. (7½ hrs.) with aq. alc. NaOH gives (10) on acidif. 3,6-diphenyltetrahydrophthalic acid, ndls. from AcOH, m.p. 230–231° cor. dec. (10).] — [For color reactns. of C̄ with various polyenes see (21).]

[C̄ on htg. at 100° with $AlCl_3$ is partially conv. to maleyl dichloride accompanied by evolution of HCl + CO (22). — C̄ with $AlCl_3$ + C_6H_6 gives (yield: 78–83% (23), 74% (24)) *trans*-α,β-dibenzoylethylene (1,4-diphenybuten-2-dione-1,4), cryst. from C_6H_6 by addn. of alc., pale yel. ndls., m.p. 109–110° (23).] [For corresp. reactn. of C̄ + $AlCl_3$ with toluene (24) (25), chlorobenzene (24), mesitylene (24), anisole (24), *m*-xylene (25), and biphenyl (25) see indic. refs.]

C̄ with excess MeOH yields (8) dimethyl fumarate (1:2415), m.p. 101.7°. (Note, however, that C̄ with 1 equiv. MeOH in C_6H_6 stood 5 hrs. at room temp. (5) or in ether (26) yields fumaric methyl ester chloride, b p. 83° at 17 mm. (26), 76° at 22 mm. (5), m.p. 16° (5), this on shaking with aq. gives alm. quant. (5) methyl hydrogen fumarate, cryst. from C_6H_6, m.p. 144.5° cor (5).

C̄ with phenol (6) or with sodium phenolate in C_6H_6 (28) yields diphenyl fumarate, ndls. from alc., m.p 161–162° (6); note, however, that the half ester, phenyl hydrogen fumarate, has m.p. 130° (28).

C̄ with aq. readily hydrolyzes yielding fumaric acid (1:0895), m.p. abt. 293–295° subl.; for the diamide, dianilide, and other derivs. corresp. to C̄ see fumaric acid (1:0895).

Note 1. For additional data on vapor press. of $\bar{C}$ at 5° intervals from 15–165° see (18).

Note 2. For effect of press. on f.p. of $\bar{C}$ see (15).

Colorless liquid with odor suggesting chloroform. — $\bar{C}$ is widely used in industry as solvent, degreasing agent, dry cleaner, component of insecticides, etc. — Note that comml. $\bar{C}$ is likely to contain other prods., notably tetrachloroethylene (3:5460) q.v.

$\bar{C}$ is very spar. sol. aq.; e.g., 1 g. $\bar{C}$ requires for soln. at 25° 2900 g. aq. (19): for study of soly. of $\bar{C}$ in aq. at 20° see (20); for study of soly. of aq. in $\bar{C}$ at 0°, 25°, and 30° as detd. by Karl Fischer reagt. see (21).

Binary systems contg. $\bar{C}$. For f.p./compn. data on systems $\bar{C}$ + *1,2-dichloroethane (ethylene dichloride)* (3:5130), eutectic, f.p. −62°, contg. about 56 wt. % $\bar{C}$ (22); $\bar{C}$ + *1,1,1-trichloroethane (methylchloroform)* (3:5085), eutectic, f.p. −69.0° contg. 72.3% $\bar{C}$ (14); $\bar{C}$ + *1,1,2,2-tetrachloroethane (acetylene tetrachloride)* (3:5750), eutectic, f.p. −73°, contg. 59.9 wt. % $\bar{C}$ (22); $\bar{C}$ + *tetrachloroethylene* (3:5460), eutectic, f.p. −54.8°, contg. 41.6% $\bar{C}$ (14); $\bar{C}$ + CCl_4 (3:5100), eutectic, f.p. −68° (82), $\bar{C}$ + CBr_4 (82) see indic. refs.

$\bar{C}$ forms binary azeotropes with various org. cpds.; e.g., $\bar{C}$ with chloroacetic acid (3:1370) forms a const.-boilg. mixt., b.p. 158.65° at 760 mm., contg. 90.1 wt. % $\bar{C}$ (23); $\bar{C}$ with trichloroacetic acid (3:1150) forms a const.-boilg. mixt., b.p. 161.8° at 760 mm., contg. 96.5 wt. % $\bar{C}$ (24). — For other examples see Beil. I_2-(57).

$\bar{C}$ either as liquid or vapor is extremely toxic; for further details see (83) (25) (26) (27) (28) (29); for extensive study of anthelmintic action see (19).

[For study of soly. in $\bar{C}$ of gaseous HCl (30) (11), H_2S (30), or NH_3 (30) see indic. refs.; for study of thermal conductivity of $\bar{C}$ see (31); for study of influence of vapors of $\bar{C}$ on

the explosion limits of mixtures of air with hydrogen, carbon monoxide, methane, acetylene, etc., see (32) (33) (34) (35).]

Preparation of $\bar{C}$. [For prepn. of $\bar{C}$ from chloral (3:5210) with PCl_5 (7) (37) or with $AlCl_3$ (38) see indic. refs.; note that in latter case (38) presence of $AlCl_3$ also facilitates loss of HCl from $\bar{C}$ with consequent formn. of tetrachloroethylene (3:5460); from trichloroethylene (3:5170) by addn. of Cl_2 in aq. (39) or under influence of ultra-violet light (40) (41) (note that O_2 retards addition of halogen (41)), or with S_2Cl_2 in s.t. at 140–150° (42), see indic. refs.]

[For formn. of $\bar{C}$ (together with various other by-products) from ethyl chloride (3:7015) (43) or from 1,2-dichloroethane (ethylene dichloride) (3:5130) (44) with Cl_2 see indic. refs.; from chloroform (3:5050) in electric arc (45) or in dark electric discharge (46) see indic. refs.; from CCl_4 in dark elec. discharge see (46); from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) or from trichloroethylene (3:5170) with Cl_2 at 80°, 95°, or 115° in ultra-violet light (41), over pumice at 700° (47), or with $FeCl_3$ on htg. in s.t. (48) see indic. refs.; from trichloroethylene (3:5170) with large excess Cl_2O in CCl_4 at −20° see (10); from β,β'-dichlorodiethyl sulfide ("mustard gas") with dry Cl_2 at 100° see (49).]

[For stabilization of $\bar{C}$ by addn. of not over 0.1% alkyl amines such as Et_3N (50) or with a wide variety of other org. N cpds. (81) see indic. refs.]

[For studies of detn. of $\bar{C}$ by reactn. with Na + ethanolamine in dioxane (51) followed by volumetric (51) or gravimetric (71) detn. of resultant chloride ion see indic. refs. (note that use of Stepanov's method (Na + EtOH) for detn. of Cl in $\bar{C}$ gives low results unless after addn. of Na mixt. is refluxed at least 20 hrs. (12)); for detn. of $\bar{C}$ by thermal decn. and subsequent detn. of chlorine see (52).]

Chemical behavior of $\bar{C}$. [$\bar{C}$ with dry Cl_2 at 70° in diffuse light does not react and even after 30 hrs. no HCl is formed (52); however, $\bar{C}$ with dry Cl_2 + $AlCl_3$ at 70° (53), or $\bar{C}$ + Cl_2 over activated charcoal at 300–400° (54), yields hexachloroethane (3:4835).]

[$\bar{C}$ with F_2 at 90° over a 10-hr. period yields (8) a mixt. of prods. contg. fluoropentachloroethane, m.p. 99.8–110° (in s.t.) (b.p. 137–139°), hexachloroethane (3:4835), tetrachloroethylene (3:5460), *sym.*-difluorotetrachloroethane, b.p. 91–92°, together with other materials. — For behavior of $\bar{C}$ with SbF_3 see (55).]

$\bar{C}$ with $K_2Cr_2O_7/H_2SO_4$ is only partially oxidized to CO_2 (56). — [$\bar{C}$ on photochem. oxidn. with O_2 in ultra-violet light (57) (58) gives a mixt. consisting of 80% trichloroacetyl chloride (3:5420) + 20% phosgene (3:5000). — $\bar{C}$ with fumg. H_2SO_4 (60% SO_3) at 50–60° yields (59) dichloroacetyl chloride (3:5290).]

$\bar{C}$ under various circumstances loses HCl yielding tetrachloroethylene (3:5460) [e.g., $\bar{C}$ over bone char at 280° (60) or over $NiCl_2$ at 330° (61), or with $AlCl_3$ at 70° (53) or under reflux (95% yield (72)) (62), or with liq. NH_3 at −18 to −34° under reduced press. (63) (64), or with prim. or sec. aliph. amines (84), or with MeOH over Al_2O_3 at 290° (methyl chloride (3:7005) is also formed) (65), or with acetylene over cat. at 200–300° (vinyl chloride (3:7010) is also formed) (68), or with alc. KOH (44) (66), or in alc. with 2 *N* aqueous NaOH in cold (98% yield (12)) gives tetrachloroethylene (3:5460). — For detn. of $\bar{C}$ by titration of chloride ion thus split off see (67); for study of kinetics of reactn. of $\bar{C}$ with EtOH/NaOH see (12).]

$\bar{C}$ under certain conditions yields trichloroethylene (3:5170) [e.g., $\bar{C}$ with H_2 over Ni at 270° (61), or $\bar{C}$ on electrolysis at Pb cathode (69), or $\bar{C}$ with MeMgI (70) gives trichloroethylene (3:5170).]

[$\bar{C}$ with $CHCl_3$ (3:5050) + $AlCl_3$ gives (72) (73) (74) (75) *unsym.*-heptachloropropane (3:0200); note that this reactn. first involves loss of HCl under influence of $AlCl_3$ (see also above) and subsequent condensation of the resultant tetrachloroethylene (3:5460)

with $CHCl_3$. — C̄ (1 mole) + 1,2-dichloroethylene (presumably mixt. of *cis* (3:5042) and *trans* (3:5028) stereoisomers) + $AlCl_3$ (1% of sum of wts. of reactants) stood 12 days at 40° gives (76) (in addition to a residue a fraction volatile with steam which consists of 1,1,2,2,3,4,4-heptachlorobutane (3:9056)), two stereoisomeric 1,1,2,3,4-pentachlorobutanes, viz., the solid isomer (3:0750) and the liquid isomer (3:9068); for genesis of these compds. see (76).]

[For survey of actn. of C̄ on various common metals see (77). — C̄ with Na or K or their alloys may (like many other polychloro compds.) explode under certain conditions; for an extensive study of this behavior including sensitivity to mechanical shock see (78).]

C̄ with excess phenylhydrazine on stdg. at ord. temp. evolves N_2, ppts. phenylhydrazine hydrochloride, and yields benzene (67); the full mechanism of this behavior seems never to have been established, but these same three prods. are similarly obtd. from hexachloroethane (3:4835) and to a lesser degree from 1,1,2,2-tetrachloroethane (3:5750).

Ⓟ *Color test with NH_4OH/Cu_2Cl_2.* C̄ *(1–2 drops) in small glass-stoppered bottle* filled with conc. aq. NH_4OH treated with powdered Cu_2Cl_2, stopper quickly inserted (to force out air and excess liq.) and shaken, gives within 5 mins. a blue color which rapidly darkens; note that this test is not specific for C̄ and is also shown by other cpds. contg. the $—CCl_3$ group such as trichloroacetic acid (3:1150), ethyl trichloroacetate (3:5950) $CHCl_3$ (3:5050), CCl_4 (3:5100), although hexachloroethane (3:4835) develops color at surface only after several hours; for further details see (79).

[*See also* "*Butyrchloral hydrate*" (3:1905).]

Oily liq.

[For prepn. of $\bar{C}$ from acetaldehyde (1:0100) (3) (7) or paraldehyde (1:0170) (7) (8) with Cl_2 see indic. refs.; from α-chlorocrotonaldehyde (3:8117) by addn. of Cl_2 (6) (10) (36) in CCl_4 soln. (9); from crotonaldehyde (1:0150) by satn. with HCl gas followed by treatment with Cl_2 see (11) cf. (37).]

[For prepn. of $\bar{C}$ from its polymers (see below) by distn. at atmospheric press. (2), or from its hydrate (3:1905) by distn. with half its wt. of Ac_2O (2), or shaking with conc. H_2SO_4 (1) cf. (2), see indic. refs.]

[$\bar{C}$ on reduction with fused $Al(OEt)_3$ in boilg. abs. alc. under H_2 or N_2 for 14 hrs. (12) or with fused $Al(OEt)_3 + AlCl_3$ in boilg. abs. alc. under H_2 or N_2 for 14 hrs. (13), or with C_2H_5OMgBr in dry ether followed by aq. (19), or by treatment with diethylzinc (14), di-*n*-propylzinc (15), or di-isobutylzinc (15) (followed by aq.) gives (92% yield (12)) 2,2,3-trichlorobutanol-1 (3:1336), m.p. 62°. — Note that $\bar{C}$ (as hydrate) (3:1905) is reduced by fermenting yeast (16) to dextrorotatory 2,2,3-trichlorobutanol-1, m.p. 62°.]

[$\bar{C}$ with Zn + HCl or Zn + aq. (17) is dehalogenated to a mixt. of α-chlorocrotonaldehyde (3:8117) + crotonaldehyde (1:0150); $\bar{C}$ with Fe filings + AcOH at room temp. for 8 days (18) dehalogenates to a mixt. of *n*-butyraldehyde (1.0130) + *n*-butyl alc. (1:6180) + crotonyl alc. [Beil. I-442, I_1-(227), I_2-(480)].]

$\bar{C}$ on oxidn. with 2 pts. fumg. HNO_3 stood overnight at ord. temp. yields (3) α,α,β-trichloro-*n*-butyric acid (3:1280) (cf. corresp. behavior of butyrchloral hydrate (3:1905)). — $\bar{C}$ on oxidn. with boilg. aq. $K_4Fe(CN)_6$ also loses 2 atoms of chlorine giving (41% yield (29)) α-chlorocrotonic acid (3:2760).

$\bar{C}$ (1 mole) with H_2O (1 mole) readily combines with evolution of heat yielding (3) (9) crystn. butyrchloral hydrate (3:1905). — Similarly, $\bar{C}$ combines with equiv. amt. of alcohols giving the corresp. alcoholates: e.g., $\bar{C}$ with EtOH yields (20) butyrchloral-ethylalcoholate [Beil. I-665, I_1-(346)]; $\bar{C}$ with butanol-2 yields (1) butyrchloral-*sec*-butylalcoholate, etc. — Note that butyrchloral-ethylalcoholate in excess EtOH on satn. with dry HCl gas gives (50% yield (21)) α,α,β-trichloro-*n*-butyraldehyde diethylacetal, b.p. 232–233°, 135° at 30 mm. (21). — [For study of dissociation of addn. cpds. of $\bar{C}$ with various *prim.*, *sec.*, and *ter.* alcohols see (22).]

$\bar{C}$ or its hydrate (3:1905) q.v. in pres. of conc. H_2SO_4 or pyridine at ord. temp. can be trimerized to a mixt. of two parabutyrchlorals (2); these are colorless, crystalline, sharp melting solids, sol. in org. solvents but insol. in aq.; the less sol. α-parabutyrchloral, rhombic cryst. from boilg. AcOH or boilg. EtOH, has m.p. 180°; the more soluble β-parabutyrchloral (stereoisomer?), cryst. from boilg. AcOH or boilg. EtOH, has m.p. 157°; these polymers can be distilled at 15 mm., but attempts to distil them at ord. press. result in complete dissociation to $\bar{C}$ (2).

[$\bar{C}$·with anhydrous acetaldehyde (1:0100) (2 moles) with dry HCl gas at 0° for 15–20 hrs. condenses to give (67% yield (23)) 2,4-dimethyl-6-(α,α,β-trichloro-n-propyl)trioxane-1,3,5, b.p. 118° at 13 mm. (23).]

[$\bar{C}$ in $CHCl_3$ with H_2S gives (24) *bis*-(α-hydroxy-β,β,γ-trichloro-n-butyl)sulfide ("butyrchloralsulfhydrate"), m.p. 85° (24).]

[$\bar{C}$ with PCl_5 (1.4 wt. pts.) at 110–120° apparently has its oxygen replaced by equivalent chlorine but also loses 1 HCl yielding (25) a cpd. of compn. $C_4H_2Cl_4$, presumably 1,1,2,3-tetrachlorobutene-2, although no other report of this cpd. can be found.]

[$\bar{C}$ with aq. HCN gives only butyrchloral hydrate (3:1905) since this prod. is too spar. sol. aq. to enter further reaction, but upon addn. of alc. and subsequent digestion this system yields (26) (27) α,α,β-trichloro-n-butyraldehyde cyanohydrin [Beil. III-322, III_1-(226)], pl. from aq , m.p. 101–102° (27) (28), also obtd. from butyrchloral hydrate with aq. KCN (2 moles) at 40° (28). — See also further comments under butyrchloral hydrate (3:1905).]

[$\bar{C}$ with ethyl diazoacetate gives (71% yield (30)) ethyl β-keto-γ,γ-trichloro-n-caproate [Beil. III-684], b.p. 149° at 20 mm. (30).]

$\bar{C}$ in $CHCl_3$ with NH_3 gas gives on evapn. of solvent (31) butyrchloralammonia, cryst., m.p. 62° [see also under butyrchloral hydrate (3:1905)].

$\bar{C}$ also readily adds amides yielding cpds. of type $CH_3.CHCl.CH_2CH(OH).NH.CO.R$; e.g., $\bar{C}$ with acetamide (1 mole) gives on htg. (31) (32) (33) (34) butyrchloralacetamide, obtd. by these workers in two isomeric forms one of m.p. 170° (spar. sol. hot alc.) (32) (33) (34), the other m.p. 158° (readily sol. in hot 50% alc.) (31) (32) (33); note, however, that butyrchloral hydrate (3:1905) with acetamide (1 mole) htd. at 100° until solidification occurs gives only (21) a prod. m.p. 208–210°; $\bar{C}$ with benzamide (1 mole) gives on htg. butyrchloralbenzamide, obtd. in two isomeric forms, one of m.p. 146° (32) (33) cf. (34), the other of m.p. 132° (31) (32) (33); note, however, that butyrchloral hydrate (3:1905) with benzamide yields only (21) a prod. m.p. 176°.

$\bar{C}$ (3.5 g.) with urea (1.2 g.) htd. at 100°, cooled, powdered and recrystd. from alc., gives (yield not stated (35)) butyrchloralurea, m.p. 156°.

68–70° at 13 mm. (1)
44–46° at 3 mm. (1)

$D_{25}^{25} = 1.3760$ (1) $n_D^{25} = 1.4901$ (1)

Oil. — Eas. sol. MeOH, EtOH, ether, acetone, C_6H_6, $CHCl_3$, CCl_4, CS_2. [Note that b.p. of 99° at 680 mm. (4) may be a typographical error (1).]

[For prepn. of C̄ from chloral (3:5210) via conversion with diazomethane to 3,3,3-trichloro-1,2-epoxypropane (3.1336) and reactn. of latter with 1 *N* LiMe in dry ether at −75° (yield 85%) see (1); from chloral (3:5210) with EtMgBr (4) (5) or EtMgI (2) in ether (yields: 44% (4), 16% (2), 15% (5)) see indic. refs. (note, however, that by virtue of reducing actn. of EtMgX large amounts of 2,2,2-trichloroethanol-1 (3:5775) are also formed (5) (2) (1)); from chloral (3:5210) with $PbEt_4$ (20% yield (6)) (note, however, that this could not be confirmed (1)), from trichloroacetyl chloride (3:5420) with EtMgBr at 10° see (3).]

C̄ with conc. HCl + $ZnCl_2$ (Lucas' reagent) stood for 1 hr. at room temp. gives (1) 1,1,1,2-tetrachlorobutane (3:5622).

C̄ with 5% soln. of Na_2CO_3 in 50% aq. alc. refluxed for 10 hrs. (1) or C̄ with aq. KOH, NaOH, Na_2CO_3, $Ba(OH)_2$, $Mg(OH)_2$, $CaCO_3$, etc., (2) undergoes both hydrolysis and hydrolytic cleavage giving respectively α-hydroxy-*n*-butyric acid [Beil. III-302, III_1-(114), III_2-(216)] (yields: 46% (1), 21% (2)), m.p. 43°, and propionaldehyde (1:0110) (29% yield (2)).

—— **Ethyl-trichloromethyl-carbinyl acetate:** b.p. 164–165° at 680 mm. (4). [From C̄ with Ac_2O at 130–135° for 2 hrs. (4). Note that in light of subsequent work (1) the identity of this prod. has been questioned.]

—— **Ethyl-trimethyl-carbinyl benzoate:** b.p. 217–218° at 680 mm. (4). [From C̄ with BzCl + cold dil. aq. alk. (4). Note that in light of subsequent work (1) the identity of this prod. has been questioned]

Ⓓ **Ethyl-trimethyl-carbinyl *p*-nitrobenzoate:** cryst. from pet. ether, m.p. 70–71.5° (1). [Note that this m.p. is identical with that of the *p*-nitrobenzoate of 2,2,2-trichloroethanol-1 (3:5775); although each appears to be authentic, whether their mixture shows depression of m.p. is not reported.]

Č when pure is colorless oil, volatile with steam.

[For f.p./compn. data and diagram of system Č + *o*-dichlorobenzene (3:6055) (eutectic, m.p. −45.9°, contg. 51.3% Č) see (12); on system Č + *p*-dichlorobenzene (3:0980) (eutectic, m.p. −29.9°, contg. 88.0% Č) see (12); for f.p./compn. data on ternary system of all three dichlorobenzenes see (7); for f.p./compn. data on systems: Č + fluorobenzene, Č + chlorobenzene (3:7903), Č + bromobenzene, and Č + *o*-chlorotoluene (3:8245) see (9).]

[For data on densities of solns. of Č in C_6H_6 (1:7400) and in *n*-hexane (1:8530) see (13).]

[Č is very spar. sol. aq. (for study of this over range 20–60° see (14)).]

[For prepn. of Č from *m*-chloroaniline [Beil. XII-602, XII_1-(300)] via diazotization and use of Cu_2Cl_2 reactn. (yields: 80% (15), 70% (16)) (7) (17) or by pptn. of the diazonium chloroplatinate and htg. of latter with Na_2CO_3 (4) see indic. refs.; from 2,4-dichloroaniline [Beil. XII-621, XII_1-(309)] via diazotization in alc. (18) (17) (3) (4) or isoamyl alc. (19) followed by replacement of orig. amino group by H by actn. of the alc. (60% yield (15)) or with hypophosphorous acid (50% yield (19)) (use of alk. $SnCl_2$ or oxidn. of the corresp. 2,4-dichlorophenylhydrazine with $CuSO_4$ gave only very low yields (15)) see indic. refs.; from *m*-phenylenediamine [Beil. XIII-33, $XIII_1$-(10)] via tetrazotization in AcOH with

nitrosylsulfuric acid followed by use of Cu_2Cl_2 reactn. (70.4% yield (20)) (21) see indic. refs.]

[For prepn. of $\bar{C}$ from *m*-chloronitrobenzene [Beil. V-243, V_1-(129)] with $SOCl_2$ in s.t. at 190–200° for 12 hrs. (71% yield (22)), from *m*-nitrobenzenesulfonic acid [Beil. XI-68, XI_1-(21)] with $SOCl_2$ in s.t. at 180–200° (23), from *m*-bromonitrobenzene [Beil. V-248, V_1-(131)] with PCl_5 in s.t. at 180° (24), from 2,6-dichlorobenzoic acid (3:4200) by htg. in acetamide at 225–235° for 6 hrs. (93% yield (25)), or from 2,6-dichlorobenzaldehyde (3:1690) with 50% KOH under N_2 at 100° for 5 hrs. (84% yield (6)) see indic. refs.]

[For formn. of $\bar{C}$ from 2,6-dichloroacetophenone (5), 2,4-dichlorobenzophenone (3:0825) (26), 2,6-dichlorobenzophenone (3:2285) (26), or 3,5-dichlorobenzophenone (3:1505) (26) by fusion with KOH/NaOH see indic. refs.; for formn. of $\bar{C}$ from 1,3-dichlorocyclohexadiene-1,3 [Beil. V-114] with PCl_5 or with Br_2 in $CHCl_3$ see (27).]

[For formn. of $\bar{C}$ from C_6H_6 (1:7400) or chlorobenzene (3:7903) with Cl_2 + cat. at 400–700° (50–60% yield (12)) (28) or with Cl_2 in pres. of $AlCl_3$ (29) cf. (30) see indic. refs.]

[$\bar{C}$ with Cl_2 + Al/Hg (31) or with Cl_2 + $AlCl_3$ (30) cf. (29) gives mainly 1,2,4-trichlorobenzene (3:6420). — $\bar{C}$ suspended in 1% aq. NaOH adds 3 Cl_2 in sunlight giving (32) *m*-dichlorobenzene hexachloride, cryst. from alc., m.p. 81.8° (32). — For study of photochemical chlorination of $\bar{C}$ see (33).]

[$\bar{C}$ with Mg (1 mole) + I_2 (0.25 equiv.) gave (34) after 3 days 62.5% *m*-chlorophenyl MgCl.]

[$\bar{C}$ with $CHCl_3$ + $AlCl_3$ at 65° for 14 hrs. as directed gives (18% yield (35)) *tris*-(2,4-dichlorophenyl)methane, white cryst. from hot acetone, m.p. 227–228.5° (35). — $\bar{C}$ with CCl_4 + $AlCl_3$ as directed gives (60% yield (35)) 2,4,2′,4′-tetrachlorobenzophenone dichloride, white pl. from hot acetone, m.p. 139.0–140.5° (35), 140° (36); hydrolysis of this prod. with $AcOH/H_2SO_4$ yields (37) 2,4,2′,4′-tetrachlorobenzophenone, m.p. 78° (37), accompanied by some 2,4-dichlorobenzoic acid (3:4560), m.p. 161° (37).]

[$\bar{C}$ with acetyl chloride (3:7065) + $AlCl_3$ gives (15% yield (38)) 2,4-dichloroacetophenone, b.p. 140–150° at 15 mm. (38), m.p. 33–34° (38). — $\bar{C}$ with chloroacetyl chloride (3:5235) + $AlCl_3$ in CS_2 yields (39) 2,4-dichlorophenacyl chloride (2,4,ω-trichloroacetophenone), pr. from lgr., m.p. 57° (39). — $\bar{C}$ with β-chloro-*n*-butyric acid (3:0035) + $AlCl_3$ or conc. H_2SO_4 yields (40) by condens. and subsequent ring closure 4,6-dichloro-3-methylindanone-1, m.p. 67–70° (40). — $\bar{C}$ with *o*-bromobenzoyl chloride + $AlCl_3$ in CS_2 gives (43% yield (41)) 2-bromo-2′,4′-dichlorobenzophenone, b.p. 227–228.5°, m.p. 33–34°.]

[$\bar{C}$ with phthalic anhydride + $AlCl_3$ at 100–110° for 7 hrs. gives (17% yield on the anhydride (42)) (43) *o*-(2,4-dichlorobenzoyl)benzoic acid, white cubes from C_6H_6 or $CHCl_3$, m.p. 106–107° (42), 100–101° (43), accompanied (44) (especially if acetylene tetrachloride is used as solvent) by 3,3-*bis*-(2′,4′-dichlorophenyl)phthalide, m.p. 176° (44); the above *o*-(2,4-dichlorobenzoyl)benzoic acid with fumg. H_2SO_4 at 155–160° ring-closes (90% yield (42)) to 1,3-dichloroanthraquinone [Beil. VII-787, VII_1-(411)], yel. ndls. from AcOH, m.p. 209–210° (42).]

[$\bar{C}$ on hydrolysis with steam + cat. at 550–850° yields (45) *m*-chlorophenol (3:0255) and/or resorcinol (1:1530). — For studies of reactn. of $\bar{C}$ with NaOMe/MeOH see (46) (47) (48).]

[$\bar{C}$ with conc. aq. NH_4OH in pres. of CuO under press. at 150–200° (49) cf. (50) (51) yields *m*-phenylenediamine. — $\bar{C}$ with K diphenylamine gives on htg. (16) (52) *N,N,N′,N′*-tetraphenyl-*m*-phenylenediamine [Beil. XIII-42], m.p. 137.5–138° (16) (52) (note that this same prod. is similarly obtd. from *o*-dichlorobenzene (3:6055) and in part also from *p*-dichlorobenzene (3:0980).]

[$\bar{C}$ on mononitration, e.g., by soln. in 4.5 moles HNO_3 (D = 1.5) in cold followed by 10 min. htg. at 70° (53) or with 5 pts. fumg. HNO_3 (D = 1.52) at 0° (90% yield (54)) cf.

(3) (27) (17) gives 1,3-dichloro-4-nitrobenzene [Beil. V-245, V_1-(131)], cryst. from alc., m.p. 34° (55), 33–34° (27), 33° (53) (3), accompanied by a little (2.6% at −30°, 4% at 0° (17)) 1,3-dichloro-2-nitrobenzene [Beil. V-246, V_1-(131)], m.p. 70.5° (55), 70° (56) (reactn. prod. with piperidine is 3-chloro-2-nitro-1-piperidinobenzene, m.p. 63° (57)).] — [The only other possible mononitro-*m*-dichlorobenzene, viz., 1,3-dichloro-5-nitrobenzene [Beil. V-246, V_1-(131)], m.p. 65° (55), has been prepd. indirectly.]

C̄ on dinitration, e.g., with 3.4 wt. pts. HNO_3 ($D = 1.54$) + 6.8 wt. pts. conc. H_2SO_4 at 99° for 1 hr. (56) (cf. (22) (58) (27) (59) (60) (61)) gives (85% yield (56)) 1,3-dichloro-4,6-dinitrobenzene [Beil. V-265, V_1-(138)], cryst. from alc., m.p. 103° (22) (60), 102–103° (58), 102° (27), 101° (56), accompanied by 15% yield (56) of 1,3-dichloro-2,4-dinitrobenzene [Beil. V-265], m.p. 68° (56). — For f.p./compn. data and diagram for these two cpds. (eutectic, m.p. 48.1°, contg. 38% of the former) see (56). — Note that 1,3-dichloro-4,6-dinitrobenzene with piperidine in alc. boiled for 10 min. replaces 1 chlorine yielding (62) 1-chloro-4,6-dinitro-3-piperidinobenzene, yel. cryst. from alc., m.p. 119° (62); with piperidine in pyridine (requires cooling) it replaces both chlorine atoms yielding (62) 4,6-dinitro-1,3-dipiperidinobenzene, yel. lfts. from AcOH, m.p. 130–131° (62). — [Both of the other two possible dinitro-*m*-dichlorobenzenes are known, viz., 1,3-dichloro-2,5-dinitrobenzene [Beil. V_1-(138)], m.p. 114°, and 1,3-dichloro-4,5-dinitrobenzene [Beil. V-264], m.p. 98°, but have been prepd. indirectly.]

[The direct trinitration of C̄ has not been reported; of the four possible trinitro-*m*-dichlorobenzenes only one, viz., 1,3-dichloro-2,4,6-trinitrobenzene [Beil. V-275], m.p. 128°, is known.]

[C̄ on monosulfonation with fumg. H_2SO_4 at 230° (3) or with fumg. H_2SO_4 (7% SO_3) at 100° (7) or with fumg. H_2SO_4 (12% SO_3) (54) gives (82% yield (54)) 1,3-dichlorobenzenesulfonic acid-4 [Beil. XI-55, XI_1-(15)], m.p. 86° (54) (corresp. sulfonyl chloride, m.p. 54.6° (7), corresp. sulfonamide, m.p. 182° (7) (see also below)), both C̄ and its *ortho* isomer (3:6055) sulfonate with about equal ease, both much more readily than *p*-dichlorobenzene (3:0980) (use in sepns. from latter).]

[C̄ on disulfonation with fumg. H_2SO_4 (45% SO_3) at 140–150° for 5 hrs. (63) gives 1,3-dichlorobenzenedisulfonic acid-4,6 (corresp. *bis*-(sulfonyl chloride), m.p. 122–123° (63) (64), corresp. *bis*-(sulfonamide), m.p. 276° (63); unlike the corresp. 1,3-dichloro-4,6-dinitrobenzene the halogen in this disulfonic acid is unreactive (63).]

[For study of kinetics of sulfonation of C̄ see (66).]

Ⓓ **1,3-Dichlorobenzenesulfonamide-4 (2,4-dichlorobenzenesulfonamide-1):** cryst. from dil. alc., m.p. 179–180° u.c. (65). [From C̄ on treatment as directed (65) with $ClSO_3H$ followed by conv. of the intermediate 1,3-dichlorobenzenesulfonyl chloride-4, m.p. 52–53° u.c. (65), to the sulfonamide by means of $(NH_4)_2CO_3$.] — [Note that although the m.p. of this sulfonamide is practically identical with that from *p*-dichlorobenzene (3:0980) each depresses the m.p. of a mixt. with the other; the m.p.'s of the precursor sulfonyl chlorides, viz., 52–53° for C̄, 38° for the *p*-isomer, may also serve to distinguish them (65).]

[*See also the isomeric 1,1-dichloro-2-methylpropanol-2* (3:5772).]

Č with aq. forms a const.-boilg. mixt., b.p. 98.3°, contg. 35.2% Č (8). — Soly. of Č in aq. at 20° is 9.4 g. Č in 100 g. aq.; soly. of aq. in Č at 20° is 10.8 g. aq. in 100 g. Č (8).

PREPARATION OF Č

[For prepn. of Č from 1-chloro-2-methylpropene-2 (methallyl chloride = isobutenyl chloride) (3:7145) by addn. of HOCl with HOCl (yields: 33% (4), 32% (3)) (7), with Cl_2/aq. (70% yield (8)), or with organic hypochlorites (7) see indic. refs.; note that if the initial methallyl chloride conts *β,β*-dimethylvinyl chloride (isocrotyl chloride) (3:7120) the crude HOCl addn. prod. will contain 1,1-dichloro-2-methylpropanol-2 (3:5772), but this can be separated from Č by fractional distillation.]

[For prepn. of Č from *α,α'*-dichloroacetone (3:0563) with MeMgBr (yields: 80–85% (6), 40% (5)) (1) see indic. refs.; from chloroacetone (3:5425) with diazomethane via *β*-methyl epichlorohydrin (3-chloro-2-methyl-1,2-epoxypropane) (3:7657) and subsequent ring opening with conc. HCl see (2).]

CHEMICAL BEHAVIOR OF Č

WITH INORGANIC REACTANTS

Dehydration. [Č is difficult to dehydrate but on twice htg. with equal wt. P_2O_5 at 110–195° for 2 hrs. gives (46% yield (6)) 1,3-dichloro-2-methylpropene-1 (3:5590). — Č with strong H_2SO_4 loses H_2O giving (9) 80% 3-chloro-2-(chloromethyl)propene-1 (3:5633) + 20% 1,3-dichloro-2-methylpropene-1 (3:5590).]

Dehydrohalogenation. Č with aq. $Ca(OH)_2$ loses 1 HCl giving (93% yield (10) (11)) 3-chloro-2-methyl-1,2-epoxypropane (*β*-methylepichlorohydrin) (3:7657) which distils as its azeotrope, b.p. 89.8°, contg. 25.6% aq. (10). — Note that, if alk. is added in excess, reactn. is complete in a few seconds at room temp. and the process can even be used as a method for detn. of Č in aq. soln. [For use of Č in comml. prepn. of *β*-methylepichlorohydrin (3:7657), *β*-methylglycerol monochlorohydrin, *β*-methylglycidol, and *β*-methylglycerol see (10).]

Behavior with sodium sulfite. [Č (1 mole) with aq. Na_2SO_3 (2 moles) at 70–90° for 2 hrs. yields (3) the salt of 2-methylpropanol-2-disulfonic acid-1,3; this prod. with PCl_5 not only is converted to the *bis* (acid chloride) but simultaneously loses H_2O yielding (3) 2-methylpropen-1,3-*bis*-(sulfonyl chloride), long ndls. from CCl_4, C_6H_6, or pet. ether, m.p.

[For prepn. of $\bar{C}$ from o-dichlorobenzene (3:6055) by partial hydrol. with aq. MeOH or EtOH alk., alk. earths, or alk. carbonates in pres. of Cu or Cu salts at elevated temps. under press. see (38)–(46) incl.]

[$\bar{C}$ in excess dil. aq. KOH with H_2 in pres. of Ni absorbs 1 mole H_2 (47) but more slowly than m-chlorophenol (3:0255) or p-chlorophenol (3:0475). — $\bar{C}$ is not reduced with HI in AcOH at 25° (48).]

[$\bar{C}$ on oxidn. with 35% peracetic acid at 25° gives slowly (17 days) in small yield (49) α-chloromuconic acid (2-chlorobutadiene-1,3-dicarboxylic acid-1,4), m.p. 190° (49), + 5-chlorohexadiene-2,4-al-6-oic acid-1, m.p. 145° (49).]

[$\bar{C}$ with Cl_2 (2 moles) in AcOH gives (80% yield (50)) 2,4-dichlorophenol (3:0560); $\bar{C}$ with Cl_2 (3 moles) undoubtedly gives 2,4,6-trichlorophenol (3:1673). — For study of chlorination of $\bar{C}$ with HOCl see (51).]

$\bar{C}$ with Br_2 (1 mole) in CCl_4 gives (87% yield (52)) 4-bromo-2-chlorophenol, ndls. from lgr., m.p. 48–49° (52), 49–50° (53), 50–51° (54). — $\bar{C}$ with Br_2 (2 moles) in aq. KBr soln. gives (55) 2-chloro-4,6-dibromophenol [Beil. VI-203], ndls. from alc., m.p. 76° cor. (55), 75–76° (56). — $\bar{C}$ with large excess Br_2 in pres. of Fe powder gives (57) 2-chloro-3,4,5,6-tetrabromophenol, ndls. from alc. or AcOH, m.p. 224° (57).

[$\bar{C}$ in aq. alk. with I_2/KI soln. as directed (55) gives 2-chloro-4,6-di-iodophenol, ndls. from alc., m.p. 96° (55). — For study of iodination of $\bar{C}$ see (58).]

[$\bar{C}$ on nitrosation as directed (59) (60) gives (96% yield (60)) 2-chloro-4-nitrosophenol (2-chlorobenzoquinone-1,4-oxime-4) [Beil. VII-631, VII_1-(346)], pale yel. ndls. from C_6H_6, m.p. 145° (60), 142° (59); for discussion of tautomerism of this cpd. see also (61) (62) (63).]

[$\bar{C}$ on mononitration, e.g., with cold mixt. of equal pts. HNO_3 (D = 1.36) + aq. (13), with HNO_3 in MeOH (64), or with HNO_3 (D = 1.5) in AcOH (65), gives a mixt. of 2-chloro-4-nitrophenol [Beil. VI-240], ndls. from aq., m.p. 110–111°, and (32% (65)) 2-chloro-6-nitrophenol [Beil. VI-239], ndls. from aq., m.p. 70–71°; of these only the latter is volatile with steam (use in detn. of $\bar{C}$ in mixts. with 4-chlorophenol (3:0475) (27)). — Both of the other mononitro-o-chlorophenols are known but have been obtd. only by indirect means; e.g., 2-chloro-3-nitrophenol, m.p. 120.5° (66), 120° (67), and 2-chloro-5-nitrophenol, m.p. 119.5° (66).]

$\bar{C}$ on dinitration, e.g., by soln. in HNO_3 (D = 1.36) and subsequent warming yields (68) 2-chloro-4,6-dinitrophenol [Beil. VI-259, VI_1-(128)], cryst. from alc., m.p. 113° (68); this prod. (unlike picric acid) is volatile with steam from H_2SO_4 soln. (use in anal. of mixts. of $\bar{C}$ with phenol (17)).

[$\bar{C}$ in alk. soln. couples with diazotized aniline giving (70% yield (69) (70) (71)) 3-chloro-4-hydroxyazobenzene (2-chlorobenzoquinone phenylhydrazone-4) [Beil. XVI-120], yel. pr. from aq. alc., m.p. 88.5° (69), 88° (70), 86° (71). — For study of corresp. coupling of $\bar{C}$ with diazotized p-nitroaniline see (72).]

[For mercuration of $\bar{C}$ and use of products as seed disinfectants, etc., see (73); for condens. prods. of $\bar{C}$ with C_6H_5.Hg.OH see (74).]

[$\bar{C}$ over pumice in a silica tube at dull red heat (75) or K salt of $\bar{C}$ + K phenolate at 250° for 8 hrs. (81) yields diphenylene dioxide [Beil. XIX-44, XIX_1-(618)], ndls. from MeOH, m.p. 119°, readily identified by dinitration with fumg. HNO_3 in AcOH (75) to dinitrodiphenylene dioxide, ndls. from pyridine, m.p. 257° (75).]

Condensation reactions involving nuclear hydrogens. [$\bar{C}$ with formalin (1:0145) in pres. of conc. HCl treated with HCl gas as directed (76) gives 3-chloro-4-hydroxybenzyl chloride, m.p. 92–93° (76). — $\bar{C}$ with formalin + H_2SO_4 (60%) at 60–65° for 16 hrs. gives (76) 3,3'-dichloro-4,4'-dihydroxydiphenylmethane, m.p. 103–104° (76). — $\bar{C}$ with formalin (1:0145) + aq. 10% NaOH as directed (77) yieds acc. to conditions 3-chloro-4-hydroxybenzyl alc., pl. from C_6H_6, m.p. 123.5–124°, and/or 3-chloro-4-hydroxy-5-(hydroxymethyl)-

benzyl alc., ndls. from $CHCl_3$, m.p. 117.5–119°. — For condens. of C̄ with formalin in prepn. of synthetic tanning agents see (78).]

[C̄ with $CHCl_3$ or $CHBr_3$ (79) in pres. of aq. NaOH undergoes Reimer-Tiemann reaction yielding both 3-chloro-2-hydroxybenzaldehyde (3:1010) and 3-chloro-4-hydroxybenzaldehyde (3:4065). — C̄ with CCl_4 in alc. alk. in s.t. at 125–136° yields (80) 3-chloro-4-hydroxybenzoic acid (3:4675). — C̄ with α,α-dichlorodiphenylmethane (3:6960) + $AlCl_3$ in cold CS_2 gives (31) 3-chloro-4-hydroxyphenyl-diphenyl-carbinol, from 60% AcOH as deep orange pl. of quinonoid desmotrope, m.p. 118°, but from alc. colorless crysts. of benzenoid desmotrope (contg. ½ mole solvent), m.p. 70–72° (31); note that in hot C_6H_6, however, this reaction takes a different course yielding (31) α,α-*bis*-(*o*-chlorophenoxy)diphenylmethane, cryst. from hot alc., m.p. 191–192° (31). — C̄ with chloral hydrate (3:1270) in pres. of alk. salts condenses (82) to 3-chloro-4-hydroxyphenyl-trichloromethyl-carbinol which on hydrolysis with NaOH yields 3-chloro-4-hydroxybenzaldehyde (3:4065).]

[C̄ with $SOCl_2$ + $AlCl_3$ in CS_2 gives (85% yield (83)) *bis*-(3-chloro-4-hydroxyphenyl) sulfoxide [Beil. VI$_1$-(422)], ndls. from dil. alc. contg. HCl, m.p. 195°. — C̄ with mixt. of conc. H_2SO_4 + fumg. H_2SO_4 (25% SO_3) at 100° for 6 hrs. disulfonates to 2-chloro-4,6-disulfophenol which undergoes bimolecular condensation to the corresp. internal ester (for details see (84)).]

[C̄ with phthalic anhydride (1:0725) with $AlCl_3$ in acetylene tetrachloride (3:5750) (85) (86) (87), or with $AlCl_3$ + NaCl at 150° (88), gives (yields: 95% (85) (86), 87% (88)) 2-(3′-chloro-4′-hydroxybenzoyl)benzoic acid, cryst. from MeOH, m.p. 224–225° (85), cryst. from AcOH, m.p. 219.5–220° (86), 219° (88); this prod. on ring closure with 15 pts. conc. H_2SO_4 at 150° for 1 hr. (88), or with 10 pts. conc. H_2SO_4 + 1 pt. $ZnCl_2$ at 130° for 5½ hrs. (85), or with 16 pts. 100% H_2SO_4 + 1 pt. H_3BO_3 at 195° for 1½ hrs. (86), gives (yields: 80% (85), 76% (88), 53.5% (86)) 3-chloro-2-hydroxyanthraquinone, yel. ndls. from AcOH, nitrobenzene + AcOH, or xylene, m.p. 267–268° (85), 266.5–267° (86), 266° (88). — Note that by slight variations other products are also formed; e.g., C̄ + phthalic anhydride + fumg. H_2SO_4 + H_3BO_3 at 170–200° for 10 hrs. gives (89) both chloro-hydroxy-anthraquinone and dihydroxyanthraquinone cf. (90) and at 255° gives (91) 1,2,4-trihydroxyanthraquinone (purpurin). — Note that C̄ (2 moles) with phthalic anhydride (1 mole) at 125° for 6 hrs. gives (75% yield (92)) dichlorophenolphthalein, m.p. 98°.]

Reactions of nuclear halogen of C̄. [C̄ on hydrolysis with aq. alk., alk. carbonates, or alkaline earths in pres. of cat. such as Cu or Cu salts at elevated temps. and under press. yields (93) (94) (95) (96) (97) (98) pyrocatechol (1:1520) cf. (43). — C̄ on fusion with KOH yields (13) pyrocatechol but some resorcinol (1:1530) is also formed (98) (99). — C̄ with aq. Na_2S + NaOH at 210–215° for 24 hrs. yields (100) 2-mercaptophenol [Beil. VI-793], b.p. 216–217° cor., m.p. +5°.]

Reactions of the phenolic group of C̄ (see also under Ⓓ, below). C̄ behaves as a weak acid; e.g., C̄ dis. in conc. aq. Na_2CO_3 soln. on shaking at room temp. (dif. and sepn. from phenol (18)) and is repptd. by treatment with CO_2 (18). — Dissoc. const. of C̄ in aq. = 32×10^{-10} (101); for studies of dissoc. const. in 50% MeOH at 20° (7) (101) (102), in 25% EtOH at 25° (103), in 30% EtOH at 25° (4) (102) see indic. refs.

C̄ has bactericidal (104) (105) (106) (107) (108) (109) and fungicidal (110) properties.

[C̄ with alkali metals gives corresp. alk. *o*-chlorophenolates; for use of these as antioxidants in motor fuels see (111). — Dry Na *o*-chlorophenolate with CO_2 at 140–150° under press. yields (25) 3-chloro-2-hydroxybenzoic acid (3-chlorosalicylic acid) (3:4745).]

[C̄ in MeOH/KOH with MeI in s.t. at 130° (112), or C̄ with aq. KOH + Me_2SO_4 at ord. temp. (113), yields *o*-chlorophenyl methyl ether (*o*-chloroanisole) (3:6255). — C̄ in abs. alc. + NaOEt with EtI yields (115) *o*-chlorophenyl ethyl ether (*o*-chlorophenetole) (3:5735). — C̄ with allyl bromide in acetone + aq. + NaOH gives (90% yield (116))

allyl o-chlorophenyl ether; b.p. 108–110° at 15 mm., D_{25}^{25} = 1.132, n_D^{25} = 1.5388; this prod. on reflux. 10 min. gives by Claisen rearr. (89% yield (146)) 2-chloro-6-allylphenol, b.p. 61–63° at 1 mm., n_D^{25} = 1.5447.]

[C̄ with $POCl_3$ refluxed for 8–11 hrs., $POCl_3$ distd. off, and crude product saponified yields (117) *bis*-(o-chlorophenyl)phosphoric acid, m.p. 105–106° cor. — For condens. of C̄ with triphenylphosphine oxide and use of prod. as seed disinfectant see (118); for use of C̄ in prepn. of triaryl phosphates (119) or of mixed triaryl thiophosphates (120) and use as plasticizers see indic. refs. — C̄ with PCl_5 gives on htg. (22) o-dichlorobenzene (3:6055).]

[C̄ with malic acid (1:0450) + conc. H_2SO_4 *fails* (121) to give the expected von Pechmann synthesis of 8-chlorocoumarin; however, C̄ with α-substituted acetoacetic esters + P_2O_5 condenses to corresp. chromones; e.g., C̄ with ethyl α-methylacetoacetate (1:1712) + P_2O_5 gives (27% yield (122)) 8-chloro-2,3-dimethylchromone [Beil. XVII₁-(177)], pale yel. ndls. from dil. alc., m.p. 108°; for further examples see (123). — C̄ (as sodium salt) + diethyl fumarate (1:3761) refluxed in xylene yields (124) diethyl α-(o-chlorophenoxy)-fumarate which on subsequent hydrolysis to the acid, ring closure with conc. H_2SO_4, and decarboxylation gives 8-chlorochromone, colorless ndls., m.p. 114–115° (124).]

C̄ with $AlCl_3$ evolves HCl and yields (125) $Cl.C_6H_4.O.AlCl_2$, insol. CS_2, but sol. in alc. and hydrolyzed by aq., m.p. 207–210° (125). — C̄ in 50% alc. with satd. soln. of PkOH in 50% alc. yields (126) a mol. cpd., C̄.PkOH, pale yel. ndls., m.p. 81–82° (126).

Ⓟ **$FeCl_3$ color reaction:** C̄ in aq. soln. with very dil. $FeCl_3$ gives violet coloration; C̄ in alc. with very dilute aq. $FeCl_3$ gives greenish-blue.

—— **o-Chlorophenyl acetate:** oil, b.p. 103° cor. at 15 mm., D_4^{20} = 1.2166 (18). [From C̄ with Ac_2O (4 pts.) + NaOAc (1 pt.) boiled for 10 min. (18).]

—— **o-Chlorophenyl benzoate** [Beil. IX-117]: oil, b.p. 314–316° (?) (127), 212–213° at 745 mm. (127), 155–157° at 3 mm. (127). [From C̄ + benzoyl chloride + aq. NaOH (127) (for study of rate see (129)).] [Note also that C̄ + BzCl + $AlCl_3$ in acetylene tetrachloride yields (128) the Fries rearr. prods. to be expected from o-chlorophenyl benzoate, viz., 3-chloro-4-hydroxybenzophenone, cryst. from alc. or C_6H_6, m.p. 180–181° (128), and 3-chloro-2-hydroxybenzophenone, pale yel. cryst. from alc., m.p. 92.5–93° (128).]

Ⓓ **o-Chlorophenyl m-nitrobenzoate:** pr. from lgr., m.p. 98° (18). [From C̄ with m-nitrobenzoyl chloride on shaking with 10% aq. NaOH at 35–50° (18).]

—— **o-Chlorophenyl p-nitrobenzoate:** ndls. from 85% alc., m.p. 114.5–114.8°. [From C̄ + p-nitrobenzoyl chloride in pyridine (unpublished work).]

—— **o-Chlorophenyl 3,5-dinitrobenzoate:** ndls. from 85% alc., m.p. 143.1–143.4°. [From C̄ + 3,5-dinitrobenzoyl chloride in pyridine (unpublished work).]

—— **o-Chlorophenyl benzenesulfonate:** unrecorded.

—— **o-Chlorophenyl p-toluenesulfonate:** m.p. 74° (4).

—— **o-Chlorophenyl benzyl ether:** oil, b.p. 138–140° at 3 mm. (130). [From C̄ (as Na salt) + benzyl chloride but in very poor yield (7.5% (130)); note that the products elsewhere (131) (132) seem to be questionable.]

—— **o-Chlorophenyl p-nitrobenzyl ether:** m.p. 100° (133). [From C̄ (as Na salt) with p-nitrobenzyl bromide refluxed in aq. alc. (133).]

Ⓓ **o-Chlorophenyl 2,4-dinitrophenyl ether:** greenish-yel. ndls. from alc., m.p. 99° (134). [From C̄ in equiv. amt. aq. NaOH refluxed with alc. 2,4-dinitrochlorobenzene (134). — Note that the m.p. of 75–76° reported earlier (135) for this compd. is identical with that given later (134) for the corresp. deriv. of m-chlorophenol (3:0255).]

Ⓓ **o-Chlorophenoxyacetic acid** (3:4375): m.p. 145–146° (136) (137), 143–145° (138); Neut. Eq. 186.5. [From C̄ in aq. NaOH (2 equivs.) with chloroacetic acid (1 equiv.) refluxed for 1 hr., then acidified (138) cf. (136) (137).]

Ⓓ *o*-Chlorophenyl *N*-(phenyl)carbamate: cryst. from C_6H_6, m.p. 120–121° (139). [From $\bar{C}$ + phenyl isocyanate in dry ether (139).]

Ⓓ *o*-Chlorophenyl *N*-(*p*-iodophenyl)carbamate: m.p. 156–157° (147). [From $\bar{C}$ + *p*-iodobenzazide in hot lgr. (147).]

Ⓓ *o*-Chlorophenyl *N*-(*p*-bromophenyl)carbamate: pr. from EtOAc, m.p. 141–143° cor. (140). [From $\bar{C}$ + *p*-bromobenzazide in lgr. (140).]

Ⓓ *o*-Chlorophenyl *N*-(*m*-nitrophenyl)carbamate: m.p. 114° u.c., 116° cor. (148). [From $\bar{C}$ + *m*-nitrobenzazide (148) or *m*-nitrophenyl isocyanate (148) in lgr. (148).]

Ⓓ *o*-Chlorophenyl *N*-(*p*-nitrophenyl)carbamate: ndls. from lgr., m.p. 143° cor. (141). [From $\bar{C}$ + *p*-nitrobenzazide in lgr. (141).] — [Note that corresp. deriv. of *m*-chlorophenol (3:0255) has m.p. 144° cor. (141).]

Ⓓ *o*-Chlorophenyl *N*-(3,5-dinitrophenyl)carbamate: pl. from C_6H_6, m.p. 182–183° (142). [From $\bar{C}$ + 3,5-dinitrobenzazide htd. in dry toluene (142).]

Ⓓ *o*-Chlorophenyl *N*-(3,5-dinitro-4-methylphenyl)carbamate: yel. pl. from lgr. or EtOAc, m.p. 175–176°, u.c., 180–181° cor. (143). [From $\bar{C}$ + *3,5-dinitro-4-methyl*-benzazide in lgr. (143).]

Ⓓ *o*-Chlorophenyl *N*-(α-naphthyl)carbamate: cryst. from lgr., m.p. 120° (144). [From $\bar{C}$ + α-naphthyl isocyanate in lgr. (144).]

Ⓓ *o*-Chlorophenyl *N*-(β-naphthyl)carbamate: pl. from lgr., m.p. 133–134° u.c., 136–137° cor. (145). [From $\bar{C}$ + β-naphthyl isocyanate (or azide) in lgr. (145).]

—— *o*-Chlorophenyl *N*,*N*-diphenylcarbamate: unreported.

75° at 12 mm. (8)				
70–73° at 14 mm. (10)				
69° at 12 mm. (45)				

Note: Because of the great magnitude of the literature of C̄ only the most important citations can be included here; for much additional data prior to 1930, the appropriate volume of Beilstein should also be consulted.

C̄ dis at 19° in 9 pts. aq ; at 72° in 6 pts. aq., misc. with ether. [For recovery of C̄ from aq. solns. by extraction with immiscible solvents (12) (13) (14) or by steam distillation (12) (15) see indic. refs.]

[For prepn. of C̄ from glycerol (1:6540) by actn. of HCl gas at 100–110° (yield: 87% (11), 82% (6), 55–57% (10)) (12) see indic refs ; for prepn. of C̄ from 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358) with fumg. HCl (yield 80% (11)) (16) (17) (1) (18), with $MgCl_2$ in dil. alc. at 125° (19), or with S_2Cl_2 (67% yield (40)) see indic. refs.; for formn. of C̄ (together with other prods.) from glycerol (1:6540) with $SOCl_2$ + pyridine see (20); from corresp. acetate (3:6318) by alcoholysis with MeOH + HCl see (21) (45); from α,α'-dichloroacetone (3:0563) reductn. with yeast see (22).]

C̄ with aq. alk. rapidly loses HCl giving 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358) (yield: 90% (6), 80–90% (23), 76–81% (24-B), 67–72% (24-A), 85% (25), 79% (26)).

C̄ on oxidn. with $Na_2Cr_2O_7$ + H_2SO_4 gives (68–75% yield (27)) α,α'-dichloroacetone (3:0563). [Overoxidn. of this prod. or C̄ on oxidn. with conc. HNO_3 (28) gives chloroacetic acid (3:1370).]

[Č on reductn. with Na/Hg in moist ether gives various products including allyl alc. (1:6145), isopropyl alc. (1:6135), propylene together with epichlorohydrin (for refs. see Beil. I-364); Č htd. with HI + P in s.t. at 180° gives (29) isopropyl iodide.]

[For behavior of Č with NaSH yielding 1,3-dithioglycerol (Hg deriv. m.p. 185°, Pb deriv. m.p. 175–180° dec.) see (41).]

Č on htg. with P_2O_5 (31) or $POCl_3$ (11) (30) yields 1,3-dichloropropene-1 (3:5280).

Č on htg. with excess EtOH + NaOH yields (by a series of definite intermediate stages (25)) (6) 1,3-diethoxypropanol-2 (glycerol α,γ-diethyl ether) b.p. 108–111° at 60 mm., $D_4^{25} = 0.953$, $n_D^{25} = 1.420$ (19) (6); similarly Č on htg. with excess phenol + aq. NaOH as specified (19) gives 80% yield 1,3-diphenoxypropanol-2 (glycerol α,γ-diphenyl ether), cryst. from alc., m.p. 80–81° (19).

—— **β,β'-Dichloroisopropyl acetate:** b.p. 205° (see 3:6318).

—— **β,β'-Dichloroisopropyl benzoate:** b.p. 296° sl. dec. (12); 171–173° at 19 mm. (43), 157–160° at 12 mm. (44). [From Č + benzoyl chloride on htg. (42) or with pyridine (44).]

Ⓓ **β,β'-Dichloroisopropyl *p*-nitrobenzoate:** m.p. 59–60° (32), 58–59° (33). [From Č + *p*-nitrobenzoyl chloride with pyridine (94% yield) (33) or with quinoline in $CHCl_3$ (100% yield) (32).]

Ⓓ **β,β'-Dichloroisopropyl 3,5-dinitrobenzoate:** m.p. 129° (32). [From Č + 3,5-dinitrobenzoyl chloride + quinoline in $CHCl_3$ in 100% yield (32).]

Ⓓ **β,β'-Dichloroisopropyl benzenesulfonate:** long colorless ndls. from C_6H_6, m.p. 50° (34). [From Č + benzenesulfonyl chloride + conc. aq. NaOH (34); for study of pyrolysis see (35).]

Ⓓ **β,β'-Dichloroisopropyl *p*-toluenesulfonate:** m.p. 52–53° (36). [From Č + *p*-toluenesulfonyl chloride with conc. aq. NaOH (36).] [For use in prepn. of vat dyes of dibenzanthrone series see (37).]

Ⓓ **β,β'-Dichloroisopropyl *N*-(phenyl)carbamate:** m.p. 73–74° (20) (38), 73° (39). [From Č with phenyl isocyanate (20) (39); also indirectly from Č by conv. to corresp. chloroformate and reacting with aq. aniline (38).] [This prod. htd. a few min. with conc. aq. KOH loses HCl and ring-closes alm. quant. to 5-chloromethyl-3-phenyloxazolidone-2, pr. from hot alc., m.p. 104–105° (39).]

Ⓓ **β,β'-Dichloroisopropyl *N*-(α-naphthyl)carbamate:** m.p. 115° (38). [Prepd. indirectly from Č by conv. to corresp. chloroformate and reacting with aq. aniline (38).] [This prod. with conc. aq. alk. loses HCl and ring-closes to 5-chloromethyl-3-(α-naphthyl)-oxazolidone-2, m.p. 118° (38).]

Ⓓ **β,β'-Dichloroisopropyl *N*-(β-naphthyl)carbamate:** m.p. 101° (38). [Prepd. indirectly from Č by conv. to corresp. chloroformate and reacting with aq. aniline (38).] [This prod. with conc. aq. alk. loses HCl and ring-closes to 5-chloromethyl-3-(β-naphthyl)-oxazolidone-2, m.p. 107° (38).]

2, 229 (1935)

3:6010 γ-CHLORO-*n*-PROPYL CHLOROFORMATE $C_4H_6O_2Cl_2$ Beil. S.N. 199
(γ-Chloro-*n*-propyl chlorocarbonate) $\underset{\displaystyle Cl}{\underset{|}{CH_2}}\,CH_2\,CH_2.O.CO.Cl$

B.P. 177° (1) D_{20}^{25} = **1.2946** (1) n_D^{20} = **1.4456** (1)
175–176° at 736 mm. (2)

Colorless liq.; insol. in aq. toward which it is relatively stable.

[For prepn. of $\bar{C}$ from 3-chloropropanol-1 (trimethylene chlorohydrin) (3:8285) with phosgene (3:5000) in 80% yield see (1) (2).]

$\bar{C}$ in quinoline begins to decompose into 1,3-dichloropropane (trimethylene (di)chloride) (3:5450) + CO_2 even at 35° (3) (for discussion see (4)).

$\bar{C}$ with primary arom. amines reacts as an acyl chloride yielding the corresp. γ-chloro-*n*-propyl *N*-arylcarbamates [e.g., $\bar{C}$ with *p*-aminobenzenearsonic acid (arsanilic acid) gives (92% yield (5)) γ-chloro-*n*-propyl *N*-(*p*-arsonophenyl)carbamate, m.p. 245–246° (5) cf. (6); for analogous reactions of $\bar{C}$ with *o*-aminobenzenearsonic acid (5) (6), *o*-toluidine-5-arsonic acid (5), *p*-phenetidine (1), *p*-aminobenzoic acid (1), *o*-chloroaniline (1), or *p*-chloroaniline (1) see indic. refs.]; for simpler cases see below.

Ⓓ **γ-Chloro-*n*-propyl carbamate:** cryst. from hot aq., m.p. 62° (2). [From $\bar{C}$ slowly added to 10% aq. NH_4OH (2 moles) (violent reactn. and cooling is required), yield 71% (2).]

Ⓓ γ-Chloro-*n*-propyl allophanate ($ClCH_2CH_2CH_2OCO.NH.CO.NH_2$): cryst. from hot alc., m.p. 166° (2). [From C̄ with urea (2 moles) fused for 3 hrs. (75% yield (2)).]

—— γ-Chloro-*n*-propyl *N*-phenylcarbamate: pr. from alc., m.p. 38° (2), 35–36° (1). [From C̄ with aniline (2 moles) both diluted with dry ether (3 vols.) slowly mixed in flask surrounded by ice water, ether evaporated and prod. distilled, b.p. 160–170° at 5 mm. (2); this prod. in alc. *on addn of 1 N aq. NaOH ring-closes with loss of HCl* giving (84% yield (2)) (1) 3-phenyl-tetrahydro-2-keto-1,3-oxazine, m.p. 96° (2), 94.0–94.5° (1).]

Ⓓ γ-Chloro-*n*-propyl *N*-(*o*-tolyl)carbamate: ndls. from alc., m.p. 49° (2), 46.0–46.5° (1). [From C̄ with *o*-toluidine in dry ether as for preceding case (69% yield (2)); this prod. in alc. on addn. of 1 *N* aq. NaOH ring-closes with loss of HCl giving (60% yield (2)) (1) 3-(*o*-tolyl)-tetrahydro-2-keto-1,3-oxazine, m.p. 89° (1), 87.0–87.5° (2).]

—— γ-Chloro-*n*-propyl *N*-(*p*-tolyl)carbamate: oil, b.p. 188° at 4.5 mm., $D_{20}^{20} = 1.186$, $n_D^{18} = 1.494$ (1). [*This prod. with alc. KOH (1 mole) refluxed 2 hrs. ring-closes with* loss of HCl giving (1) 3-(*p*-tolyl)-tetrahydro-2-keto-1,3-dioxazine, m.p. 127.5–128° (1).]

Ⓓ γ-Chloro-*n*-propyl *N*-(α-naphthyl)carbamate: ndls. from ether and lgr., m.p. 75.5–76.5° (1). [From C̄ with α-naphthylamine (2 moles) in aq. suspension (90% yield (1)); this prod. with alc. KOH (1 mole) refluxed 2 hrs. ring-closes with loss of HCl giving 3-(α-naphthyl)-tetrahydro-2-keto-1,3-dioxazine, m.p. 149.5–150.5° (1).]

Ⓓ γ-Chloro-*n*-propyl *N′*-anilinocarbamate (γ-chloro-*n*-propyl *N*-phenylcarbazate): cryst. from C_6H_6, m.p. 72° (7). [From C̄ with phenylhydrazine (1 mole) in aqueous pyridine (62% *yield* (7)).]

3:6010 (1) Pierce, Adams, *J. Am. Chem. Soc.* **45**, 791–794 (1923). (2) Dox, Yoder, *J. Am. Chem. Soc.* **45**, 725–726 (1923). (3) Carré, Passedouet, *Compt. rend.* **201**, 899 (1935). (4) Carré, Passedouet, *Bull. soc. chim.* (5) **3**, 1073–1082 (1936). (5) Rodewald, Adams, *J. Am. Chem. Soc.* **45**, 3102–3105 (1923). (6) Adams, Rodewald (to Abbott Laboratories), Brit. 255,971, Aug. 26. 1926; *Cent.* **1927**, I 1744, *C.A.* **21**, 2908 (1927). Can. 254,983, Oct. 27, 1925, *Cent.* **1927**, I 1744; *C.A.* **20**, 424 (1926). (7) Dox, *J. Am. Chem. Soc.* **48**, 1952 (1926).

3:6025 ***β,β′*-DICHLORODIETHYL ETHER** $C_4H_8OCl_2$ Beil. I —

(*bis*-(β-Chloroethyl) ether; "chlorex") $ClCH_2CH_2$–O–CH_2CH_2Cl I_1— I_2-(335)

B.P. 177–178° cor.	(1)	**M.P. −24.5°** (2)	D_4^{20} = **1.2095** (3)	
176° at 744 mm.	(2)			n_D^{20} = **1.457** (1)
80–82° at 20–22 mm.	(3)		D_{20}^{20} = **1.213** (1)	
70° at 15 mm.	(2)			
60° at 12 mm.	(2)			

Colorless oil with pleasant ethereal odor. — [For data on surface tension and parachor see (4); for vapor-press. data see (5).]

[For prepn. from ethylene chlorohydrin (3:5552) see (1); for use in prepn. of di-(β-chloroethyl) sulfate see (12).] [Note that C̄ forms with ethylene chlorohydrin (3:5552) a const.-boilg. mixt., b.p. 128.2°, contg. 8.2 mole % C̄ (15).]

The halogen atoms of C̄ are very unreactive to most reagents; C̄ is extremely resistant to hydrolysis, gives no Friedel-Crafts reaction with $C_6H_6 + AlCl_3$, no reaction with KCN, and is unaffected by $NaOH + As_2O_3$ (2).

C̄ on htg. with solid KOH yields (6) (7) (9) (3) divinyl ether (1:7800) (accompanied by some β-chloroethyl vinyl ether (3:7464) q.v.), but C̄ on htg. with dimethylaniline or quinoline fails to react at all, even to form quaternary salts (6).

C̄ on htg. with excess sodium alcoholates for 3–15 hrs. gives 36–45% yields of the corresponding liquid *bis* ethers (8); C̄ in alc. refluxed overnight with an excess of Na phenolates yields corresponding *bis* ethers (9); e.g., C̄ with Na α-naphtholate gives 52% yield *bis* [β(α-naphthoxy)ethyl] ether, m.p. 87° (9); C̄ with Na β-naphtholate gives 56% yield *bis*-[β-(β-naphthoxy)ethyl] ether, m.p. 122° (9).

C̄ on htg. with aniline (3 moles) for 2 hrs. at 200° gives (65% yield (9)) 4-phenylmorpholine, white flakes from 50% alc., m.p. 57–58° (1). [The crude prod. may also cont. *bis*-(β-anilinoethyl) ether, pl. from alc., m.p. 115.5° (9).] [For similar prepn. (77% yield (9)) of *N*-(p-tolyl)morpholine, m.p. 51° (8); *N*-(α-naphthyl)morpholine (68% yield (9)), m.p. 83° (8); *N*-(β-naphthyl)morpholine (72% yield (9)), m.p. 90° (8), see (8) (9).] [For corresp. reaction of C̄ with phenylhydrazine, p-phenylenediamine, and benzidine see (10); with ethylenediamine see (11).]

—— β,β'-*bis*-(α-Naphthoxy)diethyl ether: m.p. 87° (16). [From C̄ + α-naphthol (1:1500) + aq. NaOH in s.t. at 120° for 8 hrs. (16).]

—— β,β'-*bis*-(β-Naphthoxy)diethyl ether: m.p. 122° (16). [From C̄ + β-naphthol (1:1540) + aq. NaOH in s.t. at 120° for 8 hrs. (16).]

Ⓓ *bis*-(β-Phthalimidoethyl) ether [Beil. XXI-470]: from C̄ on refluxing 3 hrs. with phthalimide + K_2CO_3 (13) or from C̄ + K phthalimide (2 moles) + trace of diethylamine on htg. 4 hrs. at 135–140° (55% yield) (9), cryst. from alc. (14), ndls. from 50% AcOH (13), m.p. 159° (9), 157° (13), 156.5° (14). [The half reaction prod., β-chloro-β'-phthalimidodiethyl ether, ndls. from lt. pet., m.p. 72° (13), 69° (9), may be sepd. from the above *bis*-ether by its much greater solubility in pet. eth. (13).]

3:6025 (1) Kamm, Waldo, *J. Am. Chem. Soc.* **43**, 2223–2227 (1921). (2) Gibson, Johnson, *J. Chem. Soc.* **1930**, 2525–2530. 3:6035 1,1,2,3-TETRACHLOROPROPANE

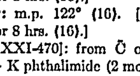
$C_3H_4Cl_4$ Beil. I - 107
I_1—
I_2—



B.P. 179–180° cor. at 756.6 mm. (1) D^{15}_{15} = 1.522 (1)
179° (3)

[For prepn. of C̄ from 1,2,3-trichloropropane (3:5840) + $SbCl_5$ at 150–190° see (2); from 1,1,2-trichloropropane (3:5630) + Cl_2 + $AlCl_3$ s[illegible] (3:5280) + Cl_2 see (4); from 3,3-dichloropropene-1 (3:[illegible] 1,2-dichloroethylene (3:5030) with CH_2Cl_2 (3:5020) + [illegible] see (5).]

3:6035 (1) Romburgh, *Bull. soc. chim.* (2) **36**, 553–557 (1881). (2) Herzfelder, *Ber.* **26**, 2435 (1893). (3) Mouneyrat, *Bull. soc. chim.* (3) **21**, 621–623 (1899). (4) Hartenstein, *J. prakt. Chem.* (2) **7**, 312–313 (1873). (5) Lehmann, Bayer (to I.G.), Ger. 715,069, Dec. 16, 1941; *Cent.* **1942**, I 2584; *C.A.* **38**, 2051 (1944).

3:6050 1,1,3,3-TETRACHLOROPROPANONE-2 $C_3H_2OCl_4$ Beil. I - 656
(*sym.*-Tetrachloroacetone) $Cl_2CH-\underset{\underset{O}{\|}}{C}-CHCl_2$ I_1-(345)
I_2—

B.P. 180–182° cor. at 718 mm. (1)
179–181° (3)

[*See also* 1,1,1,3-*tetrachloropropanone-2* (*unsym.-tetrachloroacetone*) (3:6085).]

Colorless liq. with penetrating odor; produces blisters on skin. — *Eas. sol. cold aq.*, alc., ether, C_6H_6.

$\bar{C}$ with aq. readily yields a crystn. tetrahydrate, m.p. 48–49° (1) (6), 48° (2), 47–48° (3) (4) (for crystallographic data see (2), for polymorphism see (5)); this tetrahydrate loses its aq. on distn., on stdg. over H_2SO_4, or by actn. of dry HCl gas.

[For prepn. of $\bar{C}$ from phloroglucinol (1:1620) via conversion in AcOH with Cl_2 to 1,1,3,3,6,6-*hexachloro-2,4,6-triketocyclohexane* ("*hexachlorophloroglucinol*") [Beil. VII-854, VII_1-(469)], and treatment of latter with water (yield is almost quant.) (dichloroacetic acid (3:6208) is also formed) see (6); from 2,4,6-triaminophenol [Beil. XIII-569, $XIII_1$-(211)] (2), from chloroanilic acid (3:4970) (1) (7), from 3,3,5-trichlorocyclopentanetrione-1,2,4 [Beil. VII-852] (4), or from 2,2,5-trichlorocyclopentanedione-3,4-ol-1-carboxylic acid-1 [Beil. X-985] (4) by oxidn. with $KClO_3$ + HCl (other by-products are also formed and yield is low, e.g., 7% (7)) see indic. refs.; for formn. of $\bar{C}$ from isopropyl alc. (1:6135) with Cl_2 (8), from chloroacetone (3.5425) with Cl_2 at 50–70° in light (9), or from 1,1-dibromo-3,3-dichloropropanone-2 [Beil. I-658] with alc. $HgCl_2$ in s.t. at 100° for several hours (3) see indic. refs.]

[$\bar{C}$ (as tetrahydrate) on reduction with Zn + H_2SO_4 yields (1) acetone (1:5400); $\bar{C}$ on reduction with $Al(OEt)_3$, $Mg(OEt)_2$, or EtOMgCl yields (10) 1,1,3,3-tetrachloropropanol-2 (3:9037).]

$\bar{C}$ with satd. aq. $NaHSO_3$ *readily yields a* $NaHSO_3$ cpd. (3).

$\bar{C}$ with aq. alk. does *not* (3) yield chloroform; $\bar{C}$ with alk. + aniline does *not* (3) give phenylisocyanide (carbylamine test). [Dif. from the isomeric *unsym.*-tetrachloroacetone (3:6085).]

$\bar{C}$ in abs. ether with dry NH_3 gas adds 1 NH_3 giving (92% yield (2)) 1,1,3,3-tetrachloro-2-aminopropanol-2 [Beil. I-656], ndls. from C_6H_6, m.p. 110–111° dec. with prev. sublimation; this prod. is eas. sol. in cold aq. but on warming the soln. dissociates into its components. — [The action of $\bar{C}$ with aq. NH_4OH or with aniline has not been clarified cf. (3)]

[$\bar{C}$ with excess conc. aq. HCN warmed at 50–60° soon dissolves and after 12 hrs. warming (2) ppts. $\beta,\beta,\beta',\beta'$-tetrachloro-$\alpha$-hydroxyisobutyronitrile [Beil. III-318], cryst. from C_6H_6, m.p. 112–114° (2); this prod. with $AcOH/H_2SO_4$ as directed (2) yields the corresp. $\beta,\beta,\beta',\beta'$-tetrachloro-$\alpha$-hydroxyisobutyramide, cryst. from C_6H_6, m.p. 156° (2).]

$\bar{C}$ with PCl_5 on htg. gives (2) mainly 1,1,2,2,3,3-hexachloropropane (3:6525) accompanied by some 1,1,2,3,3-pentachloropropene-1 (3:6075).

[$\bar{C}$ with diazotized aniline (4 moles) in pres. of NaOAc yields (11) dichloro-*bis*-(benzeneazo)methane, yel.-or. cryst. from hot alc., m.p. 81–82° (11); $\bar{C}$ with diazotized *p*-toluidine (4 moles) in pres. of NaOAc yields (11) dichloro-*bis*-(*p*-tolueneazo)methane, orange cryst. from C_6H_6, m.p. 159–160° (11).] [These prods. are also similarly obtd. (11) from *unsym.*-dichloroacetone (3:6085).]

D 4-(Benzeneazo)-1-phenylpyrazole [Beil. XXV-535]: golden-yel. lfts. from dil. alc. or lgr., ndls. from AcOH, m.p. 126–127° cor. (2), 126° (6). [From $\bar{C}$ in abs. alc. (2) or AcOH (6) with excess phenylhydrazine, refluxed for 5 min.]

$\bar{C}$ when pure is colorless oil, volatile with steam. — Ord. comml. $\bar{C}$ conts. also the isomeric *p*-dichlorobenzene (3:0980), even as much as 25% (16); and a comml. prod. sold as insecticide conts. 40% $\bar{C}$ + 30% *p*-dichlorobenzene (3:0980) + 30% trichlorobenzene (17).

[For f.p./compn. data and diagram of system $\bar{C}$ + *p-dichlorobenzene* (3:0980) (eutectic, m.p −23.4°, contg. 86.7% $\bar{C}$) see (10) (11); for f.p./compn. data and diagram of system $\bar{C}$ + *m-dichlorobenzene* (3:5960) (eutectic, m.p. −45 9°, contg. 48.7% $\bar{C}$) see (11); for f.p./compn. data on ternary system of all three dichlorobenzenes see (10).]

[For data on densities of solns. of $\bar{C}$ in C_6H_6 (1:6400) and in *n*-hexane (1:8530) see (18); for data on D_{20}^{20} and n_D^{20} on system $\bar{C}$ + diethylbenzene (and use of the mixt. in testing fractionating columns) see (19).]

[$\bar{C}$ is very spar. sol. aq. (for study of this soly. over range 20–60° see (20).]

[For study and use of $\bar{C}$ as cleaner for metals see (21); for use as solvent for fats and oils (16) and for detn. of oils in seeds (by use of density of resultant extract (22) see indic. refs.; for use for removal of tar or pitch from surfaces coated with cellulose esters see (23); for use as solv. in purification of anthraquinone see (24); for study of toxicity of $\bar{C}$ see (25).]

[For prepn. of $\bar{C}$ from *o*-chloroaniline [Beil. XII-597, XII_1-(297)] via diazotization and use of Cu_2Cl_2 reactn. (yields: 70% (26), 25% (27)) (1) (8) (28) see indic. refs.; from *o*-phenylenediamine [Beil. XIII-6, $XIII_1$-(5)] via tetrazotization in AcOH with nitrosylsulfuric acid followed by use of Cu_2Cl_2 reactn. (70.1% yield) see (29); from 1,2-dichlorobenzenesulfonic acid-4 (see below) by distn. from strong H_2SO_4 with superheated steam at 200–240° see (30).]

[For formn. of $\bar{C}$ from 2-chlorophenol (3.5980) by htg. with PCl_5 (20% yield) see (7); from o-bromonitrobenzene [Beil. V-247, V_1-(131)] with PCl_5 in s.t. at 180° (31) or with NH_4Cl in s.t. at 320° (32) see indic. refs , from o-dinitrobenzene [Beil. V-257, V_1-(135)] with conc HCl in s t. at 250–270° see (33)]

[For formn. of $\bar{C}$ (together with m- and p-isomers in some cases) from C_6H_6 with Cl_2 in pres. of I_2 (7), $AlCl_3$ (34) (35), or $SnCl_4$ (36) see indic refs., from chlorobenzene (3:7903) with Cl_2 + cat. at 600° (11) cf. (37) or with Cl_2 in pres. of Al/Hg (38), $AlCl_3$ (gives 30% $\bar{C}$ (11)) (34), $FeCl_3$ (gives 39% $\bar{C}$ (11)), or with $Al_2S_2Cl_8$ (i.e., $2AlCl_3 + S_2Cl_2$) + SO_2Cl_2 (8a) see indic. refs.]

[$\bar{C}$ with Cl_2 in pres. of Al/Hg (38) or $FeCl_3$ (39) (40) (41) gives mainly 1,2,4-trichlorobenzene (3:6420), but 1,2,3-trichlorobenzene (3·0990) is also formed (41). — $\bar{C}$ with Cl_2 in s t. at room temp. in sunlight as directed (42) adds $3Cl_2$ yielding o-dichlorobenzene-hexachloride, m.p. 149° (42).] — [For study of photochem chlorination of $\bar{C}$ see (43).]

[$\bar{C}$ with Mg in dry ether does not react (44)] — [$\bar{C}$ with CO + cat. at elev. temps. gives (45) benzoic acid, presumably through intermediate formn. of o-phthalic acid and subsequent loss of CO_2.]

[$\bar{C}$ with isopropyl alc (1 6135) + BF_3 + P_2O_5 under reflux gives (53% yield (87)) 3,4-dichlorocumene (3,4-dichloro-isopropylbenzene) (87)]

[$\bar{C}$ with CH_3Cl (3.7005) + $AlCl_3$ yields (30) hexamethylbenzene (1:7265) + eso-trichloromesitylene (3 8725). — $\bar{C}$ (3+ moles) with $CHCl_3$ (1 mole) + $AlCl_3$ without solv. at 55° for 8 hrs. gives (15% yield on the $CHCl_3$ (46)) tris-(3,4-dichlorophenyl)methane, white pl., m p. 160.5–162° (46) — $\bar{C}$ with CCl_4 + $AlCl_3$ presumably yields 3,4,3′,4′-tetrachlorobenzophenone dichloride (not isolated) since the reaction prod. with 95% alc. (46) or $AcOH/H_2SO_4$ (47) gives 3,4,3′,4′-tetrachlorobenzophenone, cryst. from hot alc. or hot acetone, m p. 141–142° (46), 142° (47) (accompanied in latter case (H_2SO_4) by some 3,4-dichlorobenzoic acid (3.4925), m.p 203° (47).]

[$\bar{C}$ with acetyl Cl (3:7065) + $AlCl_3$ gives (yields: 70% (49), 40% (48)) 3,4-dichloroacetophenone, b.p. 135° at 12 mm. (48), m p. 76° (48), 74° (49) (corresp. oxime, m.p. 107° (50)). — $\bar{C}$ with chloroacetyl chloride (3.5235) + $AlCl_3$ gives (50) (85) 3,4-dichlorophenacyl chloride (3,4,ω-trichloroacetophenone), m.p 43° (50), 44° (85). — $\bar{C}$ with β-chloro-n-butyric acid (3:0035) + $AlCl_3$ or conc H_2SO_4 yields (51) by condens. and subsequent ring closure a mixt. of x,y-dichloro-3-methylindanone-1 cpds.]

[$\bar{C}$ with phthalic anhydride (1·0725) + $AlCl_3$ gives (yields 80% (5), 73% (52) (53), 35% (54)) (55) o-(3,4-dichlorobenzoyl)benzoic acid, m.p 194.5° cor. (54), 192.5° (5), 191.2° cor. (52), 190° (55), this prod. on ring closure with conc. H_2SO_4 gives a mixt. of two dichloroanthraquinones consisting of 87% (54) (5) 2,3-dichloroanthraquinone [Beil. VII_1-(413)], m.p. 271° cor. (54), 268° (5), and 13% (54) (5) 1,2-dichloroanthraquinone [Beil. VII_1-(411)], m p. 196.5° cor. (54), 194 5° (5). Note that $\bar{C}$ reacts with phthalic anhydride much more readily than p-dichlorobenzene (3·0980), after making reactn. mixt. alk. any p-dichlorobenzene (as from use of crude $\bar{C}$) may be distilled out with steam (use in sepn. of p-dichlorobenzene from $\bar{C}$ (86)); note also the claim (86) that under certain conditions $\bar{C}$ with phthalic anhydride + $AlCl_3$ is claimed to replace 1 chlorine atom by hydrogen so that an o-(x-chlorobenzoyl)benzoic acid results which on ring closure with 100% H_2SO_4 gives 80% yield 2-chloroanthraquinone (3·4922). — $\bar{C}$ with 4,5-dichlorophthalic anhydride (3:4830) + $AlCl_3$ gives (80% yield (56)) 2-(3,4-dichlorobenzoyl)4,5-dichlorobenzoic acid, cryst from C_6H_6, m.p. 183° (56); this prod. with conc H_2SO_4 ring-closes giving mainly 2,3,6,7-tetrachloroanthraquinone, m.p. 348° (56), accompanied by a little 1,2,6,7-tetrachloroanthraquinone, m.p. 242° (56).]

[$\bar{C}$ on partial hydrol. with aq. MeOH alk., alk. carbonates, or best alk. earths in pres. of Cu or Cu salts at elevated temps. under press. gives in excellent yields (57) (58) (59) (60)

(61) (62) (63) (64) (65) *o*-chlorophenol (3:5980) (some phenol (1:1420) is also formed (62)); if the hydrolysis of C̄ is carried further, especially by use of aq. alk. in pres. of Ba or Sr salts and a reducing agt. (66), pyrocatechol (1:1520) is obtd. cf. (59) (61) (64).] — [For study of kinetics of reactn. of C̄ with NaOMe/MeOH at 175° see (67) (68) (69).]

[C̄ with anhyd. NH_3 in alc. in pres. of $CuCl_2$ + Cu at 200° under press. yields (70) *o*-chloroaniline; C̄ with conc. aq. NH_4OH in pres. of CuO under press. at 150–200° (71) (72) or with Na in liq. NH_3 (73) gives o-phenylenediamine.] — [C̄ with K diphenylamine gives by rearr. on htg. (74) (75) *N,N,N',N'*-tetraphenyl-*m*-phenylenediamine [Beil. XIII-42], m.p. 137.5–138° (74) (75).]

[C̄ on mononitration, e.g., at 0° with a mixt. of HNO_3 ($D = 1.52$) + conc. H_2SO_4 (75) cf. (15) (4), gives (yields: 95% (15), 67% (75)) (7) (8) (76) mainly 1,2-dichloro-4-nitrobenzene [Beil. V-246, V_1-(131)], cryst. from alc., m.p. 43° (7) (8), 42.5° (4) (reactn. prod. with piperidine is 2-chloro-4-nitropiperidinobenzene, m.p. 47–48° (78)), accompanied by a little (5.2% at −30°, 7.2% at 0° (8)) 1,2-dichloro-4,5-dinitrobenzene (see below).] — [The only other possible mononitro-isomer, viz., 1,2-dichloro-3-nitrobenzene [Beil. V-245, V_1-(130)], m.p. 61°, has been *obtd.* only by indirect means (77) (76) although prob. present (4) in the oil from the main mononitration product.]

[C̄ on dinitration, e.g., with 4 wt. pts. HNO_3 ($D = 1.52$) + 6 wt. pts. conc. H_2SO_4 at 100° for 1 hr. (79) (28) cf. (80) (or the above 1,2-dichloro-4-nitrobenzene with HNO_3 ($D = 1.5$) + fumg. H_2SO_4 (20% SO_3) 2 hrs. at 100° (78)), gives 1,2-dichloro-4,5-dinitrobenzene [Beil. V-265], cryst. from dil. AcOH, m.p. 109–110° (78), 110° (28) (79) (reactn. prod. with piperidine is 1,2-dichloro-4-nitro-5-piperidinobenzene, m.p. 62–64° (78)), accompanied (28) by a little 1,2-dichloro-3,5-dinitrobenzene [Beil. V_1-(138)], m.p. 56° (28).] — [All the other possible isomeric *o*-dichlorodinitro cpds. are known but have been obtd. only by indirect means: 1,2-dichloro-3,4-dinitrobenzene [Beil. V-264], m.p. 53–55°, 1,2-dichloro-3,6-dinitrobenzene, m.p. 60°, and 1,2-dichloro-4,6-dinitrobenzene, m.p. 56°.]

[None of the four possible 1,2-dichloro-trinitrobenzenes appears to have been reported.]

[C̄ on monosulfonation, e.g., with fumg. H_2SO_4 in s.t. at 210° for 8 hrs. (7), or at room temp. (30), or at 100° (10), or with $H_2SO_4.H_2O$ + fumg. H_2SO_4 (60% SO_3) in pres. of Hg at 100° for 1 hr. (81), gives mainly 1,2-dichlorobenzenesulfonic acid-4 [Beil. XI-55, XI_1-(16)] (Na salt less sol. aq. (81)) accompanied by a lesser amt. of 1,2-dichlorobenzenesulfonic acid-3 (Na salt more sol. aq. (81)) (some *bis*-(dichlorophenyl) sulfone, m.p. 173° (30), may also be formed during sulfonation).] — [C̄ sulfonates much more readily than *p*-dichlorobenzene (3:0980); for use in sepn. see (7) (30); for removal of chlorobenzene from mixt. with dichlorobenzenes via sulfonation of former with 95% H_2SO_4 see (11).]

Ⓓ **1,2-Dichlorobenzenesulfonamide-4 (3,4-dichlorobenzenesulfonamide-1):** cryst. from dil. alc., m.p. 134–135° u.c. (83). [From C̄ by treatment as directed (83) with $ClSO_3H$ followed by conv. of the intermediate 1,2-dichlorobenzenesulfonyl chloride-4, m.p. 18–19° (83), with $(NH_4)_2CO_3$ to the desired sulfonamide.] — [For formn. of 3,4-dichlorobenzenesulfonyl chloride with $ClSO_3H$ and use in sepn. of C̄ from *p*-dichlorobenzene see (82); for prepn. of the sulfonamide and use as plasticizer see (84).]

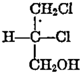
3:6060 ***d,l*-2,3-DICHLOROPROPANOL-1** (Glycerol α,β-dichlorohydrin; "β-dichlorohydrin"; allyl alcohol dichloride)



$C_3H_6OCl_2$ **Beil. I - 356** **I_1-(181)** **I_2-(370)**

B.P. 182° at 760 mm. (1)		D_4^{20} = **1.3534** (5)	
182° (2) (3) (8)			
179–181° sl. dec. (4)		D_0^{18} = **1.345** (4)	n_D^{18} = **1.4875** (4)
79–80.5° at **18** mm. (4)			
81–81.5° at **13.5** mm. (5)			
75–77° at **15** mm. (6)			

Colorless visc. liq.; spar. sol. cold aq., pet. ether; misc. with alc., ether, acetone, C_6H_6.

[For prepn. of $\bar{C}$ from glycerol (1:6540) (together with other prods.) see (1); for prepn. from allyl alcohol (1:6145) with Cl_2 + aq. (2) (7) (8) (5) (20% yield) or with Cl_2 in CS_2 (40% yield (9)) see indic. refs.; from allyl chloride (3:7035) by addition of HOCl see (10) (11) (12); from the corresp. acetate (β,γ-dichloro-*n*-propyl acetate) (3:6220) by alcoholysis using MeOH + HCl (33% yield (4)) (6); from vinyl chloride (3:7004) by reactn. with formaldehyde (30% soln.) + HCl + $CaCl_2$ see (13).]

$\bar{C}$ with aq. alk. loses HCl yielding (14) 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358). [For studies of kinetics of this loss of HCl with aq. alk. see (15); for use of $Ba(OH)_2$ hydrol. as means of detn. of $\bar{C}$ in pres. of 1,3-dichloropropanol-2 ("α-dichlorohydrin") (3:5985) see (16).]

$\bar{C}$ with sodium phenolate does *not* give the expected 2,3-diphenoxypropanol-1 but instead (4) (presumably by intermediate formation of epichlorohydrin (3:5358)) the isomeric 1,3-diphenoxypropanol-2, [Beil. VI-149, VI_1-(86)], m.p. 79° (4).

$\bar{C}$ on oxidn. with conc. HNO_3 (D = 1.47) yields (12) (17) (6) (18) α,β-dichloropropionic acid (3:0855), m.p. 50°. [$\bar{C}$ on reductn. with P + HI at 180° yields (8) isopropyl iodide + isopropyl chloride.]

[$\bar{C}$ with $SOCl_2$ at 100° gives (85% yield (19)) *bis*-(β,γ-dichloro-*n*-propyl) sulfite, b.p. 175° at 4 mm., $D_0^{23.7}$ = 1.501, n_D^{23} = 1.509 (19); $\bar{C}$ with SO_2Cl_2 gives (75% yield (19)) 2,3-dichloropropane-sulfonyl chloride-1, b.p. 122–123° at 15 mm., $D_0^{20.5}$ = 1.582, n_D^{23} = 1.457 (19).]

[$\bar{C}$ with PCl_5 yields (7) 1,2,3-trichloropropane (3:5840); $\bar{C}$ with NaCN gives (20) (presumably by formation and subsequent reaction of epichlorohydrin) 25% yield γ-chloro-β-hydroxy-*n*-butyronitrile; for reactn. of $\bar{C}$ with NH_3 see (21); for reactn. of $\bar{C}$ with Na_2S, NaSH, etc., yielding thioglycerols see (22).]

—— **β,γ-Dichloro-*n*-propyl acetate:** b.p. 192° (see 3:6220). [For general study of kinetics of esterification of $\bar{C}$ see (3).]

—— **β,γ-Dichloro-*n*-propyl benzoate:** oil, b.p. 180–183° at 24 mm. (4).

Ⓓ **β,γ-Dichloro-*n*-propyl *p*-nitrobenzoate:** m.p 37–38° (4), 35.5–37° (23). [From $\bar{C}$ + *p*-nitrobenzoyl chloride + pyridine (23).]

—— **β,γ-Dichloro-*n*-propyl 3,5-dinitrobenzoate:** unreported.

—— **β,γ-Dichloro-*n*-propyl benzenesulfonate:** unreported.

—— **β,γ-Dichloro-*n*-propyl *p*-toluenesulfonate:** unreported.

Ⓓ **β,γ-Dichloro-*n*-propyl *N*-phenylcarbamate:** cryst. from lgr., m p. 72–73° (24), 73–74° (25). [From $\bar{C}$ + phenyl isocyanate at 90° (24) or indirectly from β,γ-dichloro-*n*-propyl chloroformate with aniline (25).]

Ⓓ **β,γ-Dichloro-*n*-propyl *N*-(α-naphthyl)carbamate:** ndls. from alc., m.p. 93° (25).

[Prepd. indirectly from β,γ-dichloro-*n*-propyl chloroformate with α-naphthylamine (25).]

Ⓓ β,γ-Dichloro-*n*-propyl *N*-(β-naphthyl)carbamate: lfts. from alc., m.p. 99° (25). [Prepd. indirectly from β,γ-dichloro-*n*-propyl chloroformate with β-naphthylamine (25).]

(*unsym.*-Tetrachloroacetone)

$$CH_2(Cl){-}C({=}O){-}CCl_3$$

I₁—
I₂—

B.P. 183° (1) $D_4^{15} = 1.624$ (1) $n_D^{18} = 1.497$ (1)
180–182° (2)
71–72° at 13 mm. (3)

[*See also* 1,1,3,3-*tetrachloropropanone*-2 (3:6050).]

Colorless limpid liq.; odor faint by itself but on warming or on dilution with ether shows

lachrymatory props. — Č with aq. readily yields (1) (2) (3) (4) a crystn. tetrahydrate, m.p. 46° (1), 39° (2), 65° (3).

[For prepn. of Č from isopropyl alc. (propanol-2) (1:6135) with Cl_2 in cold see (1); from acetone (1:5400) with Cl_2 see (2) (4) (5); from chloroacetone (3:5425) with Cl_2 at 50–70° in light see (6); from 1,1,1-trichloropropanone-2 (3:5620) with $SOCl_2$ at 180° see (3).]

Č reduces $NH_4OH/AgNO_3$, Fehling's soln., or aq. $KMnO_4$ instantly in cold (1) but does not give fuchsin-aldehyde test (1).

Č with NH_4OH (1) yields chloroform (3:5050) and chloroacetamide [Beil. II-199, II_1-(90), II_2-(193)], m.p. 116–117°.

Č with aq. KOH yields (1) chloroform (3:5050) together with the salts of both chloroacetic acid (3:1370) and trichloroacetic acid (3:1150). [Dif. from the isomeric *sym.*-tetrachloroacetone (3:6050).]

Č with aq. KOH + aniline yields (5) phenyl isocyanide (carbylamine reaction). [Dif. from the isomeric *sym.*-tetrachloroacetone (3:6050).]

3:6085 (1) Brochet, *Bull. soc. chim.* (3) **13**, 117–120 (1895); *Ann. chim.* (7) **10**, 134–141 (1897); *Compt. rend.* **119**, 1271 (1894). (2) Cloëz, *Ann. chim.* (6) **9**, 180–182 (1886). less liq with weak odor suggestive both of acetic acid and butyric acid; misc. with or ether; volatile with steam, blisters skin.

prepn. of $\bar{C}$ from propionic acid (1:1025) with Cl_2 (7) (8) or with SO_2Cl_2 + dibenzoyl e in CCl_4 (9) see indic. refs.; from α-chloropropionyl chloride (3:5320) by hydrolysis) (11) (12) with water see indic. refs.; from α-chloropropionitrile by hydrolysis with ICl see (5); from 2-chloropropanol-1 (3:7917) (4) or from 3-chlorobutanone-2 (α-thyl methyl ketone) (3:7598) (13) (14) by oxidn. with HNO_3 or other oxidn. agts. ic. refs.]

n treatment with Cl_2 as specified (15) yields α,β-dichloropropionic acid (3:0855); ı $SOCl_2$ yields (16) α-chloropropionyl chloride (3:5320), b.p. 111°; $\bar{C}$ on reduction n + HCl yields (10) propionic acid (1:1025) [for study of catalytic hydrogenation or its salts see (17)]; $\bar{C}$ with SO_3 at 170° yields (18) α-chloro-α-sulfopropionic acid actn. of $\bar{C}$ with sulfites see (2)], $\bar{C}$ with conc. aq. NH_4OH gives (43–46% yield (19)) nine (α-aminopropionic acid) [for behavior of $\bar{C}$ with liq. NH_3 see (20) (21)].]

n alk. hydrolysis gives (10) (22) lactic acid (1:0400) [for study of rate of hydrolysis 23) or its sodium salt (24) see indic. refs.].

on htg. with pyridine at 100° loses CO_2 and yields (25) ethylpyridinium chloride.]

n conversion to salt, treatment with KCN, and subsequent acidification yields (26) ylmalonic acid, m.p. 132° (has been used for ident. of $\bar{C}$ (26)).

[C̄ with Cl_2 in pres. of Fe gives (16) dichloromaleyl (di)chloride (3:6197) q.v. — C̄ with Br_2 in dark does not react, but in direct sunlight for 5 hrs. adds 82% of theoretical amt. yielding (2) α-chloro-α,β-dibromosuccinyl (di)chloride, b.p. 116–118° at 10 mm. (2), which on hydrolysis with aq. gives (2) α-chloro-α,β-dibromosuccinic acid, hydrated pr. from HCl, m.p. 65–75°, which after drying over conc. H_2SO_4 gives anhydrous form, m.p. 139–140° (2).]

[C̄ with 3 *N* EtOH/KOH (large excess) in freezing mixt. loses HCl and hydrolyzes (or vice versa) and after acidification as directed gives K H acetylenedicarboxylate which with aq. at 100° for 1 hr. loses CO_2 giving (39% yield from C̄ (12)) propiolic acid [Beil. II-477, II_1-(208), II_2-(449).]

[C̄ with MeOH under reflux yields (13) dimethyl chlorofumarate (3:6582); C̄ with EtOH yields (1) (9) (15) diethyl chlorofumarate (3:6864); note that C̄ reacts with MeOH or with aniline much more rapidly than the isomeric chloromaleyl (di)chloride (3:6158) (for details and graphs see (2)).]

C̄ (1 mole) with chlorofumaric acid (3:4853) (1 mole) at 125° for 1 hr. gives (11) chloromaleic anhydride (3:0280), m.p. 33°.

[C̄ with $AlCl_3$ combines yielding a viscous oil, solidifying in freezing mixt. to yel. cryst., m.p. about 50°; this prod. with water regenerates C̄ but if first htd. at 100° for several hrs. and then treated with aq. gives (85–87% yield (2)) (3) chloromaleyl (di)chloride (3:6158).]

C̄ with excess conc. aq. NH_4OH *reacts vigorously yielding* (1) (11) *chlorofumaric* acid diamide, ndls. from alc., m.p. 187° (11).

[C̄ in aq. AcOH (1:4) with hydrazine hydrate as directed gives hydrazine salt of *N,N*-*bis* (α-chloro-β-carboxyacryloyl)hydrazine (?), m.p. 218° (9); note that C̄ with $NH_2.NH_2.H_2O$ in ether, pet. eth., or AcOH gives only (9) resinous or amorphous yel. prods.]

C̄ (1 mole) with *p*-chloroaniline (4 moles) in dry ether reacts vigorously giving mainly (11) chlorofumaro-di-*p*-chloroanilide, pale yel. ndls. from alc., m.p. 223° (11), accompanied by a little *N*-(*p*-chlorophenyl)chloromaleimide, pl. from alc. mother liquor, m.p. 175° (11).

C̄ on hydrolysis with aq. yields chlorofumaric acid (3:4853), m.p. 193°.

3:6110 DICHLOROACETALDEHYDE DIETHYLACETAL ("Dichloroacetal")

$C_6H_{12}O_2Cl_2$ — $Cl_2.CH.CH(OC_2H_5)_2$ — Beil. I - 614, I_1-(328), I_2-(677)

B.P. 185–186°	(1)	$D^{14}_{14} = 1.1383$ (6)
183–184°	(2)	
182–184°	(3)	
181–184°	(4)	
178–181° at 760 mm.	(5)	
66–71° at 12 mm.	(5)	

C̄ undergoes sl. decompn. on stdg. or distn. — [For use as insecticide see (7) (8).]

[For prepn. of C̄ from acetaldehyde diethylacetal (1:0156) by actn. of Cl_2 (37% yield (5)) see (5) (17); from ethyl alcohol (1:6130) by actn. of Cl_2 (yield 75% (1), 40% (10),

0% (5)) see (1) (10) (5) (6) (11); from α,β,β-trichlorodiethyl ether + Zn (78% yield (4)), or abs. alc. (3), or NaOEt (12), or even water (3); from α,β,β,β-tetrachlorodiethyl ether with Zn + abs. alc. (13).]

$\bar{C}$ on warming with conc. H_2SO_4 (14) (2) or on htg. at 150° with conc. HCl (15) or on htg. with benzoic anhydride + a little conc. H_2SO_4 gives (yield 81% (1), 78% (10), 71% (16)) dichloroacetaldehyde (3:5180), b.p. 90–91°.

$\bar{C}$ on htg. with alc. NaOH at 160–180° yields (17) glyoxal tetraethylacetal [Beil. I-760], b.p. 180° (17). — $\bar{C}$ with K *ter*-butylate loses HCl yielding (5) chloroketene diethylacetal, b.p. 166° at 732–740 mm., $D_{15}^{15} = 1.0534$, $n_D^{25} = 1.4375$ (5).

$\bar{C}$ with PCl_5 yields (15) α,β,β-trichlorodiethyl ether [Beil. I-615].

83.5–84.5° at 12 mm.	(5)		

Colorless liq. with weak odor suggestive both of acetic acid and butyric acid; misc. with aq. alc. or ether; volatile with steam; blisters skin.

[For prepn. of $\bar{C}$ from propionic acid (1:1025) with Cl_2 (7) (8) or with SO_2Cl_2 + dibenzoyl peroxide in CCl_4 (9) see indic. refs., from α-chloropropionyl chloride (3:5320) by hydrolysis (1) (10) (11) (12) with water see indic. refs.; from α-chloropropionitrile by hydrolysis with conc. HCl see (5); from 2-chloropropanol-1 (3:7917) (4) or from 3-chlorobutanone-2 (α-chloroethyl methyl ketone) (3:7598) (13) (14) by oxidn. with HNO_3 or other oxidn. agts. see indic. refs.]

[$\bar{C}$ on treatment with Cl_2 as specified (15) yields α,β-dichloropropionic acid (3:0855); $\bar{C}$ with $SOCl_2$ yields (16) α-chloropropionyl chloride (3:5320), b.p. 111°; $\bar{C}$ on reduction with Zn + HCl yields (10) propionic acid (1:1025) [for study of catalytic hydrogenation of $\bar{C}$ or its salts see (17)]; $\bar{C}$ with SO_3 at 170° yields (18) α-chloro-α-sulfopropionic acid [for reactn. of $\bar{C}$ with sulfites see (2)]; $\bar{C}$ with conc. aq. NH_4OH gives (43–46% yield (19)) *d,l*-alanine (α-aminopropionic acid) [for behavior of $\bar{C}$ with liq. NH_3 see (20) (21)].]

$\bar{C}$ on alk. hydrolysis gives (10) (22) lactic acid (1:0400) [for study of rate of hydrolysis of $\bar{C}$ (23) or its sodium salt (24) see indic. refs.].

[$\bar{C}$ on htg. with pyridine at 100° loses CO_2 and yields (25) ethylpyridinium chloride.]

$\bar{C}$ on conversion to salt, treatment with KCN, and subsequent acidification yields (26) methylmalonic acid, m p. 132° (has been used for ident. of $\bar{C}$ (26)).

C̄ with o-phenylenediamine in 5 N HCl refluxed 3 hrs. gives (yields: 61–64% (35), 55–60% (36)) 2 (α-chloroethyl)benzimidazole, ndls. from hot C_6H_6, m.p. 134.7–135.4° cor. (35) 134–135° cor. (36).

—— Methyl α-chloropropionate: b.p. 132°. (See 3:7908.)

—— Ethyl α-chloropropionate: b.p. 147°. (See 3:8125.)

Ⓓ α-Chloropropionamide: m.p. 80° (27). [From ethyl α-chloropropionate (3:8125) with conc. aq. NH_4OH (27).]

Ⓓ α-Chloropropion-anilide: lfts. from lgr., m.p. 92° (28) (9). [From α-chloropropionyl chloride (3:5320) + aniline in $CHCl_3$ (28).] [Note that the reactn. prod. of this compd. with more aniline, viz., α-anilinopropionanilide [Beil. XII-558], has m.p. 126°.]

Ⓓ α-Chloropropion-p-toluidide: lfts. from lgr., m.p. 124° (28), 108° (29). [From α-chloropropionyl chloride (3:5320) with 2 moles p-toluidine (28).] [Note that the reactn. prod. of this compd. with more p-toluidine, viz., α-(p-toluidino)propion-p-toluidide [Beil. XII-980] has m.p. 158°.]

Ⓓ Phenylhydrazine α-chloropropionate: m.p. 95° (30). [From C̄ + phenylhydrazine (30).]

Ⓓ α-Phenoxypropionic acid: ndls. from aq., m.p. 115–116° (31), 115° (32). [From sodium α-chloropropionate + sodium phenolate on htg. and evapn. (33).] [Note that the opt. act. forms of this deriv. melt at 87° (32).]

3:6150 1,2,3,4-TETRACHLOROBUTADIENE-1,3 $C_4H_2Cl_4$ Beil. S.N. 12

(Liquid stereoisomer)

B.P. 188° (1)	D_{15}^{15} = 1.516 (1)
67–68° at 10 mm. (1)	
43° at 1 mm. (1)	

[*See also the solid stereoisomer* (3:0870), *m.p.* 50°.]

Colorless strongly refractive liq. with agreeable honey-like odor; on stdg. turns brown and evolves HCl.

[For isolation of $\bar{C}$ from the high-boilg. fractn. resulting in the preparation of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see (1); for prepn. of $\bar{C}$ from 1,1,2,3,4,4-hexachlorobutane (3:3155) with alc. KOH at room temp. see (1).]

$\bar{C}$ on saturation with Cl_2 yields (1) the liquid stereoisomer of 1,1,2,3,4,4-...

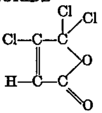
2 (3:9046), b.p. 97° at 10 mm. (1). [Note that $\bar{C}$ does *not* (1) yield octachlorobutane (3:2000).]

$\bar{C}$ with Br_2 yields 1,4-dibromo-1,2,3,4-tetrachlorobutene-2, long colorless doubly refracting ndls., m.p 105° (1).

$\bar{C}$ does not react with conc. HNO_3, but with fumg. HNO_3 or even with NO_2 gas $\bar{C}$ reacts vigorously pptg. 1,4-dinitro-1,2,3,4-tetrachlorobutene-2, colorless cryst. from AcOH, m.p. 131° (1). [Note that this prod. cannot be recryst. from alc. since it reacts yielding ethyl nitrite and a yel. viscous oil (1).]

3:6150 (1) Müller, Huther, *Ber.* **64**, 589–600 (1931); *C.A.* **25**, 3956 (1931).

3:6158 CHLOROMALEYL (DI)CHLORIDE $C_4HO_2Cl_3$ Beil. XVII—XVII$_1$-(138)



B.P.		M.P.					
189.3°	at 760 mm. (1)	**12.7°** (1)	D_4^{20} = **1.602**	(3)	n_D^{20} = **1.5126**	(3)
186.3°	at 760 mm. (1)	**11–12°** (2)				
185.2°	at 730 mm. (1)		$D_4^{18.1}$ = **1.6049**	(3)	$n_D^{18.1}$ = **1.51362**	(3)
104.0–105°	at 50 mm. (2)					
82.2–82.5°	at 26 mm. (3)		$D_4^{17.5}$ = **1.6044**	(3)	$n_D^{17.5}$ = **1.51375**	(3)
71.5°	at 10 mm. (1)					

[*See also chlorofumaryl (di)chloride* (3:6105).]

$\bar{C}$ is generally formulated in the unsymmetrical structure shown above (for discussion see (1) (2)); note, however, that the position of the chlorine atom attached to the carbon bearing the double bond is frankly assumed and may be on the other such carbon.

Note also that $\bar{C}$ appears to exist also in a labile form, m.p. 4.8° (1), which readily changes to the higher-melting (stable) variety; $\bar{C}$ on supercooling and inoculation with the labile form cryst. in the latter.

$\bar{C}$ from pet. ether cryst. as needles; $\bar{C}$ has disagreeable odor (1) and is far more lachrymatory than the isomeric chlorofumaryl (di)chloride (3:6105) (2).

[For prepn. of $\bar{C}$ from chlorofumaryl (di)chloride (3:6105) by combination with $AlCl_3$, htg. at 100° for several hrs., and subsequently decomposing with ice water (yield as high as 85–87% but varies according to nature of $AlCl_3$ used) see (1) (2).]

[$\bar{C}$ on hydrogenation in dry ether in pres. of Pt black yields (4) *n*-butyric acid (1:1035) and other prods.]

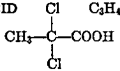
[$\bar{C}$ with $AlCl_3$ gives a cpd., red-brown ndls., m.p. abt. 100° (1); on htg. at 180–225° this prod. decomposes yielding (1) α,β-dichloroacryloyl chloride (see under 3:2265), b.p. 147.3° at 733 mm., phosgene (3:5000), CO, HCl, and other prods.]

$\bar{C}$ on protracted boilg. is converted (1) to chlorofumaryl (di)chloride (3:6105).

[$\bar{C}$ reacts with MeOH and with aniline much more slowly than the isomeric chlorofumaryl (di)chloride (3:6105) (for details and graphs see (1) cf. (2)).]

3:6158 (1) Ott, *Ann.* **392**, 256–265, 278–285 (1912). (2) Dann, Davies, Hambly, Paul, Semmens, *J. Chem. Soc.* **1933**, 15–21. (3) von Auwers, Schmidt, *Ber.* **46**, 482 (1913). (4) Ott, *Ber.* **46**, 2173–2175 (1913).

3:6162 α,α-DICHLOROPROPIONIC ACID $C_3H_4O_2Cl_2$ **Beil. II - 250**
II_1—
II_2-(228)



B.P. [185–190°] (1) (4) (6)
186–189° (7)
90–92° at 14 mm. (2)

$D_4^{22.8}$ = **1.389** (2)

Colorless liq. — Very eas. sol. aq. or alc.; from aq. solns. can be salted out with NaCl. — Volatile with steam without hydrolysis — Insol. conc. HCl.

[For prepn. of $\bar{C}$ from corresp. acid chloride, viz., α,α-dichloropropionyl chloride (3:5372), by hydrolysis see (3); from α,α-dichloropropionitrile monomer [Beil. II-251] (1) (4) (19), α,α-dichloropropionitrile dimer [Beil. II-252] (5), or α,α-dichloropropionitrile trimer [Beil. XXVI-38] (6) (7) by hydrolysis with H_2SO_4 see indic. refs.; from α,α-dichloropropionanilide (see below) by hydrolysis with conc. HCl in s t. at 140° see (2); for formn. of $\bar{C}$ from propionic acid with Cl_2 under certain conditions see (26).]

$\bar{C}$ is reduced by Zn + dil. H_2SO_4 giving (1) propionic acid (1:1025).

$\bar{C}$ on keeping gradually splits off some HCl (2). — $\bar{C}$ with alc. KOH on boilg. either loses HCl giving (8) α-chloroacrylic acid (3:1445) or by some obscure mechanism gives (9) cf. (10) (11) β-ethoxyacrylic acid [Beil. III-369], m p. 110°.

$\bar{C}$ as a monobasic acid forms corresp. salts; e.g., $NH_4\bar{A}$ (1), $K\bar{A}.6H_2O$ (1); $Ca\bar{A}_2.3H_2O$ (1); $Ba\bar{A}_2.H_2O$ (1); $Zn\bar{A}_2.H_2O$ (1) (12), $Ag\bar{A}$, spar. sol. aq. (1), note that this dry $Ag\bar{A}$ at 60° decomposes violently giving (12) AgCl and a mixed anhydride of $\bar{C}$ with pyruvic acid, viz., $CH_3.C(Cl_2).CO\ O.CO.CO.CH_3$; however, $Ag\bar{A}$ on warming with aq. gives (12) AgCl + pyruvic acid (1:1040) and/or (1) α-chloroacrylic acid (3:1445).

$\bar{C}$ with aq. Ag_2O or Ag_2CO_3 on protracted htg. gives (13) (12) pyruvic acid (1:1040), but use of excess Ag_2O (14) (1) cf (15) leads to AcOH (1:1010) + CO_2 + H_2O. — $\bar{C}$ with aq. $Ba(OH)_2$ on boilg or $\bar{C}$ with aq. in s.t. at 120–150° gives (14) (16) pyruvic acid (1:1040).

[$\bar{C}$ with finely divided Ag in C_6H_6 on refluxing 40–70 hrs. gives (17) (18) (19) α,α′-dimethylmaleic anhydride [Beil. XVII-445], m.p. 95°, and α,α′-dichloro-α,α′-dimethylsuccinic acid [Beil. II-668], m.p. 185°.]

[$\bar{C}$ (3 moles) with PCl_3 (1 mole) gives (3) (20) α,α-dichloropropionic acid anhydride [Beil. II-251], b.p. 196–200° (20), 190–192° (3). — $\bar{C}$ (3 moles) with PCl_3 (2 moles) (3) or with $SOCl_2$ refluxed for 10 hrs. (21) gives α,α-dichloropropionyl chloride (3:5372).]

$\bar{C}$ with alcohols in pres. of dry HCl gives (1) the corresp. esters (see also below).

—— **Methyl α,α-dichloropropionate:** b.p. 144–146° (7), 143–144 u c. (1). [From $\bar{C}$ with MeOH + dry HCl (1) (7); for study of kinetics of hydrolysis see (22).]

—— **Ethyl α,α-dichloropropionate:** b.p. 160° (23), 156–157° (1) (6), 83–85° at 53 mm. (2). [From $\bar{C}$ with EtOH + dry HCl (1) or from α,α-dichloropropionyl chloride (3:5372) with EtOH (23); note that this ester with aq. in s.t. at 130° gives (16) (14) undergoes hydrolysis yielding pyruvic acid (1:1040) and ethyl pyruvate (1:3308) or with aq. Ag_2O gives (15) Ag acetate]

Ⓓ **α,α-Dichloropropionamide:** lfts. from dil. alc., m.p. 117–118° (2) (24), 117° (12), 116–117° (3), 116° (23) (5) (20), 115–116° (4) (6) (7). [From ethyl α,α-dichloropropionate (above) (3) (23), from methyl α,α-dichloropropionate (above) (7), or from α,α-dichloropropionyl chloride (3:5372) (3) with conc. aq. NH_4OH.]

Ⓓ **α,α-Dichloropropion-N-ethylamide:** m.p. 51–52° (2). [From $\bar{C}$ with $EtNH_2$.]

—— **α,α-Dichloropropionanilide:** m.p. 101° (2). [Reported only by indirect means (2).]

—— **α,α-Dichloropropion-p-toluidide:** m.p. 84–86° (25). [Reported only by indirect means (25).]

3:6197 DICHLOROMALEYL (DI)CHLORIDE $C_4O_2Cl_4$ Beil. II - 754 XVII$_1$-(138)

 and/ or 
sym. form (A) *unsym.* form (B)

B.P.			
192–194°	(1)	*unsym.* (B) D_4^{20} = 1.7091 (2)	n_{He}^{20} = 1.51947 (2)
190° at 743 mm.	(2)		
86–89° at 11 mm.	(3)	*sym.* (A) D_4^{20} = 1.6723 (2)	n_{He}^{20} = 1.51572 (2)

[*See also dichloromaleic acid* (3:3634) *and dichloromaleic anhydride* (3:3635).]

Colorless mobile lachrymatory liq. with penetrating camphoraceous odor but *not* fumg. in moist air. — Insol. aq. but volatile with steam without hydrolysis. — Soluble in org. solvents.

Although C̄ has not been separated into the completely pure desmotropic forms (A) and (B), their presence is clearly evidenced (2). The relative proportion of the two forms varies with the age of the sample and other conditions, but the above data on density and refraction indicate the extremes so far realized (for much further detail see (2)).

[For prepn. of ord. C̄ (mixt. of (A) and (B)) from succinyl (di)chloride (3:6200) with Cl_2 at 145° in pres. of Fe (81% yield) see (2) (note that some dichloromaleic anhydride (3:3635) is also formed, that in absence of Fe the reactn. is very slow, and that use of I_2 in place of Fe lowers yield of C̄ to 54% (2)); from chlorofumaryl (di)chloride (3:6105) with Cl_2 in pres. of Fe see (1); from dichloromaleic anhydride (3:3635) with PCl_5 see (1); from dibromofumaryl (di)chloride [Beil. II$_1$-(303)] with $AlCl_3$ at 100° see (3).]

Ord. C̄ with 60% of its wt. of $AlCl_3$ spontaneously evolves ht.; after further htg. at 100° and pouring into aq. the ethereal extract yields (2) a prod. which reacts as substantially pure *unsym.* form (B).

Ord. C̄ is not affected by ord. treatment with boilg. aq. or boilg. aq. KOH (2), although it is attacked by alc. KOH (1). — C̄ on very protracted (168 hrs.) boilg. with aq. slowly dissolves giving (2) an acidic soln. which on extraction with ether followed by drying and evapn. of this solvent gives (80% yield) dichloromaleic anhydride (3:3635).

[For study of rate of reactn. of C̄ with MeOH or with aniline see (2).]

[For condens. of C̄ with 1-aminoanthraquinone in prepn. of dyestuffs see (2) (4).]

Ord. C̄ (2 g.) in C_6H_6 (150 ml.) treated with 4 moles aniline (3.4 g.) in C_6H_6 (30 ml.) immediately ppts. aniline hydrochloride; after stdg for ½ hr., then removing this ppt., the filtrate leaves on evapn. a mixt. (m.p. 165–185°; yield 67–83% (2)) of two different dianilides, which can be separated by recrystn. from hot alc.: the dianilide from the *sym.* dichloride (A) is *white*, has m.p. 193°, and with alc. KOH is much more slowly hydrolyzed than its isomer and during such hydrolysis shows no transient color; the dianilide from the *unsym.* dichloride (B) is *yellow*, has m.p. 170°, and with hot 8% alc. KOH readily hydrolyzes with development of a transient cherry-red coloration. — Note that, although the *white* dianilide is somewhat more readily sol. in hot alc. than the *yellow* isomer, it also separates first on slow cooling; note also that on hydrolysis of the anilides with alc. KOH the presence of aniline is readily detected but (presumably because of further attack by the alkali) no dichloromaleic acid can be recovered in either case.

58°	at	2.5 mm.	(3)

[*See also ethyl γ-chloroacetoacetate* (3:6375).]

Colorless oil with penetrating odor; vapor is strong lachrymator. — $\bar{C}$ can be preserved for some time but on very long stdg. (several years) decomposes (8) with formn. of oxalic acid (1:0445). — $\bar{C}$ is spar sol. aq., eas. sol. alc., ether.

[For prepn. of $\bar{C}$ from ethyl acetoacetate (1·1710) with SO_2Cl_2 (yields: 85% (7), 55% (6)) (2) or with Cl_2 in diffused light at room temp. (75% yield (9)) or in gas phase at 76–102° and 7 mm. press. (68% yield (40)) see indic refs.; from the copper enolate of ethyl acetoacetate in $CHCl_3$ with Cl_2 (67% yield (10)) cf. (11); from ethyl sodioacetoacetate with *p*-toluenesulfonyl chloride in dry ether or lgr. (12), or from ethyl β-(chlorimino)-*n*-butyrate [Beil. III-656] on distillation with dil H_2SO_4 (13) see indic. refs.]

[$\bar{C}$ can be further chlorinated e.g., $\bar{C}$ (1 mole) with SO_2Cl_2 (1 mole) gives (1) (2) ethyl α,α-dichloroacetoacetate [Beil. III-663, III_1-(233), III_2-(427)], b.p. 205–207° at 726 mm., 91° at 11 mm. (1), $D_{17.5}^{19} = 1.293$ (14), $n_D^{17} = 1.4492$ (1).]

$\bar{C}$ on hydrolysis with boilg. dil. H_2SO_4 *undergoes ketonic splitting yielding* (15) *chloro*acetone (3:5425) + CO_2 + EtOH (note that this does not distinguish $\bar{C}$ from ethyl γ-chloro-acetoacetate (3:6375) which yields same prods.)

[$\bar{C}$ with alc. $NaOC_2H_5$ yields (9) ethyl acetate (1·3015), ethyl α-ethoxyacetoacetate, and traces of ethyl chloroacetate (3:5700); $\bar{C}$ with sodium phenolate (free from alc. or aq.) on htg. gives (16) ethyl α-phenoxyacetoacetate (not further described) which in cold conc. H_2SO_4 *loses* H_2O *and ring-closes to 2-carbethoxy-3-methylcoumarone* [Beil. XVIII-309], tbls. from C_6H_6, m.p. 51°, b.p. 290° (16); note dif. in behavior of $\bar{C}$ with these reagents as compared with ethyl γ-chloroacetoacetate (3:6375).]

[$\bar{C}$ with diethyl sodiomalonate yields in alc. (7) ethyl acetate (1:3015), ethyl chloroacetate (3:5700), triethyl ethane-1,1,2-tricarboxylate [Beil. II-813, II_1-(321), II_2-(681)], and tetraethyl propane-1,2,2,3-tetracarboxylate [Beil. II-862, II_1-(333), II_2-(701)] but in toluene yields (7) triethyl 3-hydroxybuten-2-tricarboxylate-1,1,2 [Beil. III_2-(509)]; note dif. from behavior of ethyl γ-chloroacetoacetate (3:6375).]

[For behavior of $\bar{C}$ with KCN see (4); with ethyl sodiocyanoacetate see (17); with NH_3 in dry ether see (18).]

Note that $\bar{C}$ is capable of displaying keto enol tautomerism as is shown in the following reactions.

$\bar{C}$ with $FeCl_3$ soln. gives intense violet coloration (10) (4).

$\bar{C}$ [illegible]

alm. ident. with corresp. deriv. from the isomeric ethyl γ-chloroacetoacetate (3:6375)); for corresp. Mg, Cu, or Ni enolates see (20).

[$\bar{C}$ with phenols in pres. of conc. H_2SO_4 or P_2O_5 undergoes condensation and ring closure with loss of H_2O giving the corresp. substituted coumarins: e.g., $\bar{C}$ with *m*-cresol (1:1730) in conc. H_2SO_4 at 0° gives (6) 3-chloro-4,7-dimethylcoumarin, ndls. from alc., m.p. 135° (6); $\bar{C}$ with *p*-cresol (1:1410) similarly (6) (or in small yield (21) with P_2O_5) gives 3-chloro-4,6-dimethylcoumarin, ndls. from AcOH, m.p. 160° (6), 158° (21): for corresp. reactn. of $\bar{C}$ with α-naphthol (1:1500) (22) (6), with β-naphthol (1:1540) (23), with 6-chloro-*m*-cresol (4-chloro-3-methylphenol) (3:1535) (24) see indic. refs. — This type of condensation also occurs with polyhydric phenols: e.g., $\bar{C}$ with resorcinol (1:1530) + conc. H_2SO_4 at 0° (25) or with P_2O_5 in alc. (26) gives 3-chloro-7-hydroxy-4-methylcoumarin, cryst. from alc. with ½ H_2O (lost at 105–110°) and then melting 236° (25) (26); for corresp. behavior of $\bar{C}$ with orcinol (1:1525) (22) (25), with pyrogallol (1:1555) (22) (25), see indic. refs.; many other cases are known. — Note, however, with particular care that $\bar{C}$ with sodium salts of these phenols reacts in a different manner yielding substituted coumarone derivs. (cf. case of sodium phenolate in fifth paragraph).]

$\bar{C}$ with aq. solns. of diazonium salts behaves quite differently from the isomeric ethyl γ-chloroacetoacetate (3:6375): e.g., $\bar{C}$ in alc. with aq. benzenediazonium sulfate in pres of NaOAc (2 moles) yields (27) (28) (4) ethyl α-chloro-α-(phenylhydrazono)acetate [Beil. XV-270], yel. lfts. or pl. from alc., m.p. 80–81° (28) (4), 70–71° (27) (for use of this reactn. on mixts. of $\bar{C}$ with the isomer see (4)).

$\bar{C}$ with excess hydrazine hydrate is reduced with evolution of N_2 (1); $\bar{C}$ with phenylhydrazine (2 moles) condenses and ring-closes yielding (29) (30) 4-(benzeneazo)-3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-328, $XXIV_1$-(319)], or.-red. ndls. from alc., AcOH, or $CHCl_3$, m.p. 156–157° (note, however, that in pres. of ether the reactn. with phenylhydrazine takes a different course yielding (31) ethyl β-(benzeneazo)-crotonate [Beil. XVI-27], red ndls. from alc., m.p. 50–51°).

[$\bar{C}$ with thioacetamide on warming yields (32) 5-carbethoxy-2,4-dimethylthiazole [Beil. XXVII-318], cryst. from ether, m.p. 50–51° (32). — $\bar{C}$ with NH_4SCN (33) or better $Ba(SCN)_2$ (34) in alc. gives (55% yield (34)) 5-carbethoxy-2-hydroxy-4-methylthiazole [Beil. XXVII-338], lfts. from alc., m.p. 128° (33), 127–129° (34); note that this prod. may be regarded as merely the isomeric ethyl α-(thiocyano)acetoacetate (35). — $\bar{C}$ with NH_4 dithiocarbamate (from $NH_4OH + CS_2$) in alc. eliminates NH_4Cl giving an intermediate, m.p. 115–121°, according to mode of htg. (38) but which on fusion ring-closes with loss of aq. to 5-carbethoxy-2-mercapto-4-methylthiazole [Beil. XXVII-339], ndls. from alc., m.p. 150° (38), 141° (39).]

[$\bar{C}$ with urea in alc. contg. a little aq. HCl gives on stdg. 5 months (36) 5-carbethoxy-2-hydroxy-4-methylimidazole [Beil. XXV-216], ndls. from aq. or tbls. from alc., m.p. 218° (36). — $\bar{C}$ (1 mole) with thiourea (1 mole) at 90° reacts vigorously eliminating H_2O and giving (alm. quant. yield (37)) as the hydrochloride 2-amino-5-carbethoxy-4-methylthiazole [Beil. XXVII-338]; addn. of alk. sets free the base, ndls. from ether/alc., m.p. 175° (37) (13).]

See Note 1.					

Note 1. The b.p. of C̄ at normal press. is not very significant, some decompn. to dichloroacetyl chloride (3:5290), phosgene (3:5000), and tarry products always occurring (8).

Note 2. C̄ apparently can exist in at least two crystn. modifications (24); no clear-cut study of the matter, however, has been reported.

Note 3. For values of D_{20}^{20} and n_D^{20} for aq. solns. of C̄ see (27).

[*See also chloroacetic acid* (3:1370) *and trichloroacetic acid* (3:1150).]

C̄ when pure is a colorless liq. which does not fume in moist air and which dissolves in

aq. without opalescence. — Ordinary comml. samples of C̄ may contain also chloroacetic acid (3:1370) and trichloroacetic acid (3:1150) as well as decompn. products from these or from C̄ itself, cf. (30) (31).

MISCELLANEOUS PHYSICAL PROPERTIES OF C̄

Adsorption of C̄. [For studies of adsorption of C̄ by activated carbon, charcoal, etc., see (32) (33) (34) (35) (36) (39); by silica gel see (33); by cellulose (viscose) see (37); by hide powder see (38).]

Distribution of C̄ between solvents. [For studies and data on distribution of C̄ between *aq. + ether* at 25° (40) (41); *aq. +* C_6H_6 at 15° (42) (43) (44) (45); *aq. + nitrobenzene* (43); *aq. + toluene* (43); *aq. + o-nitrotoluene* (43) (47); *aq. +* $CHCl_3$ (3:5050) (43); *aq. +* CCl_4 (3:5100) (43) (46); *aq. + EtBr* (43) (46); *aq. (contg.* $MgSO_4$*) + di-n-butyl ether* (1:7950) (48); *aq. + olive oil* (49); *acetone + glycerol* (50) see indic. refs.]

Binary systems contg. C̄. [For f.p./compn. data on systems *C̄ + trichloroacetic acid* (3:1150) (25); *C̄ + AcOH* (1:1010) (25); *C̄ + crotonic acid* (1:0425) (25); *C̄ + benzoic acid* (1:0715) (25); *C̄ + o-toluic acid* (1:0690) (25); *C̄ + m-toluic acid* (1:0705) (25); *C̄ + p-toluic acid* (1:0795) (25); *C̄ + phenylacetic acid* (1:0665) (25); *C̄ + cinnamic acid* (1:0735) (25); *C̄ + 2,6-dimethylpyrone* (24); *C̄ + azobenzene* (19); *C̄ + urea* (51); *C̄ + ethyl carbamate (urethane)* (51) see indic. refs.]

PHYSIOLOGICAL BEHAVIOR OF C̄

[For study of toxicity of C̄ see (52); for action of C̄ on human skin see (53) (54).]

PREPARATION OF C̄

From Various Chloro Compounds

From chloral hydrate. [For prepn. of C̄ from chloral hydrate (3:1270) with aq. NaCN + $CaCO_3$ (yields: 88–92% (55), 90% (15)) or with aq. NaCN (60–65% yield (16)) or with $K_3Fe(CN)_6$ (63) see indic. refs.; cf. also (56) (57); note here also the closely related matter of conversion of anhydrous chloral (3:5210) with alcohols + KCN (58) to the corresponding alkyl dichloroacetates, e.g., with MeOH to methyl dichloroacetate (3:5655) or with EtOH to ethyl dichloroacetate (3:5850), etc.; also conversion of chloral hydrate (3:1270) in ether with KCN + conc. aq. NH_4OH to (65–78% yield (59)) cf. (58) α,α-dichloroacetamide (see also below).]

From trichloroacetic acid. [For prepn. of C̄ from trichloroacetic acid (3:1150) by partial reduction with Zn + aq. (13), with Cu powder in aq. (80% yield (14)) or C_6H_6 + aniline (75–85% yield (8)) cf. (60), or by electrolytic reduction (80% yield (61)) see indic. refs.]

From chloroacetic acid. [For prepn. of C̄ from chloroacetic acid (3:1370) with Cl_2 (1), or Cl_2 in pres. of I_2 (62), see indic. refs.]

From dichloroacetaldehyde. [For prepn. of C̄ from dichloroacetaldehyde (3:5180) by oxidn. with HNO_3 see (2).]

From other misc. chloro compounds. [For formn. of C̄ from ethyl dichloroacetate (3:5850) with HCl gas (100% yield (11)); from dichloroacetyl chloride (3:5290) by hydrolysis or by disproportionation with AcOH (acetyl chloride (3:7065) also being formed (64)); from β,β,β-trichloro-α-hydroxypropionic acid (trichlorolactic acid) [Beil. III-286, III_1-(111), III_2-(210)] or its ethyl ester with excess aq. $Ba(OH)_2$ (65); from β,β-dichloro-α-acetoxyacrylonitrile [Beil. III_1-(135), III_2-(254)] with boilg. aq. (66) or from α,β,β-trichloro-α-acetoxypropionitrile [Beil. III-288, III_1-(112)] with 33% H_2SO_4 (66); from 2,2,4,4,6,6-hexachlorocyclohexantrione-1,3,5 (hexachlorophloroglucinol) [Beil. VII-854,

VII_1-(469)] with aq. (*sym.*-tetrachloroacetone (3:6050) is also formed) (67); from *unsym.*-dichloroacetone (3:5430) by oxidn. with HNO_3 + air (68); from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) with air in ultra-violet light in pres. of water (21) cf. (69); from pentachloroethane (3:5880) by partial hydrolysis with 88–97% H_2SO_4 at 168° (90% yield (70)) see indic. refs.]

From miscellaneous non-chlorinated compounds. [For formn. of $\bar{C}$ from AcOH with Cl_2 (71) in presence of I_2 (62) see indic. refs.; from acetylene with HOCl at 75–80° see (72); from ethyl acetoacetate (1:1710) with aq. bleaching powder (yield 60%) see (73); from phloroglucinol (1:1620) with aq. Cl_2 see (74) (75); from pyrrole with NaOCl see (76).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Behavior as an Acid

Acid strength of $\bar{C}$. $\bar{C}$ in aq. soln. is a strong acid [ionization const. at 25° is $K = 5.14 \times 10^{-2}$ (77) cf. (78) (18), at 18° $K = 5.15 \times 10^{-2}$ (45); for studies of activity coefficient of $\bar{C}$ in aq. and in salt solns. see (18) (48). — For tests on corrosion of metals by $\bar{C}$ see (16)].

[Studies of acid strength of $\bar{C}$ in other solvents include the following: in aq. MeOH (79) (81), in aq. EtOH (79) (80), in abs. EtOH (82), in *n*-BuOH (5) (83), in C_6H_6 (84), in chlorobenzene (85), in formamide (86), in acetonitrile (87).]

$\bar{C}$ on titration gives Neut. Eq. = 129.

Salts of $\bar{C}$. This topic cannot be exhaustively treated here but following examples are cited.

Salts with inorganic bases. [$NH_4\bar{A}$ (88); hydroxylamine salt, $HONH_3\bar{A}$, cryst. from C_6H_6/EtOH, m.p. 116.0–116.5° (89); $Na\bar{A}$ (on electrolysis gives (90) H_2, CO_2, CO, and also (91) dichloromethyl dichloroacetate, $K\bar{A}$, lfts. from alc. (11), on dry distn. gives (92) $\bar{C}$ + KCl + CO_2 + carbon, $Ca\bar{A}_2$, ndls. from abs. alc. (93); $Ca\bar{A}_2.3H_2O$ (93); $Cu\bar{A}_2$ (88); $Cu\bar{A}_2.4H_2O$ (88); $Cd\bar{A}_2.H_2O$ (94); $Mn\bar{A}_2.1\frac{1}{2}H_2O$ (94); $Co\bar{A}_2.3H_2O$ (94); note that all the foregoing salts are sol. aq.]

[Inorg. salts of $\bar{C}$ which are sparingly sol. aq. include the following: $Ag\bar{A}$ (93); $Th(OH)_2\bar{A}_2$ (96); $(UO)\bar{A}_2.2H_2O$ (97).]

Salts with organic bases (amines). [*Aniline dichloroacetate*, m.p. 122–123° (8) (98) cf. (30) (159) (note that this prod. or its components at 140° for 24 hrs. gives (98) dichloroacetanilide, m.p. 118°). — *o-Toluidine dichloroacetate*, m.p. 132.5° (98), 140° (99) (note that this prod. or its components at 140° for 18 hrs. gives (98) dichloroaceto-*o*-toluidide, m.p. 133°, but depressing m.p. of the salt to as low as 112°). — *p-Toluidine dichloroacetate*, m.p. 138° (98) (note that this prod. or its components on htg. gives (98) dichloroaceto-*p*-toluidide, m.p. 154°). — *Piperazine bis-(dichloroacetate)*, m.p. 181° cor. (100). — *Semicarbazide dichloroacetate*, m.p. 108° (101). — For salts of $\bar{C}$ with other org. amines see (30) (99).]

Esterification of $\bar{C}$. [For this see the text of methyl dichloroacetate (3:5655), ethyl dichloroacetate (3:5850), *n*-propyl dichloroacetate (3:6000), isopropyl dichloroacetate (3:5890); for study of direct esterification of $\bar{C}$ with various butyl and amyl alcs. without cat. see (102).]

Conversion of $\bar{C}$ to corresp. acid chloride. $\bar{C}$ with PCl_3 (103), with HCl gas + P_2O_5 (104), with $SOCl_2$ (poor yield apparently due to much formn. of dichloroacetic acid anhydride (3:6430) (105) (106) (107) (108)), with BzCl (3:6240) (73% yield (111)), or with benzotrichloride (3:6540) (109) (110) gives dichloroacetyl chloride (3:5290), b.p. 108°.

Addition reactions of $\bar{C}$ with org. cpds. $\bar{C}$ in pres. of suitable cat. adds to olefins yielding corresp. esters [e.g., $\bar{C}$ with propylene + BF_3 as directed gives (39.5% yield (112)) isopropyl dichloroacetate (3:5890); $\bar{C}$ with 2-methylbutene-2 (trimethylethylene) (1:8220) at 18°

shows slight tendency toward formn. of corresp. ester in C_6H_6, $CHCl_3$ or CS_2 but none in alc. or ether (113)].

[$\bar{C}$ with ethylene oxide (1:6105) in dry ether at 0° gives (15% yield (114)) cf. (115) β-hydroxythyl dichloroacetate (3:9107).]

Behavior of $\bar{C}$ as Dichloro Compound

Reduction. [$\bar{C}$ in alc. KOH soln. with H_2 + $Pd/CaCO_3$ splits off all its halogen as HCl (116). — $\bar{C}$ with Zn + water on htg. is slowly reduced to chloroacetic acid (3:1370) but reaction is much less energetic than that of trichloroacetic acid (3:1150) under same conditions (13).]

Hydrolysis of halogen atoms of $\bar{C}$ or its salts. [$\bar{C}$ with aq. in s.t. at 100° is slowly or in pres. of NaOH or $Ba(OH)_2$ rapidly decomposed (93) cf. (117). — For study of kinetics of hydrolysis of $\bar{C}$ see (118) (119). — Note, however, that $Ag\bar{A}$ on htg. with aq. (93), or $\bar{C}$ (or its salts) on hydrolysis at elevated temp. and press. (120), or salts of $\bar{C}$ htd. with aq. solns. of NaOAc or NaOBz (121), gives glyoxylic acid, OHC–COOH [Beil. III-594, III_1-207, III_2-(385)], m.p. 98°, very sol. aq. — For a method of detn. of $\bar{C}$ in pres. of chloroacetic acid (3:1370) and trichloroacetic acid (3:1150) based on this hydrolysis see (122).]

Behavior of $\bar{C}$ with alkoxides. [$\bar{C}$ (as $K\bar{A}$) with excess MeOH/NaOMe refluxed under H_2, and the solution then further esterified with MeOH/HCl, gives (62% yield (123)) cf. (124) methyl dimethoxyacetate, b.p. 60–61° at 12 mm., $D_4^{18} = 1.0962$, $n_D^{18} = 1.4045$ (124); this ester upon alk. hydrolysis gives (85.7% yield (124)) dimethyoxyacetic acid (glyoxylic acid dimethylacetal) as a sirup.]

[$\bar{C}$ with excess EtOH/NaOEt under reflux followed by acidification and esterification as above gives (50% yield (125)) (126) ethyl diethoxyacetate [Beil. III-601, III_1-(210), III_2-(389)], b.p. *199° (127), 94–98° at 19 mm. (125), 83–85° at 13 mm. (125).]*

[$\bar{C}$ in excess EtOH/NaOEt with Na phenolate refluxed 14 hrs., then acidified and esterified as above, gives (61% yield (128)) ethyl diphenoxyacetate [Beil. VI-170], oil, b.p. 240° at 53 mm. (129), 166–168° at 0.8 mm. (128). — However, $\bar{C}$ with phenol in aq. NaOH on htg. and acidification gives (130) (131) diphenoxyacetic acid, ndls. from pet. ether or aq. AcOH, m.p. 91° (129) (130).]

Condensation with hydrocarbons. $\bar{C}$ with aromatic hydrocarbons on htg. condenses with elimination of 2 HCl giving diarylacetic acids [e.g., $\bar{C}$ with naphthalene at 180° for 60–100 hrs. gives (132) di-(α-naphthyl)acetic acid [Beil. IX-720, IX_1-(313)], cryst. from CCl_4, m.p. 224° (133), 223° u c. (134); for analogous behavior of $\bar{C}$ with other hydrocarbons see (132)].

Behavior of $\bar{C}$ with RMgX compounds. [$\bar{C}$ with C_6H_5MgBr (large excess) in ether soln. followed by usual hydrolysis gives (34% yield (135)) α,α,β-triphenylethylene glycol, ndls. from C_6H_6, m.p. 163° (135).]

Behavior of $\bar{C}$ with hydroxylamine. [$\bar{C}$ (1 mole) with $NH_2OH.HCl$ (1 mole) + aq. KOH (4 moles) at 60° for 4 hrs. gives (136) isonitrosoacetic acid (glyoxylic acid oxime) [Beil. III-599, III_1-(208), III_2-(389)], cryst. from dry ether, m.p. 138° (136) (note that this prod. forms with water a monohydrate, m.p. about 70° (137)).]

Behavior of $\bar{C}$ with aromatic amines. (See also salt formation above.)

With aniline. The products of reaction of $\bar{C}$ on htg. with aniline are disputed [on one hand $\bar{C}$ (1 mole) with aniline (4 moles) at 100°, then evapd. with NaOAc, is claimed (138) (139) to give 4,4′-diaminodiphenylacetic acid [Beil. XIV-540, XIV_1-(625)], m p. about 195° (140); on the other hand. the prod. is regarded by some (141) (142) as a mixt. of two stereoisomeric forms of 2,2′(?)-diaminostilbene-α,α'-dicarboxylic acids [Beil. XIV-573]].

With o-toluidine. [$\bar{C}$ (1 mole) with o-toluidine (4 moles) at 100° gives (140) (143) 4,4′-diamino-3,3′-dimethyldiphenylacetic acid [Beil. XIV-543, XIV_1-(627)], ndls. from alc.,

m.p. 239–240° (143) dec. (140), accompanied by some 7-methylisatin-3-(*o*-tolylimide) [Beil. XXI-512], yel. lfts. from alc., m.p. about 225° dec. (138).]

With p-toluidine. [Č (1 mole) with *p*-toluidine (4 moles) at 100° in aq. or alc. soln. gives (144) (145) 5-methylisatin-3-(*p*-tolylimide) [Beil. XXI-510, XXI_1-(401)], golden-yel. ndls. or lfts. from alc., m.p. 259° (144) (145).]

Behavior of Č with urea. Č with urea (2 moles) in pres. of NaOEt condenses to give (146) 5-ureidohydantoin (allantoin) [Beil. XXV-474, XXV_1-(692)], m.p. by ord. htg. in cap. tube is 228–230° (147), by rap. htg. in bath already at 228° is 233–234° (147).

Behavior of Č with arylhydrazines. Č with arylhydrazines in alc. KOH yields a mixt. of the two stereoisomeric arylhydrazones of glyoxylic acid [e.g., Č with phenylhydrazine in dil. alc. KOH refluxed 2 hrs. gives (148) a mixt. of the α-glyoxylic acid phenylhydrazone, m.p. abt. 138° with decompn. at 142–143°, and the β-glyoxylic acid phenylhydrazone, m.p. 128–129° dec. (rap. htg.) (148); for analogous behavior of Č with other arylhydrazines see (148)].

Ⓟ **Color test with NH_4OH/Cu_2Cl_2 reagent.** Č on shaking in filled stoppered bottle with conc. aq. NH_4OH contg. Cu_2Cl_2 gives dark blue color within 3 min. (149); note, however, that the same behavior is shown by trichloroacetic acid (3:1150).

—— **Methyl dichloroacetate:** oil, b.p. 143° (see 3:5655).

—— **Ethyl dichloroacetate:** oil, b.p. 158° (see 3:5850).

—— **Benzyl dichloroacetate:** oil, b.p. 179° at 60 mm. (150). [From Č with benzyl alcohol (1:6480) with HCl gas (150).]

—— **Phenyl dichloroacetate** [Beil. VI-153, VI_1-(87)]: m.p. 48° (151), b.p. 247.5° cor. (151). [From dichloroacetyl chloride (3:5290) + $AlCl_3$ in CS_2 (prod. m.p. 33° was probably impure (152)).]

—— ***p*-Tolyl dichloroacetate:** m.p. 58° (151). [Prepd. indirectly from α,β-dichlorovinyl ethyl ether (3:5440) with *p*-cresol (1:1410) (151).]

—— ***p*-Nitrobenzyl dichloroacetate:** oil, unsuitable as Ⓓ (160) (161).

—— **Phenacyl dichloroacetate:** oil (153).

—— ***p*-Chlorophenacyl dichloroacetate:** m.p. 93.0–93.8° (153).

—— ***p*-Bromophenacyl dichloroacetate:** m.p. 98.2–99.3° (153).

—— ***p*-Iodophenacyl dichloroacetate:** unreported.

—— ***p*-Phenylphenacyl dichloroacetate:** unreported.

Ⓓ ***S*-Benzylthiuronium dichloroacetate:** m.p. 178–179° (154). [Note that for corresp. salts from chloroacetic acid (3:1370) and from trichloroacetic acid (3:1150) the values are respectively 159–160° and 148–149° (154).]

—— ***S*-(*p*-Chlorobenzyl)thiuronium dichloroacetate:** unreported.

—— ***S*-(*p*-Bromobenzyl)thiuronium dichloroacetate:** unreported.

—— **α,α-Dichloroacetamide:** cryst. from C_6H_6, m.p. 99.4° (155), 98.5–99° (58), 98.5° (156), 97.5–99.5° (59). [From ethyl dichloroacetate (3:5850) with aq. NH_4OH (155) or in other indirect ways, e.g., from chloralammonia with KCN + aq. NH_4OH (93% yield (58)), or from chloral hydrate (3:1270) with KCN + aq. NH_4OH (65–78% yield (59)).] — [Note that dichloroacetamide forms with bromo-chloro-acetamide or with chloro-iodo-acetamide an unbroken series of mixed crystals.]

Ⓓ **α,α-Dichloroacetanilide:** colorless ndls. from alc. or by sublimation, m.p. 118° (98), 117.7° (156). [From Č with aniline at 140° for 24 hrs. (98) or from dichloroacetyl chloride (3:5290) with aniline in C_6H_6 (157) or acetone (157).] — [Note that this prod. forms with α-bromo-α-chloroacetanilide, m.p. 116.8° (157), a series of mixed cryst. and with α-chloro-α-iodoacetanilide, m.p. 142.3°, a eutectic, m.p. 105.2° (157).] — [Note also that aniline dichloroacetate (see also above) has m.p. 122–123° (98).]

Ⓓ α,α-Dichloroacet-o-toluidide: cryst. from 50% alc. or by sublimation, m.p. 133° (98). [From C̄ + o-toluidine at 140° for 18 hrs. (98); note that the salt o-toluidine dichloroacetate has same m.p. 132.5° as the α,α-dichloroacet-o-toluidide but that the m.p. of a mixture of the two compds. is depressed to below 112° (98).]

—— α,α-Dichloroacet-p-toluidide: pl. from alc. or by sublimation, m.p. 154° (98). [From C̄ + p-toluidine at 148° for 18 hrs. (98); note that the corresp. salt, p-toluidine dichloroacetate, has m.p. 138° (98).]

—— α,α-Dichloroacet-N-benzylamide: m.p. 96.2° (156), 94.8–95.6° cor. (158), 94.2–95.0° u.c. (158). [From ethyl dichloroacetate (3:5850) (158) cf. (162) or dichloroacetyl chloride (3:5290) (156) with benzylamine; note, however, that the corresp. derivs. from chloroacetic acid (3:1370) and from trichloroacetic acid (3:1150) have almost the same m.p.'s, viz., 93.0–93.6° cor. and 93.6–94.4° cor., respectively (158).]

Note 1. For vapor press. of $\bar{C}$ for range T = 85.4–105.5° see also (21).

MISCELLANEOUS PHYSICAL PROPERTIES OF $\bar{C}$

BINARY SYSTEMS CONTAINING $\bar{C}$

$\bar{C}$ + inorganic compounds. *$\bar{C}$ + $AlCl_3$:* m.p. 93° (22), 95° (26); for prepn. from $\bar{C}$ + $AlCl_3$ in CS_2 see (26); for thermal anal. (eutectic with $\bar{C}$ has m.p. −7.5° and conts. 87.3 wt. % $\bar{C}$) see (22); for conductivity of $AlCl_3$ in $\bar{C}$ see (27); for study of mol. wt. in C_6H_6 see (28).

$\bar{C}$ + $AlBr_3$: m.p. 90° (22); for thermal anal. (eutectic with $\bar{C}$ has m.p. −5° and conts. 77.8 wt. % $\bar{C}$ while eutectic with $AlBr_3$ has m.p. abt. 7–8° and conts. 21 wt. % $\bar{C}$) see (22); see also (30)

—*$\bar{C}$ + $FeCl_3$:* scarlet red hygroscopic ndls. (31); for conductivity see (28).

$\bar{C}$ + $SbCl_3$: for thermal anal. (eutectic with $\bar{C}$ has m p. −23° and conts. 55 wt. % $\bar{C}$) see (32).

$\bar{C}$ + $SbCl_5$: for prepn. see (34); for conductivity in liq. SO_2 see (33).

$\bar{C}$ + $SbBr_3$: for thermal anal. (eutectic with $\bar{C}$ has m.p. −6° and conts. 68 wt. % $\bar{C}$) see (32).

$\bar{C}$ + organic compounds. *$\bar{C}$ + C_6H_6:* for thermal anal. (eutectic has m.p. −26.8° and conts. 63 6 wt. % $\bar{C}$) see (35). — *$\bar{C}$ + p-xylene:* for thermal anal. (eutectic has m.p. −18 5° and conts. 67.2 wt. % $\bar{C}$) see (35). — *$\bar{C}$ + mesitylene:* for thermal anal. (eutectic has m.p. abt. −70° and conts. abt. 20 wt. % $\bar{C}$) see (35). — *$\bar{C}$ + biphenyl:* for thermal anal. (eutectic has m.p. −8° and conts 81 8 wt. % $\bar{C}$) see (35). — *$\bar{C}$ + diphenylmethane:* for thermal anal. (eutectic has m.p. −15° and conts 66.7 wt. % $\bar{C}$) see (35).

$\bar{C}$ + chlorobenzene: for thermal anal. (eutectic has m.p. −54.2° and conts. 19.3 wt. % $\bar{C}$) see (35) — *$\bar{C}$ + nitrobenzene:* for thermal anal. (eutectic has m.p. −20.5° and conts. 50 wt. % $\bar{C}$) see (35).

PREPARATION OF $\bar{C}$

Note that comml. $\bar{C}$ is often contaminated with various chlorobenzoyl chlorides (e.g., *o*-chlorobenzoyl chloride (3.6640), *m*-chlorobenzoyl chloride (3:6590), *p*-chlorobenzoyl chloride (3:6550), etc.), with traces of benzaldehyde (1:0195), or with benzoic acid (1:0715) + HCl from hydrolysis. For removal of BzOH + HCl from $\bar{C}$ by shaking its C_6H_6 soln. with cold aq. 5% $NaHCO_3$ see (12); by treatment with metallic oxides or carbonates see (36).

From benzoic acid. [For prepn. of $\bar{C}$ from benzoic acid (1:0715) with PCl_5 (70% yield (37)) (10) (38), with PCl_3 (39) (40) in pres. of $ZnCl_2$ (77% yield (37)) or in pres. of a little aq. at 100° under press (41), with $SOCl_2$ (90% yield (37)) (42), with SCl_2 in CS_2 (43), with $SiCl_4$ directly (23% yield (44)) or in C_6H_6 (77% yield (44)), with $POCl_3$ + alkali chloride at elev. temp. (45), or with dry HCl + P_2O_5 at 200° (46) see indic. refs.]

[For prepn. of $\bar{C}$ from benzoic acid (1:0715) with NaCl + Na or K pyrosulfate at 200° (47), or with Na chlorosulfonate (48) cf. (49), see indic. refs.]

[For prepn. of $\bar{C}$ from benzoic acid (1:0715) with other organic acyl chlorides such as carbonyl chloride (phosgene) (3:5000) at 140–200° (50) or in pres. of tertiary bases (such as pyridine) or their salts (51), with oxalyl (di)chloride (3:5060) (98% yield (15)), with *p*-toluenesulfonyl chloride in pyridine (52), or with α,β-dichloroethyl ethyl ether (3:5640) (53). see indic refs.]

From salts of benzoic acid. Note that with salts of benzoic acid more or less formn. of benzoic anhydride (1:0595) may occur.

[For prepn of $\bar{C}$ from NaOBz with $POCl_3$ (2) (54), with SCl_2 at room temp. (55) cf. (43), with SO_2 + Cl_2 (56), with Na chlorosulfonate (48) cf. (49), or with benzenesulfonyl chloride (57) see indic. refs.]

[For prepn. of $\bar{C}$ from AgOBz with carbonyl chloride (3:5000) in s.t. at 100° see (58).]

From dibenzoyl peroxide. [For prepn. of $\bar{C}$ from dibenzoyl peroxide (1:4930) with oxalyl (di)chloride (3:5060) refluxed in dark for 24 hrs. (70% yield (59)), with PCl_5 in pet. ether (60), with $AlCl_3$ in $CHCl_3$ at 0° (61) or in C_6H_6 at 100° (62), or with $FeCl_3$ in C_6H_6 at 100° (62) see indic. refs.]

From other benzoic acid derivatives. [For formn. of $\bar{C}$ from benzamide with dry HCl or AcCl at 140° see (63); from methyl benzoate (1:3586) with PCl_5 at 160–180° (64) or from ethyl benzoate (1:3721) with PCl_5 in s t. at 140° (65) see indic. refs.; from α,β-dichloroethyl benzoate or from α-chloroethyl benzoate on htg. in pres. of traces of $ZnCl_2$ see (66); from benzoic anhydride (1:0595) with PCl_3 + Cl_2 (67) or with carbonyl chloride (3:5000) (68) see indic. refs.]

From benzaldehyde. [For formn. of $\bar{C}$ from benzaldehyde (1:0195) with SO_2Cl_2 (5 moles) on distn. (69), with S_2Cl_2 in s t. at 150° (107), with $POCl_3$ in C_6H_6 (70), with NOCl (71), with EtOCl (3:7022) (72), with *ter*-AmOCl (3:9287) (8.5% soln. in CCl_4) at room temp. for 15 hrs. (73), or with Cl_2 (91) (105) (106) see indic. refs.]

From benzotrichloride. [For prepn. of C̄ from benzotrichloride (3:6540) by partial hydrolysis with limited amt. of aq. in pres. of H_2SO_4 or $FeCl_3$ (74), with aq. vapor over tin phosphate at 240° (75), with ord. comml. $ZnCl_2$ at 120° (76) in pres. of limited aq. (77) (note that *pure* $ZnCl_2$ fails to react but addn. of 1 mole aq. or initial use of tech. $ZnCl_2$ gives C̄ (76)), with pure ZnO at 100° (76), with BzOH in boilg. nitrobenzene (78) or in pres. of $ZnCl_2$ (80), with NH_4OBz at 200–210° as directed (79), or with EtOH in pres. of $FeCl_3$ or Fe (81) see indic. refs.]

Note that benzotrichloride (3:6540) on heating with carboxylic acids or anhydrides, especially in pres. of $ZnCl_2$, is often employed to prepare a mixture of C̄ with the acid chloride corresponding to the acid or anhydride so employed, particularly in cases where the two acyl chlorides are readily separable. [E g., note that benzotrichloride (3:6540) with phthalic anhydride (1:0725) (81) (82) or phthalic acid (1:0820) (83) + $ZnCl_2$ at 110–120° gives (96% yield (82)) C̄ + (93% yield (82)) *sym.*-phthalyl (di)chloride (3:6900); benzotrichloride with AcOH (1:1010) in pres. of an acid cat. gives (84) (85) (86) (87) C̄ + acetyl chloride (3:7065); for other examples see under chloroacetyl chloride (3:5235), dichloroacetyl chloride (3:5290), trichloroacetyl chloride (3:5420), fumaryl (di)chloride (3:5875), and terephthalyl (di)chloride (3:2205). Similarly, benzotrichloride (3:6540) with salts of sulfonic acids yields C̄ + the corresp. arylsulfonyl chlorides; e.g., benzotrichloride with sodium β-naphthalenesulfonate gives (88) 90% yield C̄ + 80% yield β-naphthalenesulfonyl chloride.]

From benzal (di)chloride. [For formn. of C̄ from benzal (di)chloride (3:6327) with O_2 in u.v. light (89), with air in pres. of Ni at 160° (90), or with BzOH (1:0715) + Cl_2 at 125–175° (91) see indic. refs.]

From miscellaneous sources. [For formn. of C̄ from benzyl alc. (1:6480) with Cl_2 (92) or with $SOCl_2$ at 180° (103), from benzyl acetate (1:3751) with Cl_2 at 150–170° (104), from thiobenzoyl chloride + O_2 at 100–120° (93), from benzonitrile with NOCl at 180° (94), from tolan (diphenylacetylene) with NOCl at 150–200° (95), from dibenzoyltartaric anhydride + PCl_5 (3 moles) in s t. at 130° for 3 hrs. (note that chlorofumaryl dichloride is also formed) (96), from *N,N*-dibenzoylaniline (dibenzanilide) with dry HCl at 250–270° (note that benzanilide is also formed) (97), from α-chloro-α-nitro-phenylacetamide on dry htg. (98), from phthalic anhydride (1:0725) + HCl gas + $CrCl_3$ or $ZnCl_2$ at 290–300° under press. (99), or from C_6H_6 (1:7400) with carbonyl chloride (phosgene) (3:5000) + $AlCl_3$ (100) (101), or with oxalyl (di)chloride (3:5060) + $AlCl_3$ (102) see indic. refs.]

CHEMICAL BEHAVIOR OF C̄

Pyrolysis. [C̄ in N_2 through porcelain tube at 550–600° (108) or over Ni at 420° (109) cf. (110) gives CO, chlorobenzene (3:7903), and other products; C̄ over finely divided Cu at 420–450° gives (110) benzoic anhydride (1:0595) + HCl; C̄ over $BaCl_2$ at 420–450° gives (110) benzoic anhydride (1:0595) and other products. For study of effect of radium radiation at 2–12° over 7–8 month period see (13).]

Reduction. [C̄ with H_2 in boilg. xylene in pres. of PtO_2 + trace of thiourea (111), $Pd/BaSO_4$ (112), or powd. Ni (112), or C̄ over Pd at 200–230° (113) cf. (114) gives (yields: 96% (111), 87–89% (113)) benzaldehyde (1:0195); for study of purification of xylene as *solvent for cat. reduction of C̄ see (115); for study of influence of various other solvents* see (116) (112).]

[C̄ with H_2 in pres. of $NiCl_2$ at 270–280° gives (110) benzene, toluene, biphenyl + HCl; C̄ with copper hydride is claimed (117) to yield benzaldehyde but this could not be confirmed (118). C̄ with chromous acetate in 50% KOH gives (very small yield (119)), benzyl alc. (1:6480), while C̄ with LiH in high-boilg. pet. ether at 130° gives (presumably by subsequent condensation of the intermediate benzaldehyde) 65% yield (120) benzyl benzoate (1:4422).]

[$\bar{C}$ with Na/Hg + stream of dry HCl gives (121) benzyl alc. (1:6480); $\bar{C}$ with Na/Hg in dry ether gives (122) (123) (124) benzyl alc. (1:6480), benzoic acid (1:0715), benzil (1:9015), α,α'-dibenzoxystilbene ("isobenzil") [Beil. IX-138], and α,α'-dibenzoxydibenzyl [Beil. IX-136]; $\bar{C}$ with Na in moist ether gives (125) benzyl alc. (1:6480), benzoic acid (1:0715), and benzyl benzoate (1:4422).]

Oxidation. [$\bar{C}$ on oxidn. in pres. of hydrocarbon peroxides and various oxidn. cat. is claimed (126) to give dibenzoyl peroxide (1:4930); see also below under behavior of $\bar{C}$ with Na_2O_2.]

Chlorination. [$\bar{C}$ on monochlorination with Cl_2 at 35° in pres. of $FeCl_3$ gives (10) cf. (127) mainly a mixt. of chlorobenzoyl chlorides [83.5% *m*- (3:6590) + 14.5% *o*- (3:6640) + 2.0% *p*- (3:6550)] accompanied by a small amt. of dichlorobenzoyl chlorides; for extensive study of effect of using higher proportion of Cl_2 under otherwise same conditions see (128). Note, however, that $\bar{C}$ with 3 moles Cl_2 in s t. gives (129) (130) a mixt. of addn. products, such as 1,2,3,4,5,6-hexachlorohexahydrobenzoyl chloride, substitution products, and materials formed by both addition and substitution (130)]

Sulfonation. [$\bar{C}$ cannot be sulfonated without accompanying hydrolysis of the acyl chloride function (131) (132) (133) (134) (137), the end prod. of these sulfonation processes is, therefore, not *m*-sulfobenzoyl chloride (apparently still unknown cf. (135)) but rather *m*-sulfobenzoic acid [Beil. XI-384, XI_1-(98)]. However, $\bar{C}$ added to conc. H_2SO_4 at 0–40° gives (136) a cryst addn. prod. $\bar{C}.H_2SO_4$ which on stdg loses HCl forming benzoyl hydrogen sulfate [Beil. IX_1-(94)] but shows no transformation into *m*-sulfobenzoic acid even after 6 months over dry alkali even though HCl is lost completely (136). At 100° conversion of benzoyl hydrogen sulfate occurred very slowly and the prod. consisted of *o*-sulfobenzoic acid (not *meta*) (136).]

BEHAVIOR OF $\bar{C}$ WITH OTHER INORGANIC REAGENTS

$\bar{C}$ with HF. [$\bar{C}$ with HF as directed (138) (139) or with dry KHF_2 in Cu retort (140) (141) (142), with ZnF_2 at 195° (11) (143), with AgF in s.t. at 190° for 6 hrs. (144), or with 3 moles SbF_3 (145) gives (yields: 67–80% (140), 76% (145), 69% (11)) benzoyl fluoride, b.p. 161.5° at 745 mm. (142), 159° (139), 156° (146), 155–156° at 760 mm. (11), 155° (138), 154–155° (143), 151° u.c. at 736 mm. (141), 145° (144). Note, however, that $\bar{C}$ with KF in anhydrous formic acid gives (147) formyl fluoride, b.p. 26° at 750 mm. (147), while $\bar{C}$ with KF in AcOH gives (147) acetyl fluoride, b p. 20–22° (147).]

$\bar{C}$ with HBr. [$\bar{C}$ with dry HBr gas at 100° gives (148) benzoyl bromide [Beil. IX-195, IX_1-(95)], b.p. 218–219° cor. at 760 mm. (149), 215.0° at 741 mm. (150), 90–91° at 12 mm. (16), m.p. +8.1° (150), $D_4^{20} = 1.5461$ (150), $n_D^{20} = 1.5900$ (150).]

$\bar{C}$ with HI. [$\bar{C}$ with excess HI at ord temp. (148) (16), or $\bar{C}$ with Mg + I_2 in dry ether (151), gives benzoyl iodide [Beil. IX-195, IX_1-(95)], b.p. 109–109.5° at 10 mm. (148) cf. (16). Note that $\bar{C}$ with KI does *not* (152) give benzoyl iodide.]

$\bar{C}$ with metals. [$\bar{C}$ with Na in dry ether stood 10 days at room temp. gives (86% yield (153)) (154) ethyl benzoate (1:3721) but $\bar{C}$ with Na/Hg in dry ether causes the reaction to take a more complicated course (see above under reduction of $\bar{C}$). $\bar{C}$ with Na vapor gives (155) cf. (154) benzil (1:9015). $\bar{C}$ with K in xylene refluxed 2 days gives (153) benzoic anhydride (1.0595).]

[For behavior of $\bar{C}$ with Zn in dry ether or in di-isoamyl ether at 20–32° see (156). For behavior of $\bar{C}$ with finely divided Cu or Ni at elevated temps see above under pyrolysis of $\bar{C}$.]

$\bar{C}$ WITH VARIOUS METAL OXIDES OR SALTS

$\bar{C}$ with Na_2O_2. [$\bar{C}$ with Na_2O_2 in water at 5° (157) cf. (159) or $\bar{C}$ with 30% H_2O_2 + aq. NaOH (158) cf. (159) gives (yields: 91% (157), 60–70% (158)) benzoyl hydrogen peroxide

(perbenzoic acid) [Beil. IX-178, IX_1-(93)], m.p. 42°. For other methods for prepn. of perbenzoic acid such as from dibenzoyl peroxide with $NaOCH_3$ in $MeOH/CHCl_3$ (160) or with $NaOC_2H_5$ in EtOH/toluene (161), or from benzaldehyde in acetone with air (162), see indic. refs. For study of Na perbenzoate (157) and its use in purification (163) of perbenzoic acid see indic. refs.]

[$\bar{C}$ with Na_2O_2 in aq. at 0° (164) (165) or in aq. acetone (166), or $\bar{C}$ with aq. H_2O_2 + NaOH (167) or aq. H_2O_2 + iron-free $Ca(OH)_2$ (168), or $\bar{C}$ with aq. $BaO_2.8H_2O$ (169) (170) (171), or $\bar{C}$ with perbenzoic acid (see preceding paragraph) + aq. $NaHCO_3$ (172) gives dibenzoyl peroxide [Beil. IX-179, IX_1-(93)], m.p. 105°. For review of prepn. and properties of this prod. see also (173).]

$\bar{C}$ with misc. salts. $\bar{C}$ on warming with various inorganic salts yields benzoic anhydride. [E.g., $\bar{C}$ with $NaNO_2$ (174) cf. (175) (176), with KNO_3 (177), with $Pb(NO_3)_2$ (178), with nitrates of other heavy metals (179), with $Na_3PO_4.12H_2O$ in aq. soln. at 60° (180), with $K_2S_2O_5$ *in pyridine* (181), *with* Na_2SO_3 *in pyridine* (183) *in pres. of* C_6H_6 (181) *cf.* (182), or with BaO at 140–150° (184) gives benzoic anhydride (1:0595), m.p. 42°. For other methods of conversion of $\bar{C}$ to benzoic anhydride see above under pyrolysis of $\bar{C}$ and below under behavior of $\bar{C}$ with organic acids and their salts.]

$\bar{C}$ with NaN_3. [$\bar{C}$ with NaN_3 in aq. acetone at 0° (185), or in dry ether (186), gives (54.6% yield (185)) benzoyl azide (benzazide) [Beil. IX-332], m.p. 32° (185). Note that although this prod. readily explodes on htg. (187) (188) yet in inert solvents such as C_6H_6 (194) it smoothly decomposes into N_2 and phenyl isocyanate (for study of mechanism see (189)); under certain circumstances the latter may be hydrolytically split to aniline cf. (190). For studies on decomposition of benzoyl azide by ultrasonic waves see (185) (193).]

Hydrolysis of $\bar{C}$

$\bar{C}$ with cold aq. is slowly and with warm aq. rapidly hydrolyzed (105) to benzoic acid (1:0715) and HCl. [For study of rate of hydrolysis of $\bar{C}$ in ether with aq. at 20–22° (195) or at 0° (148), in 50% aq. acetone at 0° in pres. of H_2SO_4 (196) cf. (198), in various other organic solvents immiscible with aq. (197) or with $BaBr_2.2H_2O$ at 158° (199) see indic. refs.]

$\bar{C}$ with aq. alkali on warming readily yields (105) alkali benzoate + alkali chloride. Note that $\bar{C}$ in 50% aq. pyridine hydrolyzes much faster than in aq. NaOH or aq. Na_2CO_3 (39) (use in determination of atomic weight of carbon by hydrolysis of $\bar{C}$ and pptn. of AgCl (39)). Note that rate of hydrolysis of $\bar{C}$ is 2000 times as fast (200) as that of benzyl chloride (3:8535).

[Note that $\bar{C}$ in Ac_2O soln. behaves as an acid (201) and can be titrated (202) with NaOAc in Ac_2O.]

Behavior of $\bar{C}$ with Various Inorganic Sulfur Compounds

With H_2S. [The behavior of $\bar{C}$ with H_2S is disputed; on one hand $\bar{C}$ in dry pyridine treated with H_2S at 5° and subsequently acidified is claimed (203) to give thiolbenzoic acid, $C_6H_5.CO.SH$ [Beil. IX-419, IX_1-(169)] (see next paragraph); on the [illegible] $\bar{C}$ refluxed in dry pyridine in stream of H_2S is [illegible]d (204) to yield [illegible] ide $(C_6H_5.CS)_2O$, colorless cryst. from hot alc. [illegible]]

With KSH. [$\bar{C}$ with cold alc. KSH [illegible] KOH with H_2S [illegible]
(207) (209) (8) *salt of thiolbenzoic* [illegible] IX-419, [illegible]
(207) (208), b.p. 98.0–98.6° at 11–12 [illegible] 0.05 mm. (8[illegible]
that this product is readily [illegible] dibenzoyl dis[illegible]
by air or mild oxidizing ag[illegible] (35% aq. [illegible]
air followed by H_2O_2 as di[illegible] 5–10° [illegible]

in acetone followed by I_2/KI oxidn. (213), or with HSMgBr followed by air oxidn. (208) gives (65–70% yield (210)) dibenzoyl disulfide [Beil. IX-424], cryst. from 1,2-dichloroethane (3:5130) (210) (211) (212), m.p. 128–129° (210) (211) (212); this prod. has considerable pharmaceutical interest as an antipruritic; for hydrolysis to benzoic acid as method of detn. see (210) (214).]

Behavior of C̄ with Various Inorganic Nitrogen Compounds

With NH_3. [C̄ with conc. aq. NH_4OH (215), with dry NH_3 (105), with liq. NH_3 (216), with solid $(NH_4)_2CO_3$ (217), or with KNH_2 in dry ether (218) gives benzamide [Beil. IX-195, IX_1-(96)], m.p. 130°; note that either the $(NH_4)_2CO_3$ (219) or KNH_2 (218) methods may give also small amounts of *N*-benzoylbenzamide (dibenzamide) [Beil. IX-213, IX_1-(104)], m.p. 148°, and/or *N,N*-dibenzoylbenzamide (tribenzamide) [Beil. IX-214, IX_1-(104)], m.p. 207–208°. However, C̄ with NH_3 gas over Al_2O_3 at 490–500° gives (220) benzonitrile [Beil. IX-275, IX_1-(121)], b.p. 191°, m.p. −13°.]

With NH_2OH. [C̄ in C_6H_6 with free NH_2OH (221), or C̄ in C_6H_6 with $NH_2OH.HCl$ + pyridine (221), or C̄ in ether with $NH_2OH.HCl$ + Na_2CO_3 (221), gives benzohydroxamic acid (*N*-benzoylhydroxylamine) [Beil. IX-301, IX_1-(128)], cryst. from EtOAc, m.p. 128°. Note that C̄ with aq. NH_2OH solns. (222) also gives side reactions which diminish yield and increase difficulty of purification of prod.; also that C̄ with $NH_2OH.HCl$ in toluene gives (222) benzohydroxamic acid benzoate (dibenzohydroxamic acid) [Beil. IX-303, IX_1-(128)] and other products. For alternative method of prepn. of benzohydroxamic acid from ethyl benzoate (1:3721) with $NH_2OH.HCl$ + MeOH/KOH see (223); for review of utility of hydroxamic acids in org. qual. anal. see (224); for study of formn. of benzohydroxamic acid and its $FeCl_3$ color reaction as method of detn. of hydroxylamine see (230).]

With $NH_2.NH_2$. [C̄ (1 mole) with $N_2H_4.H_2O$ (2 moles) in ether gives (225) benzhydrazide (*N*-benzoylhydrazine) [Beil. IX-319, IX_1-(129)], m.p. 112°, but this prod. is usually better obtd. from reaction of $N_2H_4.H_2O$ with MeOBz (1:3586) (226) or EtOBz (1:3721) (227) (225). C̄ (1 mole) with $N_2H_4.H_2SO_4$ (0.5 mole) + aq NaOH (2.3 moles) as directed gives (66–75% yield (228)) *N,N'*-dibenzoylhydrazine [Beil. IX-324, IX_1-(131)], ndls. from AcOH (228) or EtOH (229), m.p. 237–238° (229).]

BEHAVIOR OF C̄ WITH ORGANIC REACTANTS

Behavior of C̄ with Hydrocarbons

With cycloalkanes. [C̄ with cyclohexane (1:8405) + $AlCl_3$ gives (19% yield (231)) phenyl 2-methylcyclopentyl ketone, b.p. 160–162° at 36 mm., $D_4^{18} = 1.0255$, $n_D^{18} = 1.5380$, accompanied by much benzaldehyde (1:0195) presumably formed from C̄ by the hydrogen corresp. to coupling of 2 moles of cyclohexane.]

With alkenes. [C̄ with ethylene + $AlCl_3$ in special apparatus as directed gives (87–92% yield (232)) phenyl β-chloroethyl ketone (β-chloropropiophenone) (3:1115); cf. also (233).]

With cycloalkenes. [C̄ with cyclohexene (1:8070) + $AlCl_3$ in CS_2 gives by addition phenyl 2-chlorocyclohexyl ketone (234), which on dehydrochlorination in the pres. of $AlCl_3$ (234) or with alc. KOH (235) gives (40% yield (235)) phenyl cyclohexenyl ketone (tetrahydrobenzophenone), b.p. 147° at 8 mm., $D_4^{22} = 1.070$, $n_D^{22} = 1.5595$ (235).]

With alkynes. [For behavior of C̄ with heptyne-1 (1:8085) in pres. of $AlCl_3$, $ZnCl_2$, $SnCl_4$, BF_3, etc., see (236).]

With aromatic hydrocarbons. [C̄ with C_6H_6 in pres. of $AlCl_3$ gives (yields: 74% (237), 71–74% (238)) (240) (241) (242) (243) (244) (245) benzophenone (1:5150), but best (239) prepn. of latter is from C_6H_6 + CCl_4 (3:5100) + $AlCl_3$. — For studies of substitution for

$AlCl_3$ of $FeCl_3$ (237) (238) (246) (247) (248), $FeCl_3 + AlCl_3$ (249), $GaCl_3$ (250), $TlCl_3$ (251), WCl_6 (252), UCl_4 (252), $ZrCl_4$ (253), Cr powder (254), $ZnCl_2$ (238), $SbCl_3$ (255) (256), or $SbBr_3$ (257) see indic. refs. — $\bar{C}$ with C_6H_6 in liq. HCl at 200° and 250 pounds press. (258) or in pres. of P_2O_5 in s.t. at 180–200° (259) (260) gives small yield of benzophenone (1:5150). — $\bar{C}$ with C_6D_6 + $AlCl_3$ in CS_2 gives (261) phenyl pentadeuterophenyl ketone, b.p. 160° at 15 mm. (corresp. oxime, m.p. 140°, does *not* depress m.p. of ordinary benzophenone oxime).]

[*$\bar{C}$ with toluene in pres. of $AlCl_3$ gives (262) (263) (264) mainly phenyl p-tolyl ketone* (1:5160) together with some phenyl *o*-tolyl ketone [Beil. VII-439, VII_1-(234)]. For studies of substitution for $AlCl_3$ of $FeCl_3$ (263), $FeCl_3 + AlCl_3$ (265), or $SbCl_3$ (255) (256) see indic. refs.]

[For reaction of $\bar{C}$ in pres. of $AlCl_3$ with *o*-xylene (1:7430) (262), *m*-xylene (1:7420) (262) (266) (267), *p*-xylene (1:7415) (262), ethylbenzene (268) (266) (269), see indic. refs.]

[$\bar{C}$ with biphenyl (1:7175) in pres. of $AlCl_3$ gives (yields: 75% (270), 60% (271)) (272) (273) (274) (275) (276) (242) phenyl *p*-xenyl ketone (*p*-phenylbenzophenone) [Beil. VII-521, VII_1-(290)], scales from alc., m.p. 106° cor. (270), 106° (272) (273), 102–103° (275), 102° (271) (274), 101–102° (242), 101° (276); b.p. 413° at 758 mm. (271), 419–420° at 744 mm. (274), 258° at 10 mm. (276) (corresp. oxime exists in two stereoisomeric forms (277), m.p. 200° and 173°, usual mixt. having m.p. 193–194° (278), 186–187° (271); corresp. 2,4-dinitrophenylhydrazone, m.p. 217–217.5° (271)); for use of P_2O_5 (instead of $AlCl_3$) in *prepn. of p-phenylbenzophenone (above) see (279). Note that the isomeric o-phenyl*benzophenone, m.p. 86–87°, has been prepared indirectly (280).]

[$\bar{C}$ with naphthalene (1:7200) in pres. of $AlCl_3$ in CS_2 (281) (282) (283) (284) (285) (286) or without solvent at 150° (286), or in liq. SO_2 (287), or $\bar{C}$ with naphthalene in pres. of $ZnCl_2$ at 125° (286) cf. (288) (289) or of P_2O_5 (289) (279) (259) (260), gives (yields: 85% (282), 52% (287)) mainly phenyl α-naphthyl ketone (1-benzoylnaphthalene) [Beil. VII-510, VII_1-(283)], pr. from alc., m.p. 75.5–76° (276), 75.5° (282), 75–76° (281), 75° (283), b.p. 386° at 764 mm. (284), 222° at 8 mm. (276); note that this prod. is usually accompanied by some phenyl β-naphthyl ketone (2-benzoylnaphthalene) [Beil. VII-511, VII_1-(283)], ndls. from alc., m.p. 82° (276) (289), 81–83° (281), b.p. 398° at 754 mm. (284), 225° at 8 mm. (276).]

[For reaction of $\bar{C}$ with anthracene (1:7285) + $AlCl_3$ in CS_2 (277) (290) (291) (292) (293), or in nitrobenzene at −10° (294), or without $AlCl_3$ in boiling nitrobenzene (295) giving (*yields: 85% (277), 78% (290)) 9-benzoylanthracene (α-anthraphenone)* [Beil. VII-538], cryst. from EtOAc, m.p. 145.5–146° (277), see indic. refs.; note, however, that for prepn. of this prod. use of benzoic anhydride (1:0595) (rather than $\bar{C}$) is preferred (296). — For reaction of $\bar{C}$ with phenanthrene (1:7240) + $AlCl_3$ in CS_2 (297) (298) or in nitrobenzene (298) see indic. refs.]

With heterocyclic parent nuclei. The behavior of $\bar{C}$ with furan (1:8015) in the pres. of Friedel-Crafts cat. has apparently not been reported [however, the prod. to be expected, viz., phenyl α-furyl ketone [Beil. XVII-348, $XVII_1$-(186)], b.p. 285° at 759 mm. (299), 186° at 46 mm. (299), 164° at 19 mm. (299), D_{-}^{20} = 1.1732 (300), D_{10}^{19} = 1.1839 (299), n_D^{20} = 1.6055 (299), *1.5798 (300), has been obtd. (49% yield (301)) from benzoic* anhydride (1:0595) with furan (1:8015) + $SnCl_4$ in C_6H_6, and from furoyl chloride (3:8515) with C_6H_6 in pres. of $AlCl_3$ (299).]

[$\bar{C}$ with thiophene in pres. of $AlCl_3$ (302), $SnCl_4$ (303) (304), P_2O_5 (305), or α-thienylmercuric chloride (306) cf. (307) (308) gives (yields: 89–90% (302), 82.5% (304)) phenyl α-thienyl ketone [Beil. XVII-348, $XVII_1$-(187)], m.p. 56° (305) (307), 55.5–56° (306), 55–56° (302), 55° (303) (304).]

Behavior of $\bar{C}$ with Organic Hydroxyl Compounds

$\bar{C}$ with organic OH or SH compounds (or their metallic salts) gives in general the corresponding benzoates. With phenols, however, there is also the additional possibility (according to the conditions employed) of either direct nuclear benzoylation or Fries rearrangement of the benzoate esters to give phenolic ketones.

Esterification of alcohols or phenols with $\bar{C}$ in presence of aqueous alkali comprises a general procedure first discovered by Lossen (309) and later developed and extended by Schotten, Baumann, and others. The reaction is not restricted to the use of benzoyl chloride but covers acid halides in general, e g, acetyl chloride, *p*-nitrobenzoyl chloride, 3,5-dinitrobenzoyl chloride, benzenesulfonyl chloride, etc

For detailed quantitative study of the influence of conditions on the Schotten-Baumann reaction see (310); *for study of its application to p-nitrobenzoyl chloride (311) or of* 3,5-dinitrobenzoyl chloride (312) in the derivatization of alcohols in dilute aqueous solution *see indic. refs.; for study of substitution of the acyl halide by the corresponding anhydride* see (313).

Note that in general the yield of ester is improved by use of low temperature (0°–25°) (310), by use of relatively concentrated solutions of both the hydroxyl compound and the *alkali (310), and sometimes by additions of NaOAc or other salts. (311).*

With monohydric alcohols. $\bar{C}$ with monohydric alcs. gives the corresponding alkyl benzoates.

[E.g., $\bar{C}$ with MeOH (1 6120) gives methyl benzoate (1.3586), b.p. 199.6°, m.p. −12.5° *(for study of rate of reaction at 0° and 25° see (18)).* — $\bar{C}$ with EtOH (1:6130) gives ethyl benzoate (1·3721), b p. 213.2°, m p. −34.2° (for study of rate of esterification at 0° (17) *or at 25° in various solvents (314)* see indic. refs. — $\bar{C}$ with *n*-PrOH (1·6150) gives *n*-propyl benzoate (3:3917), b.p. 231°. — $\bar{C}$ with isopropyl alc. (1.6135) gives isopropyl benzoate (1:3766), b p. 218.5° *(for study of rate of esterification at 25° (6) or at 30° (11) (315)* see indic. refs).]

[$\bar{C}$ *with n*-BuOH (1·6180) gives *n*-butyl benzoate (1·4104), b.p. 250.3°, *m.p.* −22.4°. — $\bar{C}$ with isobutyl alc (1:6165) gives isobutyl benzoate (1.4006), b p 242.2° cor. — $\bar{C}$ with *sec*-BuOH *(1:6155) gives (yields.* 75% (316), 66% (317), 20% (318)) *sec*-butyl benzoate [Beil. IX-112, IX_1-(63)], b.p. 234 5–235 5° cor. at 757 mm. (317), 148–151° at 50 mm. (317), 115–117° at 20° (319), 112–116° at 14 mm (318), D_4^{25} = 0 9945 (317), $n_D^{21.3}$ = 1.4933 (319). — $\bar{C}$ with *ter*-BuOH (1:6140) in pres. of pyridine gives (yields 86% (320), 80% (321) (322)) *ter-butyl benzoate [Beil.* IX_1*-(64)],* b.p. *112° at 18 mm. (321), 91–92° at 8 mm. (323),* 91.3° at 7.5 mm. (320), 96° at 2 mm. (322); D_4^{25} = 0.9928 (322); n_D^{25} = 1.4896 (322) (321), n_D^{20} = 1.4910 (320).]

[$\bar{C}$ with *n*-AmOH (1:6205) gives *n*-amyl benzoate [Beil. IX_1-(64)], b.p. 138–139° at 15 mm (316), 137–138° at 15 mm. (324). — $\bar{C}$ with isoamyl alc. (1:6200) gives isoamyl benzoate (1:4166), b.p. 262.3° cor. at 760 mm. — $\bar{C}$ with neopentyl alc. (1:5812) gives (325) neopentyl benzoate, b.p. 235–237° at 740 mm., 110–111° at 10 mm., D_{25}^{25} = 0.9817, n_D^{25} = 1.4875 (325).]

$\bar{C}$ reacts with other alcohols and thiols similarly, but details cannot be tabulated here.

With phenols. $\bar{C}$ can react with phenols in either or both of two modes; on one hand it can benzoylate the phenolic OH yielding the corresponding phenol benzoates (a list of the melting points of 88 phenols of Order 1 is given on page 638 of Vol. I of this series (326); for study of effect of structure on rate of benzoylation of various monohydric phenols see (329)); on the other hand $\bar{C}$ may under certain conditions effect the direct nuclear benzoylation of phenols. Since the phenolic ketones thus formed may also be more or less readily obtained by catalyzed rearrangement of the phenol benzoates, the chemistry of the phenol

benzoates and their rearrangement products is so voluminous that it cannot here be given detailed discussion. [For extensive reviews of the Fries rearrangement (327) (328) of phenol esters (including the benzoates) see indic. refs.]

With enols (or their metallic derivatives). *With methyl acetoacetate.* [C̄ with the Na enolate of methyl acetoacetate (1:1705) gives (330) methyl α-benzoylacetoacetate, b.p. 136–137° at 2 mm. (corresp. Cu enolate, blue-green ndls. from dioxane, m.p. 226–228°; corresp. semicarbazone, prepd. by indirect means, m.p. 166° (331)).]

With ethyl acetoacetate. [C̄ with the Na enolate of ethyl acetoacetate (1:1710) gives (yields: 74.8% (332), 67% (333), 63–75% (334) cf. (335) (337) ethyl α-benzoylacetoacetate [Beil. X-817, X_1-(396)], b.p. 202° at 50 mm. (335), 177–181° at 20 mm. (334), 175–176° sl. dec. at 12 mm. (337), 169° sl. dec. at 11 mm. (338), 165–167° at 10 mm. (333) (corresp. Cu enolate, m.p. 224° (336), 221–222° (339)). Note that this prod. upon cleavage of the acetyl group, e g, with aq. $NH_4OH + NH_4Cl$, gives (77–78% yield (334)) (332) ethyl benzoylacetate (1:1778), for alternative prepn. of which see (340). — Note, however, that two forms of the isomeric ethyl *O*-benzoylacetoacetate are known (341); a liq. form, b p. 153–155° at 3 mm., prepd. from ethyl acetoacetate (1:1710) with C̄ + pyridine, and a solid form, m.p. 42°, prepd. from the Cu enolate of ethyl acetoacetate (1:1710) with C̄ in ether (for much further detail see (341)).]

With acetylacetone. [C̄ with the Na enolate (342) or K enolate (343) of acetylacetone (1:1700) in ether gives (50% yield (343)) *C*-benzoylacetylacetone (α-benzoyl-α-acetylacetone) [Beil. VII-865, VII_1-(474)], m.p. 35° (342), 34–35° (343), b.p. 167° at 22 mm. (342), accompanied by some of the higher-melting form, m.p. 103° (342), 102–103° (343), of its benzoate [Beil. IX-156]; note that the lower-melting form, m.p. 66–67° (344), is obtd. from α-benzoyl-α-acetylacetone (above) with C̄ in pyridine (344).]

With benzoylacetone. [C̄ with Na enolate of benzoylacetone (1:1450) under various conditions gives (345) (346) (347) cf. (348) α,α-dibenzoylacetone [Beil. VII-872, VII_1-(480)] (q.v. for constants of various enol and keto forms) and/or the corresp. benzoate [Beil. IX-157], m.p. 87–88° (349).]

With dibenzoylmethane. [C̄ with Na enolate of dibenzoylmethane (1:1480) gives (45% yield (350)) (351) (352) (353) tribenzoylmethane [Beil. VII-877, VII_1-(485)] (q.v. for constants of various forms) and/or the corresp. benzoate [Beil. IX-158], m.p. 121–122° (351).]

Behavior of C̄ with Ethers

With aliphatic ethers. Acyl chlorides with aliphatic ethers do not react even at elevated temperatures (354) although acid bromides (e.g., acetyl bromide (355)) or acyl iodides (e.g., benzoyl iodide (356)) are able to effect cleavage into alkyl halides and alkyl esters. However, when acyl chlorides are heated with aliphatic ethers in the presence of certain metallic salts, cleavage of the ethers is more or less readily effected. Although the topic cannot here be pursued exhaustively, several examples are cited in the following text.

[C̄ with diethyl ether (1:6110) on htg. in pres. of $ZnCl_2$ (354) (357) (358) (359) (360), $SnCl_4$ (358), $ZrCl_4$ (358), $TiCl_4$ (358) (362), $SbCl_5$ (358), $FeCl_3$ (358) (361), $AlCl_3$ (358) (362), or $SbCl_3$ (358) gives ethyl benzoate (1:3721); note, however, that use of BF_3, $CuCl_2$, and $SnCl_2$ gives only traces while $SiCl_4$, PCl_3, PCl_5, BCl_3, $AsCl_3$, or $MgCl_2$ achieves no cleavage (358) of the ether. Note that by extension of the $ZnCl_2$ method to use of 3,5-dinitrobenzoyl chloride a procedure for the identif. of ethers as the corresp. alkyl 3,5-dinitrobenzoates has been described (363) cf. (364).]

With phenol ethers. With phenol ethers where no phenolic OH remains to interfere, C̄ reacts in the pres. of suitable cat. in the Friedel-Crafts sense. Although the topic cannot here be pursued exhaustively, several examples are cited in the following text.

[$\bar{C}$ with methyl phenyl ether (anisole) (1:7445) + $AlCl_3$ in CS_2 solution (81% yield (365)) (366) (367) cf. (368) (360) or without other solvent (369) gives mainly *p*-anisyl phenyl ketone (*p*-methoxybenzophenone) (1:5170), m p. 62° (366) (367) (370), 61–62° (365) (369), 61° (371), b.p. 354–355° at 729 mm. (371); this prod. is accompanied by some *o*-anisyl phenyl ketone (*o*-methoxybenzophenone) (1:5142), m.p. 39°, which is separable from the main prod. only by repeated recrystallization from lgr. (b.p. 40–60°) and alc. (369).]

[$\bar{C}$ with ethyl phenyl ether (phenetole) (1.7485) + $AlCl_3$ in CS_2 soln. (yields: 83% (372), 73% (374)) (369) (366) (373) or without other solvent (369) gives mainly *p*-phenetyl phenyl ketone (*p*-ethoxybenzophenone) [Beil. VIII-159, $VIII_1$-(569)], m.p. 47–48° (374), 47° (369) (372), 46.5° (373), 38–39° (366), b.p. 245–250° at 25 mm. (374), 227° at 21 mm. (373), 215–225° at 15 mm. (373) (corresp. oxime, m.p. 135–136° (374)), accompanied by some *o*-phenetyl phenyl ketone (*o*-ethoxybenzophenone) which (although not further characterized) is liq. and readily separable.]

[$\bar{C}$ with diphenyl ether (1:7125) + $AlCl_3$ in CS_2 (375) (376) (374), or $\bar{C}$ with diphenyl ether (1:7125) + $HgCl_2$ at 150–160° (377) (27% yield), or $\bar{C}$ with phenyl 4-chloromercuriphenyl ether at 150° (377), gives (yields: 97% (375), 95% (374), 70% (377)) *p*-phenoxybenzophenone [Beil. VIII-159], m.p. 71° cor. (375), 70–71° (374), 66° (377) (corresp. oxime, m.p. 124° (374)); for further benzoylation of this prod. to *bis*-(*p*-benzoylphenyl) ether, m.p. 163–164°, see (376).]

[$\bar{C}$ with methyl α-naphthyl ether (1:7630) + $AlCl_3$ in CS_2 (378) or in nitrobenzene (379) gives (84% yield (379)) 4-benzoyl-1-methoxynaphthalene, m.p. 82–83° (378), 81–82° (379); for high-press. hydrogenation of this prod. giving (84–86% yield) 4-benzyl-1-methoxynaphthalene, m.p. 83–84°, see (379). — $\bar{C}$ with methyl β-naphthyl ether (1:7180) + $AlCl_3$ in CS_2 gives (85% yield (380)) 1-benzoyl-2-methoxynaphthalene, m.p. 125° cor.; note that use of 1,1,2,2-tetrachloroethane as solvent is much less satisfactory (381). — $\bar{C}$ with ethyl α-naphthyl ether (1:7635) + $AlCl_3$ in CS_2 gives (366) (382) 4-benzoyl-1-ethoxynaphthalene [Beil. VIII-207, $VIII_1$-(586)], m.p. 74–75° (366), accompanied (383) by some 4-benzoylnaphthol-1 and other products. — The presumably analogous reaction of $\bar{C}$ with ethyl β-naphthyl ether (1:7135) + $AlCl_3$ appears not to have been studied, and the expected 1-benzoyl-2-ethoxynaphthalene is unreported.]

Behavior of $\bar{C}$ with Acids (or Their Salts)

With sodium formate. [$\bar{C}$ with NaOOCH on htg. (384) gives BzOH (1:0715), CO, + HCl.]

With acetic acid. [$\bar{C}$ with AcOH (1:1010) refluxed in pres. of charcoal (385), or in pres. of a tertiary base (386) even at ord. temp., or $\bar{C}$ with NaOAc on warming (387) cf. (388) (389) gives the mixed anhydride, $CH_3.CO.O.CO.C_6H_5$ [Beil. IX-163], accompanied by various other products. Note, however, that $\bar{C}$ with AcOH (1:1010) at 100° for 3 hrs. gives (70% yield (147)) acetyl chloride (3:7065) while $\bar{C}$ with Ac_2O (1:1015) at 100° for 1 hr. gives (77% yield (147)) acetyl chloride (3:7065) accompanied by benzoic anhydride (1:0595). For prepn. of acetic-benzoic anhydride by other means, e.g., from benzoic acid (1:0715) with ketene (390), and for study of its use in Friedel-Crafts type reactions (391), see indic. refs.]

With benzoic acid. [$\bar{C}$ with benzoic acid (1:0715) in s t. at 160–200° for 12 hrs. (392), or at 220° under reduced press. (397), or with pyridine (389) (393), or $\bar{C}$ with NaOBz shaken with aq. (394) or htd. at 130° (395), gives benzoic anhydride (1:0595), m.p. 42°, b.p. 360°; for other modes of formn. of this prod. from $\bar{C}$ see above under behavior of $\bar{C}$ with various inorganic salts; for prepn. (72–74% yield) of benzoic anhydride (1:0595) from benzoic acid (1:0715) by use of acetic anhydride (1:1015) see (396).]

With HCN. [$\bar{C}$ with dry [illegible] with HgCN (400) (401) (403) (404), AgC[illegible] –65% (12)) benzoyl cyanide (phenylgly[illegible] 34° (401), 32.5–34° (403), 32–33° (12), b.p. 208–209° at 745 mm. (12), 207–210° (402), 206–208° (404), 123° at 42 mm. (401), 99° at 19 mm. (405). Note that by the HCN/pyridine method (398) (399) (406) or by reaction of $\bar{C}$ with aq. KCN (402) *dimeric* benzoyl cyanide [Beil. XIX-362], m.p. 99–100° (402), 95–96° (406), is also formed; further that benzoyl *bromide* with AgCN gives (402) a *trimeric* benzoyl cyanide, m.p. 195°.]

With cyanate or thiocyanate salts. [$\bar{C}$ with K cyanate (407), KSCN (408), or NH_4SCN (409) gives benzonitrile [Beil. IX-275, IX_1-(121)], b.p. 191.3° at 760 mm., but $\bar{C}$ with $Pb(SCN)_2$ at 160° (410), at 120° (413), or refluxed in C_6H_6 (411) (412) gives benzoyl isothiocyanate [Beil. IX-222, IX_1-107], b.p. 119° at 10 mm. (412), $D_4^{18.3} = 1.2142$ (412), $n_D^{18.3} = 1.6382$ (412).]

Behavior of $\bar{C}$ with Organic Nitrogen Compounds

$\bar{C}$ reacts with primary and secondary amines to replace one of the amino hydrogen atoms by the benzoyl radical. The molecule of HCl thus split out will, of course, convert a second molecule of amine to its hydrochloride. In order to avoid this waste of amine, the benzoylation may be effected in the presence of aqueous alkali (Schotten-Baumann reaction) or of pyridine (Einhorn reaction). Since the number of amino compounds which undergoes benzoylation is legion, the present text will be restricted to a relatively few important cases.

With aliphatic primary amines. [$\bar{C}$ with aq. CH_3NH_2 (414) in pres. of alk. (415) gives *N*-methylbenzamide [Beil. IX-201, IX_1-(97)], cryst. from alc. (416), aq. (417), or lgr./C_6H_6 (418), m.p. 82° (416), 80–81° (418) (419), 79.8° (417), 79° (414), 78° (415), b.p. 291° at 765 mm. (419), 167° at 11 mm. (420). — $\bar{C}$ with aq. $C_2H_5NH_2$ (414) gives *N*-ethylbenzamide [Beil. IX-202, IX_1-(97)], ndls. from aq., m.p. 71° (419), 70° (421), 69° (417), 68–69° (414), 67° (420), b.p. 285° at 745 mm. (419). — $\bar{C}$ with n-$C_3H_7NH_2$ presumably yields *N*-(*n*-propyl)benzamide [Beil. IX-203, IX_1-(97)], cryst. from alc. or C_6H_6, m.p. 84.5° (419), 83° (422), b.p. 294–295° sl. dec. (422), but this product has been reported only by other methods (419) (422). — $\bar{C}$ with n-$C_4H_9NH_2$ presumably gives *N*-(*n*-butyl)benzamide but this product has been characterized only as an oil cf. (423). — $\bar{C}$ with isobutylamine + aq. NaOH (416) cf. (424) gives *N*-(isobutyl)benzamide [B[illegible] ndls. from C_6H_6[illegible] $CHCl_3$, alc., or lgr.), m.p. 57–58° (416), 57° (419), 55[illegible] at 760 mm. (419), 173–178° at 13 mm. (416). — $\bar{C}$ [illegible] butyl)benzamide but the *d,l*-form of this product is unreported; note that its dextrorotatory form has been reported as m.p. 92° (425) or 86–88° (426); the levorotatory form as m.p. 88–89° (425). — $\bar{C}$ with *ter*-$C_4H_9NH_2$ in ether (427) (428) gives *N*-(*ter*-butyl)benzamide [Beil. IX_1-(97)], ndls. from ether/C_6H_6, m.p. 136.5° (428), 135.5° (427), 134–135° (429), 134° (430). Note that dibenzoylation does *not* occur and that *N*-methyldibenzamide [Beil. IX_1-(104), m.p. 94–95° (435), and *N*-ethyldibenzamide [Beil. IX-214], m.p. 101–102° (436), have been prepared only by indirect means.]

With aliphatic secondary amines. [$\bar{C}$ with $(CH_3)_2NH$ in ether (431), in aq. (414), or in aq. NaOH (405) gives *N,N*-dimethylbenzamide [Beil. IX-201, IX_1-(97)], cryst. from CS_2/pet. ether (405), m.p. 43° (405), 41–42° (431), 41° (414), b.p. 272–273° (420), 265–266° (432), 132–133° at 15 mm. (432). — $\bar{C}$ with $(C_2H_5)_2NH$ in ether (431) gives *N,N*-diethylbenzamide [Beil. IX-202], liquid, b.p. 280–282° cor. (431), 278–282° (433), 173–175° at 35 mm. (434). — Note that the analogous *N,N*-dialkylbenzamides to be expected from reaction of $\bar{C}$ with di-*n*-propylamine, di-isopropylamine, di-*n*-butylamine, di-isobutylamine, di-*sec*-butylamine, and di-*ter*-butylamine have not been characterized.]

With aromatic primary amines. See below under Ⓓ's.

With aromatic secondary amines. $\bar{C}$ with aromatic secondary amines gives the corresponding *N*-benzoyl derivatives but note that these same products are frequently also obtained by reaction of $\bar{C}$ with the appropriate tertiary amines.

[$\bar{C}$ with *N*-methylaniline (437), or $\bar{C}$ with *N,N*-dimethylaniline at 190° (438), gives *N*-benzoyl-*N*-methylaniline (*N*-methylbenzanilide) [Beil. XII-269], scales from lgr., m.p. 63° (438), 59° (437), b.p. 331–332° (439) — $\bar{C}$ with *N*-ethylaniline (not actually reported) or $\bar{C}$ with *N,N*-diethylaniline at 200° (438) gives *N*-benzoyl-*N*-ethylaniline (*N*-ethylbenzanilide) [Beil. XII-270], cryst. from ether + lgr., m.p. 54° (440), 52° (441), 60° (438).]

[$\bar{C}$ with *N*-methyl-*o*-toluidine should yield *N*-benzoyl-*N*-methyl-*o*-toluidine (*N*-methylbenzo-*o*-toluidide) [Beil. XII-796], pr. from ether/lgr., m.p. 65–66°, and $\bar{C}$ with *N*-ethyl-*o*-toluidine should yield *N*-benzoyl-*N*-ethyl-o-toluidine (*N*-ethyl-benzo-*o*-toluidide) [Beil. XII-796], pr. from ether/lgr., m.p. 71–72°, but both these products have been reported only by indirect means (442) — The analogous products to be expected from $\bar{C}$ with *N*-methyl (or *N*-ethyl)-*m*-toluidine, or $\bar{C}$ with *N*-methyl (or *N*-ethyl)-*p*-toluidine, have not been characterized in the literature.]

[$\bar{C}$ with *N*-methyl-α-naphthylamine should yield *N*-benzoyl-*N*-methyl-α-naphthylamine [Beil. XII-1234], cryst. from C_6H_6/lgr., m.p. 121°, but this prod. has actually been reported only from $\bar{C}$ with *N,N*-dimethyl-α-naphthylamine at 170–190° (438). — Similarly, $\bar{C}$ with *N*-methyl-β-naphthylamine + aq. alk. yields (443) *N*-benzoyl-*N*-methyl-β-naphthylamine [Beil. XII-1287, XII_1-(539)], ndls. from pet. eth., m.p. 84° (443); this prod. is also claimed (438) from *N,N*-dimethyl-β-naphthylamine at 170–180° but the m.p. of 169° is not in accord with the later work under mild conditions and presumably represents an isomeric material. — The analogous benzoyl derivatives of *N*-ethyl-α-naphthylamine and of *N*-ethyl-β-naphthylamine are unreported.]

[$\bar{C}$ with diphenylamine on warming (444) in ether soln. (445) gives *N*-benzoyldiphenylamine (*N,N*-diphenylbenzamide) [Beil. XII-270, XII_1-(201)], cryst. from alc., m.p. 180° (435), 179–180° (446), 177° (447).]

$\bar{C}$ with heterocyclic secondary amines. $\bar{C}$ with piperidine [Beil. XX-6, XX_1-(5)] directly (536) or better in aq. NaOH (537) (538) (539) gives (87–91% yield (537)) *N*-benzoylpiperidine [Beil. XX-46, XX_1-(15)], m.p. 49° (540), 48° (538), 44° (537); b.p. 320–321° (541), 240–244° at 130 mm. (537), 195° at 25 mm. (541), 180–184° at 20 mm. (537), 172–174° at 12 mm. (537); not volatile with steam (538). [Note that this prod. with PBr_5 (542) (543) (544) (545) (546), with $PBr_3 + Br_2$ (547), or with $PCl_3 + Br_2$ (548) comprises an important method of preparation of pentamethylene dibromide (1,5-dibromopentane).]

$\bar{C}$ with morpholine [Beil. XXVII-5] in ether gives (549) *N*-benzoylmorpholine, eas. sol. aq., pr. from dry ether, m.p. 74–75° (549).

$\bar{C}$ with aromatic diamines. [$\bar{C}$ with *o*-phenylenediamine [Beil. XIII-6, $XIII_1$-(5)] in aq. NaOH (448), or $\bar{C}$ with *o*-phenylenediamine hydrochloride in aq. soln. (449), gives *N,N'*-dibenzoyl-*o*-phenylenediamine [Beil. XIII-21, $XIII_1$-(8)], ndls. from AcOH, m.p. 301° (450), about 300° dec. (451) — Note that this prod. on htg. above m.p. (450), or on htg. with conc. HCl in s.t. at 200° (449), gives 2-phenylbenzimidazole [Beil. XXIII-230, $XXIII_1$-(61)], m.p. variously reported around 290°, which latter, although stable toward $\bar{C}$ at 260° (452), yet with $\bar{C}$ + aq. NaOH in cold (450) reverts to *N,N'*-dibenzoyl-*o*-phenylenediamine (above). — Note that *N*-benzoyl-*o*-phenylenediamine [Beil. XIII-20, $XIII_1$-(8)], m.p. 140° (453), has been reported only by indirect means (453) (454); on htg. 2 hrs. at 140° followed by a few minutes at 280° (455) it gives 2-phenylbenzimidazole (see above). — Note finally that 1-benzoylbenzimidazole [Beil. XXIII-133, $XXIII_1$-(35)], m.p. 93–94° (456), 91–92° (450), on htg. with $\bar{C}$ (457), or benzimidazole itself with $\bar{C}$ + aq. NaOH (450), both give *N,N'*-dibenzoyl-*o*-phenylenediamine (above).]

[$\bar{C}$ with hydrochloride of *m*-phenylenediamine [Beil. XIII-33, $XIII_1$-(10)] on htg. gives

(458) *N,N'*-dibenzoyl-*m*-phenylenediamine [Beil. XIII-46], ndls. from AcOH, m.p. 240° (458) (460); for behavior of this prod. with PCl_5 see (459). — Note that *N*-benzoyl-*m*-phenylenediamine (benz-*m*-aminoanilide) [Beil. XIII-46], m.p. 125°, has been reported only by indirect means (461) (462) (464).]

[$\bar{C}$ with *p*-phenylenediamine [Beil. XIII-61, $XIII_1$-(18)] + aq. NaOH (448) cf. (463) gives *N,N'*-dibenzoyl-*p*-phenylenediamine [Beil. XIII-98], m.p. above 300° (448) cf. (460); for behavior of this prod. with PCl_5 see (459). — Note that *N*-benzoyl-*p*-phenylenediamine (benz-*p*-aminoanilide) [Beil. XIII-98, $XIII_1$-(31)], m.p. 128° (452) (464), has been reported only by indirect means (452) (464).]

$\bar{C}$ with aminophenols. $\bar{C}$ with *o*-aminophenol [Beil. XIII-354, $XIII_1$-(108)] gives according to circumstances one of the two possible monobenzoyl derivatives, viz., *o*-(benzoylamino)phenol [Beil. XIII-372, $XIII_1$-(115)] (or its ring-closure product, 2-phenylbenzoxazole-1,3 [Beil. XXVII-72, $XXVII_1$-(235)]), or the dibenzoyl derivative, viz., *o*-benzoylaminophenyl benzoate [Beil. XIII-373], as more fully described below. Note, however, that the other monobenzoyl derivative of *o*-aminophenol, viz., *O*-benzoyl-*o*-aminophenol or *o*-aminophenyl benzoate, known only as its hydrochloride, m.p. 149° (465), has been prepared only by indirect means (465) viz., from *O,N*-(dibenzoyl)-*o*-aminophenol, and on heating, or even on recrystn., loses HCl giving (465) 2-phenylbenzoxazole-1,3.

[$\bar{C}$ (1 mole) with *o*-aminophenol (2 moles) in dry ether (466) gives *o*-(benzoylamino)-phenol (*N*-benzoyl-*o*-aminophenol), tbls. from MeOH (465), lfts. from C_6H_6, m.p. 169–171° u.c. (465), 169° (467), 167° (468) (corresp. acetate, m.p. abt. 140° (469) cf. (470); corresp. benzoate, m.p. 182° (470) (also below); corresp. benzenesulfonate, m.p. 90.5–91.0 (471)). — Note that this prod. on htg. above m.p. loses H_2O with ring closure yielding (468) 2-phenylbenzoxazole-1,3, m.p. 103° (see below). — Note also that *o*-(benzoylamino)phenyl benzoate (above) with $\bar{C}$ in nitrobenzene refluxed 12 hrs. gives (479) *o*-(dibenzoylamino)phenyl benzoate, m.p. 170.5–171.5° (479).]

[$\bar{C}$ with *o*-aminophenol on warming, followed by distn. of reaction product (472), or $\bar{C}$ with *o*-aminophenol hydrochloride (468) (473) gives 2-phenylbenzoxazole-1,3, ndls. from dil. alc., lfts. from dil. HCl or dil. H_2SO_4, m.p. 103° (468) (472) (473) (474), volatile with steam, b.p. 314–317° (472) (corresp. $\bar{B}$.PkOH, m.p. 104° (477), corresp. MeI quaternary salt, m.p. 196° dec. (478)).]

[$\bar{C}$ (2 pts.) with *o*-aminophenol in aq. NaOH (448) or in pyridine + $CHCl_3$ (465), or $\bar{C}$ with *o*-aminophenol hydrochloride in C_6H_6 at 100° (468), or $\bar{C}$ + aq. NaOH with *o*-formylaminophenol (480), *o*-(acetylamino)phenol (481), or *o*-(benzoylamino)phenol (467), gives *O,N*-dibenzoyl-*o*-aminophenol (*o*-benzoylaminophenyl benzoate), ndls. from alc. (480) or EtOAc (465), m.p. 185° (467), 183–184.5° (480), 182–183° (482), 181–182° (476), 180° (481), 179° u.c. (465). — Note that this prod. on boilg. with aq. $BaCO_3$ (468) or for 2 days with alc. HCl (483) hydrolyzes at the ester leakage giving *o*-(benzoylamino)phenol, m.p. 169° (above).]

[$\bar{C}$ with *m*-aminophenol [Beil. XIII-401, $XIII_1$-(128)] in pyridine + ether (484) cf. (485) gives *m*-(benzoylamino)phenol [Beil. XIII-416], ndls. from toluene, m.p. 174° (485) (486), 173° (484). — Note that the isomeric *O*-benzoyl-*m*-aminophenol (*m*-aminophenyl benzoate) is unreported. — $\bar{C}$ with *m*-aminophenol in aq. NaOH gives (486) *O,N*-dibenzoyl-*m*-aminophenol (*m*-(benzoylamino)phenyl benzoate) [Beil. XIII-416], pr. from C_6H_6 or scales from abs. alc., m.p. 153° (486); this product with boilg. alc. KOH splits at the ester linkage giving (486) *m*-(benzoylamino)phenol (above), m.p. 174°.]

[$\bar{C}$ with *p*-aminophenol [Beil. XIII-427, $XIII_1$-(143)] in aq. NaOH (487), in pyridine (488), in alc. (489), or in ether + aq. NaOH (490) gives *p*-(benzoylamino)phenol (*N*-benzoyl-*p*-aminophenol) [Beil. XIII-469, $XIII_1$-(165)], cryst. from AcOH, m.p. 216–217° (487), 214–215° (489) (for review of earlier confusion see (487)). — Note that the isomeric *O*-

benzoyl-p-aminophenol (p-aminophenyl benzoate) [Beil. XIII-440], m.p. 153–154° (491) (492), 148° (465), has been reported only by indirect means. — $\bar{C}$ with p-aminophenol on htg. (472), or in aq. NaOH (448) (487) (488) or in pyridine (488), or $\bar{C}$ with p-aminophenol hydrochloride (489) gives O,N-dibenzoyl-p-aminophenol (p-(benzoylamino)phenyl benzoate) [Beil. XIII-470, $XIII_1$-(165)], cryst. from MeOH, EtOH, AcOH, or xylene, m.p. 235° (487) (467), 233–234° (489), 231° (472).]

The acylation of aminophenols (especially of the ortho series) and the relationships of the various multiple and mixed acyl derivatives have been extensively studied by Raiford ((493)–(511), incl.), Nelson ((512)–(517), incl.), and Bell (518) (519); the cited papers are arranged in chronological sequence for each worker.

$\bar{C}$ with tertiary amines. $\bar{C}$ with certain tertiary amines especially in dry ether solution (520) forms addition products; these are presumably quaternary ammonium salts but have been very inadequately studied cf. (524).

[$\bar{C}$ with Me_3N in ether at 0° or in C_6H_6 at 80° fails to react (525). — $\bar{C}$ with Et_3N in dry ether gives an immediate ppt. which increases on stdg. but appears to be a mixture of the expected addn. prod., $\bar{C}.Et_3N$, with triethylamine hydrochloride (520). — $\bar{C}$ with triamylamine in dry ether after stdg. 2 months yields (520) long needles, m.p. 117°, whose analysis is in accord with "nearly pure" addn. prod., $\bar{C}.(C_5H_{11})_3N$.]

[$\bar{C}$ with N,N-dimethylaniline in dry ether in sunlight gives gradually hygroscopic crystals probably comprising the expected addn. prod., $\bar{C}.C_8H_{11}N$, (520). — $\bar{C}$ with N,N-diethylaniline in dry ether gives (520) a crystn. prod. containing 71% of the expected $\bar{C}.C_{10}H_{15}N$.]

[$\bar{C}$ with pyridine in dry ether gives (520) a ppt. apparently contg. only 31% of the expected addn. prod., $\bar{C}.C_5H_5N$. — $\bar{C}$ with pyridine in C_6H_6 gives (521) pyridine hydrochloride, m.p. 144°. — For study of $\bar{C}$ with pyridine in pres. of Zn dust giving the free radical N-benzoylpyridinium see (522); for study of $\bar{C}$ with pyridine + N,N-dimethylaniline + Cu powder at 100° for 5 hrs. giving 4-(p-dimethylaminophenyl)pyridine see (523).]

Note that $\bar{C}$ with pyridine in pres. of various inorganic salts gives benzoic anhydride; for further details see text above under behavior of $\bar{C}$ with miscellaneous inorganic salts.

$\bar{C}$ with arylhydrazines. $\bar{C}$ (1 mole) with phenylhydrazine (2 moles) [Beil. XV-67, XV_1-(23)] in dry ether gives (526) N'-benzoyl-N-phenylhydrazine (also known as *sym.*-benzoylphenylhydrazine or β-benzoylphenylhydrazine) [Beil. XV-255, XV_1-(67)], pr. from alc., m.p. 168° (526) (527). [Note that the isomeric N-benzoyl-N-phenylhydrazine (also known as *asym.*-benzoyl-phenylhydrazine or α-benzoyl-phenylhydrazine) [Beil. XV-250, XV_1-(65)], m.p. 70°, has been obtained only by indirect means, e.g., from $\bar{C}$ with sodio-phenylhydrazine (528) or from N-chlorobenzanilide with $NaNH_2$ (529). However, $\bar{C}$ with phenylhydrazine hydrochloride in boilg. C_6H_6 (530) (531), or $\bar{C}$ with dry K phenylhydrazine-β-sulfonate on htg. (526), or $\bar{C}$ with α-benzoyl-phenylhydrazine in ether (532), or $\bar{C}$ with β-benzoylphenylhydrazine on htg. (526), gives N,N'-dibenzoyl-N-phenylhydrazine (also called α,β-dibenzoyl-phenylhydrazine) [Beil. XV-261, XV_1-(68)], pr. from alc., m.p. 177–178° (526) (530); note that this prod. on hydrolysis with alc. NaOH gives (533) β-benzoyl-phenylhydrazine (above).]

$\bar{C}$ with p-nitrophenylhydrazine [Beil. XV-468, XV_1-(130)] presumably gives N'-benzoyl-N-(p-nitrophenyl)-hydrazine [Beil. XV-479, XV_1-(140)], ndls. from alc., m.p. 193° (534), although this prod. is actually reported (534) only from benzoic anhydride (1:0595) with p-nitro-phenylhydrazine.

$\bar{C}$ with 2,4-dinitrophenylhydrazine [Beil. XV-489, XV_1-(146)] in alc. suspension on warming gives (535) N'-benzoyl-N-(2,4-dinitrophenyl)-hydrazine [Beil. XV-492], or.-red lfts. from alc., m.p. 206–207° (535).

$\bar{C}$ with diazomethane. [$\bar{C}$ added slowly to excess CH_2N_2 in ether at 0° gives (550) (551) (552) (553) ω-diazoacetophenone [Beil. VII-362, XXIV-142]; this product may be caused

to undergo the Wolff rearrangement giving (554) phenylacetoacetic acid derivs. (e.g., amide or anilide (554)), or may be caused to react with HCl to give phenacyl chloride (3:1212): for comprehensive survey and review of the behavior of acyl halides with diazomethane see (555).]

C̄ with miscellaneous nitrogen compounds. [For studies on the behavior of C̄ with indigo see (556) (557) (558) (559) (560) (561) (562) (563).]

Behavior of C̄ with Organometallic Compounds

Behavior of C̄ with Grignard reagents. C̄ with excess RMgX compounds in ether reacts in general to give the corresponding tertiary alcohols. Although extensive discussion of this reaction is manifestly infeasible here, the following examples are cited.

[C̄ with excess MeMgI gives (564) dimethyl-phenyl-carbinol [Beil. VI-506, VI_2-(477)]. — C̄ with EtMgI gives (93% yield (565)) diethyl-phenyl-carbinol [Beil. VI-548, VI_1-(269), VI_2-(506)]. — C̄ with n-PrMgBr gives (81% yield (565)) di-n-propyl-phenyl-carbinol [Beil. VI_1-(273), VI_2-(513)]. — C̄ with C_6H_5MgBr as directed gives (91.5% yield (565)) triphenylcarbinol [Beil. VI-713, VI_1-(349), VI_2-(686)] (1:5985) accompanied by (7% yield (565)) biphenyl (1:7175); for study of limiting reaction of C̄ with C_6H_5MgBr to formation of diphenyl ketone (benzophenone) (1:5150) see (566); note also that C̄ with C_6H_5MgBr in presence of $CoCl_2$ takes a different course yielding (567) benzoic acid, ethyl benzoate, biphenyl, benzophenone, phenylbenzoin, tetraphenylethylene oxide, and stilbene dibenzoate.]

[For interference of C̄ with the Gilman color test for RMgX compounds see (568).]

[For study of relative reactivity of C̄ as compared with various other organic compounds in competition for C_6H_5MgBr see (569).]

Behavior of C̄ with other miscellaneous organometallic compounds. This topic cannot be treated extensively, but the following examples, mainly from the recent literature, will serve as lead references.

[C̄ with C_6H_5Li gives (570) no benzophenone and only 42% yield triphenylcarbinol (1:5985). — C̄ with Na phenylacetylene (571) (572) or Ag phenylacetylene (572) gives (74% yield (571)) phenyl phenylethynyl ketone (benzoyl-phenylacetylene) [Beil. VII-498, VII_1-(275)].]

[C̄ + EtCu (573) in ether gives (22% yield (573)) ethyl phenyl ketone (propiophenone) (1:5525). — C̄ with C_6H_5Cu (573) in ether gives (55% yield (573)) benzophenone (1:5150).]

[C̄ + Et_2Hg gives (small yield (574)) propiophenone (1:5525). — C̄ with $(C_6H_5)_2Hg$ in C_6H_6 gives (575) benzophenone (1:5150). — C̄ with excess di-p-tolyl mercury in CCl_4 fails (576) to react.]

[C̄ with Me_2Be gives (577) dimethyl-phenyl-carbinol [Beil. VI-506, VI_2-(477)]. — C̄ with Me_2Cd gives (85% yield (578)) methyl phenyl ketone (acetophenone) (1:5515). — C̄ with Et_2Cd gives (50% yield (578)) ethyl phenyl ketone (propiophenone) (1:5525). — C̄ with $(C_6H_5)_2Cd$ gives (57% yield (578)) diphenyl ketone (bezophenone) (1:5150). — C̄ with Me_2Zn gives (579) methyl phenyl ketone (acetophenone) (1:5515). — C̄ with Et_2Zn (580) (581) or with EtZnI (582) gives ethyl phenyl ketone (propiophenone) (1:5525).]

Ⓓ Benzamide: cryst. from hot aq., m.p. 130°. [For methods of prepn. see above text under behavior of C̄ with various inorganic nitrogen compounds.]

Ⓓ Benzanilide: lfts. from alc., m.p. 160°. [From C̄ with aniline directly (583), in ether contg. dry K_2CO_3 (584), in C_6H_6 (585), in toluene (586), in pyridine (or other tertiary amines) (587), in dil. aq. HCl (588), in AcOH/aq. NaOAc (589), or aq. NaOH. — For study of rate of reaction of C̄ with aniline in aq. at various temperatures 0–60° (590),

in C_6H_6 at 25° (591) cf. (585), in hexane at 25° (592), or in CCl_4 at 25° (592) see indic. refs. — Note that C̄ with aniline hydrochloride in boilg. C_6H_6 gives almost quant yield (530) benzanilide.]

Ⓓ **Benz-o-toluidide:** ndls. from AcOEt/acetone, m.p. 145–146° (594) (595), 144.3–144 6° cor. (586), 142–143° (593), 142° (587). [From C̄ with o-toluidine (593) (594) in pres. of dil. (4%) aq. NaOH (595), or in pyridine (or other tertiary bases) (75% yield (587)), or in boilg. toluene (586).]

Ⓓ *Benz-m-toluidide: cryst. from dil alc, m.p. 126° (587), 124.3–124.7° cor. (586), 125°* (596). [From C̄ with m-toluidine (596) in pyridine (or other tertiary bases) (80% yield (587)) or in boilg toluene (586).]

Ⓓ **Benz-p-toluidide:** ndls. from alc., m.p. 158° (597), 157.7–158.2° cor. (586), 157° (587). [From C̄ with p-toluidine (598) (599) in pyridine (or other tertiary bases) (85% yield (587)) or in boilg. toluene (586).]

Ⓓ **Benz-α-naphthalide:** ndls from alc. or AcOH, m.p. 161–162° (600), 159–160° (601) cor. (608), 159° (587), 156° (602), 155–156° (603). [From C̄ with α-naphthylamine (604) (602) in aq. NaOH (603), pyridine (or other tertiary bases) (80% yield (587)), or in AcOH/aq. NaOAc (589). — For mol. cpd. of benz-α-naphthalide with 1,3,5-trinitrobenzene, viz., $\bar{C}'.C_6H_3(NO_2)_3$, yel. ndls from alc. soln. of components, m.p. 131–132° (605); see indic. refs. — For behavior of C̄ with α-naphthylamine in pres. of $ZnCl_2$ at 175–180° yielding 1-benzoylamino-4-benzoylnaphthalene, m.p. 178°, 1-benzoylamino-2,4-dibenzoylnaphthalene, m p. 224–226°, etc., see (606) (607).]

Ⓓ **Benz-β-naphthalide:** ndls. from C_6H_6 or AcOH, m.p. 162–163° (609), 162° (587), 161° (612), 157° (610), 156.5–157° cor. (608). [From C̄ with β-naphthylamine (611) (610) in ether + K_2CO_3 (612), in pyridine (or other tertiary bases) (80% yield (587)), or in AcOH/aq. NaOAc (589).]

Ⓓ **Benzhydrazide:** m p. *112°*. [See above text under behavior of C̄ with various inorganic nitrogen compounds, specifically with $NH_2.NH_2$.]

Ⓓ **β-Benzoylphenylhydrazine** (N-Anilinobenzhydrazide). pr. from alc., m.p. 168°. [See above text under behavior of C̄ with organic nitrogen compounds, specifically with arylhydrazines]

—— **β-Benzoyl-p-nitrophenylhydrazine** (N-(p-nitroanilino)benzhydrazide): ndls. from alc., m.p. 193°. See above text under behavior of C̄ with organic nitrogen compounds, specifically with arylhydrazines.

Ⓓ **β-Benzoyl-2,4-dinitrophenylhydrazine** (N-(2,4-dinitroanilino)benzhydrazide): or.-red lfts. from alc , m.p. 206–207°. [See above text under behavior of C̄ with organic nitrogen compounds, specifically with arylhydrazines.]

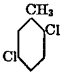
3:6245 2,5-DICHLOROTOLUENE



$C_7H_6Cl_2$

Beil. V - 296
V_1—
V_2-(231)

B.P.		M.P.		
200°	at 770 mm. (1)	5°	(2) (3)	$D^{20}_{20} = 1.2535$ (6)
199°	at 761 mm. (2)	4–5°	(6)	
198–200°	at 760 mm. (3)			
197.7–198.1°	at 760 mm. (4)			
196–198°	at 756 mm. (5)			
194°	at 745 mm. (6)			
82.5–82.8°	at 15 mm. (4)			

[For prepn. of $\bar{C}$ from 5-chloro-2-aminotoluene [Beil. XII-835] via diazotization and use of Cu_2Cl_2 reaction (yield: 87.6% (1), 70% (3) (7)) (4) (6) (2) see indic. refs.; from K (1) or Na (5) salt of 2,5-dichlorotoluenesulfonic acid-6 by hydrolysis in conc. H_2SO_4 with superheated steam see (1) (5); for formn. of $\bar{C}$ (together with other isomers) from toluene with Cl_2 in pres. of $FeCl_3$ or $MoCl_5$ see (8), from *o*-chlorotoluene (3:8245) or *m*-chlorotoluene (3:8275) with Cl_2 in pres. of Al/Hg see (9).]

[$\bar{C}$ with Cl_2 in pres. of Al/Hg yields (10) both 2,3,6-trichlorotoluene (3:0625) and 2,4,5-trichlorotoluene (3:2100).]

$\bar{C}$ on mononitration in cold with mixt. of 1½ pts. conc. HNO_3 ($D = 1.4$) and 3 pts. conc. H_2SO_4 yields (3) (11) 2,5-dichloro-4-nitrotoluene [Beil. V-332], ndls. from alc. + ether, m.p. 50–51° (3); $\bar{C}$ on dinitration with mixt. of 7 pts. fumg. HNO_3 ($D = 1.5$) and 3½ pts. conc. H_2SO_4 at 100° yields (3) (11) 2,5-dichloro-4,6-dinitrotoluene [Beil. V-345], cryst. from AcOH, m.p. 100–101° (3).

$\bar{C}$ on oxidn. with dil. HNO_3 in s.t. at 120–150° gives (yield: 82% (7), 60% (2)) (3) (5) (6) 2,5-dichlorobenzoic acid (3:4340), m.p. 154°.

$\bar{C}$ on sulfonation with fumg. H_2SO_4 yields (1) (3) (12) 2,5-dichlorotoluenesulfonic acid-4 (corresp. sulfonyl chloride, m.p. 43° (1) (12), corresp. sulfonamide, m.p. 191–192° (1) (3) (12)).

[For behavior of $\bar{C}$ with NaOMe see (2).]

3:6255 *o*-CHLOROANISOLE C_7H_7OCl Beil. VI - 184

(*o*-Chlorophenyl methyl ether) VI$_1$-(99) VI$_2$-(171)

B.P.		
198.5–199.5°		(1)
195–196°		(2)
194–200° u.c.	at 751 mm.	(3)
92–93°	at 20 mm.	(18)
90–91°	at 16 mm.	(4)
100°	at 13 mm.	(5)
80.5–81.4°	at 10 mm.	(1)

$D_4^{25} = 1.1865$ (18) $n_D^{25} = 1.5433$ (18)
$D_4^{12.6} = 1.1978$ (6) $n_{He}^{12.6} = 1.54786$ (6)

Oil with odor like acetophenone (7). — Volatile with steam.

[For prepn. of $\bar{C}$ from *o*-chlorophenol (3:5980) by methylation with Me_2SO_4 + KOH (3) or with MeI + KOH in MeOH in s.t. at 130° (8) see (3) (8); from *o*-aminoanisole via diazo and Sandmeyer reactns. see (9) (2); from guaiacol (1:1405) with PCl_5 see (8); from *o*-nitroanisole with $SOCl_2$ at 180–200° see (10).]

$\bar{C}$ on mononitration with fumg. HNO_3 (8) (11) (12) or with HNO_3 ($D = 1.5$) in Ac_2O (5) yields a mixt. of all 4 possible mononitro products from which the 3-nitro- and 5-nitro isomers are removed by refluxing with 5% NaOH for 1 hr. (5); the unaffected residue extracted by ether consists of 2-chloro-4-nitroanisole, m.p. 94° (5), and 2-chloro-6-nitroanisole, m.p. 53° (5); for f.p./compn. data on this system see (5). [2-Chloro-4,6-dinitroanisole [Beil. VI-260] has m.p. 36° (16), 37° (17).]

[For a study of the reactn. kinetics of the splitting of $\bar{C}$ in acid soln. see (15).]

Ⓓ 3-Chloro-4-methoxybenzenesulfonamide: cryst. from dil. alc., m.p. 130–131° u.c. (13), 130° cor. (14). [From Č + chlorosulfonic acid followed by conversion of the resultant sulfonyl chloride, m.p. 77–80° (14), to sulfonamide with $(NH_4)_2CO_3$; 85% yield (13).] [A by-product, 3,3′-dichloro-4,4′-dimethoxydiphenyl sulfone, m.p. 165–166° cor. (14) (but unlike the sulfonamide insol. in alk.), has also been observed (14).]

[For prepn. of Č from 6-chloro-2-aminotoluene [Beil. XII-836, XII_1-(389)] via diazotization and use of Cu_2Cl_2 reactn. (70% yield (2)) (1) (3) see indic. refs.; from 2,6-dichlorotoluenesulfonic acid-4 (itself obtd. by chlorination of *p*-toluenesulfonyl chloride and subsequent hydrolysis) by hydrolysis in conc. H_2SO_4 with superheated steam (yield 42–50% (5)) (4) (6) together with 2,3,6-trichlorotoluene (3:0625) as by-product (5) (6) see indic. refs.; for formn. of Č (together with other isomers) from toluene with Cl_2 in pres. of $MoCl_5$ (7) (8) (9), from *o*-chlorotoluene (3:8245) with Cl_2 in pres. of Fe (9) or Al/Hg (10), or from 2,6-dichlorobenzaldehyde hydrazone by Wolff-Kishner reduction (32–80% yield (19)) see indic. refs.]

[Č with Cl_2 in pres. of Al/Hg yields (11) 2,3,6-trichlorotoluene (3:0625); Č at its b.p. in u.v. light treated with Cl_2 yields (5) 2,6-dichlorobenzyl chloride (3:0410) cryst. from lgr. or ether, m.p. 39–40° (5).]

[Č with Br_2 at 170° in sunlight (2) yields (2) (12) 2,6-dichlorobenzyl bromide which on oxidn. with alk. $KMnO_4$ yields (2) (12) 2,6-dichlorobenzoic acid (3:4200), m.p. 143–144°.]

$\bar{C}$ on mononitration in cold with 2 pts. fumg. HNO_3 (11) or with mixt. of 2 pts. conc. HNO_3 (D = 1.4) + 3 pts. conc. H_2SO_4 at 100° (3) yields 2,6-dichloro-3-nitrotoluene [Beil. V-332], ndls. from alc. + AcOH, m p. 53° (3), 52–53° (11), 50° (13); note that the other possible isomer, viz., 2,6-dichloro-4-nitrotoluene, m.p. 65° (14), 63–64° (15), has been obtd. only by other means. — $\bar{C}$ on dinitration with mixt. of 7 pts. fumg. HNO_3 (D = 1.5) and 3½ pts. conc. H_2SO_4 at 100° yields (3) 2,6-dichloro-3,5-dinitrotoluene [Beil. V-345], ndls. from alc., m.p. 121–122° (3), 121° (4) (14); note that the isomeric 2,6-dichloro-3,4-dinitrotoluene, m.p. 130–131° (14), 129–130° (16), has been obtd. only by other means.

$\bar{C}$ is extremely resistant to oxidn. either with dil. HNO_3 (9) (1) (3), aq. alk. $KMnO_4$ (4) (12), acid $KMnO_4$ (12), $KMnO_4$ in acetone (4), CrO_3 in H_2SO_4 or AcOH (12), or $K_2Cr_2O_7$ in H_2SO_4 (12); by conversion of $\bar{C}$ with Br_2 to 2,6-dichlorobenzyl bromide (see above) and oxidn. of this with alk. $KMnO_4$ (2) (12) 2,6-dichlorobenzoic acid (3:4200), m.p. 143–144°, is obtd. in 57% yield (12).

$\bar{C}$ on sulfonation with fumg. H_2SO_4 (3) yields 2,6-dichlorotoluenesulfonic acid-3 (corresp. sulfonyl chloride, m.p. 60° (3) (13), corresp. sulfonamide, m.p. 204° (3) (13), 199–201° u.c. (17)); $\bar{C}$ on treatment with chlorosulfonic acid in $CHCl_3$ as directed (17) cf. (18) yields 2,6-dichlorotoluenesulfonyl chloride-3, m.p. 54–56° u.c. (17), 60° (3) (13) (18).

For f.p./compn. diagram of system: C̄ + 3,4-dichlorotoluene (3:6355) see (1); the eutectic conts. 48% C̄ and freezes about −38° (1).

[For prepn. of C̄ from 2-chloro-4-aminotoluene [Beil. XII-988, XII_1-(435)] via diazotization and use of Cu_2Cl_2 reaction (yield: 72% (5), 30% (6)) see indic. refs.; similarly from 4-chloro-2-aminotoluene [Beil. XII-835, XII_1-(389)] see (2); from 2,4-diaminotoluene [Beil. XIII-124, $XIII_1$-(40)] via tetrazotization and use of $CuCl_2$ reaction (yield: 75% (7), 57% (16), 45% (4)) (3) see indic. refs.; from toluene + $AlCl_3$ + SO_2Cl_2 at 70° (68% yield) see (10).]

[For formn. of C̄ (58% together with 42% 3,4-dichlorotoluene (3:6355) from p-chlorotoluene (3:8287) with Cl_2 in pres. of Fe see (1); for formn. of C̄ (together with other isomers) from toluene with Cl_2 in pres. of $FeCl_3$ or $MoCl_5$ (8) or by electrolysis in conc. HCl/AcOH soln. (9) see indic. refs.; from o-chlorotoluene (3:8245) or p-chlorotoluene (3:8287) with Cl_2 in pres. of $FeCl_3$ or $MoCl_5$ (8) or Al/Hg (11) see indic. refs.; from potassium salt of 2,4-dichlorotoluenesulfonic acid-5 (12), sodium salt of 2,4-dichlorotoluenesulfonic acid-6 (12), or the sodium salt or amide of 2,4-dichlorotoluenesulfonic acid-3 (12) by hydrolysis in H_3PO_4 with steam at 240° see indic. refs.]

[C̄ with Cl_2 in pres. of Fe (13) or of Al/Hg (14) yields 2,4,5-trichlorotoluene (3:2100) together with other isomers; C̄ with Br_2 at 180–200° yields (15) 2,4-dichlorobenzal dibromide which upon hydrolysis with conc. H_2SO_4 as directed gives 92% overall yield 2,4-dichlorobenzaldehyde (3:1800), m.p. 74.5° (15) (for similar reaction with Cl_2 see (5)).]

[C̄ with $AlCl_3$ + phthalic anhydride gives (60% yield (16)) (17) o-(2,4-dichloro-5-methyl)benzoyl-benzoic acid, cryst. from hot toluene, m.p. 140° (16); this prod. htd. 2 hrs. at 100° with 20 pts. conc. H_2SO_4 + 0.2 pt. H_3BO_3 ring-closes yielding 2,4-dichloro-1-methylanthraquinone, yel. cryst. from $CHCl_3$, m.p. 155° (16).]

C̄ on mononitration, e.g., with cold mixt. of 2 pts. conc. HNO_3 (D = 1.42) + 3 pts. conc. H_2SO_4 (2), yields (2) (8) 2,4-dichloro-5-nitrotoluene [Beil. V-332, V_1-(163)], long hard ndls. from alc., m.p. 54–55° (2), 55° (18), 53° (8), 49–50° (19); C̄ on dinitration, e.g., with 7 pts. fumg. HNO_3 (D = 1.5) + 3½ pts. conc. H_2SO_4 (2), yields (2) (8) (10) 2,4-dichloro-3,5-dinitrotoluene [Beil. V-345, V_1-(169)], ndls. from MeOH, m.p. 104° (2) (18) (10)

C̄ on oxidn. with dil. HNO_3 in s t. at 130–150° (2) (6) (12), with alk. $KMnO_4$ (70% yield (25)), with $Na_2Cr_2O_7$ + H_2SO_4 (60% yield (20)), or on electrolytic oxidn. (6.5% yield (21)) gives 2,4-dichlorobenzoic acid (3:4560), m.p. 164°.

C̄ on sulfonation with fumg. H_2SO_4 yields (2) (22) 2,4-dichlorotoluenesulfonic acid-5 (corresp. sulfonyl chloride, m.p. 72° (22), 71° (2) (24), corresp. sulfonamide, m.p. 176° (2) (22); 175–176° u c. (23)); C̄ on treatment with chlorosulfonic acid in $CHCl_3$ as directed (23) cf. (24) yields 2,4-dichlorotoluenesulfonyl chloride, m.p. 71–72° u.c. (23), 71° (24).

XII-840, XII_1-(390)] or from 3,5-dibromo-4-aminotoluene [Beil. XII-993, XII_1-(437)] by diazotization followed by treatment with HCl gas in alc. see (6); for prepn. from 3,5-dichloro-2-acetaminotoluene by hydrolysis with EtOH/HCl followed by HNO_2 (34% yield) see (12).]

[$\bar{C}$ with Cl_2 in pres. of Al/Hg gives (7) exclusively 2,3,5-trichlorotoluene (3:0610), m.p. 43–45° (7); $\bar{C}$ with Cl_2 at 180–190° for 10–12 hrs. gives (2) 3,5-dichlorobenzal dichloride (3:0370).]

[$\bar{C}$ with Br_2 in pres. of Fe gives in cold (70% yield (8)) 2-bromo-3,5-dichlorotoluene, ndls. from alc., m.p. 33.5° (8).]

$\bar{C}$ on mononitration by soln. in ice-cold fumg. HNO_3 (D = 1.52) (9) yields 3,5-dichloro-2-nitrotoluene [Beil. V-331], ndls. from alc. + AcOH, m.p. 61–62° (5) (crude prod. m.p. 57° (9)); $\bar{C}$ on dinitration with mixt. of 4 pts. HNO_3 (D = 1.5) + 4 pts. conc. H_2SO_4 (5) or the above mononitro deriv. on further nitration with HNO_3 (D = 1.52) at 65° (9) yields 3,5-dichloro-2,6-dinitrotoluene, ndls. from alc., m.p. 99–100° (5); note that the crude dinitration prod. often melts about 90° (9), probably because of contamination with 3,5-dichloro-2,4-dinitrotoluene, m.p. 127° (9).

$\bar{C}$ on oxidn. with dil. HNO_3 (5) (10) in s.t. at 170° (3) yields 3,5-dichlorobenzoic acid (3:4840), m.p. 188°.

$\bar{C}$ on sulfonation with fumg. H_2SO_4 yields (5) (11) 3,5-dichlorotoluenesulfonic acid-2, (corresp. sulfonyl chloride, m.p. 44–45° (5) (11), corresp. sulfonamide, m.p. 168–169° (5) (11)).

(Benzylidene (di)chloride, V_1-(152)
α,α-dichlorotoluene; V_2-(232)
ω,ω-dichlorotoluene)

B.P.	F.P.	
[207° cor. (1)]	−16.0° to −16.2° cor. (9)	D_4^{14} = 1.2557 (1)
	−16.1° cor. (10)	n_D^{20} = 1.5503 (8)
205.2° at 760 mm. (2)	−16.4° (11)	1.5502 (13)
205.15° at 760 mm. (3)	−17.0° (12)	
205° (37)	−17.4° (2)	D_4^0 = 1.2699 (4)
203.5° at 756.2 mm. (4)		$n_D^{19.4}$ = 1.5515 (14)
203.5° (5)		See Note 2. See Note 3.
201° (6)		
118° at 60 mm. (7)		
104–105° at 30 mm. (8)		
See Note 1.		

Note 1. The b.p. of 214° given by (15) appears without justification.

Note 2. $D_4^{56.8}$ = 1.2122 (4); $D_4^{79.2}$ = 1.1877 (4); $D_4^{135.5}$ = 1.1257 (4).

Note 3. The value of n_D^{20} for mixtures of C̄ with benzyl chloride (3:8535) (n_D^{20} = 1.5391 (13)) is a linear function of their composition (13).

[*See also benzyl chloride* (3:8535) *and benzotrichloride* (3:6540).]

Ordinary comml. C̄, usually obtd. by chlorination of toluene, frequently conts. benzyl chloride (3:8535) and benzotrichloride (3:6540), which are difficult (if not impossible) to remove by distillation methods. For purification of C̄ by repeated fractional freezing see (5); for patent on purification of C̄ from inorganic contaminants see (16). The best approach to pure C̄ is from benzaldehyde by action of PCl_5 (see below).

C̄ is insol. aq.; sol. alc., ether, or below −20° in equal vol. of pet. ether (17).

[For a method for quant. detn. of C̄ in mixtures with benzyl chloride (3:8535) and benzotrichloride (3:6540) see (18); for a rapid combustion method for detn. of chlorine in C̄ see (19).]

PREPARATION OF C̄

From benzaldehyde. [For prepn. of C̄ from benzaldehyde (1:0195) with PCl_5 (yield: 80–85% (20)) (21) in $CHCl_3$ (9), with $POCl_3$ in C_6H_6 (22), with $SOCl_2$ (23) (24), with $COCl_2$ (3:5000) in s.t. at 120–130° (25), with oxalyl (di)chloride (3:5060) in s.t. at 130–140° for 2 hrs. (26), or with succinyl (di)chloride (3:6200) in s.t. at 100° (27) see indic. refs.]

From toluene. [For prepn. of C̄ from toluene (1:7405) with SO_2Cl_2 (2 moles) in presence of a trace of dibenzoyl peroxide refluxed for 6 hours (90% yield (8)), with $SOCl_2$ in s.t. at 230–250° (28), with PCl_5 in s.t. at 190–195° for 2 hours (29), or with NOCl at 350° (30) see indic. refs.]

[For studies of formn. of C̄ from toluene (1:7405) with Cl_2, especially in light, see the scientific papers (13) (31) (32) (33) and patents (34) (35) (36).]

From other sources. [For formn. of C̄ from benzyl chloride (3:8535) with Cl_2 (37) (38), with NOCl at 150° (39), or with $PbCl_4.2NH_4Cl$ (40) see indic. refs.; from various benzyl ethers by cleavage with PCl_5 see (41); from α-chlorobenzyl chloroformate [Beil. VII-211] by loss of CO_2 on distn. see (42); or from benzaldazine with NOCl see (43).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis. [$\bar{C}$ passed over red-hot Pt wire gives (44) HCl and both *cis* (3:1380) and *trans* (3:4210) tolane dichlorides (*α,α′-dichloro-α,α′-diphenylethylenes*).]

Reduction. [$\bar{C}$ with H_2 in pres. of Pd/$CaCO_3$ (45) or Ni (46) in alc KOH loses all its halogen as HCl (use in quant. detn.) but the corresp. org. reduction prod. has not been characterized. — $\bar{C}$ with H_2 in pres. of colloidal Pd in dil alc. gives (47) toluene (1:7405), benzyl chloride (3:8535), and *α-stilbene dichloride* (3.4854). — $\bar{C}$ *in MeOH/KOH* with hydrazine hydrate in pres. of Pd gives (19% yield (48)) α-stilbene dichloride (3.4854).]

Hydrolysis. $\bar{C}$ upon hydrolysis yields benzaldehyde (1 0195) and HCl; frequently the reaction is so executed that the benzaldehyde reacts further according to the nature of the environment; examples of both types of reaction are cited below.

[$\bar{C}$ with aq. in s.t. at 140–160° (1), with aq in pres. of ferric salts (49) or metallic Fe (50) below 100°, with 50% aq. acetone at 72° (59), with conc. H_2SO_4 (2 moles) at 50° subsequently poured into aq. (51), with H_3BO_3 (1 mole) at 130–160° (52) (note that benzyl chloride (3:8535) is unaffected while benzotrichloride (3.6540) gives benzoic acid (1:0715)), with boilg. aq. K_2CO_3 (53), *with moist* $NiCO_3$ *at 120° or moist* $CoCO_3$ at 60° for 3 hrs. (60), with aq. Na_2SO_3 at 110° (54), with ZnO in C_6H_6 followed by aq. (55), with anhydrous formic acid (56) (57), or with anhydrous oxalic acid at 130° (58) gives (yields: 85% (52), 82% (58), 79% (51), 76% (60), 75% (59), 70% (54), 30% (55)) benzaldehyde (1:0195).]

[For study of kinetics of *hydrolysis of* $\bar{C}$ *at* 30° and 60° *in aq.* acetone either directly or in pres. of H_2SO_4 or KOH see (61), with aq. or KOH in 95% alc. see (62): for study of influence of substituents on hydrolysis of $\bar{C}$ see (61) (63) (64)]

[$\bar{C}$ with AcOH + $ZnCl_2$ gives (65) benzaldehyde (1·0195) + acetyl chloride (3:7065) + HCl. — $\bar{C}$ with anhydrous alkali acetate at 180–200° for 10–20 hrs. gives (66) cinnamic acid (1:0735) — $\bar{C}$ with AgOAc (32) (1) (67) or with PbO in AcOH (68) gives benzal diacetate [Beil VII-210, VII_1-(119)], m.p. 45–46°.]

Alcoholysis. [$\bar{C}$ with EtOH + $ZnCl_2$ gives (65) benzaldehyde (1:0195) + ethyl chloride (3:7015) + HCl; an analogous reaction occurs with $\bar{C}$ + $ZnCl_2$ + aromatic alcohols (69). — $\bar{C}$ with sodium alcoholates under ord. press. gives the corresp. benzaldehyde acetals: e g., $\bar{C}$ with MeOH/NaOMe at 100° for 15 hrs. gives (15% yield (70)) (67) benzaldehyde dimethylacetal [Beil. VII-209], b.p. 194–196°; $\bar{C}$ with EtOH/NaOEt at 100° for 24 hrs. gives (33% *yield* (70)) (67) benzaldehyde *diethylacetal* [Beil. VII-209, VII_1-(119)], b.p. 222°. — However, $\bar{C}$ with sodium alcoholates under press. in s.t. gives (70) benzaldehyde (1:0195) together with the corresp. alkyl chlorides.]

Substitution. *Chlorination* [$\bar{C}$ with Cl_2 in pres. of I_2 gives (32) *p*-chlorobenzal (di)-chloride (3:6700) — *Note, however, that* $\bar{C}$ with excess liquid Cl_2 in s.t. in sunlight gives (71) an addn. prod., viz., benzal (di)chloride hexachloride, m.p. 153° (71); *also that* $\bar{C}$ with NOCl at 150° substitutes in the side chain giving (39) benzotrichloride (3:6540). — Note further that $\bar{C}$ with SO_2Cl_2 + dibenzoyl peroxide does *not* react even when refluxed for 20 hrs. (8); cf. prepn. of $\bar{C}$ from toluene by this method (above).]

Bromination. [$\bar{C}$ with Br_2 in pres. of metallic beryllium gives (72) *p-bromobenzal (di)-bromide*, b p. 170–171° at 10 mm. (72). — $\bar{C}$ with Br_2 at 120–140° gives (57) benzodichloride bromide, $C_6H_4CCl_2Br$, b p. 88–94° at 1 mm., and benzochloride dibromide, $C_6H_5OClBr_2$, b p. 98–103° at 1 mm.]

Sulfonation. [$\bar{C}$ with SO_3 does *not* sulfonate but instead undergoes hydrolysis: e.g., $\bar{C}$ with sulfuric acid monohydrate at 35° gives (73) a mixt. of benzaldehyde-sulfonic *acids in* the ratio 10% *o-* + 30% *m-* + 60% *p-*, although these products cannot be isolated as such.]

Nitration. [All three isomeric mononitro derivatives *of* $\bar{C}$ are known, viz , *o*-nitrobenzal (di)chloride [Beil. V-332, V_1-(163)], m.p. 27.5° (63), 26–26.5° (61), 25 7° (11); *m*-nitrobenzal (di)chloride [Beil. V-332, V_1-(163), V_2-(254)], m.p. 64.5–65° (61), 64.5° (11); *p-nitrobenzal*

(di)chloride [Beil. V-332, V_1-(163), V_2-(255)], m.p. 43.0–43.5° (61), 43° (63), 42.8° (11); however, they are best prepared by reaction of the corresp. nitrobenzaldehydes with PCl_5 (74) (75). — For thermal anal. of mixtures of the three nitrobenzal (di)chlorides see (11). — For study of the mononitration of C̄ with anhydrous HNO_3 in Ac_2O at 20° giving about 23% *o*- + 34% *m*- + 43% *p*- see (11) cf. (76). — Note that neither dinitro nor trinitro derivatives of C̄ have been reported]

Behavior with other inorganic reactants. *C̄ with metals.* [C̄ with Na on htg gives (1) stilbene (1:7250). For behavior of C̄ with Na in liq. NH_3 giving dibenzyl, benzylamine, and other products see (80). — C̄ with equal wt. of Cu powder at 100° for 12 hrs. couples with loss of 2 Cl giving (77) α-stilbene dichloride (3:4854). — C̄ on boiling with Cu in aq Na_2CO_3 for 24 hrs. gives (78) benzaldehyde-copper, $2C_6H_5.CHO.Cu$, green cryst., decg. about 220° without melting. — C̄ with Cu in pyridine reacts vigorously (79), but the products have not been characterized.]

C̄ with inorganic salts. [C̄ with $AlCl_3$ in pet. eth. or CS_2 evolves HCl and resinifies (37); C̄ with very small amt. $AlCl_3$ at −15° gives (small yield (81)) phenyl-*m*-dichloromethylphenylchloromethane, b.p. 285° at 750 mm.]

[C̄ with SbF_3 on htg gives (82) (83) benzal (di)fluoride [Beil. V-290, V_1-(149), V_2-(224)], b.p. 139.95° (83), $D^{20}_{-} = 1.13572$ (84), $n^{20}_{D} = 1.45775$ (84).]

[C̄ with alc. Na_2S under N_2 gives (85) cf. (86) monomeric thiobenzaldehyde, but this cannot be isolated since it immediately undergoes polymerization to β-trithiobenzaldehyde and/or other reactions. — C̄ with alc. NaSH refluxed 3–4 hrs. gives (86) dibenzyl disulfide [Beil. VI-465, VI_1-(229), VI_2-(437)], m.p. 69–70° (86).]

[C̄ with conc. aq. NH_4OH on stdg. 4 months at ord. temp. (87), or C̄ with alc. NH_4OH in s t. at 100° (88), or C̄ with alc. NH_4OH + trace of Zn dust at room temp. (88), gives hydrobenzamide [Beil. *VII-215, VII_1-(120)*], m.p. *110°, doubtless through intermediate* hydrolysis to benzaldehyde since this can sometimes (88) be isolated.]

Behavior with organic reactants. *C̄ with hydrocarbons.* [C̄ with C_6H_6 in pres of $AlCl_3$ (37) (89), Cr (90), $BeCl_2$ at 130–140° for 20 hrs. (91), or Zn dust (92) undergoes Friedel-Crafts reaction giving (yields: 28.7% (91), 19.5% (90), 13.4% (37)) triphenylmethane (1:7220) frequently accompanied (37) (89) by other products such as diphenylmethane (1:7120) and triphenylchloromethane (3:3410). — C̄ with C_6H_6 + Al + $HgCl_2$ at 50–55° gives (93) cf. (89) 9, 10-diphenyl-9, 10-dihydroanthracene [Beil. V-745, V_2-(681)], m.p 164° *(89), 159° (93).]*

[C̄ with toluene in pres. of $BeCl_2$ refluxed 3 hrs. gives (73% yield (91)) phenyl-di-*p*-tolylmethane (4,4′-dimethyl-triphenylmethane) [Beil. V-712, V_1-(352), V_2-(623)], accompanied by other products. — C̄ with toluene + Al + $HgCl_2$ at 60–70° for 2 hrs. gives (93) a hydrocarbon $C_{28}H_{24}$, m.p. 185°, possibly having the structure 9,10-di-*p*-tolyl-9,10-dihydroanthracene.]

[C̄ with *o*-xylene (1:7430) + $AlCl_3$ in acetylene tetrachloride (3:5750) as solvent gives *(very small yield (94)) 2,3,6,7-tetramethyl-9,10-diphenylanthracene, m.p. 312°; note that* this product has composition $C_{30}H_{26}$ and is *not* a dihydroanthracene deriv.]

[For use of C̄ + conc. H_2SO_4 as a color test for various aromatic hydrocarbons see (95) (96).]

C̄ with phenols. [C̄ with phenol at 120° for 10 hrs. condenses with loss of HCl giving (87% yield (70)) 4,4′-dihydroxy-triphenylmethane (leucobenzaurin) [Beil. VI-1042, VI_1-(1010)], ndls. from aq alc. or from $CHCl_3$, m.p. 160–161° (corresp. diacetate, m p. 115° (97)): this prod. is also obtd. from benzaldehyde (1:0195) by condensation with phenol (1:1420) in pres. of H_2SO_4 (yields: 25% (98), 22% (99)) or H_3PO_4 (100): note that the isomeric benzaldehyde diphenylacetal is unreported. For formn. of resin from C̄ with phenol see (101).]

[$\bar{C}$ with 2 moles β-naphthol (*1:1540*) on htg. condenses with loss of $HCl + H_2O$ giving (97% yield (102)) (103) 9-phenyl-1,2,7,8-dibenzoxanthene [Beil. XVII-98], pr. or tbls. from AcOH, m.p. 190–191° (103), 190° (102); this prod is also obtd from benzaldehyde (1:0195) by condensation with β-naphthol in AcOH in s t. at 200° for 2 days (104) or in pres. of H_2SO_4 (104) at 100°; see also under benzaldehyde (1:0195) for use as test for latter.]

$\bar{C}$ with amines [$\bar{C}$ with aniline (2 moles) in pres. of Zn dust (92) or $BeCl_2$ at 120–125° for 2 hrs. (91) condenses giving (54% yield (91)) 4,4′-diamino-triphenylmethane [Beil XIII-274, $XIII_1$-(89)], cryst. from C_6H_6 with 1 mole solvent, m p. 106° (106), 104–105° (92), cryst. from dry ether without solvent, m p. 139–140° (106), 139° (107) (corresp. diacetyl deriv., m.p 233–234° (108) (109)); this compound is also obtd. from benzaldehyde (*1:0195*) *by condensation with 2 moles aniline in various ways, e g., see* (108) (106) (107).]

[$\bar{C}$ with *N,N*-dimethylaniline (2 moles) in pres of $ZnCl_2$ at 100° (110) condenses giving 4,4′-*bis*-(dimethylamino)-triphenylmethane (*leuco*-Malachite Green) [Beil. XIII-275, $XIII_1$-(89)], cryst. from C_6H_6 or alc in 3 forms, m p 102° (111) (112), m p. 93–94° (111), 92–93° (112), and 77° (112) cf (111); this prod is also obtd. from benzaldehyde (1:0195) *by condensation with 2 moles N,N-dimethylaniline in various ways, e.g., with $ZnCl_2$ at 100°* (113) (112), or with $POCl_3$ (alm. 100% yield (114))]

[For study of reactivity of $\bar{C}$ toward pyridine or piperidine see (115).]

$\bar{C}$ with other nitrogenous reactants [$\bar{C}$ (excess) with thiourea at not above 150° gives (116) (117) a salt, $C_9H_9N_3S_2$ HCl, m p. 236° (117), regarded as 4,6-di-imino-2-phenyl-*1,3,5-dithiazane (117). — For analogous behavior of $\bar{C}$ with N-phenylthiourea and with* *N*-(*p*-tolyl)-thiourea see (117)]

[$\bar{C}$ with Zn salt of *o*-aminophenyl mercaptan in AcOH/NaOAc refluxed 30 min. in current of H_2S gives (low yield (118)) 2-phenylbenzothiazole, m.p. 114° cor.]

$\bar{C}$ with organometallic reactants [$\bar{C}$ with MeMgI gives (22% yield (119)) α-stilbene *dichloride* (3:4854) + ethane but no isopropylbenzene (cumene) or *sym.*-dimethyldiphenylethane; however, $\bar{C}$ with MeMgCl gives (120) no α-stilbene dichloride but instead a mixture of four other compds., viz, isopropylbenzene (cumene) (1:7440), 1-chloro-1,2-diphenylpropane, and two forms of 2,4-diphenylbutane.]

[$\bar{C}$ with C_6H_5MgBr gives (119) cf. (121) triphenylmethane (1:7220) + α-stilbene dichloride (3:4854) + biphenyl (1:7175)]

[$\bar{C}$ with Me_2Zn gives (122) isopropylbenzene (cumene) (1:7440).]

[$\bar{C}$ does not react with Hg di-*p*-tolyl even on refluxing in toluene for 300 hrs (123).]

Ⓟ **Hydrolysis to benzaldehyde:** $\bar{C}$ on boilg. with 10% K_2CO_3 soln. gives benzaldehyde *(1:0195); after acidification with HCl the benzaldehyde may be detected with fuchsin* aldehyde reagent. (Dif. from *pure* benzyl chloride (*3:8535*) or *pure* benzotrichloride (3.6540).)

Ⓓ **Benzaldehyde phenylhydrazone:** m.p. 156° u.c. [From $\bar{C}$ with 3 moles phenylhydrazine refluxed in alc for 2 hrs. (55% yield (124)); note that from the mother liquor small amounts of an isomeric (γ) benzaldehyde phenylhydrazone, m.p. 154–155°, are obtd. (124).]

Ⓓ **Benzaldehyde semicarbazone:** m p. 219–220° u.c. (124). [From $\bar{C}$ (3.2 g.) with semicarbazide hydrochloride (4.4 g) + Na_2CO_3 (2.1 g.) refluxed a few hrs. in alc. and the ppt. recrystd. from hot aq. (124); note that the m.p. of this prod. varies somewhat with rate of htg. cf. (1:0195).]

[For prepn. of $\bar{C}$ from 2-chloro-3-aminotoluene [Beil. XII-870, XII_1-(404)] via diazotization and use of Cu_2Cl_2 reaction (alm. quant. yield (2), 64% (8)) see indic. refs.; for formn. of $\bar{C}$ (together with other dichlorotoluenes) from toluene or *o*-chlorotoluene (3:8245) with Cl_2 in pres. of $FeCl_3$ or $MoCl_5$ see (3) (4), from *o*-chlorotoluene + Cl_2 + Al/Hg see (4).]

[$\bar{C}$ with Cl_2 in pres. of Al/Hg gives (70% yield (5)) 2,3,4-trichlorotoluene (3:0425), m.p. 41°.] [$\bar{C}$ with Br_2 at 180–200° gives (8) 2,3-dichlorobenzal (di)bromide (not isolated) which on hydrolysis with conc. H_2SO_4 gives (71% yield (8)) 2,3-dichlorobenzaldehyde (3:1480).]

$\bar{C}$ on mononitration with conc. HNO_3 (6) or cold mixt. of 2 pts. conc. HNO_3 + 3 pts. conc. H_2SO_4 (2) yields 2,3-dichloro-4-nitrotoluene [Beil. V-332], ndls. from alc. + AcOH, m.p. 50.5–51.5° (2), 51° (6); $\bar{C}$ on dinitration with mixt. of 7 pts. fumg. HNO_3 + 3.5 pts. conc. H_2SO_4 yields (2) 2,3-dichloro-4,6-dinitrotoluene [Beil. V-345], cryst. from AcOH or alc., m.p. 71–72° (2).

$\bar{C}$ on oxidn. with alk. $KMnO_4$ (6) or with dil. HNO_3 for some hrs. in s.t. at 140° (2) (6) yields 2,3-dichlorobenzoic acid (3:4650), m.p. 166° (6), 163° (2).

$\bar{C}$ on sulfonation with 2 pts. 10% oleum at 50° gives (7) mixt. of 89% 2,3-dichlorotoluenesulfonic acid-6 (corresp. sulfonyl chloride, m.p. 51–52° (7), corresp. sulfonamide, m.p. 228° (7)) and 11% 2,3-dichlorotoluenesulfonic acid-5 (corresp. sulfonyl chloride, m.p. 87° (7), corresp. sulfonamide, m.p. 185° (7)).

Oil with fragrant odor. — Insoluble aq.

[For prepn. of $\bar{C}$ from *sym.*-heptachloropropane (3:6860) by loss of HCl in presence of $AlCl_3$ in CCl_4 at 60–70° (83% yield) see (3); from *asym*-heptachloropropane (3:0200) by htg. at 250–420°, especially in presence of $ZnCl_2$ or CuCl (4) (with latter tetrachloroethylene (3:5460), is also formed (4) (5)), or by htg with alc. KOH at 50–60° (90% yield (6)) (1); from heptachloro-*n*-butyraldehyde [Beil. I_1-(346)] by actn. of 2 moles NaOEt see (7).]

$\bar{C}$ with $AlCl_3$ + 1 mole trichloroethylene (3.5170) in CH_2Cl_2 (3:5020) or $CHCl_3$ (3:5050) at 30–37° gives (82% yield (6)) 1,1,2,3,3,4,5,5,5-nonachloropentene-1, colorless liq. with cedar-like odor, b.p. 128° at 2–3 mm., 86° at 0.2 mm., D_{20}^{20} = 1.812, n_D^{20} = 1.5703 (6): with excess trichloroethylene (3:5170) prod. is mixt. consisting exclusively of two dodecachloroheptenes, $C_7H_2Cl_{12}$, one m p. 94–96°, the other, m.p. 58–62° (6).

$\bar{C}$ with $AlCl_3$ + 1,2-dichloroethylene (3:5030) in CH_2Cl_2 soln. yields (8) a single 1,1,2,3,- [illegible] 13–113.5° at 2 mm., D_{21}^{21} = 1.749, [illegible] (80% yield (8)) a mixt. of penta- [illegible]

$\bar{C}$ forms with $AlCl_3$ at 80° a yel. cryst. addn.-prod. sparingly sol. in CCl_4 but regenerating $\bar{C}$ upon treatment with aq. (8).

$\bar{C}$ on cautious warming with conc. H_2SO_4 (9) (10) (2) (11) or on boilg. with an aqueous suspension of $BaCO_3$ (2) yields α,β,β-trichloroacrylic acid (3:1840) spar. sol. cold aq., eas. sol. hot aq., pr. from CS_2, m.p. 76° (2).

$\bar{C}$ does not add Br_2 (10), but $\bar{C}$ in sunlight adds Cl_2 yielding (10) octachloropropane (3:4450) q.v.

$\bar{C}$ with alc. NaOEt yields (1) triethyl *ortho*-α,β,β-trichloroacrylate, b.p. 236–237°, D_4^{20} = 1.2183, n_D^{20} = 1.4649 (1). [This *ortho* ester on htg. with 2 vols. conc. HCl yields (1) ethyl α,β,β-trichloroacrylate, b.p. 192–194°, D_4^{20} = 1.3740, n_D^{20} = 1.4889 (1), which can be hydrolyzed by conventional methods to α,β,β-trichloroacrylic acid (see above).]

[*See also ethyl α-chloroacetoacetate* (3:6207).]

Colorless limpid liq. which soon turns yellow (4). — Almost insol. aq. but miscible with most org. solvents. — [Note that purity of material of earlier workers (5) has been seriously questioned (2).]

[For prepn. of $\bar{C}$ from acetylketene (ketene dimer (6) (7)) by conversion with Cl_2 to γ-chloroacetoacetyl chloride (3:9088) and reactn. of the latter with excess abs. EtOH at 0° see (3); from ethyl chloroacetate (3:5700) (2 moles) with Mg (1 mole) in dry ether contg. $HgCl_2$ (56% yield (1)) cf. (19) or with Mg in dry ether contg. I_2 (35% yield (4)) or with

Al/Hg in pres. of a trace of EtOH (8) see indic. refs.; from chloroacetaldehyde (3:7212) with ethyl diazoacetate see (5); from ethyl γ-chloro-β-hydroxy-n-butyrate [Beil. III-310, III_1-(116)] by careful oxidn. with $K_2Cr_2O_7 + H_2SO_4$ (poor yield) see (9).]

$\bar{C}$ on hydrolysis with aq. HCl for 3 hrs undergoes ketonic splitting yielding (1) chloroacetone (3:5425) + CO_2 + EtOH (note that this does not distinguish $\bar{C}$ from *ethyl α-chloroacetoacetate which yields same products*).

[$\bar{C}$ with alc. NaOEt at 100° undergoes bimolecular condensation with loss of 2 HCl yielding (10) diethyl succinylosuccinate [Beil. X-894, X_1-(434)], m.p. 125–126° (10); this same condensation is also effected by other alkaline agents, e.g., sodium phenolate, dil. aq. NaOH, NH_4OH, NH_3 in ether, KOAc alone or in pres. of alc. or C_6H_6, diethyl sodiomalonate or Me_2NH in C_6H_6, or K phthalimide (10).]

[$\bar{C}$ with ethyl orthoformate (1:3241) in Ac_2O refluxed for ½ hr. ppts. on cooling (45% yield (11)) ethyl γ-chloro-α-ethoxymethylene-acetoacetate, colorless ndls. from alc. or C_6H_6, m.p 98° (11).]

Note that $\bar{C}$ is capable of displaying keto-enol tautomerism as is shown by the following reactions:

$\bar{C}$ with $FeCl_3$ soln. gives red coloration (1) (4) (9) (19); $\bar{C}$ conts. 10.9% enol, but 4% soln. of $\bar{C}$ in ether conts. 53% enol. (19).

$\bar{C}$ forms a series of metallic salts of the enolic form; these are in general insol. in aq. but soluble in org solvents: e.g., $Cu(C_6H_8O_3Cl)_2$ (from $\bar{C}$ on shaking with aq. $Cu(OAc)_2$), green ndls. from C_6H_6, m.p. 168–169° dec. (9) (4) cf. (19), 167.5° dec. (1), 163° (8); $Mg(C_6H_8O_3Cl)_2$ (from $\bar{C}$ shaken with aq. $MgSO_4 + NH_4Cl$), m.p. 170° (1); $Zn(C_6H_8O_3Cl)_2$ (from $\bar{C}$ on shaking with $NH_4OH/ZnSO_4$), m.p. 121° (1); $Ni(C_6H_8O_3Cl)_2$ (from $\bar{C}$ on shaking with $Ni(OAc)_2 + NH_4OH$), m.p. 131–132° (1); other metals behave similarly (1).

$\bar{C}$ couples with *diazonium salt solns. in pres. of NaOAc yielding the corresp. α-(arylhydrazones)* of ethyl γ-chloro-α,β-diketo-n-butyrate (ethyl γ-chloro-α-(arylazo)acetoacetates (cf. dif. behavior of isomeric ethyl α-chloroacetoacetate (3:6207)): e.g., $\bar{C}$ with benzenediazonium chloride soln. in pres. of NaOAc at 0° gives (12) (13) ethyl γ-chloro-β-keto-α-phenylhydrazono-n-butyrate, sparing sol. yel. ndls. from alc., m.p. 92–93° (12) (13), 92° (14) (note that this prod. on htg. with alc. KOAc loses HCl and ring-closes to 3-carbethoxy-4-hydroxy-1-phenylpyrazole, colorless pr. from alc., m.p. 85° (14) (15)); similarly $\bar{C}$ with p-nitrobenzenediazonium chloride soln. in pres. of NaOAc at 0° gives (16) ethyl γ-chloro-α-(p-nitrobenzeneazo)acetoacetate, yel. ndls. from alc., m.p. 135° (16) (note that this prod. with hot alc. KOAc loses HCl and ring-closes to 3-carbethoxy-4-hydroxy-1-(p-nitro)phenylpyrazole, colorless ndls. from AcOH, m.p. 220° (16). — [For analogous reactions of $\bar{C}$ with numerous other diazonium salts see the papers represented by (16) (14) (17).]

$\bar{C}$ with thiourea on warming in alc. for 4 hrs. loses HCl and ring-closes yielding (9) ethyl (2-aminothiazolyl-4)acetate, colorless cryst. from C_6H_6, m.p. 94° (18), 74° (9) (one of these is probably a misprint for the other).

[C̄ with phenol in toluene yields (13) 2-(o-chlorobenzyl)phenol, b.p. 146–151° at 3 mm. (benzoate, b.p. 173–176° at 2.5 mm.), and o-chlorobenzyl phenyl ether, b.p. 140–145° at 2.5 mm., C̄ with 2,4-dichlorophenol (3:0560) in toluene yields 2-(o-chlorobenzyl)-4,6-dichlorophenol, m.p. 59.5–60.5° (benzoate, m.p. 81–82°), and o-chlorobenzyl 2,4-dichlorophenyl ether, m.p. 61–62°.]

[C̄ with phenol + $AlCl_3$ yields (13) 4-(o-chlorobenzyl)phenol, m.p. 68–69° (benzoate, m.p. 64.5–65.5°), and 2-(o-chlorobenzyl)phenol (see above); C̄ with 2,6-dichlorophenol (3:1595) + $AlCl_3$ yields (13) 4-(o-chlorobenzyl)-2,6-dichlorophenol, m.p. 86.5–87.5° (benzoate, m.p. 86–87°).]

[C̄ with Mg in 10 moles dry ether gives (60–75% yield (4)) cf. (25) $o\text{-}Cl.C_6H_4.CH_2MgCl$ (particularly sensitive to air oxidn.); this with CO_2 followed by acidification or with methyl chloroformate (3:5075) followed by hydrolysis yields (4) o-chlorophenylacetic acid, m.p. 94–95° (3:2640); the R.MgCl cpd. with phenyl isocyanate as directed (22) for p-isomer should yield o-chlorophenylacetanilide [Beil. XII-275], m.p. 140° cor. (23), 138.5° (24), although this method has not been specifically reported for C̄; the RMgCl cpd. with $HgCl_2$ gives (25) o-chlorobenzyl HgCl, m.p. 111°, or with $HgBr_2$ gives (25) o-chlorobenzyl HgBr, m.p. 128°.]

[For study of behavior of C̄ with NaOEt see (14) (7); for study of rate of reaction of C̄ with LiI, NaI, or KI (6) (5) or with Na_2SO_3 (2) see indic. refs., for study of acid hydrolysis of C̄ in various solvents see (5); for reaction of C̄ with KCN yielding o-chlorobenzyl cyanide (which on hydrolysis gives o-chlorophenylacetic acid (3:2640)) see (15) (16); for behavior of C̄ with cellulose (17) or sodium cellulose (18) see indic. refs.]

C̄ refluxed 4 hrs. with hexamethylenetetramine (1 mole) in 60% alc. soln. yields (19) o-chlorobenzaldehyde (3:6410) q.v.; C̄ htd. in xylene with p-nitrophenylhydrazine yields (20) o-chlorobenzal-p-nitrophenylhydrazone, m.p. 241° (20).

C̄ on mononitration with 1.2 pts. fumg. HNO_3 at 30–40° gives (35% yield (21)) 2-chloro-5-nitrobenzyl chloride, pr. from alc., m.p. 66° (21).

Oil, volatile with steam. — C̄ often contains *o*-[illegible]benzyl chloride (3:6400) as impurity (7). — C̄ very easily oxidized in air (probabl[illegible]use of variant constants). — C̄ yields $NaHSO_3$ cpd. (15) (21).

[For prepn. of C̄ from *o*-chlorotoluene (3:8245) with $MnO_2 + H_2SO_4$ (8), or PbO_2 (24% yield (21)), or CrO_2Cl_2 in CCl_4 (9) or CS_2 (10), or via halogenation to *o*-chlorobenzal (di)chloride (3:6625) (5) (12) or *o*-chlorobenzal (di)bromide (11) and subsequent hydrolysis with fumg. H_2SO_4 (11) (12) (1) or anhydrous oxalic ac. (14) see indicated refs.; for prepn. from *o*-nitrobenzaldehyde via *o*-aminobenzaldehyde see (12); from *o*-chlorobenzyl alc. by dehydrogenation with CuO + dinitrobenzene in quinoline (86% yield) see (13); from *o*-chlorobenzyl chloride (3:6400) [illegible] chloride (3:6640) by cat. reduc[illegible] formalin + hexamethylenetetramine see (1); for other misc. methods see [illegible]

C̄ with CrO_3 (16) or $KMnO_4$ (2) oxidizes to *o*-chlorobenzoic acid (3:4150), m.p. 141°. [For study of auto-oxidn. see (17).] — C̄ on cat. hydrogenation gives (yield: 90% (18); 50% (19)) *o*-chlorobenzyl alc., m.p. 69° (19), 64-65° (18). — C̄ with conc. alk. undergoes Cannizzaro reactn. (for study on dioxane soln. see (20)) although presumable products, *o*-chlorobenzyl alc. and *o*-chlorobenzoic acid, have not (by this reactn.) actually been isolated.

C̄ with dil. alc. KCN for 4 hrs. at 60° gives (21% yield (22)) 2,2′-dichlorobenzoin, m.p. 63-64° (22). — C̄ with KCN + HCl yields *o*-chloromandelonitrile which on hydrolysis with HCl gives *o*-chloromandelic acid, m.p. 84-85° (23).

C̄ on htg. with NaOAc + Ac_2O for 8 hrs. at 180-200° undergoes Perkin reactn. giving (71% yield (12)) *o*-chlorocinnamic acid, m.p. 211° (12). [This with Br_2 in $CHCl_3$ gives (24) *o*-chlorocinnamic acid dibromide, m.p. 183° (24).] — C̄ + malonic acid + pyridine gives (38) alm. quant. yield of *o*-chlorocinnamic ac., m.p. 211-212° (31). [In absence of pyridine reactn. gives 93% yield *o*-chlorobenzalmalonic acid, m.p. 102° (37).]

C̄ on mononitration as specified (25) gives 2-chloro-5-nitrobenzaldehyde, cryst. from

dil. AcOH, m.p. 78–79° (25), 80° (26). [Oxime, m.p. 147–148° (26); *corresp.* acid, 2-chloro-5-nitrobenzoic acid, m.p. 165° (25).]

C̄ in alc. warmed at 58–60° for 2 hrs. with $(NH_4)_2CO_3$ + KCN as directed (37) gives 5-(*o*-chlorophenyl)hydantoin, m.p. 175.7–176.1° cor. (37).

[C̄ with hydrazine sulfate gives (91–95% yield (40)) *o*-chlorobenzaldazine, m.p. 143.5° cor., but C̄ with hydrazine hydrate gives (84% yield (40)) *o*-chlorobenzaldehyde hydrazone m.p. 33–34°, b.p. 165–170° at 14 mm.; note that latter on Wolff-Kishner reduction gives (35–82% yield (40)) *o*-chlorotoluene (3:8245).]

- Ⓓ *o*-Chlorobenzaldoxime (*anti* form): pr. from alc., m.p. 75–76° (1) (27). [From C̄ + $NH_2OH.HCl$ + Na_2CO_3 (1); the *sym.* isomer has m.p. 98–102° (28), 101–103° (7).]
- Ⓓ **o-Chlorobenzaldehyde phenylhydrazone**: m.p. 86° (29), 84° (39).
- Ⓓ **o-Chlorobenzaldehyde p-nitrophenylhydrazone**: or. pl., m.p. 249° (30) (31); br.-red. ndls., 241° (32); red ndls. from alc., 237–238° (13).
- Ⓓ **o-Chlorobenzaldehyde 2,4-dinitrophenylhydrazone**: or.-red. ndls. from xylene, m.p. 209° (33), 213.6° (34) 207° (41). [Use in detn. of C̄ (11).]
- Ⓓ **o-Chlorobenzaldehyde dimethone**: ndls. from alc., m.p. 199° u.c., 205° cor. (35). [Corresp. anhydride, cryst. from alc., m.p. 224–226° cor. (35).]
- Ⓓ **o-Chlorobenzaldehyde semicarbazone**: lfts. from MeOH, m.p. 229–230° (36), tbls. from pyridine, m.p. 225–226° (9), 226° (42).

For thermal anal. of mixts. of C̄ with 1,2,3-trichlorobenzene (3:0990) or with 1,3,5-trichlorobenzene (3:1400) see (10) (the eutectic of C̄ with the former conts. 71% C̄ and melts 2.7° (10)); for m.p./compn. data on ternary mixt. of C̄ with the other two isomers see (10).

[For use of C̄ in mfg. of elec. insulating material see (16).]

[For prepn. of C̄ from 2,4-dichloroaniline [Beil. XII-621; XII_1-(309)] (1) (11), from 2,5-dichloroaniline [Beil. XII-625, XII_1-(311)] (6), or 3,4-dichloroaniline [Beil. XII-626 XII_1-(311)] (1) via diazotization and use of Cu_2Cl_2 reaction see indic. refs.; from 4-chloro-1,3-diaminobenzene [Beil. XIII-53, $XIII_1$-(15)] via tetrazotization and use of Cu_2Cl_2 reaction (62% yield) see (17); from *p*-dichlorobenzene (3:0980) with S_2Cl_2 in SO_2Cl_2 + $AlCl_3$ (58% yield C̄) see (3) (18).]

[For formn. of C̄ from 2,3,6-trichlorobenzaldehyde (3:2287) by KOH fusion (88% yield (4)) or from 2,3,6-trichloroacetophenone by KOH fusion (82% yield (14)) see indic. refs.; from 2,4-dichlorophenol (3.0560) by htg. 7 hrs. with PCl_5 (25.5% yield) see (1); from 2-nitro-1,4-dichlorobenzene or from 4-chloro-3-nitrobenzenesulfonic acid by htg. with $SOCl_2$ in s.t. 10 hrs. at 160–180° see (19) (20); from 2-chlorobenzene-1,4-disulfonyl chloride with PCl_5 in s.t. 4 hrs. at 210° see (8); from 2,4-dichlorobenzenesulfonyl chloride by htg. with $SOCl_2$ in s.t. at 180° see (21).]

[For formn. of C̄ (together with other products) from C_6H_6 with Cl_2 in pres. of I_2 (7) or of Fe (22) see indic. refs.; from *o*-dichlorobenzene (3:6055) and/or *p*-dichlorobenzene (3:0980) with Cl_2 under various conditions see (22) (23) (24) (25) (9); from *m*-dichlorobenzene (3:5960) with Cl_2 under various conditions see (9) (13) (23); from chlorobenzene (3:7903) or *p*-dichlorobenzene (3:0980) by boilg. with $FeCl_3$ see (26); from α-benzenehexachloride (3:4410) on htg. above its m.p. (158°) (28) (21) or htd. with aq. in s.t. at 200° (27), or on boilg. with MeOH/KOH (10), EtOH/KOH (10) (28) (5) (22), alc. KCN (27), or pyridine (10), or on htg. with quinoline at 105–110° (10), see indic. refs.; from β-benzenehexachloride (3:4990) q.v. on boilg. with alc. KOH see (10).]

[C̄ with Cl_2 in pres. of Al/Hg yields exclusively (23) 1,2,4,5-tetrachlorobenzene (3:4115), m.p. 135–136° (23); C̄ with liq. Cl_2 in s.t. at room temp. for 10 days gives (29) (30) a mixt. of addn. products.]

[C̄ with NaOMe in MeOH under various conditions (31) (32) (33) (11) (34) yields 2,5-dichlorophenol (3:1190), m.p. 57°; for behavior with EtOH/KOH see (38).]

C̄ on mononitration, e.g., by soln. of C̄ (1 g.) in 5 ml. fumg. HNO_3 (D = 1.49) (35), then pouring onto ice (35), gives 100% yield (35) (1) (5) (15) (39) 1,2,4-trichloro-5-nitrobenzene [Beil. V-246], pr. from alc., m.p. 58° (1), 57° (7) (15), 56° (35); this prod. with piperidine as directed (36) yields 1,2-dichloro-4-piperidino-5-nitrobenzene, red pr. from alc., m.p. 64–65° (36).

$\bar{C}$ on dinitration, e.g., by soln. of $\bar{C}$ (1 g.) in 5 ml. fumg. HNO_3 ($D = 1.49$) + 5 ml. conc. H_2SO_4 and subsequent refluxing for 1 hr., then pouring into aq. (35), gives (100% yield (35)) (7) (37) 1,2,4-trichloro-3,5-dinitrobenzene [Beil. V-266], pr. from alc., m.p. 103.5° (7), 102.5–103.5° (35) (37); this prod. (1 g.) htd. 1 hr. at 100° with 5 g. aniline as directed (35) yields 1-chloro-2,4-dianilino-3,5-dinitrobenzene, m.p. 182° (35).

Note that the trinitration prod. to be expected from complete nitration of $\bar{C}$ has not been reported.

[$\bar{C}$ with chlorosulfonic acid as directed (35) yields 1,2,4-trichlorobenzenesulfonyl chloride, m.p. 31–34° (35) which with $(NH_4)_2CO_3$ yields 1,2,4-trichlorobenzenesulfonamide, m.p. above 200° (35).]

211° at 710 mm. (2)		**−19°** (5)		

[*See also octachlorocyclopentene* (3:0422).]

Colorless oily liq. with weak turpentine-like odor.

[For prepn. of C̄ from butadiene-1,3 (1) (3) or butane, butene, or their chloro substitution products (3) (4) with Cl_2; or from hexachlorobutene (itself obtd. from dimerization (5) (2) of trichloroethylene (3:5170)) by cat. addn. of Cl_2 followed by cat. removal of 2 HCl or vice versa (1) (2); or from acetylene with Cl_2 (6) (note that tetrachloroethylene (3:5460) is also formed).]

C̄ on reduction with Zn + alc. gives (1) butadiene-1,3 (corresp. tetrabromide, m.p. 117°).

C̄ behaves as if saturated: e.g., C̄ does *not* add Cl_2 (even in sunlight) (1); C̄ does *not* (1) react with maleic anhydride or benzoquinone-1,4; C̄ does *not* (1) polymerize (even at 100 atm.).

C̄ is stable toward acids and alkalies and (unlike some other highly chlorinated unsaturates) does *not* give a carboxylic acid on treatment with conc. H_2SO_4 (1).

Note that a product of m.p. 38° and b.p. 283° formerly regarded as C̄ is now thought to be octachlorocyclopentene (3:0390).

[For prepn. of C̄ from *m*-toluic acid (1:0705) with PCl_5 (83% yield (1)) (2) (10), with PCl_5 in $CHCl_3$ (70% yield (3)) (5), with PCl_3 (8), with $SOCl_2$ (95% yield (11)) (12) (6) (9), or with $POCl_3$ + NaCl (or KCl) (13) see indic. refs.; for formn. of C̄ from heptadiyne-1,6-carboxylic acid-4 (*pseudo-m*-toluic acid) with PCl_5 see (14).]

C̄ with pyridine and excess $K_2S_2O_5$ yields (15) *m*-toluic anhydride, m.p. 70–71°.

[For reactn. of C̄ with $AlCl_3$ and various hydrocarbons to yield corresp. ketones, e.g., with C_6H_6 yielding (10) phenyl *m*-tolyl ketone [Beil. VII-440, VII_1-(235)], with toluene yielding (16) *m*-tolyl *p*-tolyl ketone [Beil. VII-451], with *m*-xylene yielding (17) *m*-tolyl ... with $AlCl_3$ alone at 130–140° ... Beil. VII-815], m.p. 236°.]

... ₂ (20) gives (yield: 83% (20), 43% (19)) *m*-methylacetophenone (1:5527), b.p. 220°.]

[C̄ with Cl_2 at 160–180° gives (90% yield (21)) (6) *m*-(chloromethyl)benzoyl chloride (ω-chloro-*m*-toluyl chloride), b.p. 149–150° at 20 mm. (21); C̄ with Br_2 at 185–195° gives (50% yield (22)) ω-bromo-*m*-toluyl bromide, b.p. 167° at 22 mm. (22).]

[C̄ with MeOH yields methyl *m*-toluate (1:3781), b.p. 221°; C̄ with EtOH yields ethyl *m*-toluate (1:3942), b.p. 234°; for study of rate of reactn. see (4).]

C̄ on hydrolysis yields *m*-toluic acid (1:0705), m.p. 110–111° (for study of rate see (23)). —For the amide, anilide, *p*-toluidide, and other derivs. corresp. to C̄ see *m*-toluic acid (1:0705).

Colorless liquid insol. aq., sol. many org. solvents. — Ord. samples of $\bar{C}$ may also cont. benzal (di)chloride (3:6327) or even benzyl chloride (3:8535). — $\bar{C}$ when pure is stable in dry air, but ord. material (contg. dislvd. HCl) hydrolyzes rapidly in moist air (3). — The very high value (93) of molal f.p. lowering of $\bar{C}$ prob. accounts for difficulty of earlier workers in attaining high f.p. values (3). — For removal of dislvd. HCl from $\bar{C}$ by treat. with $PbCO_3$ see (9). — For purification of $\bar{C}$ via crystallization see (10); for comml. purification see (12).

$\bar{C}$ forms const.-boilg. mixts. with various cpds., e.g., $\bar{C}$ with *p*-dibromobenzene (b.p. 220.25°) forms an azeotrope, b.p. 219.6° at 760 mm., contg 28 wt. % $\bar{C}$ (2); $\bar{C}$ with nitrobenzene (b.p. 210.75°) forms an azeotrope, b.p. 210.72° at 760 mm., contg. 1.5 wt. % $\bar{C}$ (2); $\bar{C}$ with *o*-nitrotoluene (b p. 221.85°) forms an azeotrope, b.p. 219.55° at 760 mm., contg. 75.5 wt. % $\bar{C}$ (13); $\bar{C}$ with methyl salicylate (1:1750) (b.p. 222.35°) forms an azeotrope, b.p. 220.75° at 760 mm., contg. 97 wt. % $\bar{C}$ (13).

$\bar{C}$ is impt. intermediate in prepn. of benzoic acid (see below under hydrolysis), in prepn. of certain dyestuffs (see below), and in prepn. of acyl halides and anhydrides (see below); for use in prepn. of films of cellulose ethers see (14).

[For prepn. of $\bar{C}$ from toluene with Cl_2 especially in pres. of light and/or other catalysts see (15) (16) (17) (18); with Cl_2 in pres. of PCl_3 (3) cf. (19); with $SOCl_2$ in s.t. at 220° for 18 hrs. (20) or at 230–250° (21) see indic. refs.; with NOCl at 350° see (22); for formn. of $\bar{C}$ from benzal (di)chloride (3:6327) with Cl_2 (23) or with NOCl at 150° (24) see indic. refs.; from benzyl chloride (3:8535) by htg. with $PbCl_4.2NH_4Cl$ see (25); from benzoyl chloride (3:6240) with PCl_5 see (26); from benzotrifluoride + acetyl chloride + $AlCl_3$ as directed see (8); from benzyl ethers with PCl_5 see (27).]

[$\bar{C}$ on reductn. in alc. soln. with H_2 in pres. of colloidal Pd (28) or $Pd/CaCO_3$ (29) reacts bimolecularly giving (75% yield (28)) tolane tetrachloride (diphenylacetylene tetrachloride) (3:4496), colorless cryst. from AcOH, m.p. 162–163° (28), also obtd. from $\bar{C}$ by other treatments (see below); this prod. with H_2 + $Pd/CaCO_3$ in alc. KOH is further reduced yielding (29) dibenzyl (1:7149) (use in quant. detn. of its halogen (29)). — $\bar{C}$ with hydra-

zinc hydrate in MeOH/KOH in pres. of $Pd/CaCO_3$ refluxed for 1½ hrs. gives (42% yield (30)) a mixt. of the two geom. isomeric tolane dichlorides consisting mainly of the α-isomer (3:4210), colorless tbls. from alc., m.p. 148° (30), with a little of the β-isomer (3:1380), m.p. 61° (30); despite their unsaturation these prods. reduce further only with difficulty.

[C̄ satd. with Cl_2 and stood in sunlight for 8 months or C̄ with liq. Cl_2 in sunlight for a few days adds 3 Cl_2 yielding (31) 1,2,3,4,5,6-hexachloro-1(trichloromethyl)cyclohexane, cryst. from $CHCl_3$ or by sublimation, m.p. 103° (31); this may be accompanied by a little pentachlorotrichloromethylcyclohexene, m.p. 132–134° (31). — C̄ with Cl_2 in pres. of I_2 yields (32) a mixt. of mono- and di-chlorobenzotrichlorides.]

[C̄ on pyrogenic decompn. over Pt at red heat yields (32*a*) cf. (34) tolane tetrachloride (3:4496) together with its isomorphous mixt. with α-tolane dichloride (see above). — C̄ with Na in liq. NH_3 yields (33) 5% dibenzyl (1:7149) accompanied by much nitrogenous tar. — C̄ with Zn in ether soln. reacts vigorously yielding (35) a deep green soln. contg. tolane dichloride (see above). — C̄ with equal wt. reduced Cu at 100° for 10 hrs. yields (36) tolane tetrachloride, m.p. 162° (3:4496); note that distn. of crude reactn. prod. leads to further reactn. and formation (36) (37) of α- and β-tolane dichlorides (see above). — C̄ with C_6H_6 in pres. of powdered chromium metal at 100° for 5 hrs. gives (17% yield (38)) triphenylchloromethane (3:3410), m.p. 106° (38). — C̄ with small proportion of $AlCl_3$ (0.1 mole) at 50–60° evolves HCl and gives a mixt. (39) contg. 40% α,α-dichloro-*m*-trichloromethyl-diphenylmethane, m.p. 59–61°, + 10% *m*-(α',α'-dichloro-*m*'-trichloromethylbenzyl)-α,α-dichlorodiphenylmethane, oil, + 34% unchanged C̄. — C̄ with $AlCl_3$ in C_6H_6 (39) or C̄ with Al + $HgCl_2$ in C_6H_6 (40) gives (62% yield (39)) 9,9',10,10'-tetraphenyl-9,10-dihydroanthracene, cryst. from acetone or lgr., m.p. 159° (40), 157–158° (39).]

[C̄ with MeMgCl in ether gives two types of reactn. according to concn. (41); e.g., C̄ with dilute MeMgCl yields tolane tetrachloride (3:4496) + ethane + $MgCl_2$, while C̄ with conc. MeMgCl gives in 22% yield a mixt. of the two geom. isomers of tolane dichloride (see above) consisting of 5 pts. of the *trans* form (3:4210), m.p. 138–139° (41), together with 1 pt. of the *cis* form (3:1380), m.p. 63° (41), separable by fractional crystn. from alc. — For reactn. of C̄ with EtMgBr see (42). — C̄ does *not* (43) react with excess mercury di-*p*-tolyl.]

[C̄ with HF gas in Cu flask at 0° for 72 hrs. (44), or C̄ with SbF_3 (45) (46), or C̄ with $SbF_3.2NaF$ at 130–140° (47), gives (yields: 75–95% (44), 75% (45), benzotrifluoride, b.p. 102.3°, m.p. −29°. — Note that C̄ with ZnF_2 in Cu flask at 120° for 6 hrs. gives (65% yield (57)) benzoyl fluoride, b.p. 155–156° (57), also that C̄ + KF in HCOOH gives (16% yield (68)) formyl fluoride, b.p. −26° at 750 mm. (68).]

C̄ on complete hydrolysis yields benzoic acid (1:0715): e.g., C̄ on htg. with anhydrous HCOOH yields (48) BzOH + CO + HCl (use in detn. of side-chain halogen (49)); C̄ with aq. in s.t. at 150° (15) or with aq. at 90–95° in pres. of Fe salts (50), or with aq. vapor at 550–850° over cat. (51), or with aq. + $ZnCl_2$ at 110–115° under press. (52), or with aq. $CaCO_3$ at 90° followed by acidif. with minl. acid (53) yields BzOH; note, however, although C̄ in ether soln. is only slowly hydrolyzed by aq. at room temp. (54) yet C̄ adequately shaken with aq. at room temp. is completely hydrolyzed (use in detn. of C̄ + benzal (di-)chloride + benzyl chloride by titration with std. alk. using thymolsulfonphthalein (55)) and C̄ if subjected to actn. of steam (as in steam distn. of mixt. with volatile cpds.) is partially hydrolyzed (8). — [For study of kinetics of hydrolysis of C̄ in aq. acetone at 30° in pres. of acids, bases, or salts see (1).]

[C̄ on partial hydrolysis yields benzoyl chloride (3:6240): e.g., C̄ with limited amt. aq. in pres. of H_2SO_4 or $FeCl_3$ (56), or C̄ with ord. comml. $ZnCl_2$ at 120° (57) (58), or C̄ with aq. vapor over tin phosphate at 240° (59), or C̄ with pure ZnO at 100° (57), or C̄ with benzoic

acid in boilg. nitrobenzene (60), yields BzCl; note, however, that C̄ with *pure* $ZnCl_2$ fails to react but addn. of 1 mole aq. or initial use of tech. $ZnCl_2$ gives BzCl (57).]

[C̄ htd. with carboxylic acids or anhydrides especially in pres. of $ZnCl_2$ is often used to prepare a mixture of benzoyl chloride with the acid chloride of the acid employed, particularly in cases where the two acyl chlorides are readily separable: e.g., C̄ with phthalic anhydride (1:0725) (61) (62) or phthalic acid (1:0820) (62) + $ZnCl_2$ at 110–120° or above gives 96% yield BzCl (3.6240) + 93% *sym.*-phthalyl (di)chloride (3:6900); for other examples see under chloroacetyl chloride (3:5235), dichloroacetyl chloride (3:5290), trichloroacetyl chloride (3:5420), fumaryl (di)chloride (3:5875), and terephthalyl (di)-chloride (3:2205). — Similarly C̄ with salts of sulfonic acids yields BzCl + the corresp. sulfonyl chloride: e g., C̄ + sodium β-naphthalenesulfonate gives (63) 90% yield BzCl + 80% yield β-naphthalenesulfonyl chloride.]

[C̄ under certain conditions may be converted to benzoic anhydride (1:0595): e.g., C̄ with BzOH + trace Fe salts htd. 6 hrs. at 110–115° under reflux (64), or C̄ with NaOBz (65), or C̄ with ord. conc H_2SO_4 (66), or C̄ in AcOH in pres. of phosgene (67), yields Bz_2O.]

C̄ very readily undergoes alcoholysis: e.g., C̄ with EtOH in pres. of $ZnCl_2$ yields (69) ethyl benzoate (1.3721); note, however, that C̄ + abs. EtOH in s.t. at 130–140° (70) or C̄ + trace sublimed $FeCl_3$ treated at 80–110° with 95% alc. (71) yields benzoyl chloride (3:6240) + ethyl chloride (3·7015); furthermore that C̄ + ethyl acetate (2 moles) in pres. of $ZnCl_2$ yields (69) ethyl benzoate (1:3721) + acetyl chloride (3:7065) + ethyl chloride (3.7015).

C̄ reacts with phenols to give various products according to circumstances: C̄ with aq. (72) (74) or better alc. (73) sodium phenolate (3 moles) gives at 100° small yields of phenyl benzoate (1:2257), m.p. 71°, and of *o*-hydroxybenzophenone (1:1414), m.p. 41°, together with other prods. notably benzaurin (see below). — C̄ with phenol in pres. of ZnO gives (75) phenyl benzoate (see above) + *p*-hydroxybenzophenone (1:1560), m.p. 134°. — C̄ with phenol (2 moles) htd. at 100° and reactn. prod. treated with steam yields (76) (77) 4,4′-dihydroxytriphenylcarbinol (=phenolbenzein=4′-hydroxyfuchsone=benzaurin) [Beil. VI-1145, $VIII_1$-(589)], as red crystn. powder (diacetate, m.p. 119° (76) (77); dibenzoate, m p. 183–184° (76)), accompanied by *p*-hydroxybenzophenone (see above). — [For corresp. reactns. of C̄ with *o*-cresol (1:1400) yielding *o*-cresolbenzein (78) (79), with thymol (1:1430) yielding thymolbenzein (80), with resorcinol (1:1530) yielding resorcinolbenzein (76), or with pyrogallol (1:1555) yielding pyrogallolbenzein (81) see indic. refs. — For reactn. of C̄ with α-naphthol (1:1500) (73) (94) (95) (or with 1-hydroxynaphthoic acid-2 (82) (83) (95)) yielding 4-(1-hydroxynaphthyl) phenyl ketone (or the corresp. 4-(1-hydroxy-2-carboxynaphthyl) phenyl ketones) respectively *see indic. refs.; for reactn. of* C̄ *with* β-naphthol (1:1540) see (84).]

C̄ with ammonia or amines gives varied reactns. — C̄ with liq. NH_3 (85) or with NH_4Cl in s.t. at 200° (86) gives (75% yield (85)) benzonitrile; C̄ with conc. aq. NH_4OH in s.t. at 130° yields (85) benzoic acid + benzamide + benzonitrile. — C̄ (1 mole) with aniline (2 moles) warmed together without solvent or with $ZnCl_2$ in AcOH soln. gives (87) *N,N′*-diphenylbenzamidine hydrochloride [Beil. XII-273, XII_1-(202)], the free base of which has m.p. 147°; note, however, that C̄ with aniline hydrochloride + nitrobenzene + Fe filings htd. at 180° for 3–4 hrs. yields (87) the dyestuff Doebner's Violet (the HCl reactn. prod. of 4,4′-diaminotriphenylcarbinol) [Beil. XIII-742, $XIII_1$-(293)]. — C̄ (1 mole) with dimethylaniline (2 moles) htd. at 100° preferably in pres. of $ZnCl_2$ yields (86) the dyestuff Malachite Green (the HCl reactn. prod. of 4,4′-dimethylaminotriphenylcarbinol) [Beil. XIII-743, $XIII_1$-(293)] (see Ⓟ below); analogous dyestuffs from other tertiary amines cannot be discussed here.

[C̄ with excess phenylhydrazine in alc. does not react until Cu powder is added; the

solution then (89) rapidly turns or.-red. and on cooling soon ppts. a mixture of benzaldehydephenylhydrazone, m.p. 157° (see 1:0195) (doubtless accounted for by reductn. of C̄ to benzal (di)chloride (3:6327) at the expense of phenylhydrazine), together with phenylhydrazine hydrochloride. — C̄ + excess phenylhydrazine heated in alc. without Cu (89) turns dark red and ppts. a mixt. of "formazylbenzene" [Beil. XVI-17], red lfts. from alc., m.p. 173° (doubtless accounted for as above), and phenylhydrazine hydrochloride.]

[C̄ with amides or ammonium salts gives on htg. mixtures of corresp. nitriles and acid halides: e.g., C̄ with benzamide at 140° yields (90) benzonitrile + benzoyl chloride; C̄ with *p*-toluamide at 140° yields (90) benzonitrile, *p*-tolunitrile, benzoyl chloride, and *p*-toluyl chloride (3:6600). — For patents exemplifying this type of reactn. see (91) (92).]

C̄ on mononitration, e.g., with 0.44 pt. fumg. HNO_3 + 0.44 pt. conc. H_2SO_4 at 25–30° for ½ hr. (4), gives 85% yield *m*-nitrobenzoic acid, m.p. 140° (4); very possibly hydrolysis here precedes nitration since C̄ on nitration with N_2O_5 in cold CCl_4 gives (32) (93) an oily mixt. of nitrobenzotrichlorides more stable to hydrolysis than original C̄, but which on cleavage with alk. or conc. H_2SO_4 yields a mixt. of nitrobenzoic acids containing 70% *m*-nitrobenzoic acid (for other studies of nitration of C̄ see (5) (10)). — C̄ on dinitration by soln. in 5.4 pts. conc. H_2SO_4 and treatment with 6.8 pts. fumg. HNO_3 at 185° for 1 hr. gives (4) 33% yield of 3,5-dinitrobenzoic acid, m.p. 203–204° (4).

[C̄ cannot be sulfonated without hydrolysis of the $—CCl_3$ group; C̄ with conc. H_2SO_4 even at 30° yields (66) benzoic acid (or its anhydride). — However, C̄ with gaseous SO_3 at room temp. (6) gives on subsequent vac. distn. an oil (perhaps *m*-sulfobenzotrichloride) which with aq. yields *m*-sulfobenzoic acid [Beil. XI-384, XI_1-(98)], dihydrate, m.p. 97–98°, losing aq. at 160° yielding anhydrous acid, m.p. 140–141° (6).]

Ⓟ **Malachite Green formation.** C̄ (1 drop) + dimethylaniline (1 drop) warmed with 0.1 g. fused $ZnCl_2$ gives intense green color.

Ⓓ **Benzoic acid:** C̄ on refluxing with *aq.* NaOH soln., subsequently acidified, ppts. benzoic acid (1:0715), m.p. 121°.

[For formn. of C̄ (together with other products) from benzoyl chloride (3:6240) with $Cl_2 + FeCl_3$ (14.5% C̄) (15) (16), from *o*-hydroxybenzoic acid (salicylic acid) (1:0780) with PCl_5 (17) (18) or with phosgene (3:5000) + pyridine in toluene at 60–80° (19); from sodium salicylate with PCl_5 (18) (20); from *o*-sulfobenzoic acid dichloride by distn. at ord. press. (21) (8) (22) (3) see indic. refs.]

[C̄ with MeOH yields (1) methyl *o*-chlorobenzoate (3:6695) (for study of rate of reaction see (6)); C̄ with EtOH yields (23) ethyl *o*-chlorobenzoate (3:6800) (for study of rate of reaction see (5)).]

[C̄ with Na *o*-chlorobenzoate should yield *o*-chlorobenzoic acid anhydride, ndls. from lt. pet. (25) or alc. (26), m.p. 79.6° (25), 78–79° (26); this anhydride also results from *o*-chlorobenzoic acid with P_2O_5 in boilg. toluene (25) or with oxalyl dichloride (3:5060) in boilg. C_6H_6 (26).]

[C̄ on cat. hydrogenation gives (70% yield (27)) (28) *o*-chlorobenzaldehyde (3:6410).]

[For reactn. of C̄ with $AlCl_3$ + benzene yielding (29) *o*-chlorobenzophenone (3:0715), with $AlCl_3$ + *o*-chlorotoluene yielding (30) 2,3-dichloro-4-methylbenzophenone, with $AlCl_3$ + *p*-dichlorobenzene yielding (31) 2,2′,5′-trichlorobenzophenone, with $AlCl_3$ + naphthalene yielding (32) α-naphthyl *o*-chlorophenyl ketone, or with anisole + $AlCl_3$ (1:7445) yielding (33) 2-chloro-4-methoxybenzophenone see indic. refs.]

[For reactn. of C̄ with perylenetetracarboxylic acid diimide (34) or with aminodibenzanthrones (35) yielding vat dyes see indic. refs.]

C̄ on hydrolysis yields *o*-chlorobenzoic acid (3:4150), m.p. 141°; for the amide, anilide, *p*-toluidide, and other derivs. corresp. to C̄ see *o*-chlorobenzoic acid (3:4150).

89.4–91°	at 5 mm.	(8)			

Insol. aq.; misc. alc. or ether. — C̄ does *not* yield an addn. prod. with $NaHSO_3$.
[For prepn. of C̄ from chlorobenzene (3:7903) with Ac_2O + $AlCl_3$ in CS_2 (yields: 83–79% (15), 78–74% (5), 68–66% (1)) (8) (9) or with acetyl chloride (3:7065) + $AlCl_3$ in absence

of solvent (poor yield (2)) or in CS_2 (yields: 80–90% (16), 81% (6), 41% (17)) see indic. refs.; from p-chlorobenzoylacetic acid on warming (18); from methyl p-chlorobenzoylacetate (4) on ketonic hydrolytic cleavage by boilg. 10–12 hrs. with 20% H_2SO_4 see (4).]

[$\bar{C}$ in CS_2 treated with 1 mole Cl_2 yields (19) p-chlorophenacyl chloride (3:2990), m.p. 101°; $\bar{C}$ with 2 moles Cl_2 at 50–60° without solv. (19) yields 4,ω,ω-trichloroacetophenone [Beil. VII-283], m.p. 57°. — $\bar{C}$ with 1 mole Br_2 in CS_2 or AcOH yields (17) (20) p-chlorophenacyl bromide [Beil. VII-285], cryst. from alc., m.p. 96.5° (20), 96° (17) (for studies of rate of bromination see (13), of influence of light and other factors see (21)); $\bar{C}$ with excess Br_2 directly (22), in AcOH (17), or in CCl_4 susp. of $CaCO_3$ (22) yields 4-chloro-ω,ω-dibromoacetophenone [Beil. VII-286], m.p. 93.5–94.5° (22), 92.5° (17).] [Note proximity of this m.p. to that (96°) of p-chlorophenacyl bromide (above).]

[$\bar{C}$ on mononitration with mixt. of conc. HNO_3 + conc. H_2SO_4 at −10° as directed (6) or added slowly to 10 pts. HNO_3 ($D = 1.5$) at 0° (23) yields 4-chloro-3-nitroacetophenone, *ndls. from alc., m.p. 104° (6), 99–101° (23) (accompanied in the former case (6)* by a little 4-chloro-3-nitrobenzoic acid, m.p. 181°).]

$\bar{C}$ in alk. medium readily condenses with aldehydes: e.g., $\bar{C}$ in dil. alc. with a little alk. gives (yields: 96% (24), 93% (25), 83% (7)) benzal p-chloroacetophenone (p-chlorochalcone), cryst. from ether of $CHCl_3$, m.p. 101° (24), 98.5° (7), 96.4° (12), 96° (25) (for study of rate of condensation see (12)); similarly $\bar{C}$ with salicylaldehyde (1:0205) yields (23) salicylidene-p-chloroacetophenone, yel. ndls. from alc., m.p. 151° (23); $\bar{C}$ with p-dimethylaminobenzaldehyde yields (26) p-dimethylaminobenzal-p-chloroacetophenone, yel. ndls. from alc., m.p. 140–140.5° (26); for corresp. condensation of $\bar{C}$ with p-chlorobenzaldehyde (3:0765) see (16), with o-nitrobenzaldehyde see (27) (28).

[$\bar{C}$ also readily condenses with esters: e.g., $\bar{C}$ in abs. alc. + NaOEt treated with ethyl formate (1:3000) gives (28) hydroxymethylene-p-chloroacetophenone, yel. ndls. from pet. eth., m.p. 48–49° (28); $\bar{C}$ with ethyl phenylacetate (1:3872) in ether with Na gives (40% yield (29)) ω-(phenylacetyl)-p-chloroacetophenone.]

[$\bar{C}$ with PCl_5 at 100° for 4 hrs. gives (60% yield (30)) p,α-dichlorostyrene, b.p. 115–116° at 20 mm., m.p. −6 to −5°, $D_{-}^{25} = 1.247$, $n_D^{25} = 1.5735$ (30); $\bar{C}$ with selenium oxychloride ($SeOCl_2$) gives (50% yield (31)) *bis*-(p-chlorophenacyl)selenium dichloride, m.p. 126° (31); $\bar{C}$ with K pyrosulfate + a little conc. H_2SO_4 htd. at 80° for 4 hrs. (46% yield (32)) or $\bar{C}$ with 1% I_2 htd. 4 hrs. at 170° (32) gives 1,3,5-*tris*-(p-chlorophenyl)benzene, white ndls. from AcOEt, m.p. 238° (32); for behavior of $\bar{C}$ with NOCl see (33) (14), with NaOEt + amyl nitrite in alc. see (34) (35).]

[$\bar{C}$ htd. as directed with excess NH_4 formate and the intermediate formyl deriv. hydrolyzed with HCl gives (yields: 82% (36), 65% (37)) *d,l*-α-(p-chlorophenyl)ethylamine, b.p. 105° at 10 mm., $D_{20}^{20} = 1.1178$, $n_D^{25} = 1.5420$ (hydrochloride, m.p. 192–193°, *N*-benzoyl deriv., m.p. 144–145° (36)).]

[$\bar{C}$ on htg. with 10% aq. NaOH + Cu at 190° for 5 hrs. under press. yields (38) p-hydroxyacetophenone (1:1527), m.p. 109°; $\bar{C}$ with conc. aq. NH_4OH in pres. of Cu_2O htd. 5 hrs. at 220° under press. yields (39) p-aminoacetophenone [Beil. XIV-46, XIV_1-(366)]; $\bar{C}$ on htg. with 50% KOH as directed (40) gives small yield of p-chlorobenzoic acid (3:4940); $\bar{C}$ with alc. NaOEt htd. in s.t. at 130°–140° gives (41) p-chlorophenyl-methyl-carbinol, p-chlorobenzoic acid, and other prods.]

$\bar{C}$ on oxidn. with $KMnO_4$ (2) or in MeOH soln. with NaOH + Cl_2 (93% yield (42)) or with CrO_3 + H_2SO_4 (95% yield (43)) or by cat. vapor-phase oxidn. (90% yield (44)) gives p-chlorobenzoic acid (3:4940), m.p. 242°. [Note that $\bar{C}$ in abs. alc. refluxed with SeO_2 gives (45) p-chlorophenylglyoxal, m.p. 122° (for study of rate see (46)).]

Ⓓ *p*-Chloroacetophenone oxime: ndls. from alc., m.p. 95° (17). [This prod. with conc.

H_2SO_4 htd. at 100° rearranges to acet-*p*-chloroanilide [Beil. XII-611, XII_1-(306)], m.p. 172–173° (17).]

Ⓓ *p*-Chloroacetophenone phenylhydrazone: m.p. 114° (17), 112–113° (48) (decomposes on stdg. 2 days (17) (4).)

Ⓓ *p*-Chloroacetophenone *p*-nitrophenylhydrazone: maroon cryst. from AcOH, m.p. 239° (4).

Ⓓ *p*-Chloroacetophenone 2,4-dinitrophenylhydrazone: scarlet cryst., m.p. 231° cor. (47).

Ⓓ *p*-Chloroacetophenone semicarbazone: white cryst. from 40% AcOH, m.p. 200–201° (4).

124.8–125.1°	at 20 mm.	(1)	
122.5°	at 15 mm.	(7) (8)	

[For prepn. of C̄ from o-chlorobenzoic acid (3:4150) with EtOH + HCl see (2); from o-chlorobenzoyl chloride (3:6640) with abs. EtOH see (5) (1).]

[C̄ on electrolytic reductn. in alc./H_2SO_4 soln. yields (10) mainly o-chlorobenzyl ethyl ether [Beil. VI-444; VI_1-(222)], b.p. 212° (10), together with a little o-chlorobenzyl alc. [Beil. VI-444; VI_1-(222)], ndls. from dil. alc., m.p. 72° (10).]

[C̄ with C_6H_5MgBr in ether as directed (11) yields α,α'-*bis*-(o-chlorophenyl)-α,α'-diphenylethylene glycol (*sym.*-2,2′-dichlorobenzpinacol) [Beil. VI_1-(523)].]

C̄ in alc. on refluxing with hydrazine hydrate yields (14) (15) o-chlorobenzhydrazide, white ndls. from alc., m.p. 117–118° (15), 109–110° (14). [This prod. with BzH yields benzal-o-chlorobenzhydrazide, white ndls. from 95% alc., m.p. 162° (15).] [For use of o-chlorobenzhydrazide as reagt. for identification of aldehydes and ketones see (15).]

C̄ on hydrolysis (Sap. Eq. = 184.5) yields ethyl alcohol (1:6130) + o-chlorobenzoic acid (3:4150). [For studies of hydrolysis of C̄ under various conditions see (7) (8) (12) (13) (3) (6).] — For the amide, anilide, p-toluidide, and other derivs. corresp. to C̄ see o-chlorobenzoic acid (3:4150).

[For formn. of $\bar{C}$ from diethyl *d*-tartrate (1:4256) with PCl_5 see (11) (note that ethyl hydrogen chlorofumarate, cryst. from pet. ether, m.p. 52–53°, has also been obtd. (12) as *one of the prods. of this reactn.); from diethyl d,l(?)-α,α-dichlorosuccinate by loss of* HCl under actn. of dimethylaniline see (5).]

[$\bar{C}$ (1 mole) with diethyl sodio-malonate (1 mole) is said (13) to yield tetraethyl cyclopropane-1,1,2,3-tetracarboxylate [Beil. IX-991] although no details are given; in the presence of excess NaOEt in cold alc. for 12 hrs., however, the same components give (15–20% yield (14)) (15) triethyl γ-carbethoxyaconitate [Beil. II-876], b.p. 205–207° at 16 mm. (14); for reactn. of $\bar{C}$ (1 mole) with diethyl mono- and di-substituted malonates yielding triethyl corresp. subst. aconitates see (13) — $\bar{C}$ (1 mole) with ethyl *sodioaceto-acetate* (1 mole) in abs. alc. refluxed for ½ hr. gives (72% yield (3)) (16) triethyl γ-acetyl-*aconitate [Beil. III-860], yel. oil, b.p. 187–188° at 15 mm. (3),* the same as similarly obtd. (3) from diethyl chloromaleate (3:6697).]

[$\bar{C}$ *with o-chlorophenol (3:5980)* or its Na deriv. in boilg. xylene for 2 hrs. gives (77% yield (17)) diethyl o-chlorophenoxyfumarate, b.p. 203–204° at 14 mm. (17). — $\bar{C}$ with *p*-chlorophenol (3:0475) + NaOEt gives (17) diethyl p-chlorophenoxyfumarate, b.p. 199–200° at 12 mm. (17).]

The reactn. of $\bar{C}$ with NH_3 under various circumstances is disputed and confused and cannot profitably be discussed here; for refs. see Beil. II-745.

$\bar{C}$ (1 mole) with hydrazine hydrate (2 moles) directly (18) or in alc. or AcOH (9) yields ethyl pyrazolone-5 (or 3)-carboxylate-3 (or 5) [Beil. XXV-206, XXV_1-(567)], ndls. from boilg. aq., m.p. 184–185° (18); 178° (9); note that in the direct treatment with just 2 moles of hydrazine hydrate much heat is evolved and the product ppts. on cooling; if excess base is employed (in which the prod. is soluble) neutralization with acid is necessary.

[$\bar{C}$ with phenylhydrazine reacts much more slowly; however, after several hrs. at 100° phenylhydrazine HCl ppts. leaving an oil from which a cryst. prod. spar. sol. in boilg. AcOH but sepg. from it in colorless ndls., m.p. 272° dec., can be obtd. (18); this prod. is *not*, however, the ethyl 1-phenylpyrazolone-5(or 3)-carboxylate-3(or 5) which might be expected, but is regarded [Beil. XXVI-578] (18) as a 4,4′-*bis* derivative of it.

$\bar{C}$ on boilg. with 1:1 HCl and subsequent evapn. to dryness undergoes hydrolysis yielding (4) chlorofumaric acid (3:4853), m.p. 191.5° (4).

	128.8–129.0°	at 8 mm.	(6)
	119.6°	at 1 mm.	(7)
	105–106°	at 1 mm.	(8)

Colorless liquid.

[For prepn. of C̄ from o-methoxybenzoic acid (o-anisic acid) (1:0685) with PCl_5 (1) (4) (9) (10) (11) (every trace of salicylic acid must first be removed (9)) or with $SOCl_2$ (2) (3) (4) (5) (6) (7) (12) (prolonged heating tends to demethylate product (4)) see indic. refs.; note that for none of the prepns. is the yield recorded.]

[C̄ on cat. reductn. at 280° with H_2 at ord. press. in pres. of Pd gives (11), not the expected o-methoxybenzaldehyde, but instead o-methoxytoluene (methyl o-tolyl ether) (1:7480).]

C̄ with anhydrous Na_2CO_3 in pyridine shaken for ½ hr., poured onto ice, yields (13) o-methoxybenzoic acid anhydride, ndls. from pet ether, m.p. 72.4° (13).

[C̄ with C_6H_6 + $AlCl_3$ gives (14) (9) (2) (12) o-hydroxybenzophenone (1:1414) (note demethylation of intermediate o-methoxybenzophenone (1·5142) and also the formn. in small amt. (12) of 2-hydroxy-5-(2′-hydroxybenzoyl)benzophenone, m.p. 131–132° (12)).]

[C̄ with Et_2Zn gives (87% yield (3)) ethyl 2-methoxyphenyl ketone [Beil. VIII-102], b.p. 137° cor. at 16 mm. (3).]

[For reaction of C̄ with ethyl sodio-acetoacetate (5), with ethyl sodio-α-methylacetoacetate (15), with ethyl sodio-α-allylacetoacetate (16), or with ethyl sodio-α,γ-dimethoxyacetoacetate (17) (together with hydrolytic cleavage of the resulting products to ketones and/or acids) see indic. refs.; for reactn. of C̄ with Na phenylacetylene and ring closure of intermediate to corresp. 2-methoxyflavone see (18).]

[C̄ (1 mole) with HCN (4 moles) in dry ether + pyridine gives (4) o-methoxybenzoyl cyanide, yel. ndls. from lgr., m.p. 56°, b.p. 161° at 12 mm. (4).]

[C̄ with urea refluxed in C_6H_6 for 15 hrs. gives (19) N-(o-methoxybenzoyl)urea, ndls. from hot aq. or toluene, m.p. 192° (19).]

[C̄ with methyl salicylate gives (20) methyl O-(2-methoxybenzoyl)salicylate, m.p. 102–104° (20); C̄ with salicylamide in pyridine gives (21) N-(2-methoxybenzoyl)salicylamide, m.p. 189° (21).]

[C̄ with MeOH yields methyl o-methoxybenzoate (1:4091), b.p. 248°; C̄ with EtOH yields ethyl o-methoxybenzoate (1:4151), b.p. 261°; for study of rate of reactn. of C̄ with EtOH at 0° see (22) (8).]

C̄ on hydrolysis yields o-methoxybenzoic acid (1:0685), m.p. 100–101°; for the amide, anilide, and other derivs. corresp. to C̄ see o-methoxybenzoic acid (1:0685).

Colorless oil, volatile with steam. — Note that presence of as much as 10% of 2-chloronaphthalene (3:1285) has no effect upon density of $\bar{C}$ (9). — Note also that addn. of 1,4-dichloronaphthalene (3:1655), m.p. 68°, or of 1,6-dichloronaphthalene (3:0810), m.p. 48°, lowers m.p. of $\bar{C}$ (9).

[For sepn. of mixts. of $\bar{C}$ with the isomeric 2-chloronaphthalene by fractional freezing of their soln. in appropriate solvents see (6). — For purification of tech. $\bar{C}$ by treatment with 1–2% alk. at 150° under reduced press. see (13). — For sepn. of $\bar{C}$ from dichloronaphthalenes by means of its const.-boil. mixt. (b.p. 99°) with aq. see (18).]

[For prepn. of $\bar{C}$ from α-naphthylamine [Beil. XII-1212, XII_1-(519)] via diazotization and use of Cu_2Cl_2 reactn. (70–75% yield (9)) (8) (7) or even by warming diazo soln. with HCl (10–20% yield (14)) or from diazonium/$ZnCl_2$ cpd. on addn. to phenol at 60° (46% $\bar{C}$ + 29% hydroxybiphenyl + 20% diphenyl ether (62)) see indic. refs.; from α-naphthalenesulfonyl chloride [Beil. XI-157, XI_1-(37)] (2), or from 1-nitronaphthalene [Beil. V-553, V_1-(264)] (15), or from β-naphthol (1:1500) (16) with PCl_5 as directed see indic. refs.; for formn. of $\bar{C}$ from 1-nitronaphthalene with Cl_2 see (17).]

[For prepn. of $\bar{C}$ from naphthalene with Cl_2 in boilg. naphthalene (19) (48), in vapor phase (20) (22) (27), in various solvents (21) (22) (23) (24) (25) (26) see indic. refs.; from naphthalene with HCl gas + air in pres. of cat. see (28); from naphthalene with $PbCl_4 \cdot 2NH_4Cl$ at 140–150° (29) or with SO_2Cl_2 + $AlCl_3$ (79% yield (30)) see indic. refs.; from

naphthalene dichloride [Beil. V-519] with boilg. alc. KOH (31) cf. (32) or by distn. (33) cf. (34) see indic. refs.]

[For thermal anal. of systems of $\bar{C}$ with $SbBr_5$ see (35); with PkOH see (36); with 2,4,6-trinitroresorcinol (styphnic acid) see (37).]

[$\bar{C}$ with Cl_2 in cold or $\bar{C}$ with Cl_2 in lt. pet. yields (38) 1-chloronaphthalene tetrachloride, m.p. 131° (38), and 1,4-dichloronaphthalene (3.1655), m.p. 68° (38); $\bar{C}$ with Cl_2 in $CHCl_3$ yields (38) the above 1-chloronaphthalene tetrachloride and 1,4-dichloronaphthalene tetrachloride, m.p. 172° (38); $\bar{C}$ with Cl_2 in CS_2 gives (38) a new dichloronaphthalene tetrachloride, m.p. 158° (38).]

[$\bar{C}$ on chloromethylation with paraformaldehyde + HCl gas + H_3PO_4 in AcOH gives (81) 1-chloro-4-(chloromethyl)naphthalene, m.p. 78–79° (81).]

[$\bar{C}$ is *not* reduced with excess 5% Na/Hg in alc. even after 5 hrs. (39) nor by HI + P at 182° for 10 hrs. (42); however, $\bar{C}$ in boilg. AmOH treated with Na yields (40) 1,4-dihydronaphthalene [Beil. V-518, V_1-(249)] (identified by addn. of Br_2 giving dibromide, m.p. 74° (40)) and 1,2,3,4-tetrahydronaphthalene (1:7550) q.v.; furthermore, $\bar{C}$ with Mg in boilg. MeOH evolves gas and upon acidification and pouring into aq. gives alm. quant. yield (41) naphthalene (1:7200), m.p. 80°.]

[$\bar{C}$ on cat. oxidn. with air at 250–300° gives (43) 97% phthalic anhydride (1:0725) + 3% 3-chlorophthalic anhydride (3:3900).]

[$\bar{C}$ with Li in s.t. 17½ hrs. at 263° followed by treatment with aq. gives (44) naphthalene (1:7200) + 1,1′-binaphthyl [Beil. V-725, V_1-(358)], m.p. 156°. — $\bar{C}$ with Li in dry ether yields soln. of α-naphthyl-lithium which with Me_2SO_4 gives (77% yield (45)) 1-methylnaphthalene (1:7600), the reactn. of $\bar{C}$ with Li occurring even more readily (46) than with Mg.]

[$\bar{C}$ with Mg at 200–220° reacts very energetically and is complete within a few minutes; naphthalene sublimes abundantly, and yield of α-$C_{10}H_7MgCl$ is only 10–13% (47).]

[$\bar{C}$ with $AlCl_3$ at 100° gives small amts. (50) naphthalene (1:7200) + 2-chloronaphthalene (3:1285).]

[$\bar{C}$ with CuCN in pyridine htd. 24 hrs. in bath at 245–250° (92% yield (10)) or $\bar{C}$ with $K_4Fe(CN)_6$ + pyridine at 270° for 18 hrs. (49) gives α-naphthonitrile [Beil. IX-649, IX_1-(275)], b.p. 299° cor., b.p. 173–174° at 27 mm., 166–169° at 18 mm. (10).]

[$\bar{C}$ does *not* with Ag 3,5-dinitrobenzoate yield corresp. ester (80).]

[$\bar{C}$ with 15% aq. NaOH above 300° for 12 hrs gives (46% yield (51)) α-naphthol (1:1500); $\bar{C}$ with 5 moles 3–25% aq. NaOH at 350–360° under pressure in pres. of Cu for 1 hr. gives (52) a mixt. of α-naphthol (1:1500) + β-naphthol (1:1540). — $\bar{C}$ with aq. Na_2CO_3 + Cu at 300° under press. (53) or $\bar{C}$ with aq. Na_2CO_3, Na_2HPO_4, or $Na_2B_4O_7$ at 325° and 280 atm. (54) yields α-naphthol (1:1500). — $\bar{C}$ with aq. vapor over cat. at 300–400° yields (55) α-naphthol (1:1500).]

[$\bar{C}$ with conc. aq. NH_4OH + CuO at 150–250° under press. (56) or $\bar{C}$ with conc. aq. NH_4OH + Cu_2Cl_2 + $Ca(OH)_2$ at 225–230° under press. (57) cf. (58) yields α-naphthylamine (for study rate of reactn. see (58) (61); under suitable conditions the main prod. may be di-α-naphthylamine (60).]

[$\bar{C}$ with KNH_2 in liq. NH_3 at −33° gives (82) only 2–3% α-naphthylamine, the main prod. (43–53%) being β-naphthylamine; for behavior of $\bar{C}$ with $LiNEt_2$ see (83).]

[$\bar{C}$ on mononitration, e.g., with a mixt. of conc. HNO_3 (D = 1.4) (1 mole) + conc. H_2SO_4 (2 moles) at 0° (63) cf. (64) (65) (66) gives a mixt. of *three* mono nitro derivs., viz., 1-chloro-4-nitronaphthalene [Beil V-555, V_1-(264)], pale yel. ndls. from alc., m.p. 85° (66) (63), 87–87.5° (67); 1-chloro-5-nitronaphthalene [Beil. V-556], m.p. 111° (63) (68); and 1-chloro-8-nitronaphthalene [Beil. V-556], ndls. from AcOH or C_6H_6, m.p. 94° (63), 93–94° (69). (Note that the relative proportions of these three *mononitration* products

[C̄ on htg. with Cu powder in C_6H_6 for 25 hrs. gives (5) a mixt. of the two stereoisomeric forms of 1,2-*bis*-(o-chlorophenyl)-1,2-dichloroethylene, [Beil. V-635]; by repeated cryst. from pet. ether this mixt. is separable into 3 pts. higher-melting stereoisomer, m.p. 172° (5), and 1 pt. lower-melting stereoisomer, m.p. 129° (5).]

C̄ on hydrolysis, e.g., by htg. with aq. in s.t. at 150° (1) or by boilg. with conc. HNO_3 (2), yields *o*-chlorobenzoic acid (3:4150) q.v.

137.6–137.8°	at 14 mm.	(2)			
90.8°	at 1 mm.	(6)			

[For prepn. of C̄ from *p*-methoxybenzoic acid (*p*-anisic acid) (1:0805) with PCl_5 (93% yield (3)) (4) (9) (10) (11) or with $SOCl_2$ (6) (7) (12) (13) see indic. refs.; from sodium *p*-anisate with oxalyl chloride (3:5060) in C_6H_6(75–90% yield) see (14).]

[C̄ with 3% H_2O_2 in acetone + pyridine at 0° yields (15) di-*p*-anisyl peroxide, cryst. from AcOEt or pet. eth., m.p. 128° (15); for reactn. of C̄ with H_2S_2 + $ZnCl_2$ giving (60% yield) di-*p*-anisyl disulfide see (30).]

[C̄ on cat. reductn. with H_2 and cat. as directed gives (81% yield (16)) *p*-methoxybenzaldehyde (1:0240) (under some conds. (17) reductn. goes to *p*-methoxytoluene (methyl-*p*-tolyl ether) (1:7495)).]

[Although 2-methoxybenzoyl chloride (3:6870) with anhydrous Na_2CO_3 + pyridine gives the corresp. anhydride, this reactn. is not specifically reported for C̄; however, C̄ + a tertiary amine (pyridine) in C_6H_6 with excess $K_2S_2O_5$ yields (18) *p*-methoxybenzoic acid anhydride, m.p. 99–100° (18).]

[C̄ with C_6H_6 + $AlCl_3$ yields (1) *p*-methoxybenzophenone (1:5170); C̄ with toluene + $AlCl_3$ gives (40% yield (11)) 4-methoxy-4′-methylbenzophenone, cryst. from alc., m.p. 89° (11); C̄ with perylene + $AlCl_3$ in CS_2 gives (19) 3,9-*bis*-(*p*-methoxybenzoyl)perylene, m.p. 319.5° (19).]

[C̄ condenses with many phenol ethers in pres. of $AlCl_3$; e.g., for reactn. of C̄ with anisole

yielding 4,4′-dimethoxybenzophenone [Beil. VIII-317, VIII$_1$-(641)], m.p. 143–144° (20), see (20) (21); for C̄ with phenetole yielding 4-methoxy-4′-ethoxybenzophenone, m.p. 112° (13), 111° (20), *see indic. refs.*; for C̄ with pyrocatechol dimethyl ether (veratrole) (1:7560) yielding 3,4,4′-trimethoxybenzophenone [Beil. VIII-422], m.p. 98–99°, see (22); for C̄ with resorcinol dimethyl ether (1:7570) yielding 2,4,4′-trimethoxybenzophenone [Beil. VIII$_1$-(702)], m.p. 70–71° (23), see (23); for C̄ with phloroglucinol trimethyl ether (1:7148) yielding 2,4,6,4′-tetramethoxybenzophenone [Beil. VIII-496], m.p. 146°, see (22); for C̄ with many other phenol ethers see (20).]

[C̄ with MeZnI (24) or better with Me_2Cd (25) gives (yields. 25% (24), 84% (25)) *p*-methoxyphenyl methyl ketone (*p*-methoxyacetophenone) (1.5140), m.p. 38°; C̄ with C_6H_5ZnBr gives (65% yield (26)) *p*-methoxybenzophenone, (1:5170), m.p. 61°, b.p. 202° at 14 mm. (26)]

[C̄ with ethyl sodioacetoacetate yields (4) ethyl α-(*p*-methoxybenzoyl)acetoacetate [Beil. X-1004]; C̄ with ethyl sodio-α,γ-dimethoxyacetoacetate yields (27) ethyl α,γ-dimethoxy-α-(*p*-anisoyl)acetoacetate (which on ketonic hydrolytic cleavage yields (27) ω,4-dimethoxyacetophenone).]

[C̄ (1 mole) with HCN (4 moles) in dry ether + pyridine gives (12) *p*-methoxybenzoyl cyanide, m.p. 63°, b.p. 150° at 12 mm. (12); C̄ with KCN + quinoline yields (28) 1-(*p*-anisoyl)-2-cyano-1,2-dihydroquinoline, m.p. 120°, which upon acid hydrolysis gives (57% yield (28)) *p-methoxybenzaldehyde (p-anisaldehyde) (1:0240).*]

[C̄ with urea refluxed in C_6H_6 for 15 hrs. yields (29) *N*-(*p*-methoxybenzoyl)urea, ndls. from alc., m.p. 215° (29).]

[*For reactn. of C̄ with K_2S in alc. + ether yielding* K salt of *p-methoxythiobenzoic acid* see (30); for reactn. of C̄ with sodium phenylacetylene see (31); for reactn. of C̄ with diphenylketene see (32); for reactn. of C̄ with *d*-glucose and other carbohydrates see (33); for reactn. of C̄ *with* 3,4-dimethoxyphenylethylamine (34) *or with* β-(*n*-butylamino)ethanol (3) see indic. refs.]

C̄ with MeOH yields methyl *p*-methoxybenzoate (methyl *p*-anisate) (1:2128), m.p. 49°; C̄ with EtOH yields ethyl *p*-anisate (1:4191), b.p. 269°, m.p. +7° (for study of rate of reactn. of C̄ with EtOH see (8) (35)).

C̄ on hydrolysis yields *p*-methoxybenzoic acid (1·0805), m.p. 184°; for the amide, anilide, *p*-toluidide, and other derivs. corresp. to C̄ see *p*-methoxybenzoic acid (1:0805).

3:6900 *sym.-o-*PHTHALYL DICHLORIDE  $C_8H_4O_2Cl_2$ Beil. IX - 805
(*sym.-o-*Phthaloyl dichloride) IX₁-(363)

B.P.		M.P.		
276.7°	at 760 mm. (1)	16°	(7)	D_4^{20} = 1.4089 (2)
275.4°	at 726 mm. (2)	15–16° (1)	(8)	1.4060 (6)
269–270°	(3)	13°	(5)	n_D^{20} = 1.5692 (6)
156–157°	at 23 mm. (4)	11.5–12°	(6)	1.56919 (2)
150° cor.	at 23 mm. (5)	11–12°	(7)	$D_4^{15.5}$ = 1.4077 (4)
153.3–153.7°	at 22 mm. (6)			$n_D^{15.5}$ = 1.57099 (4)
131–133°	at 9–10 mm. (7)			

[*See also unsym.-o-phthalyl dichloride* (3:2395).]

The m.p. of ord. samples of C̄ is usually abt. 12°, but distn. at ord. press. (7) yields a prod. with m.p. 16°. The chem. of C̄ is closely connected with that of the isomeric *unsym.-o-*phthalyl dichloride (3:2395) q.v.; for f.p./compn. curve for mixts of the two isomers see (8).

[For prepn. of C̄ from phthalic anhydride (1:0725) with PCl_5 (92% yield (7)) (1) (3) (9) (10), with $PCl_3 + Cl_2$ (12), with benzotrichloride (3:6540) + a little $ZnCl_2$ (13), with a little $ZnCl_2$ at 220° by grad. addn. of $SOCl_2$ (100% yield (14)) (15), or with CCl_4 (etc.) + 2% $ZnCl_2$ at 250–280° (16) see indic. refs.; from phthalic acid (1:0820) with benzotrichloride + a little $ZnCl_2$ see (17).]

[For prepn. of C̄ from *unsym.-o*-phthalyl dichloride (3:2395) by htg. at 150° for 1 hr. see (5); from thiophthalic anhydride [Beil. XVII-486, XVII₁-(256)] with dry Cl_2 at 245° see (18); for formn. as by-product of action of Cl_2 on *o*-toluoyl chloride (3:8740) see (19).]

[For purification of C̄ by treatment with MgO or CaO see (20).]

C̄ on htg. with $AlCl_3$ (½ mole), then decg. cpd. with aq. and extracting with pet. ether, isomerizes (72% yield (7)) (1) (21) to *unsym.-o*-phthalyl dichloride (3,3-dichlorophthalide) (3:2395), m.p. 89°.

[C̄ with Cl_2 at 120–170° in pres. of Fe yields (22) tetrachlorophthalic acid (3:4946).]

[C̄ on reduction with Zn + HCl (23) (24) or HI + P in CS_2 (23) (25) yields phthalide (1:4920); C̄ on boilg. with AcOH + Na/Hg yields (26) phthalyl alcohol (*o*-xylylene glycol) [Beil. VI-910].]

C̄ on heating with K in xylene (27), or with *ter*-bases + $K_2S_2O_5$ (28), or with $ZnCl_2$ + SO_2 at 200° (14) yields phthalic anhydride (1:0725). [Note that last reaction is the reverse of an impt. method (15) of prepn. of C̄.]

[C̄ on shaking for 20 min. at 60° in glass flask with ZnF_2, then extracting with pet. eth. yields (29) *o*-phthalyl difluoride, m.p. 42–43°, b.p. 224–236° at 760 mm. (29); C̄ with HBr gas at 150–160° gives (50% yield (30)) *sym.-o*-phthalyl dibromide, m.p. 78–81° rap. htg., b.p. 191° at 24 mm., 134° at 2 mm. (30).]

[C̄ htd. with a little $ZnCl_2$ and diethyl ether (31) or diethyl phthalate (32) gives (80% yield (31)) ethyl chloride (3:7015).] [Use in mfg. of alkyl chlorides (33).]

[For reactn. of C̄ with glycols see (34); for use of C̄ in acylation of cellulose see (35).]

[For behavior of C̄ with H_2O_2 yielding phthalyl peroxide see (36); with PCl_5 see (37); with NaN_3 see (38) (39); with C_6H_5MgBr see (40).]

C̄ on treatment with cold conc. NH_4OH followed by acidification yields (41) (42) *o*-cyanobenzoic acid [Beil. IX-814, IX₁-(365)], m.p. 190° dec., converted by htg. to phthalimide, m.p. 228.5° u.c. [For reactn of C̄ with dimethylamine yielding *N,N,N',N'*-tetramethyl-*o*-phthaldiamide, m.p. 121–122°, see (43); with diethylamine yielding (44) (45) corresp. *N,N,N',N'*-tetra-ethyl-*o*-phthaldiamide, m.p. 36° (44), 39° (45) see indic. refs.]

C̄ htd. with 1 mole acetamide until no more HCl is evolved gives in good yield (46) *N*-acetylphthalimide, cryst. from toluene, m.p. 135–136° (46); similarly benzamide gives *N*-benzoylphthalimide, m.p. 168° (46).

C̄ reacts instantly with aniline yielding (29) *sym.*-phthalyldianilide, m.p. 253–255°. [Note that when C̄ is treated with aniline in ether or C_6H_6 and stood for some time the prod. has m.p. about 231°; when recrystd. from EtOH, however, the m.p. rises to 253–255°. This apparent anomaly is attributable to the pres. in most samples of C̄ of some phthalic anhydride whose slower reactn. with aniline contaminates the main prod. but is removed by recrystn. from alc. If, on reactn. of ord. C̄ with aniline, the resultant ppt. is filtered at once (before the anhydride has reacted), washed with C_6H_6, alc., and then aq., the prod. shows m.p. 253–255° without recrystn. (29).]

C̄ on hydrolysis yields *o*-phthalic acid (1:0825) q.v.

172–173° at 15 mm.	(3) (4)	20° (3) (9)
167–168° at 15 mm.	(11)	
158° at 12 mm.	(5)	
168° at 10 mm.	(6)	
163° at 10 mm.	(7) (8)	

[For prepn. of C̄ from α-naphthoic acid (1:0785) with PCl_5 (yield: 100% (4) (8)) (6) (1) (11) in CCl_4 (10) or with $SOCl_2$ (12) (13) (14) (7) see indic. refs.]

C̄ + anhyd. Na_2CO_3 + pyridine treated with a few drops of aq. (14), or C̄ with various RMgX or other organometallic cpds. (15), or C̄ htd. with Ca α-naphthoate (1), gives (80% yield (14)) α-naphthoic acid anhydride, pr. from C_6H_6, m.p. 145–146° (1) (14) (15).

[C̄ on cat. hydrogenation gives (33% yield (5)) α-naphthaldehyde [Beil. VII-400, VII_1-(212)], b.p. 173–174° at 35 mm. (p-nitrophenylhydrazone, m.p. 233–235° (5)).]

[C̄ with $AlCl_3$ + hydrocarbons give corresp. α-naphthyl ketones: e.g., with C_6H_6 (6), biphenyl (8), α-methylnaphthalene (16), β-methylnaphthalene (17) (18), with 2,3- (19), 2,6- and 2,7- (20) dimethyl-naphthalenes, with various subst perylenes (21) (22), see indic. refs.; C̄ with RMgX cpds. also yields corresp. α-naphthyl ketones. e.g., with α-naphthyl MgBr (14) or α-tetralyl MgBr (23), see indic. refs.]

C̄ with aq. hydrolyzes very slowly (9) yielding α-naphthoic acid (1·0785) m.p. 161–162°. — For the amide, anilide, and other derivs. corresp. to C̄ see α-naphthoic acid (1:0785); in addition to these see below

Ⓓ α-Naphthoic β-naphthalide: cryst. from alc., m.p. 200° (13) [From C̄ + β-naphthylamine in C_6H_6 (13).]

$D^{18.5}_{18.5} = 1.235$ (1)

Colorless oil showing bluish fluorescence and having only faint odor (3).

[For prepn. of $\bar{C}$ from benzophenone (1:5150) with PCl_5 (yield: 90% (3), 85% (7), 68% (9)) (1) (10) (11) (12) (15); with PCl_5 in C_6H_6 (92% yield (13)), or with oxalyl dichloride (3:5060) in s.t. at 130–140° (14) see indic. refs.; from C_6H_6 + $AlCl_3$ + excess CCl_4 (yield: 90–95% (16), 80–90% (18)) (17) see indic. refs.; for formn. of $\bar{C}$ from diphenylmethane (1:7120) with PCl_5 in s.t. at 170° see (13), from *bis*-(triphenylmethyl) peroxide with PCl_5 (19) or with Cl_2 in CCl_4 in pres. of I_2 (19), from diphenyldiazomethane with $SOCl_2$ or SO_2Cl_2 in pet. ether (100% yield (20)), or from benzotrichloride (3:6540) htd. with uranium metal at 115–128° (4) see indic. refs.]

[For use of $\bar{C}$ in prepn. of acid anhydrides by htg. at 110–120° with salts of aliph. or arom. acids see (21).]

$\bar{C}$ hydrolyzes slowly with cold but rapidly with hot aq. yielding (1) benzophenone (1:5150) and HCl (for study of rate of hydrol. of ether soln. on shaking with aq. see (22)); $\bar{C}$ dis. in conc. H_2SO_4 with yel color (which grad. disappears) and on pouring onto ice yields (6) benzophenone (1:5150); $\bar{C}$ in dry ether shaken 2 hrs. with silver oxide gives (78% yield (23)) benzophenone (1:5150); $\bar{C}$ with alc. NH_3 yields (33) benzophenone.

$\bar{C}$ with MeOH alone (6), with dry MeOH + Mg (24), with dry MeOH in dry pyridine at 0° (25), with NaOMe in MeOH (3) (26), or with NaN_3 in dry MeOH (27) gives (yields: 86% (6) (24), 81% (3)) α,α-dimethoxy-diphenylmethane (benzophenone dimethylacetal) [Beil. VII-415], cryst. from MeOH, m.p. 107–108° (25), 107.5° cor. (24), 106.5–107° (3) (for application to higher alcs. see (3) (26)).

$\bar{C}$ htd. with Ag (11) (5), or stood overnight with Ag or Zn in dry EtOAc (28) cf. (29), or refluxed in CS_2 with 3–4 moles Hg (28) (less Hg gives different result), or with 2 moles NaI in boilg. acetone (30) (1 mole NaI gives different result), or with excess cyclohexyl-MgBr (31) (less reagent gives different result), or with Na in liq. NH_3 (90% yield (32)) or htd. 8 hrs. with diphenylmethane (1:7120) (88% yield (12)) gives tetraphenylethylene [Beil. V-743, V_1-(376)], m.p. 227° cor., 222° u.c. (31), 221° (11). — [$\bar{C}$ does not react with

Mg in dry ether even in pres. of I_2 (28).] — [C̄ refluxed in CS_2 with less than 3 moles Hg (28), or C̄ with 1 mole NaI in acetone in cold (30), or C̄ with 1 mole cyclohexyl MgBr (31), gives tetraphenylethylene dichloride [Beil. V_1-(371)], cryst. from ether, m.p. 186° cor. dec. (31).]

[C̄ with 2 moles Ag azide in ether gives (88% yield (34)) benzophenone diazide, m.p. 42°; C̄ treated as directed (15) with alc. NaSH gives 42–50% yield thiobenzophenone [Beil. VII-429, VII_1-(232)], cryst. from pet. ether, m.p. 53–54° (15) (note that an excess of C̄ must always be present to prevent reduction of the thiobenzophenone to dibenzohydryl disulfide [Beil. VI-681], ndls. from alc., m.p. 152°, and that the latter is obtd. in 70% yield (15) if C̄ is added to the alc. NaSH instead of the reverse); for reactn. of C̄ with diethyl sodio-malonate (2) (9) or with ethyl sodioacetoacetate (8) see indic. refs.; for reaction of C̄ with SbF_3 yielding α,α-difluorodiphenylmethane, b.p. 260° dec., 125° at 10 mm., m.p. −1.8°, $D_4^{20} = 1.1614$, $n_D^{20} = 1.53786$, see (35).]

C̄ with 4 moles aniline in cold gives (36) benzophenone anil [Beil. XII-201, XII_1-(174)] + aniline hydrochloride, the former is sol. in ether, the latter in aq.; sepn. of the layers and addition of alc. to the ether ppts. benzophenone anil, pale yel. lfts. from abs. alc., m.p. 109° u.c. (36) 113°.

CHAPTER XVI

DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

Section 2. D_4^{20} less than 1.1500

(3:7000–3:7499)

3:7000 CHLOROACETYLENE HC≡C—Cl C_2HCl Beil. I - 244
(Chloroethyne) I_1-(106)
I_2-(221)

B.P. −29.6° (1)
−32 to −30° (2)

[*See also dichloroacetylene* (3:5010).]

C̄ is a gas with extremely nauseating odor reminiscent both of yellow phosphorus and of carbylamines; its inhalation even in traces produces very unpleasant symptoms. It is also treacherously explosive and may detonate during manipulation (2).—C̄ ignites spontaneously in air (6) (3).

[For prepn. of C̄ from *cis*-1,2-dichloroethylene (3:5042) via treatment in dil. alc. with aq. alk. $Hg(CN)_2$ to yield $Hg(C{\equiv}CCl)_2$ (see below) which is then warmed (under N_2) with alk. NaCN soln. see (1) (2) (3) (4)] cf. (7).

[For formn. of C̄ during reaction of 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) with solid KOH see (5); from 1,2-dichloroethylene with alc. KOH see (3) (4); from β,β-dichloroacrylic acid (3:1875) with $Ba(OH)_2$ see (6).]

C̄ with $NH_4OH/CuCl$ gives (3) (6) an explosive ppt.—C̄ with $NH_4OH/AgNO_3$ gives (2) (3) a ppt. of silver salt, which is extremely explosive, detonating with great violence not only in dry state but also when moist *and even under water*, quantities as small as 0.1 g. causing considerable damage (2).

C̄ with aq. alk. $Hg(CN)_2$ yields (3) (4) (1) (2) a mercury salt, $Hg(C{\equiv}CCl)_2$, cryst. from $CHCl_3$ (1) (2) (3) (4), m.p. 185° (1) (4), 186° (2); explodes at 195° with flame and deposition of soot (3) (4). [This prod. with alk. KCN evolves C̄ (use in prepn. of C̄ as above).]

C̄ with Br_2/aq. yields (6) 1-chloro-1,1,2,2-tetrabromoethane [Beil. I-95], m.p. 33–34° (6).

[For other reactns. see (2) (7); for study of oxidation of C̄ see (1).]

(7) Ott, Dittus, Weissenburger, *Ber.* **76**, 87–88 (1943).

3:7005 CHLOROMETHANE CH_3Cl CH_3Cl Beil. I - 59
(Methyl chloride) I_1-(8)
I_2-(11)

B.P.	M.P.	
−24.22° at 760 mm. (1)	−97.72° (1)	$n_D^{-42.5} = 1.3830$ (5)
−23.7° at 760 mm. (3) (4)	−96.65° (2)	

Colorless gas with ethereal faintly sweet non-irritating odor. — Important comml. fluid for refrigerating systems; for extensive reviews of properties, uses, handling, toxicity, hazards, etc., see (4) (5) (6). — For b.p. at various pressures from 26–761 mm. together with extensive thermodynamic data see (1) (4). — Solubility of C̄ (in cc.) in 100 cc. solvent at 20°C and 760 mm.: water, 303; EtOH, 3740; AcOH, 3679; CCl_4, 3756; C_6H_6, 4723 (4); for extensive data on solubility of C̄ in other solvents see (7) (8) (9).

[For prepn. of C̄ from MeOH (1:6120) with conc. H_2SO_4 + NaCl (10); with conc. HCl + $ZnCl_2$ (yield: 79% (11), (12)); with HCl gas + various catalysts (13) (14) (15); with PCl_3 + $ZnCl_2$ (68% yield (11)); with PCl_5 + $ZnCl_2$ (72% yield (11)); with $SOCl_2$ + pyridine (80% yield (11)); with $AlCl_3$ (100% yield (16)); with $FeCl_3$ (17) (20) see indic. refs.; for prepn. of C̄ from Me_2SO_4 with strong HCl (or NaCl) (90% yield (18)) or with $AlCl_3$ (100% yield (19)) see indic. refs.] [For study of mechanism of formn. of C̄ from MeOH + HCl see (24).] [For formn. (53% yield) from NH_4Cl with diazomethane in ether see (36).]

[For study of drying of C̄ see (21); for detn. of aq. in C̄ see (22); for study of pyrolysis see (23); for behavior with Na see (25).]

C̄ on warming with NaI in MeOH or EtOH gives (26) methyl iodide, b.p. 42°. [Use in detection and detn. of C̄ (26).]

C̄ is inflammable in air within range 8.1–17.2% by vol. (4) (28) cf. (35). — [For study of detn. of C̄ via combustion see (27) (29) (31) (32).] — C̄ on burning in presence of copper gives strong Beilstein test; [use in detection and detn. of C̄ in air and foods (29); for testing device see (30)].

[For detn. of C̄ by absorption in AcOH see (27); for detn. of small amts. of C̄ in air (31) (37) or in mixts. with other gases (32) see indic. refs.]

Ⓓ *Acetanilide: m.p. 112–113° u.c. (33). [From C̄ via conversion to CH_3MgCl and* reaction with phenyl isocyanate (33); note that C̄ with Mg in dry ether + trace I_2 gives in 4 hrs. (99.7% yield) MeMgCl (38).]

—— *N*-Methyl-3-nitrophthalimide: ndls. from CS_2, m.p. 112–113° (34). [Not recorded directly from C̄ but from MeI by reactn. with K 3-nitrophthalimide, probably therefore from C̄ + NaI + K 3-nitrophthalimide in MeOH.]

3:7010 CHLOROETHENE $CH_2{=}CHCl$ C_2H_3Cl Beil. I - 186
(Vinyl chloride) I_1-(77)
I_2-(157)

B.P. −13.9° at 760 mm. (1) **F.P. −159.7° (1)**

Colorless gas easily liquefied by cooling. — For b.p.'s at various pressures from 39.5–760.3 mm. see (1). — Readily polymerizes in light or in dark if catalysts are present. The literature on polymerization of $\bar{C}$ and on its polymers and copolymers is extremely extensive and cannot be treated here.

[For prepn. of $\bar{C}$ from 1,2-dichloroethane (ethylene dichloride) (3:5130) by action of alc. KOH (85% yield (2)) see (2) (3); for prepn. of $\bar{C}$ from acetylene by addn. of HCl see (4) (5) (14) (15) + Beil.; for purification of $\bar{C}$ with conc. H_2SO_4 see (8).]

$\bar{C}$ as liq. + SO_2 as liq. in 95% alc. + catalyst gives ppt. (6) of insol. pdr. of vinyl chloride polysulfone $[(CH_2{=}CHCl)_2.SO_2]_n$, darkens 135–140°, melts 250–275° (6); on hydrolysis with 20% aq. NaOH this polymer gives (7) acetaldehyde (1:0100) q.v.

$\bar{C}$ adds HBr to give according to conditions (9) (10) either 100% 1-chloro-1-bromoethane (ethylidene chlorobromide), b.p. 82.7° at 760 mm. (11), b.p. 80.5–81.5° at 735 mm. (9), $n_D^{20} = 1.4660$ (9), or 1-chloro-2-bromoethane (ethylene chlorobromide), b.p. 106.7° at 760 mm. (12), b.p. 104–105° at 735 mm. (9), $n_D^{20} = 1.4908$ (9). [Note: the ethylidene chlorobromide may be further identified by htg. with moist silver oxide in a s.t. for 5 hrs. at 100° giving acetaldehyde (1:0100) q.v.; the ethylene chlorobromide may be further identified by refluxing with aniline to yield N,N'-diphenylethylenediamine, m.p. 63.5–64° (9).]

$\bar{C}$ with HI yields only (9) 1-chloro-1-iodoethane (ethylidene chloroiodide), b.p. 117–119° (13), 114–115° (9).

$\bar{C}$ adds Br_2 yielding (16) (17) 1-chloro-1,2-dibromoethane, b.p. 159–160° (16); 163° at 760 mm., 48° at 12 mm.; $D_4^{19} = 2.248$; $n_D^{19} = 1.554$ (17); for study of this photochem. reaction see (18).

12.18° at 760 mm. (12)			
12–12.5° (13) (14)			

Colorless mobile liq. with pungent ethereal odor and sweetish taste. — C̃ is inflammable (see also below) and burns with smoky green-edged flame producing fumes of HCl.

SELECTED PHYSICAL PROPERTIES

Vapor pressure. [For vapor-press. data over various temp. ranges, e.g., from −30 to +40° (5), −30° to 100° (21), 12–187° (4) (22), see indic. refs.]

Solubility relations. C̃ is very spar. sol. aq., e.g., 100 g. aq. at 0° dis. 0.447 g. C̃ (23), 0.570 wt. % (24), although even this is somewhat more than its homologs (24).

C̃ is miscible with EtOH although forced out of soln. by addn. of aq. (25); for use of mixt. of EtOH (50–80%) + aq. (50–20%) as selective solv. for C̃ in sepn. from butane see (26). — C̃ is also miscible with ether. — [For study of rate of volatilization of C̃ from solns. in ether or oils see (32).]

[For soly. of C̃ in CCl_4 (3:5100) or in ethylene dichloride (3:5130) at −10° and 20° and at 100–760 mm. press. see (27); for soly. of C̃ in various high-boilg. ethers and esters of interest to refrigeration industry see (28) (29); for solubility, density, b.p., vapor/liq. equil., etc., of system C̃ + kerosene see (30); for sepn. of C̃ from butane by azeotropic distn. with SO_2 see (31).]

[For soly. in C̃ of anhydrous $FeCl_3$ (33) (34) or anhydrous $AlCl_3$ (35) (36) see indic. refs.]

Adsorption of C̃. [For studies on adsorption of vapors of C̃ by activated carbon at −15° (37), 0° (37) (38), 20° (37), 25° (39), or 50° (40) see indic. refs. and also (41); for sepn. of C̃ from ethylene + HCl gas by adsorption on carbon see (42). — For adsorption of vapors of C̃ by dehydrated chabasite see (43).]

Inflammability of C̃ or its mixtures. C̃ is readily inflammable; in mixts. with air explosive range conts. 4.00–14.18 vol. % C̃ with minimum ignition temp. 517°C. (44) cf. (47) (48); in mixts. with O_2 explosive range conts. 4.05–67.2 vol. % C̃ (44) (45) with min. ignition temp. 468°C; in mixts. with N_2O explosive range conts. 2.1–32.8 vol. % C̃ (45) cf. (46); for study of explosion range of C̃ + $C_2Cl_2F_2$ ("Freon") + air or C̃ + butane + air see (49). — See also below under use of C̃ as anesthetic.

Other miscellaneous physical props. [For study of thermal conductivity of C̃ see (50).]

Binary systems contg. C̃. [For f.p./compn. data and diagram of system C̃ + methylene (di)chloride (3:5020), eutectic, f.p. −149.7°, contg. 68.3 wt. % C̃, see (18); for f.p./compn. data and diag. of system C̃ + EtBr (note no eutectic is formed) see (18); for system C̃ + solid CO_2 see (8).]

TOXICITY AND PHYSIOLOGICAL ACTION OF C̄

Full treatment of this topic is beyond the scope of this work; however, for lead references on its pharmacology (51), toxicity (52) (53) (54) (55), or anthelmintic props. (56) see indic. refs. — For use as narcotic and anesthetic see below.

USES OF C̄

Use for anesthesia and narcosis. [For general reviews on use of C̄ as anesthetic see (57) (58) (59) (60); for use of C̄ as dental anesthetic see (61) (62) (63); for short narcosis see (64) (65). — For data on mortality from use of C̄ as anesthetic see (66). — For studies of explosion hazards with C̄ or C̄ + ether (67) especially in presence of X-ray apparatus (68) see indic. refs. (see also above under inflammability of C̄).]

Use as a refrigerant. C̄ either alone or mixed with other cpds. is often used in refrigerating systems: e.g., for general survey of this aspect see (21); for examples of patents on use in refrigerating systems of C̄ (70), of C̄ (96%) + MeCl (4%) (3:7005) (71), of C̄ (25%) + methylene (di)chloride (3:5020) (75%) (72), of C̄ (40%) + EtBr (60%) (72), of C̄ + an alc. + a hydrocarbon lubricant (74) see indic. refs. — For study of use of C̄ with other suitable liq. in low-temp. cryostats see (18).

Use as solvent for extraction of oils. For use of C̄ as extremely volatile solvent for extraction of oils, fats, resins, perfumes, etc., see (75) (76) (77).

Miscellaneous uses of C̄. C̄ is now an important raw material in the prepn. of tetraethyllead for use as an anti-knock agent in gasoline; for further details see below under chem. behavior of C̄ toward metals.

[For use of C̄ in purification of metallic mercury see (78).]

Because of its inertness toward ozone, its availability, and its low b.p., C̄ is often used as solvent for ozonolysis.

DETERMINATION OF C̄

For detn. of C̄ by pyrolytic dissociation at 900° into ethylene and HCl, followed by detn. of chloride ion with stand. $AgNO_3$ (42) (80) cf. (81) or by combustion with O_2 in an explosion pipet to yield H_2O, CO_2 + HCl (47), see indic. refs. — For detn. of C̄ by hydrolysis with excess std. $N/2$ alc. KOH in s.t. at 120° for 15 min. and back titration with $N/2$ HCl see (79).

For detn. of C̄ in $CHCl_3$ (3:5050) see (82); for detection of C̄ in perfumes see (83).

For further aspects of identification of C̄ see below under Ⓓ.

PREPARATION OF C̄

C̄ can be *prepared from various sources and by many methods (see amplification below)*; however, for quick laboratory methods the most convenient are those from EtOH by htg. with $AlCl_3$ (1 mole) at 150° (97.6% yield (13)) and from diethyl sulfate with aq. $CaCl_2$ (63% yield (84)).

From ethyl alcohol (1:6130).

With hydrogen chloride or hydrochloric acid. [For prepn. of C̄ from EtOH by reactn. with HCl in absence of cat. under reflux (85) (86) or at 125° and 16 atm. (87), or 140° and 24 atm. (88), *see indic. refs.; for use of EtOH + liq. HCl see (89).]*

For prepn. of C̄ from EtOH with conc. HCl in pres. of $ZnCl_2$ (60% yield (7) (91)) see articles represented by (90) (7) (91) (92) (93) [for patents (often including also other metal salt cat. such as $BiCl_3$, etc.) see (94)–(102), incl.].

[For prepn. of C̄ from EtOH + HCl in pres. of H_3PO_4 (103) (104) (105) or H_2SO_4 (106) or $EtHSO_4$ (107) see indic. refs.]

By use of metal salts For prepn. of $\bar{C}$ from EtOH by use of $AlCl_3$ at 150° (97.6% yield (13)) or of aq $FeCl_3$ at 80° (108), or by reflux with subl. $FeCl_3$ for 1½ hrs. (86% yield (112)), see indic. refs.

By use of inorganic acid chlorides. For prepn. of $\bar{C}$ from EtOH by use of PCl_3 (43% yield (109)), $PCl_3 + ZnCl_2$ (62% yield (91)), $PCl_5 + ZnCl_2$ (70% yield (91)), $SOCl_2$ + pyridine (75% yield (91)), or SO_2Cl_2 + pyridine (110) see indic. refs.

By use of organic acid chlorides. {For prepn. of $\bar{C}$ from EtOH with benzotrichloride (3:6540) + $FeCl_3$ see (111)}

From diethyl ether (1:6110).

By cleavage with HCl + a catalyst. {For prepn of $\bar{C}$ from diethyl ether with HCl + $ZnCl_2$ (113) at 80–280° under press. (114) or at 300–370° under press. (115), or with HCl + $AlCl_3/NaCl/FeCl_3$ at 200–325° (116), or with HCl + a nitrogen heterocycle (117) see indic. refs}

By cleavage with acid chlorides + a catalyst. {For prepn of $\bar{C}$ from diethyl ether with $SOCl_2$ or S_2Cl_2 in pres. of $SnCl_4$ or $TiCl_4$ (118), or with $SOCl_2 + ZnCl_2$ (119); or with benzoyl chloride (3:6240) in pres of Zn (120) cf. (121), $ZnCl_2$ at 150° (78% yield (122)) cf. (123) (124), MeZnI (125) or $AlCl_3$ (126), or with phthalyl (di)chloride (3:6900) in pres. of $ZnCl_2$ at 170° (80% yield (122)); or with acetyl chloride (3:7065) in pres. of $ZnCl_2$ (127) or $AlCl_3$ (126) see indic refs.}

{For formn. of $\bar{C}$ from diethyl ether + $CHCl_3$ (3:5050) + cat. at 290° and 25 atm. see (128)}

From various ethyl esters of inorganic and organic acids. {For prepn. of $\bar{C}$ from diethyl sulfate with aq $CaCl_2$ as lab method (63% yield (84)) or as manufacturing process (129); from diethyl sulfate with conc HCl at 140° and 24 atm. (130), from ethyl chlorosulfonate with fumg. HCl at 100° (91% yield (131)) (132) cf. (189), pyridine (133), or di-*n*-butylamine at 100° (53% yield (134)) see indic. refs.}

{For prepn. of $\bar{C}$ from ethyl formate (1:3000) with $AlCl_3$ (1 mole) at 110° (82% yield (135)); from ethyl chloroformate (3:7295) on htg. at 250° (for study of this reaction see (136) (137)), with dimethylaniline at 150° (138), with pyridine (139), with quinoline at 100° (139) or even 59° (140) (141), or with $AlCl_3$ at room temp (142), or with $EtHSO_4$ (143) see indic. refs.}

{For prepn. of $\bar{C}$ from ethyl acetate (1:3015) with subl. $FeCl_3$ on 1½ hrs. reflux (73% yield (112)), or with $SiCl_4$ (144), from ethyl benzoate (1:3721) with subl. $FeCl_3$ on 1½ hrs. reflux (74% yield (112)); or from diethyl phthalate (1:4331) with phthalyl (di)chloride (3:6900) + trace $ZnCl_2$ at 130° (145) see indic. refs.}

From vinyl chloride (3:7010). {For prepn. of $\bar{C}$ from vinyl chloride by cat. hydrogenation at elev. temp. and press see (146)}

From ethane. {*For prepn. of $\bar{C}$ from ethane with Cl_2 above 290° in pres. of ethylene or* $PbEt_4$ as cat. (yields 67.8–71.4% (147)) (148) see indic. refs. — For examples of other patents on prepn. of $\bar{C}$ from ethane with Cl_2 in pres. of various cat. (149) (150) (151) (152) (153) see indic refs.}

From ethylene. The preparation of $\bar{C}$ from ethylene by catalytic addn. of hydrogen chloride has been extensively studied both in the scientific and in technical literature. At very low temperatures, the catalyzed reaction is quantitative, but as the temperature is increased the reverse reaction (dissociation of $\bar{C}$ into ethylene and HCl) is favored.

{For studies on the prepn. of $\bar{C}$ from ethylene with HCl in pres. of $AlCl_3$ or $BiCl_3$ at −78° (100% yield (3) (153)), or as high as −12° (95% yield (154) (155)) or 130° (37% yield (42)), see indic refs.; for studies on equilibrium at 114° and 124° (156), at 170°, 200°, and 230° (157) or for calcn. of entropy of system (158) see indic. refs.; for study of various cat. see (159)}

[The patent literature on prepn. of C̄ from ethylene + HCl is extensive and overlapping, but illustrative examples may be cited. For patents involving use of $AlCl_3$ (160) (161) under pressure (162) (163) (164) (165) in the pres. of a solvent (often C̄ itself) (162) (166) (167) (168) (190) see indic. refs. — For use of ethylene + mixt. of HCl (90%) + Cl_2 (10%) + $AlCl_3$ (169) (170) or for prepn. (171) or revivification (172) of $AlCl_3$ cat. see indic. refs.]

[For patents on prepn. of C̄ from C_2H_4 + HCl with various cat., e.g., with $BiCl_3$ (173) (174) (175), with anhydrous $EtHSO_4$ (176), with $SnCl_4$ on activated carbon at 150° (177), with bauxite cat. (178), with iron oxide cat. at 50° and ord. or increased press. (179), with $BaCl_2$ at 250° (180), with $FeCl_3$ in C̄ or $AlCl_3$ in nitrobenzene (181), with $ZnCl_2$ on activated carbon, silica gel, etc., (182) (183), with various surface agts. (184) (185), with SO_2 (186), with 90% H_2SO_4 + NaCl (188), or in liq. ethyl chlorosulfonate + $BiCl_3$ (189) see indic. refs.]

[For purification of C̄ obtd. from techn. gases by HCl method see (187).]

From miscellaneous sources. [For formn. of C̄ from EtBr with $CHCl_3$ (3:5050) in pres. of $AlCl_3$ at 50° (191), from EtMgBr during reaction with S_2Cl_2 (192) or with 1,2-dichloroethylene (3:5030) (193), from EtI with Hg_2Cl_2 in s.t. at 140° (12), from ethyl α,β-dichlorovinyl ether (3:5540) with Cl_2 at ord. temp. followed by warmg. or stdg. in absence of aq. (194), or from dichloroacetaldehyde diethylacetal (3:6110) with $ZnEt_2$ (195) see indic. refs.]

[For formn. of C̄ from succinic acid (1:0530) with aq. $FeCl_3$ in sunlight (196) or from MeCl (3:7005) + aq. by disproportionation over cat. at 200–275° (197) see indic. refs.]

CHEMICAL BEHAVIOR OF C̄

Pyrolysis of C̄

C̄ passed through plain tube at 410° is largely unchanged, but C̄ passed at 550° through tube contg. pumice (198) cf. (42) or other cat. (199) dissociates completely into ethylene + HCl (use in detn. of C̄ (42)).

Behavior of C̄ with Inorganic Reactants

Chlorination. [C̄ with liq. Cl_2 (1 mole) in u.v. light and cooling yields (200) mainly 1,1-dichloroethane (3:5035) accompanied by some 1,2-dichloroethane (3:5130) and higher chlorination prods.; the two dichloroethanes are also obtd. from C̄ with Cl_2 + aq. (201). — For very impt. study of behavior of C̄ with Cl_2 at 202–380° see (202) (147).]

[C̄ with $SbCl_5$ in s.t. at 100° (203) or C̄ with NCl_3 (204) yields 1,2-dichloroethane (ethylene dichloride) (3:5130).]

Bromination. [For behavior of C̄ with Br_2 see (207) (208).]

Fluorination. [C̄ at 900° with F_2 in pres. of Cu yields (205) CF_4, CF_3Cl, $CF_3.CF_2Cl$, $CHF_2.CH_2Cl$, $CF_2{=}CCl_2$, and other prods.]

Hydrogenation. [For behavior of C̄ with atomic hydrogen see (206).]

Hydrolysis. [C̄ over suitable partially dehydrated $Al(OH)_3$ at room temp. (209), or C̄ + aq. vapor over cat. at 300–500° at ord. press. (210) (211) (212), or C̄ with aq. NaOH above 150° under press. (213), or C̄ with alc. NaOH (214), alc. Na_2CO_3, MgO, or CaO (215) is saponified yielding EtOH (1:6130). — The reaction of C̄ with EtOH/KOH is bimolecular (216); furthermore during hydrol. of C̄ with alk. some diethyl ether is always formed cf. (213) (214) and the reaction may be adapted to its prepn. (217).]

Amination. [C̄ with alc. NH_3 in s.t. at 100° (218) or C̄ with liq. NH_3 at 220° and 220 atm. press. (219) gives salts of ethylamine, diethylamine, triethylamine, and other prods. —

C̄ with $NaNH_2$ in liq. NH_3 at 0° and 20 atm. gives ethylamine (30% *yield* (220)) and ethylene.]

Behavior of C̄ with inorganic acids. [C̄ passed through boilg. H_2SO_4 gives C_2H_4 + SO_2 + HCl; C̄ is absorbed by SO_3 giving a liq. which probably comprises a mixture of ethyl chlorosulfonate, β-chloroethanesulfonic acid, and β-hydroxyethanesulfonyl chloride (221).]

Behavior of C̄ with inorganic salts. [For study of rate of reaction of C̄ with KI in acetone at 50° and 60° see (222). — C̄ with $AlBr_3$ under suitable cond. yields (223) ethyl bromide.]

Behavior of C̄ with metals. *With sodium.* The most important reaction of C̄ with metals is that involved in the manufacture of tetraethyllead for use as an anti-knock agent in motor fuels. Tetraethyllead is prepared for C̄ either by direct reaction with Na/Pb alloys, or by reaction with Mg and subsequent conversion of the EtMgCl by means of $PbCl_2$. For a general survey (without references) on the manufacture of tetraethyllead see (224).

For patents involving the prepn. of Et_4Pb from C̄ by reactn with Na/Pb alloys under various circumstances see (225)–(244) incl.; for patents involving the use of EtMgCl see (245)–(248) incl.

[For behavior of C̄ with Na in lgr. followed by CO_2 (249) or with amyl-sodium or octyl-sodium (250) *see indic. refs.* — C̄ with K/Na alloy in xylene gives (251) ethane (32%) and ethylene (5.5%). — C̄ with Tl/Na yields (252) $TlEt_3$.]

With magnesium. [C̄ with Mg in s.t at 260° for 4 hrs gives (253) gas (consisting of 45% butane + 20% olefins + 22% H_2) and a white solid which with aq. gives a gas contg. 86% H_2 + 13% ethane]

C̄ with Mg in dry ether in absence of air and in pres. of trace of I_2 gives (99.7% yield in 4 hrs. (254)) EtMgCl; this reagt. is actually an equil. mixt. contg. 25% EtMgCl + 42.5% $MgEt_2$ + 42.5% $MgCl_2$ (255). — For study of competitive reaction with Mg in ether of an equimolar mixt of C̄ + EtI yielding 27% EtMgCl + 73% EtMgI see (256). — [For reactn. of EtMgCl with NH_4Cl or triethylamine.HCl (254), with NH_2Cl (257), or with NCl_3 (258) see indic. refs.; for study of electrolysis of EtMgCl in ether see (259). — For reactn of EtMgCl with $PbCl_2$ yielding $PbEt_4$ see (245)–(248) incl ; with C_6H_5NCO *yielding propionanilide see below under* Ⓓ's.]

Behavior of C̄ with Organic Reagents

[C̄ with C_6H_6 + Al/Hg gives (76% *yield* (260)) ethylbenzene (1:7410); C̄ + hexane + $AlCl_3$ gives (261) octane.]

[C̄ with CO + $AlCl_3$ at 40–50° and 120 atm. followed by treatment with H_2O gives (43% yield (262)) (263) propionic acid (1:1025).]

[C̄ with ethylene oxide (1:6105) + $AlCl_3$ gives (264) a mixt. contg. 4-chlorobutanol-1 (3:9170) + ethylene chlorohydrin (3:5552).]

[C̄ may be used for the ethylation of OH groups or NH_2 groups: e.g., for reaction of C̄ with sodium phenolate yielding (265) ethyl phenyl ether (1:7485) or for use of C̄ in ethylation of cellulose (266) (267) see indic. refs.; for use of C̄ in ethylation of metanilic acid (268) (214) (215), *o*-toluidine (269), or *m*-aminophenol (268) see indic. refs.]

[For condens. of C̄ with *hexamethylenetetramine see* (270).]

[C̄ (2 moles) with ethylene (di)bromide (1 mole) + 3% $AlCl_3$ in steel bomb at 25° for 14 days undergoes a redistribution reactn. yielding (271) a mixt. consisting of 5 cpds., viz., C̄ (35 mole %) + EtBr (30 mole %) + ethylene chlorobromide (17 mole %) + ethylene (di)bromide (11 mole %) + ethylene dichloride (3.5130) (7 mole %).]

[C̄ (1 mole) with quinoline (1 mole) in s.t. in direct sunlight reacts only very slowly (incomplete in 1 year) but grad. separates ethylquinolium chloride, cryst. from abs. EtOH by addn. of dry ether, m.p. 122° (290).]

Ⓓ Propionanilide: m.p. 104.0–104.5° u.c. (272). (See also under propionic acid (1:1025).) [From C̄ by conversion to EtMgCl (see above) and reactn. in dry ether with phenyl isocyanate (272).]

—— Propion-*p*-toluidide: m.p. 123°. [Presumably obtainable (272) from C̄ via conversion to EtMgCl (see above) and reaction in dry ether with *p*-tolyl isocyanate.]

—— Propion-α-naphthalide: m.p. 126° u.c. (273). [Presumably obtainable (272) from C̄ via conversion to EtMgCl (see above) and reaction in dry ether with α-naphthyl isocyanate; the analogous process for EtBr has been reported (273).]

—— Ethyl mercuric chloride: m.p. 193.5° cor. (274), 192.5° (275), 192° (276). [Prepd. indirectly (276); but should be preparable from EtMgCl with $HgCl_2$ since corresp. EtHgBr has been reported (276) from EtMgBr + $HgBr_2$. — Note that m.p. of EtHgCl is almost identical with that (193.5°) of EtHgBr cf. (276).]

—— *S*-(Ethyl)isothiourea picrate: m.p. 188° (277). [Not reported from C̄, but readily obtd. from EtBr or EtI (277) (278) (1 g.) with thiourea (1 g.) in alc. (10 ml.) on refluxing for 2 hrs., then adding PkOH (1 g.), htg. until clear soln. results, then cooling (277). — Note that the m.p. of this prod. is very close to those of *S*-(*sec*-butyl)isothiourea picrate, m.p. 190° (278), and *S*-benzylisothiourea picrate, m.p. 188° (277).]

—— *N*-Ethylphthalimide: [Beil. XXI-461, XXI_1-(363)], ndls. from alc., m.p. 79° (279), 78° (280). [Prepd. indirectly (280), also from EtI with potassium phthalimide in s.t. at 150° (279).]

—— *N*-Ethyl-3-nitrophthalimide: pl. from CS_2, m.p. 105–106° (281) (282); for photographs of crystals see (282). [Not reported from C̄ itself, but obtd. from EtBr with K phthalimide on protracted reflux. (281).]

—— *N*-Ethyltetrachlorophthalimide: pl. from $CHCl_3$ on pouring into 2 vols. EtOH, m.p. 192–193° (283). [Not reported from C̄ but obtd. from EtBr or EtI with K *tetra*-chlorophthalimide in s.t. at 200° for 6 hrs. (283).]

—— *N*-Ethylsaccharin: cryst. from dil. alc., m.p. 94° (284). [This prod. cannot be obtd. from C̄ itself (284) but is obtd. from either EtBr or EtI with sodium saccharin in aq. butylcarbitol (1:6517) contg. KI on refluxing for 30 min. (284).]

—— *N*-Ethyl-*N*-(*p*-bromobenzenesulfonyl)-*p*-anisidide: m.p. 113 5° u c. (285). [Not reported from C̄ but obtained from EtBr with *N*-(*p*-bromobenzenesulfonyl)-*p*-anisidide (285).]

—— *p*-Ethoxybenzoic acid: m.p. 195° (286) cf. (287).

—— Ethyl 2,4,6-triiodophenyl ether: m.p. 83.5° cor. (288).

—— Ethyl α-naphthyl ether: oil, b.p. 280.5° cor., f.p. below −10° (289). (Corresp. picrate, m.p. 118.5–119.5° cor.; Neut. Eq. 401 (289).)

—— Ethyl β-naphthyl ether: m.p. 35.5–36 0° cor., b.p. 282° cor. (289). (Corresp. picrate, m.p. 101.0–101.5° cor., Neut. Eq. 401 (289).)

[For prepn of $\bar{C}$ (45%) together with 2,2-dichloropropane, b.p. 70° [illegible] from acetone (1:5400) + PCl_5 see (6) (7) [illegible] KOH (3) or [illegible] from 1,2-dic[illegible] with cyclop[illegible] [illegible]propane (3:5450) + 1,2,2-trichloroprop[illegible] [illegible]ment with Zn see (14).]

$\bar{C}$ with MeOH forms a const.-boilg. mixt., b.p. 22.0°, contg. 97% $\bar{C}$ + 3% MeOH (15).

$\bar{C}$ treated with conc. H_2SO_4 and (after evoln. of HCl has ceased) poured into much aq. and steam-distd. (16) or $\bar{C}$ htd. with 10 vols. aq. in s.t. at 140–180° (17) yields acetone (1:5400) q.v.

$\bar{C}$ adds Br_2 yielding (8) (12) 2-chloro-1,2-dibromopropane [Beil. I-111], b.p. 169–170° cor (12).

$\bar{C}$ adds HBr fairly readily; in the presence of air or of antioxidants in vacuo, the product is pure 2-chloro-2-bromopropane, b.p. 91.0–92.0° at 740 mm., 34.6–34.8° at 100 mm., n_D^{20} = 1.4575 (4), in the presence of organic peroxides the major reactn prod. is 2-chloro-1-bromopropane, b.p. 117.6–118.0° at 740 mm, 52.2–52.8° at 75 mm., n_D^{20} = 1.4778 (4).

3:7022 ETHYL HYPOCHLORITE $CH_3.CH_2OCl$ C_2H_5OCl Beil. I - 324
I_1-(164)
I_2-(325)

B.P. 36° at 758 mm. (1) **D^{-6}_{4} = 1.013 (1)**
36° at 752 mm. (2)

[*See also ter-butyl hypochlorite* (3:7165).]

Colorless oil (rapidly turning yellow in light) with odor like hypochlorous acid. — $\bar{C}$ explodes on superhtg. its vapor or even in cold upon addn. of Cu powder or in bright sunlight — $\bar{C}$ gradually decomposes on stdg. in diffuse light with formn. of ethyl acetate and other prods. (3) (4) (10). [For study of stability of $\bar{C}$ in aq. or in CCl_4 soln. see (4).] — Sol. ether, C_6H_6, $CHCl_3$; for distrib. of $\bar{C}$ between aq. and CCl_4 see (4).

[For prepn. of $\bar{C}$ from EtOH (1:6130) with Cl_2 in cold aq. alk. (2) (5) (1) (6) (7) (8) (9) or alk. earth (9) or with aq. HOCl in pres. of CCl_4 (4) see indic. refs.; for formn. of $\bar{C}$ from EtOH (1:6130) with Cl_2 at −18° (8) or with dry $Ca(OCl)_2$ (15) or aq. HOCl (15) (16) see indic. refs.]

$\bar{C}$ is able according to prevailing circumstances to act as an oxidizing agent, chlorinating agent, or for addn. to unsaturated linkages: furthermore since in aq. $\bar{C}$ is extensively hydrolyzed (69% in sat. aq. soln. (4)) it may serve as source of HOCl; examples of these reactions are given below.

$\bar{C}$ with inorganic reactants. $\bar{C}$ with KI + AcOH liberates I_2 quant. according to the equation $C_2H_5OCl + 2HI \rightarrow C_2H_5OH + HCl + I_2$ (use in quant. detn. of $\bar{C}$ (2) (4) (7)); $\bar{C}$ with dil. alk. Na_3AsO_3 gives (11) (12) EtCl (3:7015) + Na_3AsO_4; $\bar{C}$ in dil. alk. KSH/KCN mixt. gives (12) KSCN + KCl + EtOH.

[$\bar{C}$ adds to dry SO_2 yielding (5) ethyl chlorosulfonate [Beil. I-327, I_2-(327)], b.p. 151–154° dec., n_D^{18} = 1.4174]

[$\bar{C}$ (1 mole) with KCN (2 moles) in 7 pts. aq. at −5° gives (30% yield (13)) ethyl cyanoiminoformate [Beil. II-549, II_1-(238), II_2-(511)], oil, b.p. 133° dec., accompanied by a little diethyl di-imino-oxalate [Beil. II-547, II_1-(238)], m.p. 38°, b.p. 172° strong dec.; in aq. alc., however, the same components give (13) diethyl iminocarbonate [Beil. III-37, III_1-(18), III_2-(31)], oil, b.p. 141° cor., accompanied by diethyl di-iminooxalate (see above).]

$\bar{C}$ with organic reactants. [$\bar{C}$ with EtOH (1:6130) yields (8) acetaldehyde (1:0100), acetaldehyde diethylacetal (1:0156), and paraldehyde (1:0170). — $\bar{C}$ with acetaldehyde (1:0100) at 0° followed by distn. of the mixture with anhyd. oxalic acid yields (3) chloroacetaldehyde (3:7212).]

[$\bar{C}$ with acetone (1:5400) yields (3) chloroacetone (3:5425); $\bar{C}$ with methyl phenyl ketone (acetophenone) (1:5515) yields (3) ω-chloroacetophenone (phenacyl chloride) (3:1212); $\bar{C}$ with benzaldehyde (1:0195) yields (3) benzoyl chloride (3:6240).]

[$\bar{C}$ with phenol in CCl_4 yields (3) both *o*-chlorophenol (3:5980) and *p*-chlorophenol

(3:0475); C̃ with hydroquinone (1:1590) in ether gives (3) 2,3-dichlorohydroquinone (3:4220).]

C̃ with phenyl MgBr in ether at 0° gives (60% yield (14)) (1) chlorobenzene (3:7903).

[C̃ with phenylacetylene (1:7425) in CCl_4 yields (3) ω,ω-dichloroacetophenone (3:6835).]

[C̃ with cyclohexene (1:8070) in CCl_4 yields (3) 2-chlorocyclohexanol-1 (3:0175); for reactn. of C̃ with indene (1:7522) or with 1,4-dihydronaphthalene see (3).]

[C̃ with olefins adds to the unsatd. linkage to give chlorohydrin ethyl ethers (a process now generically designated as chloroalkoxylation): e.g., C̃ with ethylene yields (15) (17) β-chloroethyl ethyl ether (ethylene chlorohydrin ethyl ether) (3:7463); C̃ with amylene gives (3) a corresp. prod.; the rate of addn. of C̃ to olefins increases from ethylene to amylene (18). — For extensive studies on the prepn. of chlorohydrin ethers from olefins by use of alcs. + *N,N*-dichlorobenzenesulfonamide (which mixture appears to generate ROCl as the active addn. agent) see (18) (19) (20) (21).]

[C̃ has, however, but slight tendency to add to unsaturated acids: e g., C̃ in CCl_4 has no actn. (22) on cinnamic acid (1:0735); C̃ in dry ether or CCl_4 with crotonic acid (1:0425) or sorbic acid gives only traces (23) of the expected prods. — C̃ in CCl_4 with hexen-3-oic acid-1 (hydrosorbic acid) [Beil. II-435, II_1-(193), II_2-(404)] gives addn. to extent of 92% in 3 days (23), but the prod. is not a chloro-ethoxy-hexanoic acid and consists entirely of a mixt. of two stereoisomeric β-chlorohexanoic lactones.]

3:7030 1-CHLOROPROPENE-1 (Propenyl chloride, β-methylvinyl chloride)

$CH_3.CH{=}C(H)Cl$ C_3H_5Cl Beil. I - 198, I_1—, I_2—

trans form

B.P.	F.P.	
37.4° at 760 mm. (1)	**−99° (1)**	n_D^{20} = **1.4054 (2)**
36.7° at 747 mm. (2)		

cis form

B.P.	F.P.	
32.8° at 760 mm. (1)	**−134.8° (1)**	n_D^{20} = **1.4053 (2)**
32.0–32.2° at 747 mm. (2)		

Mobile colorless liq. lighter than water (3). $\bar{C}$ is stable toward hydrolysis; for use in anal. of mixts. of $\bar{C}$ with 3-chloropropene-1 (allyl chloride) (3:7035) see (7).

[For prepn. of $\bar{C}$ from 1,1-dichloropropane (3:7230) + alc. KOH in s.t. at 100° (3) (4) or with alc. NaOEt (2) see indicated refs.; for formn. from 1,2-dichloropropane (propylene dichloride) (3:5200) + alc. KOH see (3) (5) ($\bar{C}$ is principal product (5), but some 2-chloropropene-1 (3:7020) and propadiene are also formed); for formn. of *cis* isomer from α,β-dichloro-*n*-butyric acid of m.p. 62.5–63° by warming with Na_2CO_3 see (6).]

$\bar{C}$ with Br_2 at −15° yields 1-chloro-1,2-dibromopropane, b.p. 177–177.5° cor. (3).

$\bar{C}$ in presence of air or added peroxides adds HBr rapidly to give exclusively (2) 1-chloro-2-bromopropane, b.p. 117.2–117.3° at 740 mm., 52.0° at 75 mm., n_D^{20} = 1.4795 (2).

[For study of molecular refraction and dipole moment of both *cis* and *trans* forms of $\bar{C}$ see (8).]

Colorless oil, spar. sol. aq.; volatile with steam.

$\bar{C}$ with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 44° at 760 mm., contg. 95% $\bar{C}$ (5); with formic acid (1:1005) forms a const.-boilg. mixt., b.p. 45.0° at 760 mm., contg. 92.5% $\bar{C}$ (15).

$\bar{C}$ is one of most toxic of all halohydrocarbons (for study see (16)).

[For prepn. of $\bar{C}$ from allyl alcohol (1 [illegible] in s.t. at 100° for 3 hrs. (17), with conc. HCl [illegible] (1) (23) or 10 days at room temp. (55–6 [illegible] 6 *N* HCl (50% yield (19)), with $ZnCl_2$ [illegible] or dislvd. in cold conc. HCl and treated with Cu_2Cl_2 (small amt.) + conc. H_2SO_4 (yield 85–90% (2), 80% (22)) see indic. refs.; from allyl alcohol (1:6145) with $SOCl_2$ in C_6H_6

(71% yield (21)), with PCl_3 (1) (24), with $PCl_3 + ZnCl_2$ in C_6H_6 at 0° (63% yield (21)), with PCl_3 + pyridine (73% yield (9)), with $PCl_5 + ZnCl_2$ in C_6H_6 (57% yield (21)) see indic. refs.]

[For prepn. of $\bar{C}$ from allyl formate (1:3035) with conc. HCl + a little Cu_2Cl_2 + conc. H_2SO_4 (93–98% yield (22)), or with $ZnCl_2$ + HCl gas (80–90% yield (25)) (26) see indic. refs.; from allyl oxalate in alc. $CaCl_2$ in s.t. at 100° see (27); from allyl iodide with alc. $HgCl_2$ at ord. temp. see (27).]

[For comml. prepn. of $\bar{C}$ from propylene with Cl_2 at elevated temps., e.g., 500° (yield 96% $\bar{C}$ accompanied by 3% 2-chloropropene-1 (3:7020) + 1% mixed *cis* and *trans* isomers of 1-chloropropene-1 (3:7030) (11)) (28) (29), see indic. refs. (note also that the high-boiling material from distn. of comml. $\bar{C}$ contains (110) approx. 60% 1,3-dichloropropene-1 (3:5280) + 30% 1,2-dichloropropane (3:5200)); for examples of patents covering this procedure see (30) (31) (32) (33) (34) (35), from propane (34) (36) or 1-chloropropane (3:7040) (36) with Cl_2 + cat. at 500–700° see indic. refs.; from 1,2-dichloropropane (3:5200) by suitable pyrolysis (yield: 55–70% $\bar{C}$ + 30–40% of mixt. of *cis* and *trans* isomers of 1-chloropropene-1 (3:7030) + 5% 2-chloropropene-1 (3:7020) (11)) cf. (12) (13) (39); for examples of relevant patents see (37) (38) (40).]

Reactions involving the double bond of $\bar{C}$. [$\bar{C}$ with Cl_2 adds and/or substitutes according to conditions (for study of relative proportions of these reactions see (29) (11)); $\bar{C}$ with Cl_2 at ord. temp. (41) or $\bar{C}$ with SO_2Cl_2 in CCl_4 in pres. of peroxides (42) gives (80–90% yield (42)) 1,2,3-trichloropropane (3:5840) (note that this comprises one step in one of the modern syntheses of glycerol from petroleum (43) (44)); $\bar{C}$ with Cl_2 at high temp. yields (11) a mixt. of prods. of which the dichloropropene fraction comprises (11) 47% 1,3-dichloropropene-1 (high-boilg. isomer) (3:5280) + 42% 1,3-dichloropropene-1 (low-boilg. isomer) (3:5280) + 11% 1,1-dichloropropene-2 (3:5140) + trace of 1,2-dichloropropene-2 (3:5190).]

[$\bar{C}$ with Br_2 adds 1 mole of halogen yielding (45) mainly 1,2-dibromo-3-chloropropane (γ-chloropropylene dibromide) [Beil. I-111], b.p. 195° (45); for study of rate of addn. of Br_2 under various conditions see (14) (9) (46) (105); for heat of reactn. see (47).]

[$\bar{C}$ with conc. aq. HCl in s.t. at 100° for 18 hrs. (48), or $\bar{C}$ with dry HCl in dark at 0° in absence of $FeCl_3$ (33% yield (49)) or at room temp. in pres. of $FeCl_3$ (85–89% yield (49)), gives 1,2-dichloropropane (propylene dichloride) (3:5200); note that addn. of HCl is not complicated by a peroxide effect but is very slow unless $FeCl_3$ (or less advantageously $AlCl_3$) is used as a cat. (49). — $\bar{C}$ satd. with HBr gas at 0° or below (50), or with conc. aq. HBr at 0° (51), or with HBr gas in s.t. at 100° for 8 hrs. (48) cf. (52), or in presence of Fe (53) or other cat., e.g., $BiCl_3$ (54), as directed, gives (yields: 36–38% (53), 43% (52), 50% (51), 87% (50)) 1-bromo-3-chloropropane (γ-chloro-*n*-propyl bromide) (trimethylene chlorobromide) [Beil. I-109, I_1-(36), I_2-(75)], b.p. 142°; note that the above mode of addn. is favored by peroxides (49) (54) cf. (106). — $\bar{C}$ with HI (10–20% excess at 0°) gives exclusively (90–100% yield (55)) 1-chloro-2-iodopropane, b.p. 66.2° at 50 mm., $n_D^{20} = 1.5472$ (55); note that in this reactn. formn. of 2-iodopropane (isopropyl iodide) has also been reported (56).]

[$\bar{C}$ (1 mole) with conc. H_2SO_4 (2 moles) at 0° gives an oily addn. prod. (24) (presumably β-chloroisopropyl hydrogen sulfate) which upon dilution with aq. and subsequent distillation gives (50% yield (57) (61)) (24) (58) (59) (60) 1-chloropropanol-2 (3:7747); in pres. of $CuSO_4$ the yield rises to 66–70% (62). — $\bar{C}$ adds HOCl yielding (63) (64) (65) (76) 2,3-dichloropropanol-1 (glycerol β-dichlorohydrin) (3:6060). — $\bar{C}$ with *ter*-butyl hypochlorite (3:7165) in MeOH contg. a little *p*-toluenesulfonic acid gives at 40° (44% yield (66)) 1,3-dichloro-2-methoxypropane (β,β'-dichloroisopropyl methyl ether), b.p. 154–156° at 730 mm., $D_4^{20} = 1.2235$, $n_D^{20} = 1.4542$ (66).]

[$\bar{C}$ with liq. SO_2 + trace of ascaridole + a few drops of aq. or alc. HCl, HBr, or H_2SO_4 gives (70–100% yield (67)) cf. (68) allyl chloride polysulfone, no def. m.p., dec. 210–235°, sol. $CHCl_3$ or acetone but insol. most other org. solvents; note, however, that this addn. of SO_2 is completely inhibited by the pres. of as little as 5 mole % of allyl *bromide* or cinnamyl *bromide* (67). — $\bar{C}$ (2 moles) with S_2Cl_2 (1 mole) in s.t. at 100° for 6 hrs. deposits sulfur and yields (69) *bis*-(β,γ-dichloro-*n*-propyl) sulfide, pale yel. oil, b.p. 181–182° at 15 mm. (69); the same components maintained at room temp. for 10 days, however, deposit no sulfur and on distn. yield (69) *bis*-(β,γ-dichloro-*n*-propyl) *di*sulfide, b.p. 190° at 11 mm. (69).]

[$\bar{C}$ (2 moles) with cyclopentadiene (1 mole) (1:8030) in s.t. at 170–180° for 8 hrs. gives (74% yield on C_5H_6 (70)) by Diels-Alder addn. 2,5-endomethylene-1,2,5,6-tetrahydrobenzyl chloride (1-(chloromethyl)-2,5-endomethylenecyclohexene-3), b.p. 54–57° at 11 mm. (70). — For polymerization of $\bar{C}$ see (71) (101).]

[$\bar{C}$ with excess diazomethane in ether stood for 3 days yields a yel. very hygroscopic ppt. presumably 3-(chloromethyl)-Δ^2-pyrazoline (72).]

[$\bar{C}$ with C_6H_6 + conc. H_2SO_4 gives (73) by addn. to the ethylene linkage β-chloro-*n*-propylbenzene (2-chloro-1-phenylpropane) [Beil. V-391, V_1-(189), V_2-(304)], b.p. 85° at 13 mm., D_{-}^{19} = 1.047, n_D^{19} = 1.5245 (73); note, however, that $\bar{C}$ with C_6H_6 in pres. of $FeCl_3$ at −20° gives (33.5% yield (74)) (73) the isomeric (β-chloroisopropyl)benzene (1-chloro-2-phenylpropane) [Beil. V_1-(191)], b.p. 79° at 10 mm., D_4^{17} = 1.0367, n_D^{18} = 1.52129 (74); $\bar{C}$ with C_6H_6 + $AlCl_3$ (⅙ mole) gives none of the β-chloroisopropylbenzene since it apparently reacts with more C_6H_6 yielding (74) α-methylbibenzyl (1,2-diphenylpropane [Beil. V-613, V_1-(288), V_2-(517)].] [For analogous condensation of $\bar{C}$ with fluorobenzene, chlorobenzene (3:7903), and bromobenzene see (118).]

[For oxidn. of $\bar{C}$ in liq. phase at 75–250° by O_2 in pres. of $Cu(OAc)_2$ or peroxide catalysts and in an org. solv. such as AcOH to hydroxylated cpds. see (75).]

Reactions involving the halogen atom of $\bar{C}$. [$\bar{C}$ + H_2 over activated charcoal at 300–500° gives (58% yield (77)) propylene; note that the double bond is *not* (77) hydrogenated.]

[$\bar{C}$ passed over activated charcoal contg. 1–2% KOH is dehalogenated (78) at 375° to extent of 21%; at 400°, 58%.]

[$\bar{C}$ with aq. vapor at 550–850° + cat. (79) or under press. with alkali hydroxides (80) or with HCl/Cu_2Cl_2 (108) yields (cf. (43) (44)) allyl alcohol (1:7145). — $\bar{C}$ with alc. KOH (81) (107) or alc. NaOH (12) yields allyl ethyl ether (1:7850) + alkali chloride; for use of this reactn. in detn. of $\bar{C}$ in pres. of *cis*-1-chloropropene-1 (3:7030) and *trans*-1-chloropropene-1 (3:7030) see (12); for study of rate of reactn. of $\bar{C}$ with NaOMe at 16–18° (82) or of $\bar{C}$ with NaOEt at 35° and 50° (83) see indic. refs.]

[$\bar{C}$ with alc. KSH gives mainly (84) di-allyl sulfide [Beil. I-441, I_1-(226), I_2-(478)], b.p. 138–139° (84).] — [For reactn. of $\bar{C}$ with alkali polysulfides in prepn. of rubber-like prod. see (85).]

[*For studies of rate of reactn. of* $\bar{C}$ *with KI in acetone at 20° (83), 25° (86), or 60° (87)* cf. (9) see indic. refs.; for reactn. of $\bar{C}$ with Na_3AsO_3 yielding allylarsinic acid see (88); for reactn. of $\bar{C}$ with CuCN giving (85% yield (22)) allyl cyanide (vinylacetonitrile) [Beil. II-408, II_1-(187), II_2-(389)], b.p. 117.8–118.2° at 757 mm. (22), see indic. refs.; for reactn. of $\bar{C}$ with Mg + acetone, giving allyl-dimethyl-carbinol [Beil. I-445, I_2-(487)], b.p. 118–120°, D_4^{17} = 0.83452, n_D^{17} = 1.4300 see (89).]

[$\bar{C}$ with conc. aq. NH_4OH as directed (90) yields allylamine [Beil. IV-205, IV_1-(389), IV_2-(662)], b.p. 56°, misc. aq. — For study of rate of addn. of $\bar{C}$ to pyridine or reactn. with piperidine see (82) (91); for sepn. of $\bar{C}$ from other chloro-olefins, e.g., 1-chloropropene-1 (3:7030) or 2-chloropropene-1 (3:7020), by conv. of $\bar{C}$ to quaternary salt see (111).]

$\bar{C}$ with Mg in dry ether under carefully regulated conditions gives (84% yield (102))

cf. (109) (119) allyl MgCl; note that if this prod. reacts with phenyl isocyanate in a fashion analogous (103) to allyl MgBr the prod. obtd. should be crotonanilide, m.p. 113–114° cor. (103).

[$\bar{C}$ with Mg in dry ether as directed gives (68% yield crude, 27% pure (92), 60% (93)) hexadiene-1,5 (1:8045). — $\bar{C}$ with $NaNH_2$ in liq. NH_3 as directed gives (30% yield (94)) hexatriene-1,3,5 [Beil. I-263, I_1-(243)], b.p. 76–80°, $D_4^{20} = 0.7182$, $n_D^{20} = 1.4330$ (94); during the reactn. an intermediate chlorohexadiene (95), b.p. 115° at 748 sl. dec., 46–47.5° at 96 mm., $n_D^{20} = 1.4483$, appears to be formed, and the hexatriene is accompanied (94) (95) by variable amts. of its dimer, trimer, and tetramer. — For reaction of $\bar{C}$ with monosodium acetylene in liq. NH_3 see (96).]

[$\bar{C}$ with 1-chloro-2-methylpropene-2 (methallyl chloride) (3:7145) + Mg in ether gives (93) 47% 2-methylhexadiene-1,5 (b.p. 88.1° at 760 mm., $D_4^{20} = 0.7198$, $n_D^{20} = 1.4184$) + 30% 2,5-dimethylhexadiene-1,5 (b.p. 114.3° at 760 mm., $D_4^{20} = 0.7423$, $n_D^{20} = 1.4293$) + 12% hexadiene-1,5 (biallyl) (1:8045). — $\bar{C}$ with crotyl chloride (the equil. mixt. of 1-chlorobutene-2 (3:7205) and 3-chlorobutene-1 (3:7090)) + Mg in ether gives 34% heptadiene-1,5 (b.p. 93.7° at 760 mm., $D_4^{20} = 0.7186$, $n_D^{20} = 1.4200$) + 21% 3-methylheptadiene-1,5 (b.p. 111.0° at 760 mm., $D_4^{20} = 0.7291$, $n_D^{20} = 1.4240$) + 10% hexadiene-1,5 (1:8045) + 10% 3-methylhexadiene-1,5 (b.p. 80.0° at 760 mm., $D_4^{20} = 0.7103$, $n_D^{20} = 1.4116$) + 1% octadiene-1,6 (b.p. 124.5° at 760 mm., $D_4^{20} = 0.7441$, $n_D^{20} = 1.4336$) (93).]

[$\bar{C}$ reacts with RMgX cpds. in normal coupling; e.g., $\bar{C}$ with EtMgBr gives (97) pentene-1 (1:8205); $\bar{C}$ with n-PrMgBr gives (97) hexene-1 (1:8255); $\bar{C}$ + n-C_5H_{11}MgCl gives (80% yield (93)) octene-1 (1:8375); $\bar{C}$ with iso-AmMgCl gives (60% yield (93)) 6-methylheptene-1 (b.p. 113.2° at 760 mm., $D_4^{20} = 0.7119$, $n_D^{20} = 1.4068$); $\bar{C}$ with o-tolyl MgBr gives (98) o-allyltoluene (b.p. 182–183° at 757 mm., $D_4^{20} = 0.9001$, $n_D^{20} = 1.5186$).]

Miscellaneous reactions of $\bar{C}$. [$\bar{C}$ with phenol (1:1420) + conc. H_2SO_4 stood at room temp. for 6 months gives (99) o-isopropenylphenol [Beil. VI-572, VI_1-(283)]; for analogous prods. from $\bar{C}$ with o-cresol (1:1400), m-cresol (1:1730), and p-cresol (1:1410) see (99).]

Ⓓ *S*-**Allylisothiurea picrate**: m.p. 155° (100). [From $\bar{C}$ thiourea in EtOH, refluxed for 5 min., treated with PhOH (100).]

—— *N*-**(Allyl)phthalimide** [Beil. XXI-464, XXI_1-(364)]: m.p. 70°. [The direct prepn. of this cpd. from $\bar{C}$ has not been reported; it has, however, been obtd. from allyl bromide with K phthalimide in s.t. at 150° for 2–3 hrs. (50% yield (104)) and has also been prepd. by numerous indirect means; with Cl_2 in $CHCl_3$ it yields N-(β,γ-dichloro-n-propyl)phthalimide, ndls. from alc., m.p. 93° (104); with Br_2 in $CHCl_3$ it yields N-(β,γ-dibromo-n-propyl)phthalimide, m.p. 113–114° (104).]

—— *N*-**(Allyl)-3-nitrophthalimide**: pl. from CS_2, m.p. 100–101° (112). [Not reported from $\bar{C}$ but obtd. from allyl bromide with K 3-nitrophthalimide (112), for photographs of cryst. see (113).]

—— *N*-**(Allyl)tetrachlorophthalimide**: unreported.

Ⓓ *N*-**(Allyl)-o-sulfobenzoic imide** (*N*-**allylsaccharin**): m.p. 58° (114). [From $\bar{C}$ with sodium saccharin in aq. butylcarbitol (1:6517) on refluxing 30 min. (114).]

—— *N*-**(Allyl)-*N*-(*p*-bromobenzenesulfonyl)-*p*-anisidide**: m.p. 82° u.c. (115). [Not reported from $\bar{C}$ but obtd. from allyl bromide with N-(p-bromobenzenesulfonyl)-p-anisidine in alc. KOH (115).]

—— *p*-**Allyloxybenzoic acid**: m.p. 162–163° u.c. (116). [From $\bar{C}$ (?) or from allyl bromide with ethyl p-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (116); note, however, that m.p. of prod. is almost identical with corresp. deriv., m.p. 160–163°, from isopropyl halides.]

—— Allyl α-naphthyl ether: m.p. −10° (117) (corresp. picrate, m.p. 100.5–101.0° cor. (117)).

—— Allyl β-naphthyl ether: m.p. +16° (117) (corresp. picrate, m.p. 98.5–99.0° cor. (117).)

Colorless limpid liquid with not unpleasant odor. — Almost insol. aq. [for precise data see (10) (11) (12)].

$\bar{C}$ with MeOH, b.p. 64.7°, forms const.-boilg. mixt., b.p. 40.5°, contg. 90.5 wt. % $\bar{C}$ (13); $\bar{C}$ with EtOH, b.p. 78.3°, forms const.-boilg. mixt., b.p. 45.0°, contg. 94 wt. % $\bar{C}$ (14); $\bar{C}$ with isopropyl alc., b.p. 82.5°, forms const.-boilg. mixt., b.p. 46.4°, contg. 97.2 wt. % $\bar{C}$ (14); $\bar{C}$ with CS_2, b.p. 46.3°, forms const.-boilg. mixt., b.p. 42.05°, contg. 44.5 wt. % $\bar{C}$ (14). — [For f.p./compn. data on mixts. of $\bar{C}$ with cyclohexyl chloride (3:8040) or with isopropyl bromide see (15).]

[For prepn. of $\bar{C}$ from propanol-1 (1:6150) with con- HC . Z-C ...
70–72% (16), 65–70% (17), 61% (18) (19)); with PCl_3 (2 ...
with PCl_5 (5) + $ZnCl_2$ (76% yield (19)); with $SOCl_2$ + ...
refs.; for other misc. methods see Beil.]

[For formn. of $\bar{C}$ (togeth ...
for further actn. of Cl_2 on ...

[For isomerization of $\bar{C}$ ...
(28); for isomerization of $\bar{C}$ accompanying alkylation see (29); for $\bar{C}$ in Friedel-Crafts reactn. see (30).]

$\bar{C}$ on passing over various cat. espec. at elevated temps. loses HCl (30) (31) + Beil. I_2-(72).

[For study of behavior of $\bar{C}$ with KI see (33); toward Na see (34) (35) (36); with Mg in dry ether see (37) (note that $\bar{C}$ with Mg in dry ether contg. trace of I_2 gives in absence of air 98.2% yield (51) RMgCl).]

Ⓓ *n*-**Butyranilide**: m.p. 96° (38); 97° (39); 92° cor. (40), u c. (41). [From $\bar{C}$ (41) or *n*-propyl bromide (40) via conversion to RMgX and reactn. with phenyl isocyanate (41).]

—— *n*-**Butyr-*p*-toluidide**: m.p. 75° (38); 74–75° (42); 73–74° (43). [Presumably similarly obtainable via RMgCl + *p*-tolyl isocyanate, but not actually so recorded.]

Ⓓ *n*-**Butyr-α-naphthalide**: m.p. 120° (44); 121° (45). [From RMgBr via reactn. with α-naphthyl isocyanate (45).]

—— *n*-**Propyl mercuric chloride**: m.p. 140° (46).

Ⓓ *S*-(*n*-**Propyl)isothiourea picrate**: m p. 176° (47). [In small yield from $\bar{C}$ on htg. 5 hrs. with thiourea in alc., followed by addn. of PkOH (47).]

—— *n*-**Propyl 2,4,6-triiodophenyl ether**: m.p. 82° cor. (48). [From *n*-propyl bromide on *refluxing with 2,4,6-triiodophenol, m.p. 157–158°, in alc. NaOEt (48).]* [*Note* that this ether depresses m.p. of corresp. Et 2,4,6-triiodophenyl ether, m.p. 82° cor. (48).]

—— *N*-(*n*-**Propyl)-3-nitrophthalimide**: ndls. from CS_2, m.p. 84–85° (49). [From *n*-propyl bromide on refluxing with K 3-nitrophthalimide (49).]

—— *n*-**Propyl α-naphthyl ether**: b.p. 293.5° cor. (50) [picrate: m.p. 99.5–100° cor. (50)].

—— *n*-**Propyl β-naphthyl ether**: b.p. 297.0° cor., m.p. 39.5–40 0° cor. (50) [picrate: m.p. 80.5–81.5° cor. (50)].

Binary systems of C̄ with other org. cpds. — For f.p./compn. data of mixts. of C̄ with CCl_4 (3:5100) (23) (13), with *n*-butyl chloride (3:7160) (19), with *n*-butyl bromide (19), or with isobutyl bromide (19) see indic. refs.

C̄ with MeOH (1:6120) forms a const.-boilg. mixt., b p. 43.75°, contg. 90% C̄ (24); C̄ with formic acid (1:1005) forms a const.-boilg. mixt , b.p. 50.0°, contg. 88.8% C̄ (3); C̄ with CS_2 forms a const.-boilg mixt., b.p. 43.3°, contg 37% C̄ (25). — Note that C̄ gives no azeotrope with *ter*-BuOH (1:6140) (9).

Preparation of C̄. [For prepn. of C̄ from *ter*-BuOH (1:6140) with conc. HCl (3 vols.) by shaking in cold (espec. in pres. of $CaCl_2$) (78–88% yield (26)) or by distillation (using

7–8 pts. by wt. conc. HCl) (94% yield (27)), or with dil. aq. HCl (18–20 Bé) in pres. of inorg. halide cat. (28) see indic. refs.]

[For prepn. of C̄ from *ter*-BuOH (1:6140) with dry HCl gas in cold (1) (29), with HCl gas in pres. of pyridine at elevated temp. (some isobutyl chloride (3:7135) is also formed (30)); with PCl_3 (31), $PCl_3 + ZnCl_2$ (92% yield (32)), PCl_5 (33) (34), $PCl_5 + ZnCl_2$ (85% yield (32)), or excess $AlCl_3$ (35); with oxalyl (di)chloride (3:5060) (36) or with trichloromethyl chloroformate (diphosgene) (3:5515) (20) see indic. refs.]

C̄ can also be obtained from various isobutyl cpds. (see following paragraphs), but it must be constantly kept in mind that reactns. of this type involve the equilibrium between *C̄, isobutylene, and isobutyl chloride, and the proportions of the two halides* may vary widely according to particular conditions; for some types of utilization, however, such a mixture may serve just as well as pure C̄.

[For prepn. of C̄ from 2-methylpropane (isobutane) with Cl_2 see (37) (38) (39); from isobutylene with HCl gas (40) (41) (4) (18), with conc. aq. HCl (42) (43) (44), with HCl gas + $AlCl_3$ at −50° (45), with HCl gas + cat. (46), from tech. cracked gas (contg. isobutylene) with HCl (47) (48) (49) (57), with chloromethyl methyl ether (3:7085) + $HgCl_2$ (other prods. are also formed (50)), or even with Cl_2 (other prods. also formed) (51) (52) (53) see indic. refs.]

[For prepn. of C̄ from 1-chloro-2-methylpropane (isobutyl chloride) (3:7135) by htg at 306° (8% C̄ (54)), or passing vapor over $BaCl_2$ at 380–400° (40% C̄ (55)), or over suitable cat. at 200° as directed (56); from isobutyl iodide with ICl (58); from isobutylamine with NOCl in xylene at −15° (59); from isobutyl alcohol (1:6165) with HCl gas (60) cf. (1), with HCl gas over Al_2O_3 at 420° (61), or with $PCl_3 + ZnCl_2$ (62) see indic. refs.]

[For formn. of C̄ from 2-chloro-2-methylbutane (*ter*-amyl chloride) (3:7220) by cleavage with $AlCl_3$ (35) or with anhydrous HF at 0° (10–17% yield (17)) see indic. refs.]

Pyrolysis of C̄. [C̄ on suitable htg. dec. into isobutylene + HCl; this begins to occur at 300° even in absence of cat. (63) (for study of equilibria involved see (4) (18)); for study of reactn. over ThO_2 at 100° (64), over pumice at 400–500° (65), or over activated carbon contg. 1–2% KOH (dehalogenation is 19.8% at 375°, 51% at 400° (66)) see indic. refs. — Note that C̄ passed over activated carbon at 400° in pres. of H_2 is 51% dehalogenated but the isobutylene is not reduced (67).]

Further halogenation of C̄. [C̄ in liq. phase with Cl_2 in light gives (68) a mixt. of chlorination prods. contg. approx. 37% 1,2,3-trichloro-2-methylpropane (3:5885) + 25% 1,1,2-trichloro-2-methylpropane (3:5710) + 21% 1,1,2,3-tetrachloro-2-methylpropane (3:6165) + 10% 1,2-dichloro-2-methylpropane (3:7430) + 6% 1,2,3-trichloro-2-(chloromethyl)-propane (3:6335) + a trace of 1,1,1,2-tetrachloro-2-methylpropane (3:4725). — C̄ in vapor phase under reduced press. with Cl_2 in u.v. light or in dark electric discharge (69) or C̄ with $SbCl_5$ (1 mole) with cooling (34) gives 1,2-dichloro-2-methylpropane (3:7430).]

C̄ with Br_2 in pres. of Fe (70) or in liq. SO_2 at room temp. for 14 hrs. (100% yield (72)) evolves HCl and gives 1,2-dibromo-2-methylbutane (isobutylene dibromide) [Beil. I-127, I_1-(41), I_2-(90)], b.p. 149.0°.

Reactions of the halogen atom of C̄. The tertiary chlorine atom of C̄ is very reactive and therefore readily hydrolyzed or alcoholized. — C̄ on shaking with aq. for 24 hrs. at room temp. (6) or C̄ on refluxing with 2 vols. aq. for 8 hrs. (71% hydrolysis (72)) yields *ter*-BuOH (1:6140); note rate of hydrolysis of C̄ is greater in pure aq. than in 5% aq. Na_2CO_3 (72); for use of this facile hydrolysis in removal of C̄ from isobutyl chloride (3:7135) see under latter). [For details of studies of kinetics of hydrol. of C̄ under various circumstances, e.g., in aq. alc., see (73) (74) (75) (6) (11); in formic acid (14) (77) (78).] [For use in prepn. of *ter*-butyl alc. (1:6140) see (79).]

[C̄ (2 moles) in ether shaken with Ag_2CO_3 (1 mole) gives (35% yield (114)) di-*ter*-butyl ether, b.p. 106.5–107°, $D_4^{20} = 0.7658$, $n_D^{20} = 1.3949$ (114).]

[$\bar{C}$ in the presence of small amts. $AlCl_3$ exchanges halogen with reactive H atoms of certain hydrocarbons; e.g., $\bar{C}$ with 2,3-dimethylbutane (1:8515) + $AlCl_3$ shaken for ½ min. at room temp. gives (23% yield (112)) 2-chloro-2,3-dimethylbutane (3:7600); $\bar{C}$ with 2,2,3-trimethylbutane (1:8544) + $AlCl_3$ shaken for 30–45 *seconds* gives (16% yield (112)) 3-chloro-2,2,3-trimethylbutane (3:4020); for other examples see (112).]

[$\bar{C}$ also undergoes alcoholysis: e.g., $\bar{C}$ shaken with equal vol. 50 mole % MeOH for several days (74) (11) seps. a non-aq. phase of *ter*-butyl methyl ether (1:7830), b.p. 55°; $\bar{C}$ with EtOH gives (11) *ter*-butyl ethyl ether (1:7860), b p. 73°; for study of this equilibrium and detn. of these ethers see (11).]

[For rate of reactn. of $\bar{C}$ with KI in acetone at 60° see (80); for reactn. of $\bar{C}$ with Ca formate yielding (77) (78) *ter*-butyl formate (1:3033), b.p. 83°, see indic. refs.; for conv. of $\bar{C}$ to esters by htg. with alkali salt of a suitable acid under press. at 125–225° in pres. of Cu and the use of this reactn. in sepn. of $\bar{C}$ from less reactive chlorine cpds. see (81).]

[$\bar{C}$ readily condenses with arom. hydrocarbons and phenols: e.g., $\bar{C}$ with Al/Hg + C_6H_6 gives (74.5% yield (109)) or $\bar{C}$ with C_6H_6 + $AlCl_3$ gives (yields: 69% (82), 60% (83)) (62) (1) mainly *ter*-butylbenzene (1:7460), b.p. 168.8°, often accompanied by some *p*-(di-*ter*-butyl)benzene, cryst. from alc., m p. 77° (82); this same condensation can also be effected in anhydrous HCl at 235° under press. (88% yield (84)) or in anhydrous HF (yield: 60% di- + 10% mono- (85)). — $\bar{C}$ with toluene + $AlCl_3$ gives *both* *p*-*ter*-butyltoluene and *m*-*ter*-butyltoluene (in ratio of 30–35/65–70, resp. (86)) but $\bar{C}$ with toluene in anhyd. HCl or HF (85) (22) cf. (113) gives exclusively (84) *p*-*ter*-butyltoluene, b p. 188–189°, n_D^{20} = 1.4930 (84). — For reactn. of $\bar{C}$ with naphthalene + $AlCl_3$ (87) or Al/Hg (109) or $\bar{C}$ with *m*-cymene + $AlCl_3$ (88) see indic. refs.]

[$\bar{C}$ with phenol (1:1420) in anhyd. HF gives (85% yield (89)) *p*-*ter*-butylphenol (1:1510); $\bar{C}$ with β-naphthol (1:1540) + $AlCl_3$ gives (90) 4-(*ter*-butyl)naphthol-2, m.p. 102° (90). — $\bar{C}$ with anisole (1:7445) + ZnF_2 gives (30.6% yield (91)) *p*-*ter*-butylanisole, but $\bar{C}$ does not react with anisole + AlF_3 or with furan + ZnF_2 (91).]

[$\bar{C}$ with acetanilide + $AlCl_3$ in ethylene dichloride at —10° gives (93% yield) *N*-acetyl-*p*-*ter*-butylaniline (111).]

$\bar{C}$ under proper conditions gives the corresponding RMgCl cpd.: e.g., $\bar{C}$ with Mg in dry ether as directed gives (yields: 80% (92), 62% (93), 60% (95)) cf. (94) *ter*-BuMgCl; this RMgCl cpd. undergoes the usual reactions (see also below under Ⓓ's) including the following: *ter*-BuMgCl with O_2 below 0° gives (80% yield (95)) *ter*-BuOH (1:6140) q.v.; with acetyl chloride (1 mole) in C_6H_6 gives (40–54% yield (92)) *ter*-butyl methyl ketone (pinacolone) (1:5425) (note, however, that *ter*-BuMgCl with excess acetyl chloride takes a different course (97) and that with various other acyl halides the reducing action of the *ter*-BuMgCl becomes conspicuous cf. (98) (99) (100)); $\bar{C}$ with ethyl chloroformate (3:7295) or diethyl carbonate (1:3150) gives (56% yield (92)) ethyl trimethylacetate (ethyl pivalate) (1:3117), with $\bar{C}$ itself to give (10% yield (96)) hexamethylethane (1:7090).

$\bar{C}$ reacts with other RMgX cpds. in conventional fashion: e.g., $\bar{C}$ with MeMgCl gives (42–50% yield (108)) tetramethylmethane (neopentane) (1:8499); $\bar{C}$ with *n*-PrMgBr in ether + $HgCl_2$ gives (yield 21% (101), 20% (110)) 2,2-dimethylpentane (1:8543); the numerous other reactions of *ter*-BuMgCl cannot be reviewed here.

[For reactn. of $\bar{C}$ with Et_2Zn and numerous homologs see (102).]

Ⓓ *ter*-Butyl alcohol (*1:6140*): m.p. 25.6°, b.p. 82.5°. [From $\bar{C}$ by shaking with aq. for 24 hrs. at room temp. (6), or on refluxing with 2 vols. aq for 8 hrs. (72), neutralizing with Na_2CO_3, salting out the alcohol with NaCl, drying over anhyd. Na_2CO_3, and distilling.]

Ⓓ Trimethylacetic acid (pivalic acid) (1:0410): m.p. 35.5°, b.p. 163–164°. [From $\bar{C}$ by

conversion to *ter*-BuMgCl (see above) and reactn. of latter with dry CO_2 (yields based on C̄, 75% (92), 62% (93), 42.5% (17)) (94).]

Ⓓ **Trimethylacetic anilide (pivalanilide):** m.p. 132–133° u.c. (103), 132.5–133° (17). [From C̄ by conv. to *ter*-BuMgCl (see above) and reactn. of latter with phenyl isocyanate in dry ether (17) (103) (104).]

Ⓓ **Trimethylaceto-*p*-toluidide (pivalo-*p*-toluidide):** m.p. 119–120° u.c. (103). [From C̄ by conversion to *ter*-BuMgCl (see above) and reactn. of latter with *p*-tolyl isocyanate in dry ether (103).]

Ⓓ **Trimethylaceto-α-naphthalide (pivalo-α-naphthalide):** m.p. 146–147° u.c. (103) [From C̄ by conversion to *ter*-BuMgCl (see above) and reactn. of latter with α-naphthyl isocyanate in dry ether (103).]

—— ***ter*-Butyl mercuric chloride:** long ndls. from aq. acetone as directed (105), m.p. 122–123° dec. (105). [From *ter*-BuMgCl with $HgCl_2$ (105).]

—— ***S*-*ter*-Butylisothiourea picrate:** m.p. 160–161° (106). [From C̄ with thiourea on htg. in alc. followed by conversion of the resultant hydrochloride to picrate (106); note, however, that, because of the lability of the *ter*-butyl radical, reactions carried out in MeOH or EtOH may give the corresp. *S*-methylisothiourea picrate, m.p. 224°, or *S*-ethylisothiourea picrate, m.p. 188°, and this definitely occurs (107) starting with *ter*-butyl iodide.]

—— ***N*-(*ter*-Butyl)phthalimide:** unreported.

—— ***ter*-Butyl 2,4,6-triiodophenyl ether:** unreported.

—— ***ter*-Butyl α-naphthyl ether:** unreported.

—— ***ter*-Butyl β-naphthyl ether:** unreported.

50.08–50.12°	at 741 mm.	(10)		n_D^{20} = 1.38976 (4)
50°	at 740 mm.	(13)		1.3887 (8)

Colorless mobile liq. with sharp and penetrating odor. — Note that ordinary samples of C̄ may (according to their method of preparation) contain more or less PCl_3 (b.p. 75.95° at 760 mm.), $POCl_3$ (b.p. 107.2° at 760 mm.), $SOCl_2$ (b.p. 78.8°), AcOH (b.p. 118.2°), Ac_2O (b.p. 140.0°), or various acetylated derivs. of phosphorous acid (if present in large amt. the last in part form a white ppt. on long stdg.), removal of which is difficult; the presence of these impurities doubtless accounts for various instances of abnormally high b.p.'s cf. (7). — C̄ may be freed from dissolved HCl and from AcOH by distn. with dimethylaniline (13) or by treatment with powdered basic oxides, hydroxides, carbonates, etc. (14).

PREPARATION OF C̄

C̄ can be prepared from various sources with a wide variety of reagents; examples of the more important types of combinations are given below grouped under indicated subheadings. — It must also be recognized that many other processes (notably for manufacture of Ac_2O) involve the formation of C̄ but immediately utilize it without separate isolation; these cannot be included here.

Preparation of C̄ from AcOH. [For prepn. of C̄ from AcOH with PCl_3 (79% yield (20)) (15) (16) (7) (17) under press. at 80° (yield 100% (18)) or in Ac_2O (85% yield (19)) see indic. refs. (note particularly the formn. of Ac_2O and of $AcO.P(OH)_2$ discussed in (17)): with $PCl_3 + ZnCl_2$ (90% yield) see (20); with PCl_5 (80% yield (20)) (21) see indic. refs.; with $POCl_3$ (22) (23) see indic. refs.; with P_2O_5 + HCl gas at 0° see (24) (25); with $P + Cl_2$ in $POCl_3$ see (26).]

[For prepn. of C̄ from AcOH with $SOCl_2$ (46% yield (20)), with $S_2Cl_2 + Cl_2$ at −4° in pres. of Fe (95.5% yield (27)), with $ClSO_3H$ (20–25% yield (28)); with sodium chlorosulfonate (29) in pres. of NaCl or $Na_2S_2O_7$ (30) (31), or with $SiCl_4$ in toluene (85% yield (32)), see indic. refs.]

[For prepn. of C̄ from AcOH with $COCl_2$ (3:5000) at 110–120° (33) in vapor phase at 160° over $MgCl_2$ on diatomaceous earth (34) cf. (35) (36); with an arylsulfochloride such as *p*-toluenesulfonyl chloride + NaCl (30); with another org. acid chloride such as chloroacetyl chloride (3:5235) (37), dichloroacetyl chloride (3:5290) (38), or benzoyl chloride (3:6240) (yield 85–88% (39), 70% (42)) (40) (41); with benzotrichloride (3:6540) (90% yield (42)) see indic. refs.]

Preparation of C̄ from salts of acetic acid. [For prepn. of C̄ from NaOAc (or other metallic acetates) with $POCl_3$ (43) (44); with SO_2Cl_2 (45) (46); with sodium chlorosulfonate

(29) cf. (30); with $SiCl_4$ (47) (48); with $COCl_2$ at 120° under press. (49); with p-toluenesulfonyl chloride (50); with benzoyl chloride (3:6240) (40) see indic. refs.; from NaOAc/H_2SO_3 compd. with Cl_2 see (51).]

Preparation of Č from acetic anhydride. [For prepn. of Č from Ac_2O (1:1015) with Cl_2 (52); with dry HCl gas at 100° (52) or in continuous process at 85–90° (93% yield (53)) or under 18–42 atm press. (100% yield (54)); with PCl_3 (15); with PCl_5 (21); with $SOCl_2$ at 20–25° (SO_2 being evolved) (55), or with sodium chlorosulfonate (29) see indic. refs.]

[For prepn of Č from Ac_2O (1:1015) with phosgene (3:5000) + cat. (56); with benzoyl chloride (3:6240) (77% yield (42)) (41) (40); with oxalyl (di)chloride (3:5060) (80–95% yield (57)); with benzo-trichloride (3:6540) + $ZnCl_2$ (33% yield (58)); with benzyl chloride (3.8535) + cat. (59) see indic. refs.; for formn. of Č as by-prod. from reactn. of ethylene with Cl_2 in Ac_2O see (60).]

Preparation of Č from methyl chloride. [For prepn. of Č from CH_3Cl (3:7005) with CO at 700–800° over pumice contg. sodium metaphosphate (61) or with CO, $COCl_2$, or COS at 700–900° in pres. of metallic cat. (62) see indic. refs.]

Preparation of Č from miscellaneous sources. [For prepn. of Č from 1,1,1-trichloroethane (methylchloroform) (3:5085) by partial cat. hydrolysis (63) (64); from ketene + liq. HCl (65) or with HCl gas over activated carbon at 100° (100% yield (66)); from ethyl, isobutyl, isoamyl, benzyl, phenyl, or p-tolyl acetates with $SiCl_4$ (67); from α-chloroethyl acetate (3:7625) (68) (69) or α,β-dichloroethyl acetate (69) with $ZnCl_2$ (68) or over pumice at 250–300° (69); from β-bromo-α,β-dichlorovinyl ethyl ether with AcOH (70); from acetyl bromide with HCl gas at ord. temp. (71); from N,N-diacetylaniline (diacetanilide) with HCl gas at 150–170° (72); from diacetyl sulfite (see below) with $SOCl_2$ (73) see indic. refs.]

PYROLYSIS OF Č

[Č in absence of cat. is stable to heat up to at least 450° (74). — Č passed at 700–850° over hot Pt wire gives ethylene + CO + HCl (75), but at 400° over Pt on pumice gives (74) 45% MeCl (3:7005) + 49% CO + 5% H_2. — Č over Cu filings at 350° is partially decomposed yielding (74) MeCl (3:7005) + CO + CO_2 + H_2 + dehydroacetic acid (1:0700) + acetone. — Č over $ZnCl_2$ on pumice at 400° gives (74) HCl + dehydroacetic acid (1:0700) + gas mixt contg. 87% CO_2 + 4% CO + 2% H_2. — Č over Ni at 420° gives (76) HCl + gas mixt. contg. 62% CO + 32% H_2. — For studies on pyrolysis of Č over Al_2O_3, Cu_2Cl_2, CuO, Ni, etc., see (74).]

REACTIONS OF Č WITH INORGANIC REAGENTS

Reaction of Č with H_2O (hydrolysis). Č reacts violently with aq. hydrolyzing to AcOH (1:1010) + HCl (for kinetic studies see (77)); for use of this reactn. in volumetric detn. of H_2O in org. liquids see (185) (78). — Because of its ease of reactn. with aq. Č is widely used for condensations, ring closures, etc.

Reaction of Č with NH_3 and similar cpds. Č with cold conc. aq. NH_4OH (16) or Č with liq. NH_3 (79) gives (yields: 77% (16), 88% (79)) acetamide, very sol. aq., m.p. 81.5°, b.p. 222° (best recrystd. from dry AcOEt by addn. of dry ether).

[The direct reaction of Č with NH_2OH (or its salts) seems to be unreported, but the presumable prod., viz., N-acetylhydroxylamine (acethydroxamic acid) [Beil. II-187, II_1-(85), II_2-(181)], very eas. sol. aq. or alc., insol. ether, cryst. from EtOAc, m.p. anhydrous 89°, contg. crystal aq. 57°, has been obtd. indirectly.]

[The direct reactn. of Č with hydrazine hydrate, $NH_2.NH_2.H_2O$, seems to be unreported, but the presumable prod., viz., acethydrazide (acetylhydrazine) [Beil. II-191, II_1-(86), II_2-(185)], ndls. from alc., m.p. 67°, has been obtd. by indirect means.]

Reaction of $\bar{C}$ with halogens. [$\bar{C}$ with Cl_2 in CCl_4 in light (80) or in pres. of I_2 (82) gives mainly chloroacetyl chloride (3:5235); for study of mechanism of chlorination see (81); for influence of $\bar{C}$ on chlorination of AcOH or Ac_2O see (82), on bromination of AcOH see (83).]

[For studies of $\bar{C}$ with Br_2 see (84) (85) (86).]

Reaction of $\bar{C}$ with inorganic acids. [$\bar{C}$ with dry HBr gas for 2 hrs. gives (80% yield (87)) acetyl bromide [Beil. II-174, II_1-(79), II_2-(176)], b.p. 76.7° at 760 mm., $D_4^{15.8}$ = 1.6625, $n_D^{15.8}$ = 1.45370; for details on this equilibrium see (88).]

[$\bar{C}$ with 3 pts. dry HI in the cold gives (70% yield (87)) (89) acetyl iodide [Beil. II-174, II_1-(80), II_2-(177)], b.p. 104–106° at 735 mm. (89) (for studies of use of AcI in splitting of aliphatic ethers (90) or in addn. to unsatd. hydrocarbons (91) see indic. refs.).]

[$\bar{C}$ with cold conc. H_2SO_4 (1 mole) forms a mol. cpd. (88) (92) which can even be obtd. in cryst. form (92); this cpd. loses HCl only upon htg. (88) (92), and the residual acetyl hydrogen sulfate [Beil. II-170, II_1-(78), II_2-(174)] which might be expected is transformed into sulfoacetic acid and other prods. (92). — $\bar{C}$ with nitrosylsulfuric acid in CCl_4 evolves NOCl and yields acetyl HSO_4 which rapidly changes to sulfoacetic acid (93)]

[$\bar{C}$ with $ClSO_3H$ stood for several days (94) (95) evolves HCl and forms the transient acetyl sulfonyl chloride, $CH_3.CO.O.SO_2Cl$; above 45° this intermediate rearr. to sulfoacetyl chloride which with water hydrolyzes to sulfoacetic acid; $\bar{C}$ with $ClCO_3H$ at 60–140°, however, *also* undergoes condensation involving 4 moles of $\bar{C}$ with evoln. of HCl and formn. of an acid chloride which on hydrolysis with aq. gives (3% yield (94)) a monobasic acid of compn. $C_8H_8O_4$ [Beil. XVIII-412], m.p. 99°, which is either 2,6-dimethylpyrone-4-carboxylic acid-3 or 2-methylpyrone-1,4-acetic acid-6 (96); note that this acid is isomeric with but distinct from dehydroacetic acid (1:0700), m.p. 109°. — Note also that $\bar{C}$ in AcOH boiled with conc. H_2SO_4 gives (97) traces of 2,6-dimethylpyrone.]

[$\bar{C}$ with solid H_2O_2 (0.6 mole) yields (98) about 60% acetyl hydrogen peroxide (peracetic acid) [Beil. II-169, II_1-(78), II_2-(174)] accompanied by some diacetyl peroxide [Beil. II-170, II_1-(78), II_2-(174)]. — $\bar{C}$ with liq. H_2S yields (99) "dithioacetic acid anhydride," $(CH_3.CS)_2S$, white cryst., m.p. 225° (99); note that, although neither $\bar{C}$ nor Ac_2O separately treated with H_2S gas shows any appreciable reaction, yet Ac_2O contg. 2% $\bar{C}$ absorbs H_2S giving (70% yield (100)) thiolacetic acid [Beil. II-230, II_1-(101), II_2-(208)], $CH_3.CO.SH$, b.p. 93°. — $\bar{C}$ (4 moles) with H_2S_3 + $ZnCl_2$ yields (101) diacetyl trisulfide.]

Reaction of $\bar{C}$ with salts of inorganic acids. [$\bar{C}$ with metal oxides in $CHCl_3$ at −60 to −20° yields (102) the corresp. metallic chlorides. — $\bar{C}$ with Sb_2S_3 at 300–350° (103) or with K_2S (104) gives diacetyl sulfide [Beil. II-232], b.p. 120°. — $\bar{C}$ with $PbSO_3$ gives (72) diacetyl sulfite which with $SOCl_2$ gives $\bar{C}$ + SO_2 (72).

[$\bar{C}$ (6 pts.) with KNO_3 (first fused, then powdered) (1 pt.) (105) or $\bar{C}$ with $Pb(NO_3)_2$ (106) gives mainly (yields: 81–85% (105), 58% (106)) acetic anhydride (1:1015).]

[$\bar{C}$ with NaN_3 in di-isoamyl ether stood overnight (108) (109), then warmed at 60–70°, evolves N_2 and gives (86% yield (107)) methyl isocyanate [Beil. IV-77, IV_1-(337), IV_2-(578)], b.p. 27.4–27.8°; note, however, that $\bar{C}$ with NaN_3 in AcOH evolves N_2 and gives (50–63% yield (110)) *N*-methylacetamide, m.p. 27–28°, b.p. 202–204° (presumably by cleavage of the CH_3NCO and acetylation of the $MeNH_2$).]

[$\bar{C}$ with $NaHF_2$ in Ac_2O (111), with KF in AcOH (41) (42), AgF (112), ZnF_2 (112) (113), HgF_2 (114), C_6H_5HgF (115), SbF_3 (112) (116), or AsF_3 (112) gives (yields: 132% on $\bar{C}$ or 66% on $NaHF_2$ (111), 76% (41) (42), 40% (113), 30.8% (116)) acetyl fluoride, b.p. 20.8° at 770 mm.]

[$\bar{C}$ with $AlCl_3$ in CS_2 at −10° gives (117) a mol. cpd., $\bar{C}.AlCl_3$, as a pale yel. gummy mass; $\bar{C}$ with $AlCl_3.Et_2O$ gives EtOAc (70% yield (118)) + EtCl (3:7015) + $AlCl_3$. — $\bar{C}$ (1 mole) with $AlCl_3$ (6 moles) in $CHCl_3$ gives (124) $(CH_3CO)_2.CH.CCl_2.O.AlCl_2$ (125) which with

aq. yields (124) (125) acetylacetone (1:1700). — Note also that $\bar{C}$ forms other analogous complexes. e.g., $\bar{C}.BCl_3$ (119), $\bar{C}.BF_3$ (119), $\bar{C}.SbCl_5$ (119) (for use of these in splitting of ethers see (119)).]

[$\bar{C}$ with 2 pts. sublimed $FeCl_3$ in CS_2 for 24 hrs. gives (small yield (120)) dehydroacetic acid (1:0700).]

[$\bar{C}$ with CaI_2 in s.t. at 70–75° for 120 hrs. gives (121) acetyl iodide (see above under HI).]

Reaction of $\bar{C}$ with esters of inorganic acids. [$\bar{C}$ with Me_2SO_4 (1 mole) + trace of $ZnCl_2$ at 140–150° evolves HCl and gives (20–25% yield (122)) dimethyl sulfoacetate, b.p. 155–165° at 20–22 mm. (122). — $\bar{C}$ + di-*n*-propyl sulfite + trace $ZnCl_2$ at 170–200° gives (80% yield (123)) *n*-propyl acetate (1:3075).]

Reaction of $\bar{C}$ with metals. [$\bar{C}$ in excess with metallic Zn gives a solid of compn. $C_{16}H_{18}O_4$ (126), now (127) thought to be 3,8-diacetyl-5,6-dimethyldecatetraene-3,4,6,7-dione-2,9. — $\bar{C}$ with metallic Zn in dry ether yields (128) EtOAc (1:3015) and AcOH (1:1010). — $\bar{C}$ with metallic Zn in dry dioxane (1:6400) gives (85% yield (128)) (129) ethylene glycol diacetate (1:3511). — $\bar{C}$ with CuH evolves H_2 and gives (130) cf. (131) EtOAc (1.3015) + ethylidene diacetate (1·3383).]

REACTIONS OF $\bar{C}$ WITH ORGANIC REAGENTS

Reactions of $\bar{C}$ with Hydrocarbons

Reactions of $\bar{C}$ with alkanes. [$\bar{C}$ with *n*-butane (or isobutane) + $AlCl_3$ at 60° for 15 hrs. under press. gives (small yield (132)) isobutyl methyl ketone (1 5430) — $\bar{C}$ with *n*-pentane + $AlCl_3$ at 15° at ord. press. gives (10% yield (133)) (134) 2,3-dimethylpentanone-4 (*unsym.*-isopropyl-methyl-acetone) [Beil. I-703, I_1-(360)], b p. 135–136° (oxime, b.p. 101–105° at 20 mm., semicarbazone, m.p. 114° (133)) accompanied (134) by some 2,3-dimethylpenten-3-one-2 (*unsym.*-isopropylidene-methyl-acetone) [Beil. I_2-(796)] (corresp. semicarbazone, m.p. 192.5° (134)). — $\bar{C}$ with *n*-hexane + $AlCl_3$ in similar fashion gives (7% yield (135)) (134) 3-ethyl-2-methylpentanone-4 (*unsym* -ethyl-isopropyl-acetone) [Beil. I-707], b.p. 154–155° (semicarbazone, m.p. 120° (135)) accompanied by a little 3-ethyl-2-methylpenten-2-one-4 (*unsym.*-ethyl-isopropylidene-acetone), b p. 177–178° (semicarbazone, m p. 220° (135).]

Reactions of $\bar{C}$ with alkenes. [$\bar{C}$ in the pres of suitable cat. can add to olefin linkages forming halogenated ketones: e g , $\bar{C}$ with ethylene + $AlCl_3$ at 0° (137) (138) or $\bar{C}$ + ethylene over activated carbon at 100° and 50 atm. (139) gives (yields· 53% (136), 33% (137)) (138) cf. (60) β-chloroethyl methyl ketone (3:7640) (note that $\bar{C}$ + ethylene + $AlCl_3$ in CS_2, latter subsequently replaced by C_6H_6, goes further yielding (140) benzylacetone [Beil VII-314, VII_1-(167)], b.p. 235°). — For studies of analogous cat. addn. of $\bar{C}$ to 2-methylbutene-2, 2,3-dimethylbutene-2, and 2-methylhexene-2 see (141).]

Reactions of $\bar{C}$ with alkynes. [$\bar{C}$ in the pres. of suitable cat. can also add to a triple unsatd linkage yielding olefinic chloroketones: e.g., $\bar{C}$ with acetylene + $AlCl_3$ at 15° (142) (143) or other cat. (143) gives (25% yield (142)) β-chlorovinyl methyl ketone, b.p. 35–38° at 12 mm. (143). — $\bar{C}$ with butyne-1 (ethylacetylene) + $SnCl_4$ gives (144) 4-chlorohexen-3-one-2, b p 46–53° at 10 mm., $D_4^{25} = 1.0973$, $n_D^{25} = 1.4906$ (144); for analogous reactions with pentyne-1, hexyne-1, hexyne-3, heptyne-1, octyne-4, decyne-5, and dodecyne-6 together with corresp constants of prods. see (144)]

Reaction of $\bar{C}$ with cycloparaffins (cycloalkanes). [$\bar{C}$ in the pres of $AlCl_3$ also condenses with cycloalkanes eliminating HCl; e g., $\bar{C}$ (1.9 moles) + cyclopentane (1:8400) (5 4 moles) + $AlCl_3$ (2.2 moles) at 0° gives (145) cyclopentyl methyl ketone (acetylcyclopentane), b.p. 159.5–160 5° at 760 mm., $D_{20}^{20} = 0.9172$, $n_D^{20} = 1.44351$ (145) (semicarbazone, m.p. 142–143° (145)); $\bar{C}$ + methylcyclopentane (1:8403) + $AlCl_3$ similarly gives (145) 1-

methylcyclopentyl-2 methyl ketone (1-acetyl-2-methylcyclopentane) accompanied by some 1-methylcyclopenten-1-yl-2 methyl ketone (1-acetyl-2-methylcyclopentene-1) (see below).]

[C̄ *in the pres. of $AlCl_3$ also condenses with cyclohexane, but here the reaction involves* in addn. a change from a 6-membered to 5-membered ring: e.g., C̄ with cyclohexane (1:8405) + $AlCl_3$ gives (135) (146) (147) (148) 1-methylcyclopentyl-2 methyl ketone (1-acetyl-2-methylcyclopentane), b.p. 167–168° at 759 mm., $D_4^{20} = 0.8976$, $n_D^{20} = 1.4404$ (semicarbazone, m.p. 162.5–163° (148), 158° (146); *p*-nitrophenylhydrazone, m.p. 102.5° (148)), accompanied under certain circumstances (135) by *1-methylcyclopenten-1-yl-2 methyl* ketone (1-acetyl-2-methylcyclopentene-1), b.p. 185–187° (135) (oxime, m.p. 85–85.5° (148), *p*-nitrophenylhydrazone, m.p. 162° (148), semicarbazone, m.p. 221° (148), 220° (135)); note that various hydrocarbon by-products are also formed. — C̄ + methylcyclohexane (hexahydrotoluene) (1:8410) + $AlCl_3$ at room temp. *similarly* gives (149) *1-acetyl-2,3-dimethylcyclopentane*, b.p. 182–184° at 754 mm., $D_{20}^{20} = 0.8969$, $n_D^{22} = 1.44551$ (semicarbazone, m.p. 152°) (149).]

Reaction of C̄ with cycloalkenes. [C̄ in the pres. of suitable cat. *adds* to unsatd. linkages of cycloalkenes: e.g., C̄ with cyclopentene (1:8037) + $AlCl_3$ (2 moles) in cyclohexane at −15° gives (50% *yield* (150)) *cyclopentyl methyl ketone* (*1-acetylcyclopentane*) (for constants see above under C̄ + cyclopentane); note, however, that C̄ + cyclopentene (1:8037) + $AlCl_3$ at −14° in CS_2 (the latter being subsequently replaced by benzene) gives (140) 1-acetyl-3-phenylcyclopentane (note rearr.).]

[C̄ with cyclohexene (1:8070) + $AlCl_3$ (2 moles) in cyclohexane gives (53% yield (150)) cyclohexyl methyl ketone (1-acetylcyclohexane) [Beil. VII-22, VII_1-(16)]. — C̄ with cyclohexene (1:8070) + $AlCl_3$ (1 mole) in CS_2 gives (21% yield (151)) (152) cyclohexen-1-yl-1 methyl ketone (1-acetylcyclohexene-1) (tetrahydroacetophenone) [Beil. VII-58, VII_1-(49)], b.p. 201–202°, $D_4^{20} = 0.9655$, $n_D^{20} = 1.4881$ (oxime, m.p. 99°, semicarbazone, m.p. 220–221°). — C̄ *with cyclohexene* (1:8070) + $AlCl_3$ *in* CS_2 *at* −15° *gives* by addn. a prod. supposed (153) to be 2-chlorocyclohexyl-1 methyl ketone (since it can be converted by loss of HCl to tetrahydroacetophenone (above)) but which when reacted with C_6H_6 + $AlCl_3$ gives (140) 4-phenylcyclohexyl-1 methyl ketone (1-acetyl-4-phenylcyclohexane); in just which *phase rearr. occurs has not been established with certainty.*]

Reaction of C̄ with aromatic hydrocarbons. C̄ with aromatic hydrocarbons in the presence of various cat. (notably $AlCl_3$) evolves HCl and yields aryl methyl ketones; examples are cited in the following paragraphs.

[C̄ with C_6H_6 + $AlCl_3$ (154) in CS_2 (155) gives (70% yield (155)) methyl phenyl ketone (acetophenone) (1:5515) accompanied by a little 1,3-diphenylbuten-2-one-1 (dypnone) cf. (155); for study of relative reactivity in this sense of AcF, AcCl, AcBr, and AcI see (111); for study of influence of other cat., e.g., $FeCl_3$ (156) (157), $TlCl_3$ (158), $ZrCl_4$ (159), UCl_4 (160), $BeCl_2$ (161), Al powder (162) or Cr powder (163), or for study of effect of various solvents with $AlCl_3$ (164) see indic. refs.]

[C̄ with toluene + $AlCl_3$ gives (70% yield (165)) (166) methyl *p*-tolyl ketone (1:5530); for study of use of $BeCl_2$ (80% yield (161)) or of 39 other metallic chlorides (167) (168) see indic. refs. — For reactn. of C̄ + $AlCl_3$ with a long series of homologous monoalkylbenzenes see (169) (170), with *p*-cymene (1:7505) see (171); many other, similar cases cannot be included here.]

[C̄ with naphthalene (1:7200) + $AlCl_3$ in CS_2 gives a mixt. (75% yield (172)) comprising 50–60% 1-acetylnaphthalene (1:5600) + 15–20% 2-acetylnaphthalene (1:5153). — C̄ with 1-methylnaphthalene (1:7600) + $AlCl_3$ in nitrobenzene at −3° gives (173) cf. (174) 1-aceto-4-methylnaphthalene; C̄ with 2-methylnaphthalene (1:7605) + $AlCl_3$ in nitrobenzene gives a mixt. (64% yield (175)) comprising mainly 6-acetyl-2-methylnaphthalene accompanied by some 8-acetyl-2-methylnaphthalene.]

[$\bar{C}$ with biphenyl (1:7175) + $AlCl_3$ in CS_2 (176) or C_6H_6 (177) gives (yields: 90% (176), 70% (177)) 4-acetylbiphenyl (*p*-phenylacetophenone) (1:5201); under appropriate conditions $\bar{C}$ with biphenyl + $AlCl_3$ in CS_2 gives (yields: 45% (176), 43% (178)) 4,4′-diacetylbiphenyl.]

[$\bar{C}$ with acenaphthene (1:7225) + $AlCl_3$ in nitrobenzene (179) or with liq. HF (180) gives (29% yield (180)) 1-acetoacenaphthene.]

[Friedel-Crafts condensation can also be carried out with $\bar{C}$ and heterocyclic systems: e.g., $\bar{C}$ with thiophene + $SnCl_4$ in C_6H_6 gives (79–83% yield (181)) 2-acetylthiophene (methyl 2-thienyl ketone), $\bar{C}$ with thionaphthene + $AlCl_3$ in CS_2 gives (30% yield (182)) 3-acetylthionaphthene.]

Reactions of $\bar{C}$ with Organic OH (or SH) Compounds (or Their Metallic Derivatives)

Reactions of $\bar{C}$ with alcohols. [$\bar{C}$ reacts with alcs. in general yielding the corresp. acetates: e g., $\bar{C}$ with MeOH (1:6120) yields methyl acetate (1:3005), $\bar{C}$ with EtOH (1:6130) yields EtOAc (1:3015), etc ; for studies on rate of reactn. of $\bar{C}$ with EtOH in ether (1), or with β-chloroethyl alc. in dioxane (182) (183), or with benzyl alc. or cyclohexanol (182) see indic. refs.] — For use of $\bar{C}$ in quant. detn. of OH groups in prim. and sec. alcs. see (186) (187) (188) cf. (185).

[Special interest, however, attaches to reaction of $\bar{C}$ with *ter*-alcohols: under ord. conditions these react with $\bar{C}$ to exchange Cl for OH yielding alkyl chloride + AcOH (e.g., $\bar{C}$ + *ter*-butyl alc. giving *ter*-BuCl + AcOH); note, therefore, that under special conditions $\bar{C}$ with *ter*-alcs. also gives the corresp. esters; e g , $\bar{C}$ with *ter*-butyl alc. (1:6140) in dry ether + Mg (189) (190) or dimethylaniline (191) or in xylene with pyridine (192) gives (yields: 98% (192), 83% (189), 63–68% (191), 45–55% (190)) *ter*-butyl acetate (1:3057); other *ter*-alcs. (189) and other acid chlorides (191) behave similarly.]

[For reactn. of $\bar{C}$ with cellulose (or cotton) see (193) (194) (195); with polyoxymethylenes see (196).]

[$\bar{C}$ with mercaptans yields the corresp. thiolacetates: e g., $\bar{C}$ with C_2H_5SH gives (80% yield (197)) ethyl thiolacetate, $CH_3CO.S\ C_2H_5$, b.p. 116–117°, $D_4^{25} = 0.9755$, $n_D^{23} = 1.4503$ (197).]

Reactions of $\bar{C}$ with phenols. $\bar{C}$ can react with phenols in either or both of two modes: on one hand it can acetylate the phenolic OH yielding the corresp. phenol acetates, or in the pres. of suitable cat. or solvents it can condense with one or more of the nuclear H atoms yielding phenolic ketones. Furthermore the phenol acetates can more or less readily be caused to rearr. into phenolic ketones (Fries rearr.) so that the chemistry of the two classes is closely related and so voluminous that it cannot be given extensive discussion here.

[$\bar{C}$ with phenol (1:1420) directly (198) (199) or in C_6H_6 + Mg (200) gives (yields: 92% (200), 90% (199)) phenyl acetate (1:3571); other mono-, di-, and polyhydric phenols behave analogously.]

[$\bar{C}$ with phenol (1:1420) + $FeCl_3$ in CS_2 (156) (201) or phenyl acetate (above) + $AlCl_3$ in nitrobenzene at 20–25° for 24 hrs. (202) gives (yields: 75% (202), 33% (201)) *p*-hydroxyacetophenone (1.1527), m.p. 109° (for extensive review of the Fries rearr. reactn. see (203)); the corresp. analogous reactns. of $\bar{C}$ with other mono-, di-, and polyhydric phenols are legion and will not be cited here.]

[For study of series of mol. cpds. of $\bar{C}$ with various benzeneazophenols see (230).]

Reaction of $\bar{C}$ with phenol ethers. With phenol ethers where no phenolic OH remains to interfere $\bar{C}$ reacts in the pres. of suitable cat. in the Friedel-Crafts sense: e g. [$\bar{C}$ (2 moles) with methyl phenyl ether (anisole) (1:7445) (1 mole) + $AlCl_3$ (2 moles) gives (75% yield

(204)) (205) *p*-methoxyacetophenone (*p*-acetylanisole) (1:5140); note that C̃ + anisole do not react in the pres. of AlF_3 or ZnF_2 (111). — Countless analogous condensations of C̃ with other phenol ethers cannot be discussed here].

Reaction of C̃ with enols (or their metallic derivatives). [The reaction of C̃ with ethyl acetoacetate (1:1710) leads according to circumstances to either or both of two very closely similar derivatives; one of these is ethyl *O*-acetylacetoacetate (ethyl β-acetoxycrotonate) (*A*) [Beil. III-373, III_1-(135), III_2-(255)], b.p. 212–214° sl. dec. (206), D_4^{20} = 1.060 (207), n_D^{20} = 1.4447 (207); the other is ethyl α-acetylacetoacetate (ethyl diacetylacetate) (*B*) [Beil. III-751, III_1-(263), III_2-(467)], b.p. 209–211° (208), D_4^{20} = 1.093 (207), n_D^{20} = 1.4687 (207); note that the latter (*B*) as liquid is 100% enolized (209) (210) and this prop. is used (211) for detn. of both *A* + *B* in their mixtures. — Note furthermore that the *O*-ester (*A*) by suitable htg. (212) (213) (214) (215) (216) can be converted to the isomer (*B*).]

[C̃ with ethyl acetoacetate (1:1710) in pres. of pyridine (217) or C̃ with its Na enolate in ether (219) or its Cu enolate in ether or C_6H_6 (220) gives mainly the *O*-acetyl deriv. (*A*) (above); C̃ with ethyl sodioacetoacetate in ether (221) (222) (223) (226) or pet. ether (216) or with the Ca enolate in C_6H_6 (224) or C̃ with ethyl acetoacetate + Mg in C_6H_6 (225) (226) gives (yields: 65% (224), 46–52% (225)) ethyl diacetylacetate (*B* above) (Cu enolate, m.p. 151° (226)).]

[For study of influence of C̃ on rate of enolization of ethyl acetoacetate see (228); for formn. of ethyl *O*-acetylacetoacetate (isomer *A* above) from C̃ + ketene diethylacetal (30% yield together with other prods.) see (229).]

Reaction of C̃ with acids or their salts. [C̃ on htg. with NaOAc or other metal salts of ...cOH yields acetic anhydride (1:1015); this reactn. is well known and will not be amplified ...re; C̃ with salts of acids other than acetic gives in some cases the corresp. mixed anhydride, ... others only the anhydride of the second acid. E.g., C̃ (1 mole) with dry Na isovalerate ... mole) gives at 120° the mixed anhydride contg. 1 acetyl and 1 isovaleroyl radical (231); ... the other hand, C̃ with dry Na cinnamate gives only cinnamic anhydride (231); many ...r examples are known.]

... on htg. with AcOH under appropriate conditions (232) (233) (234) loses HCl giving ... yields Ac_2O (1:1015).]

...te that C̃ in Ac_2O behaves as a weak acid and can actually be titrated with NaOAc ...O using methyl orange as indicator (235).

Reaction of C̃ with Amines (or Their Derivatives)

...ion of C̃ with primary and secondary amines. C̃ readily reacts with such amines ... under ord. conditions the *N*-acetylated derivative: e.g., C̃ with $MeNH_2$ gives *N*-...etamide [Beil. IV-58, IV_1-(329), IV_2-(563)], very sol. aq., m.p. 27–28°, b.p. 206°; ... other examples are known. Note that only 1 acetyl group is introduced into ...o group; also that C̃ with a mixture of two amines gives mainly (or even exclu-...) *N*-acetyl deriv. of the more negative accompanied by the hydrochloride of the ...ive (236). See also below under Ⓓ's.

... of C̃ with tertiary amines. C̃ (1 mole) with pyridine (1 mole) directly (237) ... C_6H_6 (237) ppts. an addn. prod. (presumably *N*-acetylpyridinium chloride), ... turning red in light, m.p. abt. 100°, after darkening at 90°; for use of this cpd. ... of phenol ethers see (237). — For use of C̃ + pyridine in toluene as means of ... of OH groups see (186).

...) with Et_3N (1 mole) in 10 vols. dry C_6H_6 (239) or C̃ in equal. vol. pyridine ...38) yields dehydroacetic acid (1:0700), m.p. 209°.]

... also a novel method of intermolecular dehydrohalogenation: e.g., C̃ with

lauroyl chloride (3:9858) + Et_3N in dry ether ppts. $Et_3N.HCl$ and yields (240) a mixt. of acetylketene (detene dimer) + lauroylketene and other prods. — Note further that since dehydroacetic acid (above) may be viewed as ketene tetramer, its formation from $\bar{C}$ with *ter*-amines (above) may (241) involve preliminary formation of acetylketene followed by Diels-Alder addn. with a second identical molecule to give dehydroacetic acid.]

Reaction of $\bar{C}$ with other miscellaneous nitrogenous systems. [$\bar{C}$ with diazomethane in dry ether yields (242) diazoacetone (acetyldiazomethane) [Beil. I_1-(396), I_2-(823)] yel. liq., b.p. 49° at 13 mm. (242).]

[$\bar{C}$ with oximes often is used to effect either dehydration to nitriles or Beckmann rearr. or both (for review see (243)).]

[$\bar{C}$ with acetanilide refluxed for 7 hrs. gives (244) diphenylacetamidine; other anilides behave in analogous fashion (244). — However, $\bar{C}$ with acetanilide + $AlCl_3$ in CS_2 (245) or other inert solvent (246) gives Friedel-Crafts reactn forming (57% yield (245)) *p*-(acetylamino)acetophenone [Beil. XIV-48, XIV_1-(366)], m p 166–167°.]

[$\bar{C}$ with thiosemicarbazide results in acetylation followed by elimination of HCl and ring closure yielding (247) (248) the hydrochloride, m.p. 110° (248), of 5-amino-2-methyl-1-thiodiazole-3,4 [Beil. XXVII-629], m.p. 235° (248). — For study of reactn. of $\bar{C}$ with Schiff's bases see (249).]

Reaction of $\bar{C}$ with Various Organometallic Compounds

Reaction of $\bar{C}$ with Grignard reagents. [The normal reaction of $\bar{C}$ with 1 mole RMgX is to eliminate MgXCl and yield the corresp. ketone; e.g., $\bar{C}$ with EtMgBr in pres. of $CdCl_2$ gives (46% yield (250)) ethyl methyl ketone (1:5405); in the presence of excess RMgX, however (and sometimes without excess), the ketone may react further to yield the corresp. tertiary alcohol; e.g., $\bar{C}$ with C_6H_5MgBr gives 39% yield (251) diphenyl-methyl-carbinol; countless other examples cannot be included here.]

[Certain divergences from the above normal reaction have, however, now been recognized; these appear to be largely a function of the particular types of RMgX employed. *E.g.*, $\bar{C}$ (0 5 mole) with benzyl MgCl (0 37 mole) in dry ether gives (instead of the expected phenylacetone (1:5118)) 24% yield (252) of *o*-methylacetophenone (1:5524).]

[Furthermore $\bar{C}$ with Grignard reagents derived from tertiary alkyl halides is often *reduced* and the reactn. prod then contains (in addn. to the normal prods.) other material derived from the reduction prods E g, $\bar{C}$ (in excess) with *ter*-BuMgCl gives (40% yield (253) (254)) *ter*-butyl methyl ketone (pinacolone) (1:5425); note, however, that further study (255) (256) (13) has shown the formation of numerous other prods. including 2-methylpropane (isobutane), 2-methylpropene-1 (isobutylene), carbon monoxide, ethyl acetate, pinacolyl acetate, and mesityl oxide. — For study of reactn. of $\bar{C}$ with *ter*-AmMgCl (254) (13) and other *ter*-RMgX cpds. (254) see indic. refs — Note that even RMgX cpds. from even primary halides may effect reduction; e.g., $\bar{C}$ with *n*-BuMgCl gives (255) 13% hexanol-2 (1:6210) + 8% EtOH (1:6130).]

[Note also that $\bar{C}$ with 2,4,6-trimethylbenzyl MgBr (mesityl MgBr) gives (257) mesitylene but no 2,4,6-trimethylacetophenone (acetomesitylene) although $\bar{C}$ with 2,4,6-triphenylphenyl MgBr *does* give (258) the corresp. 2,4,6-triphenylacetophenone.]

Reaction of $\bar{C}$ with other miscellaneous organometallic compounds. [$\bar{C}$ with diphenylmethylsodium reacts to replace Na by H yielding (259) diphenylmethane (1:7120); $\bar{C}$ with phenylsilver gives (260) 21% acetophenone (1:5515) + 40% biphenyl (1:7175); $\bar{C}$ with phenylcopper gives (260) 48–51% acetophenone (1:5515).]

[$\bar{C}$ with Et_2Mg gives (261) 3-methylpentanol-3 (1:6189) (not *ter*-butyl alc. as was formerly supposed); $\bar{C}$ with dibenzylzinc in pet. ether gives (262) 9% ketones; $\bar{C}$ with dibenzylcadmium in ether gives (262) 18% phenylacetone (1:5118), $\bar{C}$ with Et_2Hg gives

(204)) (205) *p*-methoxyacetophenone (*p*-acetylanisole) (1:5140); note that $\bar{C}$ + anisole do not react in the pres. of AlF_3 or ZnF_2 (111). — Countless analogous condensations of $\bar{C}$ with other phenol ethers cannot be discussed here].

Reaction of $\bar{C}$ with enols (or their metallic derivatives). [The reaction of $\bar{C}$ with ethyl acetoacetate (1:1710) leads according to circumstances to either or both of two very closely similar derivatives; one of these is ethyl *O*-acetylacetoacetate (ethyl β-acetoxycrotonate) (*A*) [Beil. III-373, III_1-(135), III_2-(255)], b.p. 212–214° sl. dec. (206), D_4^{20} = 1.060 (207), n_D^{20} = 1.4447 (207); the other is ethyl α-acetylacetoacetate (ethyl diacetylacetate) (*B*) [Beil. III-751, III_1-(263), III_2-(467)], b.p. 209–211° (208), D_4^{20} = 1.093 (207), n_D^{20} = 1.4687 (207); note that the latter (*B*) as liquid is 100% enolized (209) (210) and this prop. is used (211) for detn. of both *A* + *B* in their mixtures. — Note furthermore that the *O*-ester (*A*) by suitable htg. (212) (213) (214) (215) (216) can be converted to the isomer (*B*).]

[$\bar{C}$ with ethyl acetoacetate (1:1710) in pres. of pyridine (217) or $\bar{C}$ with its Na enolate in ether (219) or its Cu enolate in ether or C_6H_6 (220) gives mainly the *O*-acetyl deriv. (*A*) (above); $\bar{C}$ with ethyl sodioacetoacetate in ether (221) (222) (223) (226) or pet. ether (216) or with the Ca enolate in C_6H_6 (224) or $\bar{C}$ with ethyl acetoacetate + Mg in C_6H_6 (225) (226) gives (yields: 65% (224), 46–52% (225)) ethyl diacetylacetate (*B* above) (Cu enolate, m.p. 151° (226)).]

[For study of influence of $\bar{C}$ on rate of enolization of ethyl acetoacetate see (228); for formn. of ethyl *O*-acetylacetoacetate (isomer *A* above) from $\bar{C}$ + ketene diethylacetal (30% yield together with other prods.) see (229).]

Reaction of $\bar{C}$ with acids or their salts. [$\bar{C}$ on htg. with NaOAc or other metal salts of AcOH yields acetic anhydride (1:1015); this reactn. is well known and will not be amplified here; $\bar{C}$ with salts of acids other than acetic gives in some cases the corresp. mixed anhydride, in others only the anhydride of the second acid. E.g., $\bar{C}$ (1 mole) with dry Na isovalerate (1 mole) gives at 120° the mixed anhydride contg. 1 acetyl and 1 isovaleroyl radical (231); on the other hand, $\bar{C}$ with dry Na cinnamate gives only cinnamic anhydride (231); many other examples are known.]

[$\bar{C}$ on htg. with AcOH under appropriate conditions (232) (233) (234) loses HCl giving good yields Ac_2O (1:1015).]

Note that $\bar{C}$ in Ac_2O behaves as a weak acid and can actually be titrated with NaOAc in Ac_2O using methyl orange as indicator (235).

Reaction of $\bar{C}$ with Amines (or Their Derivatives)

Reaction of $\bar{C}$ with primary and secondary amines. $\bar{C}$ readily reacts with such amines to yield under ord. conditions the *N*-acetylated derivative: e.g., $\bar{C}$ with $MeNH_2$ gives *N*-methylacetamide [Beil. IV-58, IV_1-(329), IV_2-(563)], very sol. aq., m.p. 27–28°, b.p. 206°; countless other examples are known. Note that only 1 acetyl group is introduced into each amino group; also that $\bar{C}$ with a mixture of two amines gives mainly (or even exclusively) the *N*-acetyl deriv. of the more negative accompanied by the hydrochloride of the more positive (236). See also below under Ⓓ's.

Reaction of $\bar{C}$ with tertiary amines. $\bar{C}$ (1 mole) with pyridine (1 mole) directly (237) (238) or in C_6H_6 (237) ppts. an addn. prod. (presumably *N*-acetylpyridinium chloride), white cryst. turning red in light, m.p. abt. 100°, after darkening at 90°; for use of this cpd. in cleavage of phenol ethers see (237). — For use of *$\bar{C}$ + pyridine in toluene as means of* quant. detn. of OH groups see (186).

[$\bar{C}$ (1 mole) with Et_3N (1 mole) in 10 vols. dry C_6H_6 (239) or $\bar{C}$ in equal. vol. pyridine or picoline (238) yields dehydroacetic acid (1:0700), m.p. 209°.]

[Note here also a novel method of intermolecular dehydrohalogenation: e.g., $\bar{C}$ with

lauroyl chloride (3:9858) + Et_3N in dry ether ppts. $Et_3N.HCl$ and yields (240) a mixt. of acetylketene (detene dimer) + lauroylketene and other prods. — Note further that since dehydroacetic acid (above) may be viewed as ketene tetramer, its formation from $\bar{C}$ with *ter*-amines (above) may (241) involve preliminary formation of acetylketene followed by Diels-Alder addn. with a second identical molecule to give dehydroacetic acid.]

Reaction of $\bar{C}$ with other miscellaneous nitrogenous systems. [$\bar{C}$ with diazomethane in dry ether yields (242) diazoacetone (acetyldiazomethane) [Beil. I_1-(396), I_2-(823)] yel. liq., b.p. 49° at 13 mm. (242).]

[$\bar{C}$ with oximes often is used to effect either dehydration to nitriles or Beckmann rearr. or both (for review see (243)).]

[$\bar{C}$ with acetanilide refluxed for 7 hrs. gives (244) diphenylacetamidine; other anilides behave in analogous fashion (244). — However, $\bar{C}$ with acetanilide + $AlCl_3$ in CS_2 (245) or other inert solvent (246) gives Friedel-Crafts reactn forming (57% yield (245)) *p*-(acetylamino)acetophenone [Beil. XIV-48, XIV_1-(366)], m.p. 166–167°.]

[$\bar{C}$ with thiosemicarbazide results in acetylation followed by elimination of HCl and ring closure yielding (247) (248) the hydrochloride, m.p. 110° (248), of 5-amino-2-methyl-1-thiodiazole-3,4 [Beil. XXVII-629], m p. 235° (248). — For study of reactn. of $\bar{C}$ with Schiff's bases see (249).]

Reaction of $\bar{C}$ with Various Organometallic Compounds

Reaction of $\bar{C}$ with Grignard reagents. [The normal reaction of $\bar{C}$ with 1 mole RMgX is to eliminate MgXCl and yield the corresp. ketone; e.g., $\bar{C}$ with EtMgBr in pres. of $CdCl_2$ gives (46% yield (250)) ethyl methyl ketone (1.5405), in the presence of excess RMgX, however (and sometimes without excess), the ketone may react further to yield the corresp. tertiary alcohol; e g., $\bar{C}$ with C_6H_5MgBr gives 39% yield (251) diphenyl-methyl-carbinol; countless other examples cannot be included here.]

[Certain divergences from the above normal reaction have, however, now been recognized; these appear to be largely a function of the particular types of RMgX employed. E.g., $\bar{C}$ (0.5 mole) with benzyl MgCl (0.37 mole) in dry ether gives (instead of the expected phenylacetone (1:5118)) 24% yield (252) of *o*-methylacetophenone (1:5524).]

[Furthermore $\bar{C}$ with Grignard reagents derived from tertiary alkyl halides is often *reduced* and the reactn. prod. then contains (in addn. to the normal prods.) other material derived from the reduction prods E g., $\bar{C}$ (in excess) with *ter*-BuMgCl gives (40% yield (253) (254)) *ter*-butyl methyl ketone (pinacolone) (1:5425); note, however, that further study (255) (256) (13) has shown the formation of numerous other prods. including 2-methylpropane (isobutane), 2-methylpropene-1 (isobutylene), carbon monoxide, ethyl acetate, pinacolyl acetate, and mesityl oxide. — For study of reactn. of $\bar{C}$ with *ter*-AmMgCl (254) (13) and other *ter*-RMgX cpds. (254) see indic. refs. — Note that even RMgX cpds. from even primary halides may effect reduction; e g., $\bar{C}$ with *n*-BuMgCl gives (255) 13% hexanol-2 (1:6210) + 8% EtOH (1:6130).]

[Note also that $\bar{C}$ with 2,4,6-trimethylbenzyl MgBr (mesityl MgBr) gives (257) mesitylene but no 2,4,6-trimethylacetophenone (acetomesitylene) although $\bar{C}$ with 2,4,6-triphenylphenyl MgBr *does* give (258) the corresp. 2,4,6-triphenylacetophenone.]

Reaction of $\bar{C}$ with other miscellaneous organometallic compounds. [$\bar{C}$ with diphenylmethylsodium reacts to replace Na by H yielding (259) diphenylmethane (1:7120); $\bar{C}$ with phenylsilver gives (260) 21% acetophenone (1:5515) + 40% biphenyl (1:7175); $\bar{C}$ with phenylcopper gives (260) 48–54% acetophenone (1:5515).]

[$\bar{C}$ with Et_2Mg gives (261) 3-methylpentanol-3 (1:6189) (not *ter*-butyl alc. as was formerly supposed); $\bar{C}$ with dibenzylzinc in pet. ether gives (262) 9% ketones; $\bar{C}$ with dibenzylcadmium in ether gives (262) 18% phenylacetone (1:5118); $\bar{C}$ with Et_2Hg gives

(263) EtHgCl + butanone-2 (1:5405), but $\bar{C}$ with dibenzylmercury or with benzylmercuric chloride shows little reaction (262) even after refluxing 2 weeks.]

[$\bar{C}$ with tetraphenyltin in s.t. at 100° for 15 hrs. gives (very small yield (264)) of acetophenone (1:5515); for reactn. of $\bar{C}$ with tetraethyllead and use in detn. of latter in gasoline see (265).]

[$\bar{C}$ with triphenylbismuth in CCl_4 yields (266) acetophenone (1:5515).]

[$\bar{C}$ (2 moles) with $Ni(CO)_4$ (1 mole) in pet. ether gives (267) $4CO + NiCl_2$ + biacetyl the latter sepg. as a 1:1 addn. cpd. with the $NiCl_2$.]

Ⓓ Acetanilide: cryst. from hot aq., m.p. 114°. [From $\bar{C}$ with aniline (2 moles) followed by recrystallization to remove aniline hydrochloride. Note that even with aniline + aq. at room temp. acetanilide formn. occurs to extent of 35–45% but its proportion diminishes with increase of temp. (268).]

Ⓓ Acet-*p*-toluidide: cryst. from hot aq. or dil. alc., m.p. 153°. [From $\bar{C}$ + *p*-toluidine (2 moles) followed by recrystallization to remove *p*-toluidine hydrochloride.]

Ⓓ Acet-α-naphthalide: m.p. 159°.

Ⓓ Acet-β-naphthalide: m.p. 132°.

—— β-Acetophenylhydrazide (β-acetylphenylhydrazine) ($C_6H_5.NH.NH.COCH_3$) [Beil. XV-241, XV_1-(63)]: m.p. 128–129°. [Note that α-acetphenylhydrazide [Beil. XV-236, XV_1-(62)], m.p. 124°, is obtd. from α,β-diacetylphenylhydrazine [Beil. XV-245, XV_1-(64)], m.p. 107–108°, by partial hydrolysis.]

—— β-Acet-*p*-nitrophenylhydrazide [Beil. XV-478]: yel. ndls. from alc., m.p. 205–206°.

—— β-Acet-2,4-dinitrophenylhydrazide [Beil. XV-492]: yel. pr. from alc., m.p. 201° (269).

6.4° at 100 mm. (1)		

Colorless liq. with ethereal odor suggesting C_2H_5Br. Only slightly sol. aq. but miscible with most org. solvs.

C̄ was first reported in 1931 (1) and given the name chloroprene (1) because of its analogy to 2-methylbutadiene-1,3 (isoprene) in structure and reactions. Despite its immense practical importance in the manufacture of various types of synthetic rubbers and plastics, comparatively little information on C̄ itself has been released for publication in the scientific literature.

[For a study of the toxicity and pathology of C̄ see (3); for study of poisoning by C̄ and its treatment see (4).]

[For studies of detn. of C̄ (5) by diazometric methods (6) (7) see indic. refs.]

PREPARATION OF C̄

C̄ has been prepared from vinylacetylene by addn. of HCl, from dichlorobutenes by elimination of 1 HCl, and from various other sources. Comparatively little on these methods has appeared in the scientific literature, and most of the information is available only through patents. Such of the latter as are here cited must be regarded only as illustrative as no guarantee of complete patent coverage can be offered.

From vinylacetylene. $\bar{C}$ is formed from vinylacetylene (8) by addn. of HCl from aqueous soln. in pres. of catalysts (usually copper salts). The initial step comprises 1,4 addition, and the primary product is 4-chlorobutadiene-1,2 (isochloroprene) (3:7225). Under certain conditions this may be isolated as the major reaction product, but it readily isomerizes (especially in the presence of cuprous chloride and/or other salts (9)) yielding chloroprene. When sufficient amounts of HCl are present further addition to $\bar{C}$ may also occur leading to 2,4-dichlorobutene-2 (3:5550) (see also below).

[For prepn. of $\bar{C}$ from vinylacetylene (8) with conc. aq HCl in pres. of Cu_2Cl_2 + NH_4Cl at 30° for 4 hrs. (65% yield) see (1) (47); for studies of this process in foreign laboratories see (10) (11) (12) (2) (24) For examples of patents on this process see (13)-(23) incl. For analogous prepn of certain homologs of $\bar{C}$ such as 2-chloro-3-methylbutadiene-1,3 (3:7290) and 2-chloro-3,4-dimethylbutadiene-1,3, etc., see (25) cf. (26).]

From dichlorobutenes. [For prepn of $\bar{C}$ from 3,4-dichlorobutene-1 (1,2-dichlorobutene-3) (3:5350) with powdered KOH or alc. NaOH see (27) (28), for 2,3-dichlorobutene-1 (3:9074) by thermal dehydrochlorination at 530° without cat. see (29); from 2,4-dichlorobutene-2 (3:5550) by dehydrochlorination (and isomerization) in pres. of fused KOH at 180–190° (30) or over silica gel or clay at 245–275° (31) cf. (30) see indic refs.; from 1,2-dichlorobutenes by dehydrochlorination with inorg. or org. bases in pres. of org. solvs. see (32)]

From other sources. [For prepn of $\bar{C}$ from 2,2,3-trichlorobutane (3:5680) by thermal dehydrochlorination over $MgCl_2/MgSO_4$ cat. see (33); from polychlorobutanes of 55–66% chlorine content (corresp. to dichloro-and trichlorobutanes) by thermal dehydrochlorination at 400–500° see (34) (note that 1-chlorobutadiene-1,3 (3.7210) is also formed; for separation of it from $\bar{C}$ see (35)): for formn of $\bar{C}$ from vinyl chloride (3:7010) with acetylene in pres. of aq. Cu_2Cl_2/NH_4Cl see (36).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Addition Reactions

With chlorine. [$\bar{C}$ (2 moles) with Cl_2 (1 mole) in $CHCl_3$ at −10° in pres. of hydroquinone gives mainly (37) cf (38) (39) 1,2,4-trichlorobutene-2 (1,3,4-trichlorobutene-2) (3:9062) accompanied by other products such as 1,2,3-trichlorobutene-1 (37), b.p. 40–42° at 10 mm., $D_4^{15} = 1.3190$, $n_D^{15} = 1.4902$ (giving on oxdn. α,β-dichloropropionic acid); note: data also consistent with 2,3,4-trichlorobutene-1 (3:9064) and 1,2-dichlorobutadiene-1,3 (3:9057), b.p. 45–48° at 10 mm. (37), $D_4^{15} = 1.1905$ $n_D^{15} = 1.5065$ (37).]

With bromine. [$\bar{C}$ (0.3 mole) with Br_2 (0.25 mole) in $CHCl_3$ at 0–5° gives mainly (40) 2-chloro-1,4-dibromobutene-2, b p. 98–101° at 10 mm. (oxidizing with $KMnO_4$ to bromoacetic acid), accompanied by other products; note that in pres. of anti-oxidants distn. range of prod. is much wider perhaps owing to formn. of geom. stereoisomers.]

With iodine chloride. [$\bar{C}$ with ICl in $CHCl_3$ at −5° to 0° gives (70% yield (41)) a prod. regarded as 2,4-dichloro-1-iodobutene-2.]

With hydrogen chloride. [$\bar{C}$ with conc. aq HCl in pres. of Cu_2Cl_2 (42) adds HCl giving 2,4-dichlorobutene-2 (3:5550); for behavior of $\bar{C}$ in liq HCl see (43).]

With hydrogen bromide. [$\bar{C}$ (0.96 mole) with dry HBr (0.88 mole) in AcOH at −5° gives (72% yield on Br_2 (44)) 2-chloro-4-bromobutene-2, b.p. 150–152°; $D_4^{20} = 1.5264$, $D_4^{15} = 1.5335$; $n_D^{20} = 1.5160$, $n_D^{15} = 1.5185$; note that this prod. with aq. $KMnO_4$ oxidizes to AcOH + bromoacetic acid and adds 1 mole Br_2 giving 2-chloro-2,3,4-tribromobutane, b.p. 104.5–106° at 10 mm., $D_4^{15} = 2.1907$.]

With hydrochlorous acid. [The behavior of $\bar{C}$ with HOCl appears not to have been reported; 1,4 addition to $\bar{C}$ might be expected to yield 1,2-dichlorobuten-2-ol-4 and/or 2,4-dichlorobuten-2-ol-1, but neither is reported from any source; an isomer, viz., 2,3-

dichlorobuten-1-ol-4, b.p. 72–73° at 10 mm., $D_4^{20} = 1.3108$, $D_4^{15} = 1.3243$, $n_D^{20} = 1.4956$, $n_D^{15} = 1.4978$, has been reported (45) by indirect means.]

With hypobromous acid. [$\bar{C}$ with HOBr (from *N*-bromoacetamide) gives mainly (45) (note 3,4 addition) 2-chloro-4-bromobuten-1-ol-3, b.p. 77.0–77.25° at 10 mm.; $D_4^{20} = 1.6710$, $D_4^{15} = 1.6770$; $n_D^{20} = 1.5228$, $n_D^{15} = 1.5249$; this prod. in $CHCl_3$ adds 1 mole Br_2 giving 3-chloro-1,3,4-tribromobutanol-2, m.p. 69.5–71°.]

With alkyl hypoiodite. [$\bar{C}$ with MeOI (from MeOH + HgO + I_2) gives (62% yield (46)) 2-chloro-4-iodo-3-methoxybuten-1, b.p. 76.5–77.0° at 10 mm., $D_4^{20} = 1.7135$, $D_4^{15} = 1.7209$; $n_D^{20} = 1.5312$, $n_D^{15} = 1.5338$. — $\bar{C}$ with EtOI (from EtOH + HgO + I_2) gives (46% yield (46)) 2-chloro-4-iodo-3-ethoxybuten-1, b.p. 82–83° at 10 mm.; $D_4^{20} = 1.6163$, $D_4^{15} = 1.6231$; $n_D^{20} = 1.5198$, $n_D^{15} = 1.5220$. — Note for both these cases the same type of 3,4 addn. observed for HOBr above.]

With sulfur dioxide. [$\bar{C}$ in ether contg. pyrogallol treated with SO_2 at 100–105° in s.t. for 12 hrs. gives in very small amt. (2.5% (47)) an addition prod. 3-chloro-1-thiacyclopenten-3 dioxide (chloroprene sulfone).]

With naphthoquinone-1,4. $\bar{C}$ (2 moles) with α-naphthoquinone (1:9040) (1 mole) in C_6H_6 refluxed 3 hrs. and the intermediate addition prod. suspended in alc. NaOH and oxidized with air gives (1) 2-chloroanthraquinone (3:4022).

With maleic anhydride. $\bar{C}$ (1+ moles) with maleic anhydride (1:0625) (1 mole) warmed at 50° then boiled with aq. gives (77% yield (1)) 4-chloro-1,2,3,6-tetrahydrophthalic acid, cryst. from aq., m.p. 173–175° cor. (1).

POLYMERIZATION OF $\bar{C}$

$\bar{C}$ readily polymerizes at 30–35° in light from a 150-watt lamp in 48–80 hours (26); for study of various types of polymers from $\bar{C}$ alone see (1). Furthermore, $\bar{C}$ with various other unsaturated compounds undergoes copolymerization processes. The practical importance of the polymers and copolymers thus obtained can scarcely be overestimated, but the field is so large, so interlocked, and so rapidly developing that any attempt to organize it is quite beyond the scope of this book. Attention is here directed, however, to a few scientific papers of interest in this connection.

[For studies on structure of polychloroprene see (48) (49); for study of polymers of $\bar{C}$ by ozonization and HNO_3 oxidn. see (50); for detn. of unsaturation in polymers of $\bar{C}$ see (51); for permeability of polychloroprene to gas see (52).]

[For study of influence of tetralin peroxide (53) in nitrobenzene (54) or of high-frequency field (55) (56) on polymerization of $\bar{C}$ see indic. refs.; for photopolymerization of $\bar{C}$ see (57); for study of kinetics of polymerization of $\bar{C}$ in di-*n*-butyl phthalate soln. in pres. of dibenzoyl peroxide see (58); for detection of free radicals in peroxide polymerization of $\bar{C}$ see (59).]

II-151, II_1-(70), II_2-(163)], b.p. 117–118° (3); for corresp. react. with Pb propionate or Na *n*-butyrate see (3).]

[$\bar{C}$ in C_6H_6 with $ZnCl_2$ + HCl gas at 55–65° gives (52) cf. (28) benzyl chloride (3:8535). — $\bar{C}$ with chlorobenzene (3:7903) + dehydrating agts. gives (28) *p*-chlorobenzyl chloride (3:0220). — $\bar{C}$ with toluene + $SnCl_4$ gives (35–40% yield (53)) *p*-methylbenzyl chloride (*p*-xylyl chloride) (3:8660) together with other prods.]

[$\bar{C}$ in AcOH soln. without cat. condenses with aromatic nuclei: e.g., $\bar{C}$ with toluene in AcOH gives (25% yield (15)) a mixt. of *o*-xylyl chloride (3:8710) and *p*-xylyl chloride (3:8660); for analogous reactns. of $\bar{C}$ in AcOH with *o*-xylene (1:7430), *m*-xylene (1:7420), pseudocumene (1:7470), mesitylene (1:7455), naphthalene (1:7200), tetralin (1:7550), anisole (1:7445), etc., see (15).]

[By virtue of its reactive halogen atom $\bar{C}$ reacts readily with Grignard reagents giving (54) the corresp. methyl ethers: e.g., $\bar{C}$ with *n*-BuMgBr gives (67% yield (55)) (56) *n*-amyl methyl ether (1:7905); $\bar{C}$ (2 moles) with decamethylene-*bis*-MgBr gives (53% yield (57)) dodecanediol-1,12-dimethyl ether; $\bar{C}$ with $CH_3—C{\equiv}C—MgBr$ gives (58) $CH_3.C{\equiv}C.CH_2OCH_3$; $\bar{C}$ with $Br—Mg.C{\equiv}C—MgBr$ gives (63% yield (32)) 1,4-dimethoxybutyne-2; $\bar{C}$ with C_6H_5MgBr gives (60% yield based on initial C_6H_5Br (59)) benzyl methyl ether (1:7475); $\bar{C}$ with benzyl MgCl gives mainly (60) cf. (61) (62) methyl β-phenylethyl ether (ω-methoxyethylbenzene) [Beil. VI-479, VI_1-(238)], b.p. 185–187° (61), accompanied by some *o*-tolylcarbinol methyl ether and *p*-tolylcarbinol methyl ether, cf. (60).]

[In the pres. of appropriate catalysts $\bar{C}$ adds to olefinic unsatd. linkages, addition occurring as if $\bar{C}$ dissociated into (Cl-) and ($CH_3O.CH_2$-) radicals; examples of these addition reactions are given as follows: $\bar{C}$ with ethylene + $BiCl_3$ at 80° under 700–800 lbs. press. for 7 hrs. gives (63) *γ-chloro-n-propyl methyl ether;* $\bar{C}$ with propylene + $BiCl_3$ similarly gives (63) γ-chloro-*n*-butyl methyl ether; $\bar{C}$ with 2-methylpropene-1 (isobutylene) + $HgCl_2$ on stdg. in s.t. 4 days at room temp. gives (60% yield (64)) 2-chloro-4-methoxy-2-methylbutane, b.p. 136° at 751 mm. D_4^{20} = 0.9455, accompanied by some *ter*-butyl chloride (3:7045); but $\bar{C}$ with isobutylene + $TiCl_4$ as directed (65) gives the corresp. alc., viz., 3-chloro-3-methylbutanol-1; $\bar{C}$ with 2-methylbutene-2 (trimethylethylene) (1:8220) with $ZnCl_2$ as directed (63) or with $HgCl_2$ in s.t. at room temp. for 48 hrs. (64) gives (40% yield (64)) 2-chloro-4-methoxy-2,3-dimethylbutane, b.p. 153° at 761 mm., 46–46.5° at 14 mm., D_4^{20} = 0 9528, accompanied by some *ter*-AmCl (3:7220); $\bar{C}$ with cyclohexene (1:8070) + $ZnCl_2$ in CS_2 stirred 5 hrs. at 0°, then 3 hrs. at room temp., gives (28.7% yield (66)) cf. (64) (*o*-chlorocyclohexyl)methyl methyl ether (2-chloro-1-(methoxymethyl)cyclohexane), b.p. 88–91° at 17 mm., D_4^{20} = 1.1552 (66).]

[$\bar{C}$ with butadiene-1,3 + $ZnCl_2$ in s.t. at room temp. for 24 hrs. gives (70% yield (64)) a mixt. of 1-chloro-5-methoxypentene-2, b.p. 168° at 758 mm., 56° at 10 mm., D_4^{20} = 1.0022 (from 1,4- addn. (?)) + 3-chloro-5-methoxypentene-1, b.p. 148° at 756 mm., 35° at 10 mm., D_4^{20} = 0.9740 (from 1,2 addn. (?)) (note that these two prods. represent synionic mesomers); $\bar{C}$ with cyclohexadiene-1,3 (1:8057) + $HgCl_2$ under CO_2 at 0° stood 24 hrs. gives (38% yield (64)) (4-chlorocyclohexenyl)methyl methyl ether, b.p. 81° at 10 mm., D_4^{20} = 1.0636 (64).]

[$\bar{C}$ (1 mole) + vinylacetylene (1 mole) + $BiCl_3$ (trace) + pyrogallol (trace) in dry ether at 5–15° for 9 hrs. (with periodic addns. of $BiCl_3$) gives (67) 34.8% yield 1-chloro-5- [illegible]-61° at 10 mm., D_4^{20} = 1.0427, n_D^{20} = 1.4893 (by 1,4 addn.), [illegible]hloro-5-methoxypentadiene-1,3, b.p. 46° at 10 mm., D_4^{20} = [illegible] with other prods.; note that of the two preceding dienes the former with Cu_2Cl_2 + HCl in ether at 20–40° for 2 hrs. readily isomerizes (81% yield (67)) to the latter; for further reactions of the pair see (67).]

[$\bar{C}$ with 4.67% dislvd. $ZnCl_2$ shaken with CO at 25–50° at 275–625 pounds press. for 8 hrs. gives (68) *methoxyacetyl chloride* (3:5225).]

C̄ with tertiary amines yields the corresp. quaternary ammonium salts: e.g., C̄ with Me_3N in dry ether gives (69) methoxymethyl-trimethyl-ammonium chloride (chloroplatinate, m.p. 228–229°, picrate, m.p. 198°); C̄ with pyridine in dry ether gives (69) methoxymethyl-pyridinium chloride (chloroplatinate, m.p. 182–185° (70), 180–182° dec. (35), $HgCl_2$ cpd., m.p. 91° (69)); C̄ with quinoline in $CHCl_3$ gives (69) methoxymethyl-quinolinium chloride (chloroplatinate, m.p. 232–234°; chloroaurate, m.p. 126–127°); for other quaternary salts see (69).

—— Methoxymethyl benzoate: oil, b.p. 283° (71). [From C̄ with NaOBz at 100° (71).]

—— Methoxymethyl *p*-nitrobenzoate: unreported.

—— Methoxymethyl 3,5-dinitrobenzoate: unreported.

—— *S*-(Methoxymethyl)isothiourea picrate: m.p. 163° (72). [From C̄ + thiourea in cold acetone giving (90% yield (72)) corresp. hydrochloride, m.p. 112° dec., which is then converted to the picrate.]

—— *N*-(Methoxymethyl)phthalimide: cryst. from dry MeOH, m.p. 120–121° (73), 118° (74). [Prepn. reported only by indirect means (73) (74).]

62–67°	(3)		n_D^{15} = 1.4232 (2)
59–61° at 761 mm.	(4)	D_4^{15} = 0.9220 (2)	

Both stereoisomers form with abs. EtOH const.-boilg. mixts from which C̄ can be recovered by repeated shaking with 3 vols. aq. to remove the alc., the azeotrope with *cis*-C̄, b.p. 60.0–60.4° at 760 mm., D_4^{15} = 0.8964, conts. 81.6% by wt. of *cis*-C̄, the azeotrope with *trans*-C̄, b.p. 56.8–57.2° at 760 mm., D_4^{15} = 0.8960, conts. 84.6% by wt. of *trans*-C̄ (1).

[For study of toxicity of C̄ see (5); for use as anthelmintic see (6).]

[For prepn. of the two geom. stereoisomers of C̄ from either *d,l*- (3:7615) or *meso*- (3:7580) 2,3-dichlorobutane with alc. KOH (1 mole + 25% excess) refluxed for 3 days see (1).]

[For prepn. of ord. C̄ (mixt. of *cis* + *trans* stereoisomers) from 2,2-dichlorobutane (3:7415) with alc. KOH see (8), from ord 2,3-dichlorobutane (3:7615) with alc. KOH (1) (2) (3) (8) (9), with aq. $NaHCO_3$ + Na_2CO_3 under press. (yield 20% C̄ accompanied by 4% butanone-2 (ethyl methyl ketone) (1:5405) + 5% butenols) (7), with aq. alkali or alkaline-earth hydroxides under press. at 118–250° (10), by passing vapor over $BaCl_2$ at 200–300° (11), or by passing vapor + steam at 300–400° over silica gel contg. $MgCl_2$ + $CaCl_2$, etc. (yields 21–25% C̄ accompanied by 35–38% butadiene-1,3 and 6–8% butanone-2) (3) see indic. refs.; from butanone-2 (ethyl methyl ketone) (1:5405) with PCl_5 (C̄ is accompanied by 2-chlorobutene-1 (3:7075) (12) and by 2,2-dichlorobutane (3:7415) (4)) see indic. refs.]

[For prepn. of C̄ from 2,2-dichloro-3-iodobutane (see below) with alc. KOH see (2); from 2-bromo-2-chloro-3-iodobutane with alc. KOH see (2) (note that the isomeric 2-bromo-3-chloro-2-iodobutane under same circumstances gives 3-bromo-2-chlorobutene-2).]

[For prepn. of C̄ from 2,3-dichlorobutene-2 (3:5500) with aq. alk. or alkaline-earth hydroxides under press. at 118–250° see (13).]

[C̄ with Cl_2 may *add* halogen, or be further *substituted* by halogen, or both, according to

circumstances: e.g., C̄ in liq. phase with Cl_2 at 20–40° in absence of light but in pres. of cat. *such as $SnCl_4$ or $FeCl_3$ adds Cl_2 giving (14) 2,2,3-trichlorobutane (3:5680);* C̄ in liq. phase with Cl_2 in pres. of light and of O_2 (15) or C̄ with Cl_2 in pres. of $NaHCO_3$ at 0° (4) substitutes further giving (55% *yield* (4)) (15) 2,3-dichlorobutene-1 (3:9074) (accompanied by 45% 2,2,3-trichlorobutane (3:5680) (4)); C̄ with Cl_2 at 350° gives (16) a mixt. of unsatd. chlorobutenes, probably 1,2-dichlorobutene-2 (3:5300) or (3:5615) and 1,3(2,4)-dichlorobutene-2 (3:5550).]

C̄ adds Br_2 yielding (2) 2,3-dibromo-2-chlorobutane, b.p. 182.5–186° sl. dec., 66–66.5° at 12 mm., D_4^{15} = 1.8975, n_D^{15} = 1.5339 (2) (this prod. with alc. KOH loses HBr yielding (2) 3-bromo-2-chlorobutene-2, b.p. 128–129.5°, D_4^{15} = 1.4998, n_D^{15} = 1.4950 (2)).

[C̄ adds ICl yielding (2) 2,2-dichloro-3-iodobutane, b.p. 69.5° at 11.5 mm., D_4^{15} = 1.8580, n_D^{15} = 1.5505 (2) (this prod. with KOH regenerates C̄).]

[*C̄ also adds HOCl but from the addn. prod. HCl splits out immediately: e.g., C̄ in CCl_4* with Cl_2 + aq. as directed (17) gives (85% yield (17)) 3-chlorobutanone-2 (α-chloroethyl methyl ketone) (3:7598).]

[For behavior of C̄ with dry HF yielding 2,2-difluorobutane see (18).]

[C̄ with steam passed at 300–400° over silica gel contg. $MgCl_2$ + $CaCl_2$ is unchanged (3) (dif. from 3-chlorobutene-1 (3:7090) or 1-chlorobutene-2 (3:7205) which lose HCl yielding butadiene-1,3 (3)). — Note that with alc. KOH the *cis*-C̄ splits off HCl 2.5 times as fast as the *trans*-C̄ (1).] [For dehydrohalogenation of C̄ yielding butadiene-1,3 see (19) (20).]

[C̄ with alcoholates or phenolates as directed (9) yields the corresp. ethers; e.g., C̄ with NaOEt yields (9) α,β-dimethylvinyl ethyl ether.]

C̄ on oxidn. with boilg. aq. $KMnO_4$ *yields (12) acetic acid (1:1010) and propionic acid* (1:1025); the *cis*-C̄ appears to give mainly acetic acid; the *trans*-C̄ gives mainly propionic acid (12).

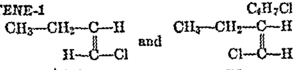
3:7110 1-CHLOROBUTENE-1 C_4H_7Cl Beil. S. N. 11



trans *cis*

trans Stereoisomer

B.P.		
68.0–68.2° at 760 mm. (1)	D_4^{15} = 0.9205 (1)	$n_D^{14.6}$ = 1.4225 (1)
	D_4^0 = 0.9376 (1)	

cis Stereoisomer

B.P.		
63.4–63.6° at 760 mm. (1)	D_4^{15} = 0.9153 (1)	n_D^{15} = 1.4194 (1)
	D_4^0 = 0.9329 (1)	

Both stereoisomers form with abs. EtOH const.-boil. mixts from which C̄ can be recovered by repeated shaking with 3 vols. aq. to remove the alc.: the azeotrope with the *trans* form, b.p. 61.2–61 6° at 760 mm, D_4^{15} = 0.8912, conts. 79 8% by wt. of C̄; the azeotrope with the *cis* form, b.p. 57.0–58.2° at 760 mm, D_4^{15} = 0.8946, conts. 85.2% by wt. of C̄ (1).

[For formn of both *trans* and *cis* forms of C̄ from *d,l*-1,2-dichlorobutane (3:7680) with alc. KOH (1 mole + 25% excess) refluxed 3 days (some 2-chlorobutene-1 (3:7075) is also formed) see (1).]

[The *cis* form of C̄ with alc. KOH splits off HCl 2.9 times as fast as the *trans* form (1).]

[*C̄ with Cl_2 in dark at 10° gives (70–75% yield (2)) 1,1,2-trichlorobutane, but no constants for latter can be found either in (2) or in prior literature.*]

3:7110 (1) Navez, *Bull. soc. chim. Belg.* **39**, 435–443 (1930), *Cent.* **1931**, I 1269–1270; *C.A.* **25**, 2412 (1931) (2) Henne, Hinkamp *J Am Chem Soc.* **67**, 1197 (1945).

3:7120 1-CHLORO-2-METHYLPROPENE-1 C_4H_7Cl Beil. I - 209
(β,β-Dimethylvinyl chloride; I_1—
isocrotyl chloride; I_2—
α-chloroisobutylene)

B.P.			
68–69° at 775 mm.	(1)	D_{25}^{25} = 0.9144 (3)	n_D^{25} = 1.4198 (3)
68.1°	(2) (5)		
66.9° at 757 mm.	(3)	D_4^{20} = 0.9186 (2)	n_D^{20} = 1.4221 (2)
65–68°	(4)	0.918 (6)	1.422 (7)

[*See also 3-chloro-2-methylpropene-1* (3:7145).]

Note that for C̄ the designation β,β-dimethylvinyl chloride is now preferred, cf. (5); great care should be used to avoid confusion of C̄ with the isomeric and very closely related 3-chloro-2-methylpropene-1 (methallyl chloride) (3:7145); both these compounds are now commercial chemicals in the U.S.A.

[For prepn. of C̄ from 3-chloro-2-methylpropene-1 (methallyl chloride) (3:7145) see (2) (8): e.g., methallyl chloride (10 moles) with 80% H_2SO_4 (1 mole) stirred at 40° for 2½ hrs. gives an upper phase contg 87% C̄ + 7% residual methallyl chloride + 6% dichlorides and polymers; after washing free from acid, drying, and distilling it yields 85% C̄ (8) (20).]

[For formn. of C̄ (usually accompanied by the isomeric methallyl chloride and/or other

prods.) from 2-methylpropene-1 (isobutylene) with Cl_2 (5) (9); from 1,1-dichloro-2-methylpropane (isobutylidene dichloride) (3:7425) by actn. of NH_4OH or alc. KOH (4), from 1,2-dichloro-2-methylpropane (isobutylene dichloride) (3:7430) with alc. KOH (10) see indic. refs.]

[For formn. of $\bar{C}$ (together with the isomeric methallyl chloride) from 1-chloro-2-methylpropanol-2 (isobutylene chlorohydrin) (3:7752) by soln. in cold 45% H_2SO_4 and subsequent warming (giving 90% $\bar{C}$ + 10% methallyl chloride (2) (8)), or by use of P_2O_5 (11) cf. (12); from 1,1,1-trichloro-2-methylpropanol-2 (1,1,1-trichloro-*ter*-butyl alc. = "Chloretone") (3:2662) with Zn dust + boilg. alc. (13), or from isobutyraldehyde (1:0120) by actn. of PCl_5 (4) see indic. refs.]

$\bar{C}$ forms with aq. a const.-boilg. mixt., b.p. 61.9°, contg. 7.5% aq. (2)

[For study of anesthetic props. of $\bar{C}$ see (14).]

Reactions involving further substitution of H atoms in $\bar{C}$. [$\bar{C}$ with Cl_2 (in pres. of 1.5 moles $NaHCO_3$ at 0° (15)) cf. (2) reacts not only by addn. but *also* by substitution (the latter involving a shift of double bond) giving respectively 32% 1,1,2-trichloro-2-methylpropane (3:5710) + 68% 1,1-dichloro-2-methylpropene-2 (3:7480).]

Reactions involving the double bond of $\bar{C}$. [$\bar{C}$ adds Cl_2 (see preceding paragraph).]

[*$\bar{C}$ also adds HOCl (chlorohydrination)*; e.g., $\bar{C}$ with Cl_2 + aq., or aq. HOCl, or even alkyl or aralkyl hypochlorites as directed (16) cf. (2) (4), yields 1,1-dichloro-2-methylpropanol-2 (β,β-dichloro-*ter*-butyl alc.) (3:5772), b.p. 150°.]

[$\bar{C}$ can also undergo catalytic hydration of the double bond: e.g., $\bar{C}$ (1 mole) with 90% H_2SO_4 (1 mole) stirred at −10° to 0° for 2½ hrs., then poured onto cracked ice, diluted with aq., and distilled, gives 66% of the initial $\bar{C}$ as 1-chloro-2-methylpropanol-2 (β-chloro-*ter*-butyl alcohol) (isobutylene chlorohydrin) (3:7752); note that other acids can also be used for this hydration, e.g., 85% H_3PO_4, 70% HNO_3, 60% $HClO_4$, benzenesulfonic acid, e.g., each having its own optimum conditions. Note also that some 18% of the initial $\bar{C}$ is not hydrated but is partially isomerized to a mixt. contg. 90% $\bar{C}$ + 10% methallyl chloride (2) (17).]

Reactions involving the halogen atom of $\bar{C}$. Note that in $\bar{C}$ the halogen is *extremely* inert as compared with that of the isomeric methallyl chloride (3:7145); this permits removal of the latter from $\bar{C}$ by chemical means (see below).

[$\bar{C}$ is virtually unattacked by aq. or alc. KOH even at 100° (11) (1) (2) (dif. from methallyl chloride (3:7145)). — $\bar{C}$ does not react with boilg. aq. K_2CO_3 or KOAc (1) (dif. from methallyl chloride (3:7145)).]

[$\bar{C}$ is not normally convertible to isobutyraldehyde except under extreme conditions (5) (dif. from methallyl chloride (3:7145) which upon acid hydrolysis or even boilg. with aq. gives isobutyraldehyde).]

—— β,β-Dimethylvinyl (isocrotyl) acetate: unreported.
—— β,β-Dimethylvinyl (isocrotyl) benzoate: unreported.
—— β,β-Dimethylvinyl (isocrotyl) *p*-nitrobenzoate: unreported.
—— β,β-Dimethylvinyl (isocrotyl) 3,5-dinitrobenzoate: unreported.
—— *N*-(β,β-dimethylvinyl)phthalimide: unreported.

Liquid with agreeable ethereal odor.

[For prepn. of $\bar{C}$ from butanol-2 (1:6155) by saturation with dry HCl gas and htg. in s.t. at 100° for several hrs. (9); by distillation with 18 wt. pts. 6 *N* HCl (50% yield (12)); with conc. HCl + $ZnCl_2$ (2 moles) (yields: 85-88% (13), 83% (14), 82% (5), 78% (15), 60-68% (16) (17)) (6); with PCl_3 + $ZnCl_2$ (yields: 67% (15), 40% (6)); with PCl_5 + $ZnCl_2$ (71% yield (15)); with $SOCl_2$ + pyridine (yields: 90% (15), 47% (5)); or with HCl in pres. of H_3PO_4 (18) see indic. refs.]

[For formn. of $\bar{C}$ from either butene-1 or butene-2 with HCl gas by addn. to unsatd. linkage (7) (19) in pres. of cat. (20) (21) (22) see indic. refs.; from *n*-butane with Cl_2 see (4) (23); from *n*-butylamine with HNO_2 (2.8% yield $\bar{C}$ accompanied by 36.5% butenes, 25% butanol-1, 13.2% butanol-2, 5.2% *n*-butyl chloride (3:7160) and other prods.) see (24); from *sec.*-butylamine with NOCl in xylene see (25).]

[For study of anthelmintic props. of $\bar{C}$ see (26).]

Pyrolysis of $\bar{C}$. [$\bar{C}$ at 450-550° without cat. loses HCl and yields (4) (27) a mixt. contg. butene-1, *cis*-butene-2, and *trans*-butene-2 (dif. from 1-chlorobutane (3:7160) which gives only butene-1); $\bar{C}$ at 450° in pres. of anhyd. $CaCl_2$ as cat. gives (4) (27) the same mixt. (as does also 1-chlorobutane (3:7160)). For use of this pyrolysis in distinction of $\bar{C}$ from *ter*-butyl chloride (3:7045) see (23).]

Further halogenation of C̄. [C̄ with Cl_2 at 200–380° gives (28) a mixt. of dichlorobutanes contg. 1,3-dichlorobutane (3:7925), 2,2-dichlorobutane (3:7415), and *d,l*-2,3-dichlorobutane (3:7615) but no 1,2-dichlorobutane (3:7680); note, however, that C̄ with Cl_2 in pres. of light gives (29) 1,2-dichlorobutane (3:7680), 1,3-dichlorobutane (3:7925), 2,2-dichlorobutane (3:7415), and both *d,l*- (3:7615) and *meso*- (3:7580) 2,3-dichlorobutanes.]

Reactions of the halogen atom of C̄. [For study of rate of reactn. of C̄ with KI in acetone at 60° see (30).]

[C̄ with C_6H_6 + $AlCl_3$ gives (yields: 82.5% (9), 69% (31)) *sec.*-butylbenzene (1:7490); C̄ with C_6H_6 + Al/Hg gives (59.5% yield (32)) *ter*-butylbenzene (1:7460); C̄ with naphthalene + AlHg gives (48% yield (32)) 1-(*sec.*-butyl)naphthalene.]

[C̄ with acetanilide + $AlCl_3$ in ethylene dichloride (3:5130) at −5° gives (33) *N*-acetyl-*p*-(*sec.*-butyl)aniline, cryst. from di-isopropyl ether, m.p. 121–122° (33).]

C̄ with Mg in dry ether gives (87% yield (34)) *sec.*-BuMgCl (see also below).

Ⓓ Ethyl-methyl-acetic acid (1:1105): b.p. 176–177°. [From C̄ by conversion to RMgCl and carbonation of the latter with CO_2 (yields: 76–86% (35), 72%) (by adding ether soln. directly to solid CO_2 (36)).]

Ⓓ Ethyl-methyl-acetic anilide: m.p. 110–111° (37), 108° u.c. (38), 105.5–106.5° u.c. (39). [From C̄ (39) (24) or *sec.*-BuBr (38) by conversion to RMgX and reactn. in dry ether with phenyl isocyanate.] [Note that this prod. does not distinguish C̄ from ethyl chloride (3:7015) or from isopropyl chloride (3:7025) for which the corresp. anilides melt at 104–104.5°; moreover, it is not recommended as distinction from isobutyl chloride (3:7135) for which the corresp. isovaleranilide has m.p. 109–110° u.c. (39).]

Ⓓ Ethyl-methyl-acetic-*p*-toluidide: m.p. 92.5–93° u.c. (39). [From C̄ by conversion to RMgCl (see above) and reactn in dry ether with *p*-tolyl isocyanate (39).]

Ⓓ Ethyl-methyl-acetic α-naphthalide: m p. 128–129° u.c. (39). [From C̄ by conversion to RMgCl (see above) and reactn. in dry ether with α-naphthyl isocyanate (39).] [Note that this prod. does not distinguish C̄ from isobutyl chloride (3:7135) for which the corresp. isovalero-α-naphthalide has m.p. 125–126° u.c. (39).]

—— *sec.*-Butyl mercuric chloride (*sec.*-BuHgCl): cryst. from alc., m.p. 30.5° (40). [Reported only by indirect means (40).]

—— *S*-(*sec.*-Butyl)isothiourea picrate: m.p. 190° (41). [Not reported from C̄ but obtd. from *sec.*-BuBr (0.2 g.) + thiourea (0.2 g.) refluxed in alc. (2 ml.) for 2 min., then treated with PkOH (0.2 g.) dislvd. in least possible hot alc. (41).]

—— *N*-(*sec.*-Butyl)phthalimide (2-(*N*-phthalimido)butane): m.p. 24.5–25.5° (42). [Not reported from C̄ but obtd. (35% yield (42)) from *sec.*-BuBr with K phthalimide by htg. in s t. at 210° for 4 hrs.; note that m.p. is too low to be recommended as deriv. for identification.]

—— *N*-(*sec.*-Butyl)-3-nitrophthalimide: unreported.

—— *N*-(*sec.*-Butyl)tetrachlorophthalimide: unreported.

—— *N*-(*sec.*-Butyl)-*o*-sulfobenzoic imide (*N*-(*sec.*-butyl)saccharin): m.p. 81° (43). [Not reported from C̄ but obtd. from *sec.*-BuBr or *sec.*-BuI with sodium saccharin in aq. butylcarbitol (1·6517) on refluxing for 30 min. (43).]

—— *N*-(*sec.*-Butyl)-*N*-(*p*-bromobenzenesulfonyl)-*p*-anisidide: unreported.

—— *p*-(*sec.*-Butoxy)benzoic acid: m.p. 121–123° u.c. (44). [From C̄ (7) or from *sec.*-BuBr with ethyl *p*-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (44).] [Note, however, that this prod. does not distinguish C̄ from the corresp. deriv. of *n*-amyl chloride (3:7460) whose m.p. is 123–124° u.c. (44).]

—— *sec.*-Butyl 2,4,6-triiodophenyl ether: unreported.

—— *sec.*-Butyl α-naphthyl ether: b.p. 293.5° cor. (45). (Corresp. picrate, m.p. 100.5–101.0° cor.; Neut. Eq. calcd. 429, found 427 (45).)

—— *sec.*-Butyl β-naphthyl ether: b p. 298.5° cor. (45), 298° (46). (Corresp. picrate, m p. 86.0–86 5° cor (45); 85° (46); Neut. Eq., calcd. 429, found 429 (46).)

Colorless liquid. — Very spar. sol. aq.; 100 ml. aq. at 12.5° dis. 0.092 g. C̄ (9).

C̄ forms with aq. a const-boilg. mixt. (consts. not reported (10)) (use in sepn. from *ter*-butyl alc. (1:6140) (10); C̄ also forms binary azeotropes with many org. compounds; e.g., C̄ with *EtOH* (1:6130) forms a const.-boilg. mixt., b.p. 61.45° at 760 mm., contg. 72 mole % C̄ (11); C̄ with *propanol-1* (1:6150) forms a const.-boilg. mixt., b.p. 67.7° at 760 mm., contg. 78 wt. % C̄ (12); C̄ with *propanol-2* (1:6135) forms a const.-boilg. mixt., b.p. 64.8° at 760 mm., contg 83 wt. % C̄ (13); C̄ with *ter-butyl alc.* (1:6140) forms a const.-boilg. mixt., b.p. 65.5° at 760 mm., contg. 83 wt. % C̄ (14); C̄ with *allyl alc.* (1:6145) forms a const.-boilg. mixt., b.p. 67.2° at 760 mm., contg. 93 wt. % C̄ (14); C̄ with *EtOH* (1:6130) + *aq.* forms a ternary const.-boilg. mixt., b.p. 58.62° at 760 mm. (2 phases), contg. 62.6 mole % C̄ + 19.8 mole % EtOH + 17.6 mole % aq. (11).

[For prepn. of C̄ from isobutyl alc. (1:6165) with dry HCl gas in s.t. at 120° for 8 hrs. (3) cf. (23) (gives 94% yield of a mixt. of C̄ + *ter*-butyl chloride (3:7045) from which latter can be removed by 5-hr. shaking with 10% aq. KOH (3)) cf. (22); with dry HCl gas at 100° for 10 hrs. (4) or in pres. of pyridine (15) or CdO, $ZnCl_2$ or other cat. (16); or over Al_2O_3 at 420° (*ter*-butyl chloride is also formed (17)); with conc. aq. HCl + $ZnCl_2$ refluxed 1 hr. (15% yield (18) (19)); with PCl_3 + $ZnCl_2$ (yields: 85% (20), 80% (18), 32% (21)) (note that some *ter*-butyl chloride is formed (21)); with PCl_5 (24) or PCl_5 + $ZnCl_2$ (76% yield (18)); or with $SOCl_2$ + pyridine (88% yield (18)) (5), $SOCl_2$ + dimethylaniline (70% yield (18)), $SOCl_2$ + diethylaniline (58% yield (18)) (note that use of aniline gives only 19% yield (18)) see indic. refs.]

[For formn. of C̄ from 2-methylpropane (isobutane) with Cl_2 + cat. at 180° (60% yield (25) together with other prods.) (26) see indic. refs.; for formn. of C̄ from isobutylene by cat. addn. of HCl (note "abnormal" addition) see (27).]

[For formn. of C̄ from isobutylamine with NOCl in xylene at −15° (28) or with aqua regia (29) see indic. refs.; from *n*-butyl acetate (1:3145) by pyrolysis with $AlCl_3$ see (30).]

[For sepn. of C̄ from *ter*-butyl chloride (3:7045) by hydrol. of latter with aq. alk. and extraction of the resultant *ter*-butyl alc. with aq. see (10) (3); for sepn. of C̄ from more reactive alkyl chlorides (such as *ter*-butyl chloride (3:7045), methallyl chloride (3:7145), etc.) by esterification of the reactive chlorides by htg. at 125–225° under press. in pres. of Cu with alkali salt of a suitable acid, followed by fractional distn., see (47).]

[C̄ on suitable htg dec. into isobutylene and HCl; if the process is so conducted that these prods. can react at lower temp. they combine to yield *ter*-butyl chloride (3:7045): e.g., C̄ passed over pumice at 500° (31), or over clay at 250–300° (32), or over $BaCl_2$, $ThCl_4$, ThO_2, *kaolin*, etc., at 300° (33) (34) (35) (36), or with H_2 over reduced *Ni at 270°* (35) (36) yields isobutylene + HCl; for execution of this process so as to permit recombination to *ter*-butyl chloride (3:7045) see (37). — Note that C̄ on htg. in s.t. at 306° for 6 hrs. gives (3) 8% *ter*-butyl chloride; for study of the equilibrium in the system C̄ + *ter*-butyl chloride + HCl over range 88–237° see (38).]

[C̄ with Cl_2 yields (39) (26) 1,3-dichloro-2-methylpropane (3:7960) and other prods. — C̄ with Br_2 (1 mole) in pres. of Fe in s.t. at 100° for 6 hrs. gives (40) 1,2-dibromo-2-methyl propane (isobutylene dibromide), b.p. 148° (40).]

[C̄ with aq. soln or susp of inorg. bases under press. at 120–350° yields (41) a mixt. contg isobutyl alc. (1:6165), *ter*-butyl alc. (1:6140), and isobutylene. — For study of rate of hydrolysis of C̄ in 50% alc. in pres. and abs. of dil. H_2SO_4 see (42). — In connection with hydrolysis of C̄ to isobutyl alc. note that these two form no azeotrope (1).]

[C̄ with Na in liq. NH_3 gives 2-methylpropane (isobutane) (43); but C̄ with $NaNH_2$ in liq. NH_3 gives isobutylene (43).]

[C̄ with C_6H_6 + $AlCl_3$ gives exclusively (44) (45) (46) (21) *ter*-butylbenzene (1:7460).]

C̄ with Mg in dry ether in pres. of trace of MeI as cat. gives in 8 hrs. (98.0% yield (48))

corresp. isobutyl MgCl; the ethereal soln. of this RMgCl undergoes the usual reactns. (see also below).

Ⓓ Isovaleric acid (1:1050) q.v. [From isobutyl MgCl with CO_2 followed by dil. non-volatile acid and subsequent distn. (49) (yield not reported).]

Ⓓ Isovaleranilide: m.p. 109–110° u.c. (50). [From isobutyl MgCl (above) with phenyl isocyanate in dry ether (50).] [Note that this derivative does *not* distinguish C̄ from isoamyl chloride (3:7365) or 2-chlorobutane (3:7125) q.v.]

Ⓓ Isovalero-*p*-toluidide: m.p. 106–107° u.c. (50). [From isobutyl MgCl (above) with *p*-tolyl isocyanate in dry ether (50).] [Note that this derivative does not distinguish C̄ from 3-chloropentane (3:7330) q.v., but that it is the best means of distinction from 2-chlorobutane (3:7125).]

Ⓓ Isovalero-α-naphthalide: m.p. 125–126° u.c. (50). [From isobutyl MgCl (above) with α-naphthyl isocyanate in dry ether (50).] [Note that this derivative does *not* distinguish C̄ from 2-chlorobutane (3:7125) q.v.]

—— Isobutyl mercuric chloride: unreported.

—— *S*-(Isobutyl)isothiourea picrate: m.p. 174° (51). [This prod. has been reported from isobutyl bromide (or iodide) (but not from C̄) by htg. with thiourea in alc. for 2 min., followed by addn. of alc. PhOH (51).]

—— *N*-(Isobutyl)phthalimide (1-(*N*-phthalimido)-2-methylpropane): lfts. from CS_2, m.p. 93° (53). [This prod. has been reported from isobutyl *bromide* with K phthalimide on htg. in s.t. at 210° for 3–4 hrs. (53).]

—— *N*-(Isobutyl)-3-nitrophthalimide: unreported.

—— *N*-(Isobutyl)tetrachlorophthalimide: unreported.

—— *N*-(Isobutyl)-*N*-(*p*-bromobenzenesulfonyl)-*p*-anisidide: cryst. from 75% alc., m.p. 78–79° (57). [From C̄ (?) or the corresp. isobutyl bromide with *N*-(*p*-bromobenzenesulfonyl)-*p*-anisidine in alc. KOH after 1 hr. refluxing (57).]

—— *N*-(Isobutyl)-*o*-sulfobenzoic imide (*N*-(isobutyl)saccharin: m.p. 75.0° (55). [Not reported from C̄, but obtd. from isobutyl bromide or iodide with sodium saccharin in aq. butylcarbitol (1:6517) on refluxing 30 min. (55).]

—— *p*-(Isobutoxy)benzoic acid: m.p. 140–141° u.c. (56). [From C̄ with ethyl *p*-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (56).] [Note, however, that this prod. does not distinguish C̄ from isoamyl chloride (3:7365) for which the corresp. *p*-(isoamoxy)benzoic acid has m.p. 141–142° (56).]

—— Isobutyl 2,4,6-tri-iodophenyl ether: m.p. 48.0° cor. (52). [This prod. has been obt. from isobutyl bromide (but not C̄) with 2,4,6-tri-iodophenol in alc. NaOEt (52).] [Note that it would not distinguish C̄ from 1-chloropentane (3:7460) or 1-chlorohexane (3:7955).]

—— Isobutyl α-naphthyl ether: b.p. 301.5° cor. (54). (Corresp. picrate, m.p. 104.5–105.5° cor. (54).)

—— Isobutyl β-naphthyl ether: b.p. 204.5° cor. (54), m.p. 33.0–33.5° cor. (54). (Corresp. picrate, m.p. 84.0–85.0° cor. (54).)

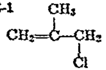
3:7145 3-CHLORO-2-METHYLPROPENE-1 (Methallyl chloride; isobutenyl chloride; β-methylallyl chloride; γ-chloroisobutylene)



C_4H_7Cl Beil. I - 209, I_1—, I_2—

B.P. [73.74°	(1)]	$D_4^{20} = 0.9475$ (7)	$n_D^{20} = 1.4340$ (7)
71–74°	(2)		
72.2°	(3) (8)		
71.5–72.5°	(4) (5)		
70–71° (6) at 739 mm.	(7)		

[*See also* 1-*chloro-2-methylpropene*-1 (3:7120).]

Note that for C̃ the designation methallyl chloride is now preferred (3); great care should be used to avoid confusion of C̃ with the isomeric and very closely related 1-chloro-2-methylpropene-1 = isocrotyl chloride = β,β-dimethylvinyl chloride = α-chloroisobutylene (3:7120); both these compounds are now commercial products in the U.S.A.

Commercial C̃ contains approx. 4% (10) of the isomeric β,β-dimethylvinyl chloride (3:7120); owing to the proximity of their boiling points the two isomers are extremely difficult to separate by distillation (8), but owing to the great reactivity of the halogen of C̃ (see amplification below) and the relative unreactivity of the halogen of β,β-dimethylvinyl chloride (3:7120) interference from the latter in *metathetical* reactions of comml. C̃ need not be expected.

[For prepn. of C̃ from 2-methylpropene-1 (isobutylene) with Cl_2 see (3) (2) (5) (9) (other prods. are also formed); for formn. of C̃ as its equilibrium mixt. (10% C̃) with β,β-dimethylvinyl chloride (3:7120) by actn. of H_2SO_4 on latter see (8).]

[For use of C̃ as insecticide see (11) (12); for toxicity studies on beetles see (13); for detn. of C̃ (when used as industrial fumigant) by reaction with ethanolamine in dioxane

(14) or by thermal decomposition (15) see indic. refs.; for use of $\bar{C}$ *in prepn. of cellulose* ethers see (16) (17).]

Reactions involving further substitution of H atoms in $\bar{C}$. [$\bar{C}$ with Cl_2 at room temp. (8) cf. (5) (9) or in pres. of $NaHCO_3$ soln. at 0° (2) gives (70% yield (8)) a mixt. of approximately equal amounts of 1,3-dichloro-2-methylpropene-1 (3:5590) and 1-chloro-2-(chloromethyl)propene-2 (3:5633) (see also next paragraph).]

Reactions involving the double bond of $\bar{C}$. [$\bar{C}$ with Cl_2 (5) (42) or with SO_2Cl_2 (42) also (see above) adds halogen to the unsaturated linkage yielding (5) (42) 1,2,3-trichloro-2-methylpropane (3:5710), b.p. 163.5–164° at 772 mm. (5).]

[$\bar{C}$ with Br_2, however, gives chiefly (93% yield (8)) cf. (5) (9) the expected addition prod., 1-chloro-2,3-dibromo-2-methylpropane [Beil. I-128], b.p. 57° at 5 mm., $D_4^{20} = 1.9168$, $n_D^{20} = 1.5834$ (8).]

[*$\bar{C}$ adds HCl with considerable difficulty*; e.g., $\bar{C}$ with equal vol. 12 *N* HCl at 3°, or $\bar{C}$ at b.p. treated with HCl gas for 2 hrs., shows no reaction (3); however, $\bar{C}$ with equal vol. 12 *N* HCl shaken for 1½ hrs. at 63° forms 30% of the expected 1,2-dichloro-2-methylpropane (3:7430). — $\bar{C}$ with dry HBr gas readily reacts giving (97% yield (8)) 1-chloro-3-bromo-2-methylpropane, b.p. 49° at 15 mm., $D_4^{20} = 1.4839$, $n_D^{20} = 1.4816$ (8) (note that this "abnormal" mode of addition of HBr *is presumably attributable to the presence in* $\bar{C}$ of peroxidic material (8)).]

[$\bar{C}$ with aq. HOCl below 5° (1) (7) cf. (8), or $\bar{C}$ with Cl_2/aq. (8) (18) or even org. hypochlorites (18), gives by addn. of HOCl to unsatd. linkage 1,3-dichloro-2-methylpropanol-2 (3:5977). — $\bar{C}$ with aq. HOBr (from Br_2/KBr in aq.) at room temp. for 4 hrs. gives 97.5% yield (1)) 1-bromo-3-chloro-2-methylpropanol-2, b.p. 84–85° at 20 mm., $D_{20}^{20} = 1.7578$, $n_D^{20} = 1.5171$ (1). — $\bar{C}$ in ether with aq. HgO + I_2 (HOI) at room temp. for 5–6 hrs. gives *(15% yield (1)) 3-chloro-1-iodo-2-methylpropanol-2, b.p. 101–103° at 18 mm.,* n_D^{20} = 1.547 (1).]

[$\bar{C}$ can also add hypochlorite esters; e.g., $\bar{C}$ with *ter*-BuOCl (3:7165) in MeOH + trace *p*-toluenesulfonic acid at 40° for 3–4 hrs. gives (35% yield (6)) *β,β*-dichloro-*ter*-butyl methyl ether (1,3-dichloro-2-methoxy-2-methylpropane), b.p. 170° at 748 mm., $D_{-}^{20} = 1.1953$, $n_D^{20} = 1.4595$ (6).]

[$\bar{C}$ can also undergo cat. hydration of the double bond; e.g., $\bar{C}$, although but slightly sol. in 80% H_2SO_4 at 0°, grad. dissolves on stirring; and after *the solution is poured onto ice* and the liquid distilled (8) (19) 63% of the original $\bar{C}$ can be recovered as *β*-chloro-*ter*-butyl alcohol *(isobutylene chlorohydrin) (1-chloro-2-methylpropanol-2) (3:7752).* Note that other acids can also be used for this hydration, e.g., 85% H_3PO_4, 70% HNO_3, 60% $HClO_4$, benzenesulfonic acid, etc., each having its own optimum conditions (8). Note also that in this reaction some 32% of the initial $\bar{C}$ is not hydrated but is partially isomerized to a mixt. contg. 10% $\bar{C}$ with 90% *β,β*-dimethylvinyl chloride (3:7120) (see also below) (8).]

[$\bar{C}$ can also be rearranged to the isomeric isocrotyl chloride; e.g., $\bar{C}$ (10 moles) with 80% H_2SO_4 (1 mole) stirred at 40° for 2½ hrs. gives an upper phase which conts. abt. 87% isocrotyl chloride + 7% $\bar{C}$ + 6% dichlorides and polymers; after washing free from acid, drying, and distilling it yields 85% *β,β*-dimethylvinyl chloride (3:7120) (8) (20).]

[$\bar{C}$ on sulfonation with dioxane sulfotrioxide in ethylene dichloride gives (21) a complex mixt. of prods.; about 40% of the SO_3 *adds* to the unsatd. linkage giving a cyclic anhydride of the carbyl sulfate type, the remainder *substituting* to yield the three *isomeric mono*sulfonic acids of $\bar{C}$; neither polymerization nor disulfonation takes place; for details the original paper (21) should be consulted.]

[For polymerization of $\bar{C}$ in the pres. of peroxides see (22).]

[$\bar{C}$ condensed with C_6H_6 in pres. of anhydrous liq. HF at 0–10° for 20 hrs. as directed

gives (58% yield on CuCN (10)) (27) methallyl cyanide, b.p. 136.2–136.4°, $D_4^{20} = 0.844$, $n_D^{20} = 1.4202$ (10); note that use of NaCN gives a prod. of somewhat higher b.p., 138.0–139.5° (10), indicating pres. (by rearr.) of some *β,β-dimethylacrylonitrile, b.p. 140–142°.*]

[C̄ (1 mole) with conc. aq. NH_4OH (10 moles) at 90° under press. reacts completely within 2 minutes giving (10) (32) mixt. of 56% methallylamine, b.p. 78.8°, $D_4^{20} = 0.782$, $n_D^{20} = 1.431$ (10) (B̄.HCl, m.p. 190–191° cor. (41); B̄.PkOH, m.p. 202–206° cor. (41)) + 26% di-(methallyl)amine, b.p. 148–149°, $D_4^{20} = 0.799$, $n_D^{20} = 1.446$ (10), + 8% tri-(methallyl)amine, b.p. 194–195° (32), 83–85° at 15 mm., $D_4^{20} = 0.8256$, $n_D^{20} = 1.457$ (10), together with 5% tetra(methallyl)ammonium chloride; C̄ htd. with primary amines behaves in analogous fashion (10) (32).]

[C̄ with Mg in dry ether under very carefully regulated conditions (using large excess of Mg + ether and slow addn. of C̄) gives as high as 90% yield (10) corresp. methallyl MgCl; this with acetaldehyde (1:0100) gives (65% yield (10)) the expected secondary alc. 4-methylpenten-4-ol-2, b.p. 129° (10); similarly C̄ with Mg + acetone (1:5400) in dry ether gives (59 mole % yield (10)) 2,4-dimethylpentene-4-ol-2, b.p. 126° (10) accompanied by (37 mole % yield (10)) of the coupling prod. di-methallyl (see next paragraph); note that this coupling reaction is very difficult to suppress.]

[C̄ with Mg in dry ether (10) (33), or with Na in dry ether (34), gives (yields: 90 mole % (10), 65% (33)) di-methallyl (2,5-dimethylhexadiene-1,5) [Beil. I-259, I_1-(122), I_2-(237)], b.p. 114.3° at 760 mm. (10) (33), $D_4^{20} = 0.7487$ (10), 0.7423 (33), $n_D^{20} = 1.4293$ (33). — Coupling of C̄ with other reactive alkenyl chlorides can also be effected: e.g., C̄ with allyl chloride (3:7035) + Mg in dry ether gives (33) 47% yield 2-methylhexadiene-1,5 [Beil. I-257, I_1-(120)], b.p. 88.1° at 760 mm., $D_D^{20} = 0.7198$, $n_D^{20} = 1.4184$ (33), + 30% di-methallyl (see above) + 12% hexadiene-1,5 (biallyl) (1:8045). — For analogous mixed couplings with 2-chloropentene-3 (piperylene hydrochloride) (3:7400) and with 4-chloro-2-methylbutene-2 (isoprene hydrochloride) (3:7465) see (36).]

[C̄ with $NaNH_2$ in liq. NH_3 gives (27% yield (35)) 2,5-dimethylhexatriene-1,3,5, b.p. 145° at 747 mm., 90.2° at 200 mm., m.p. −9°, $n_D^{21} = 1.5150$ (35); note that an intermediate *x*-chloro-2,5-dimethylhexadiene, b.p. 33–34° at 5 mm., $n_D^{20} = 1.4612$, has been detected (35).]

[C̄ reacts normally with other RMgX compounds: e.g., C̄ with MeMgBr in di-isopropyl ether (ord. ether boils too close to prod.) gives (10) 2-methylbutene-1 (1:8210); C̄ with *n*-BuMgCl gives (83 mole % yield (10)) (33) 2-methylheptene-1, b.p. 119.3° at 760 mm., $D_4^{20} = 0.7206$, $n_D^{20} = 1.4123$ (33) (contaminated with 2-methylheptene-2 formed by rearr. of the former by the inevitable $MgCl_2$ (33)); C̄ with iso-AmMgCl gives (10) 2,6-dimethylheptene-1, b.p. 140–143° (10); C̄ with C_6H_5MgBr gives (10) methallylbenzene (2-methyl-1-phenylpropene-1), b.p. 175–176° (10).]

[For reactn. of C̄ with diethyl malonate (1:3581) and with various diethyl alkylmalonates see (37); for prepn. of methallyl substituted barbituric acids (37) (4) or thiobarbituric acids (38) see indic. refs.]

—— Methallyl acetate [Beil. I-137, I_2-(150)]: b.p. 124° at 760 mm., $D_{20}^{20} = 0.9239$, $n_D^{20} = 1.4129$ (39). [From C̄ + KOAc at 150° in s.t. (5) (9) cf. (10).] [For data on the formate, propionate, and *n*-butyrate see (39).]

—— Methallyl benzoate: yel. odorless oil, b.p. 120° at 50 mm. (40). [Prepd. indirectly (40).]

—— Methallyl *p*-nitrobenzoate: unreported.

—— Methallyl 3,5-dinitrobenzoate: unreported.

Ⓓ *N*-(Methallyl)phthalimide: white cryst. from MeOH, m.p. 88.5–90° cor. (41). [From C̄ + K phthalimide in s.t. at 150° for 3 hrs. (41).]

3:7150 α-CHLOROETHYL METHYL ETHER C_3H_7OCl Beil. I - 606
(α-Methoxyethyl chloride) I_1-(327)
I_2-(674)

$$CH_3\overset{\displaystyle H}{\underset{\displaystyle Cl}{C}}.O\,CH_3$$

B.P.

72–73° cor. at 751 mm. (1)	D_4^{20} = **0.9909 (2)**	n_D^{20} = **1.4004 (1)**
70–72° at 746 mm. (2)	**0.9902 (1)**	**1.3969 (2)**

[For prepn. (yields: 97% (1), 95% (2)) from paraldehyde (1:0170) + methyl alc. (1:6120) + dry HCl see (1) (2) (3).]

$\bar{C}$ on stdg. polymerizes to dark tarry residue.

[$\bar{C}$ with Br_2 at 0° gives (3) α,β-dibromoethyl methyl ether, b.p. 67–69° at 22 mm. (3).]

$\bar{C}$ on shaking with aq. yields acetaldehyde (1:0100), methyl alc. (1:6120), + HCl.

3:7151 4-CHLOROBUTENE-1 $CH_2—CH_2—CH=CH_2$ (with Cl on first C) C_4H_7Cl Beil. S.N. 11

B.P. 75.0° at 773 mm. (1) $D_4^{20} = 0.9211$ (1) $n_D^{20} = 1.42330$ (1)

Colorless liq. with odor similar to allyl chloride but less strong; insol. aq.

[For prepn. of Č from buten-1-ol-4 (allylcarbinol) [Beil. I-441, I_1-(226), I_2-(480)] with PCl_3 + pyridine (41% yield) see (1).] [Č is not formed (2) (3) during reactn. of butadiene-1,3 with HCl.]

3:7151 (1) Juvala, *Ber.* **63**, 1993 (1930). (2) Kharasch, Kritchevsky, Mayo, *J. Org. Chem.* **2**, 494 (1938). (3) Ganguly, *J. Indian Chem. Soc.* **13**, 581, 684 (1936).

3:7153 ACRYLOYL CHLORIDE (Propenoyl chloride) $CH_2=CH—C=O$ (with Cl on C) C_3H_3OCl Beil. II - 400, II_1—, II_2-(388)

B.P. 75–76°	(1)	$D_4^{20} = 1.1136$ (13)	$n_D^{20} = 1.4343$ (13)
74–75°	(11)		
74–76° at 760 mm.	(13)	$D^0 = 1.14$ (1)	
30–32° at 140 mm.	(13)		

Colorless mobile strongly lachrymatory liq., fumg. in air.

[For prepn. of Č from sodium acrylate with $POCl_3$ (yields 80% (11), 60% (1), 27% (12), 22% (9) (2) (3) (4), with $SOCl_2$ (19% yield (9)), or from β-chloropropionyl chloride (3:5690) by loss of HCl (35% yield (12)) when passed over suitable cat. at 280–300° (5) see indic. refs.; for prepn. of Č from acrylic acid (1:1020) with PCl_3 (66% yield) see (13).]

[For polymerization of Č by light (10) in pres. of a small amt. of org. base see (6); for polymerization of Č in pres. of u.v. light or by dibenzoyl peroxide see (9).]

[Č with MeOH yields (1) methyl β-chloropropionate (3:5765), b.p. 148°; Č with EtOH yields (1) ethyl β-chloropropionate (3:8290), b.p. 162°; Č with phenol yields (1) phenyl β-chloropropionate, b.p. 154–157° at 30 mm. (1); note, however, that Č reacting with a large excess of alcs. or phenols and/or in the pres. of acid binding agents such as $CaCO_3$ yields (7) esters of acrylic acid.]

[Č with Na acrylate yields (1) acrylic anhydride, b.p. 97° at 35 mm. (1).]

Č with C_6H_6 + $AlCl_3$ yields (8) (2) (by Friedel-Crafts reactn. and subsequent ring closure) indanone-1 (1:5144), m.p. 42°.

Č in $CHCl_3$ treated with Br_2 in $CHCl_3$ yields (1) 2,3-dibromopropionyl chloride, b.p. 191–193°, 97–99° at 37 mm. (1), $D^0 = 2.181$ (1), which with warm aq. easily hydrolyzes to α,β-dibromopropionic acid, m.p. 64° (1).

Č on hydrolysis yields (1) acrylic acid (1:1020) q.v. (for the amide, m.p. 84–85° (11), anilide, and p-toluidide corresp. to Č see 1:1020).

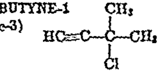
3:7155 3-CHLORO-3-METHYLBUTYNE-1 (2-Chloro-2-methylbutyne-3)



C_5H_7Cl Beil. S.N. 12

B.P. 76° (1)
74–76° (2)

$D_{?}^{?} = 0.9061$ (1)

[For prepn. of $\bar{C}$ from 2-methylbutyn-3-ol-2 (dimethyl-ethynyl-carbinol) on shaking as specified (1) (3) with HCl + $CuCl_2$ + NH_4Cl; if Cu_2Cl_2 is used or if reactn. is protracted $\bar{C}$ is isomerized (cf. (4)) to 1-chloro-3-methylbutadiene-1,2 (3:7390) q.v.; for reverse conversion of latter to $\bar{C}$ (and other products) by htg. with $CaCO_3$ + aq. see (3).]

$\bar{C}$ on htg. with aq. + $CaCO_3$ at 80° gives (2) the precursor 2-methylbutyn-3-ol-2.

$\bar{C}$ with $NH_4OH/AgNO_3$ gives (1) a white ppt. [dif. from 1-chloro-3-methylbutadiene-1,3 (3:9200)].

3:7155 (1) Favorskii, Favorskaya, *Compt. rend.* **200**, 839–840 (1935); *Cent.* **1935**, II 1340; *C.A.* **29**, 3651 (1935). (2) Favorskaya, *J. Gen. 76–77° at 750 mm.	(18)			1.40147 (19)

See also Note 1.

Note 1: For further data on b.p. at press. over range 565–760 mm. see (15).

Note 2: $\bar{C}$ is very spar. sol. aq.; e.g., 0.066 wt. % at 12° (20).

Binary systems of $\bar{C}$ with other org. cpds. For f.p./compn. data on mixts. of $\bar{C}$ with *ter*-BuCl (3:7045) see (21); for partial vapor press. (17) or n_D^{20} (22) of mixts. of $\bar{C}$ with *n*-heptane (1:8575) or *n*-BuBr see indic. refs.

$\bar{C}$ *forms azeotropes with various other org. cpds.; e.g.,* $\bar{C}$ with MeOH (1:6120) forms a const.-boilg. mixt., b.p. 57.0° at 760 mm., contg. 73 wt. % $\bar{C}$ (4); $\bar{C}$ with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 65.7° at 760 mm., contg. 79.7 wt. % $\bar{C}$ (4); $\bar{C}$ with *n*-PrOH (1:6150) forms a const.-boilg. mixt., b.p. 74.8° at 760 mm., contg. about 82 wt. % $\bar{C}$ (4); $\bar{C}$ with iso-PrOH (1:6135) forms a const.-boilg. mixt., b.p. 70.8° at 760 mm., contg. 77 wt. % $\bar{C}$ (4); $\bar{C}$ with isobutyl alc. (1:6165) forms a const.-boilg. mixt., b.p. 77.65° at 760 mm., contg. 96 wt. % $\bar{C}$ (4); $\bar{C}$ with EtOAc (1:3015) forms a const.-boilg. mixt., b.p. 75.5° at 760 mm., contg. 55 wt. % $\bar{C}$ (23).

[For prepn. of $\bar{C}$ from *n*-butyl alc. (1:6180) with dry HCl gas on protracted htg. (11) (13) (24) (25), with conc. aq. HCl + $ZnCl_2$ (2 moles) (yields: 76–78% (26) (27) (29), 66–72% (30), 64–66% (28), 65% (8)) (31), other metal salts (31) (32), or H_3PO_4 (33); with PCl_3 + $ZnCl_2$ (60% yield (30)) (34) or PCl_3 + pyridine (for important study of mechanism see (35) (36)); with PCl_5 + $ZnCl_2$ (74% yield (30)) cf. (35) (36); with $SOCl_2$ + pyridine (71% yield (8)) (for important study of mechanism see (37) (36)) see indic. refs.]

[For formn. of $\bar{C}$ from *n*-butyl HSO_4 with HCl (25); from *n*-butyl MgBr with *p*-toluenesulfonyl chloride (8.7% yield (38)); from *n*-butyl *p*-toluenesulfonate as by-prod. of its reactn. with benzyl MgCl in prepn. of *n*-amylbenzene (39) cf. (40) (41); from *n*-butyl iodide with $HgCl_2$ in s.t. at 120–120° for 2 hrs. (10); from *n*-butylamine with HNO_2 (5.2% $\bar{C}$ accompanied by 36.5% butenes + 25% butanol-1 + 13.2% butanol-2 + 2.8% 2-chlorobutane (42)); from *n*-butane with Cl_2 at 400–475° (together with other prods. (3)) see indic. refs.]

[For use as denaturant for alc. see (43) (for detn. of $\bar{C}$ in denatured alc. see (4)); *for use in removal of water from volatile fatty acids see (45); for study of anthelmintic props. see (46).*]

Pyrolysis of $\bar{C}$. [$\bar{C}$ at 450–650° without catalyst loses HCl and yields exclusively butene-1 (3) (47); however, $\bar{C}$ passed at 450° over $CaCl_2$ cat. gives mixt. contg. 20% butene-1 + 80% *cis* + *trans* isomers of butene-2 (3) (47) (for influence of other cat. cf. (48) (49)).]

Further halogenation of $\bar{C}$. [$\bar{C}$ with Cl_2 under various conditions (50) (51) (52) (53) (54) (5) gives a mixt. of 1,1-dichlorobutane (3:7550), 1,2-dichlorobutane (3:7680), 1,3-dichlorobutane (3:7925), and 1,4-dichlorobutane (3:5835) (together with higher chlorination prods.); note that the chlorination is facilitated by peroxides or by light but inhibited by O_2 (e.g., $\bar{C}$ with Cl_2 in absence of air at 0° in dark reacts 7% in 20 hrs. but in pres. of 2 mole % ascaridole 85% *in same time or in light 100% in 1 min.; in pres. of 2%* O_2 *in dark* no reactn. occurs in 96 hrs. (18). — $\bar{C}$ (2.5 moles) with SO_2Cl_2 (1 mole) + trace dibenzoyl peroxide 3 hrs. under reflux in the dark gives (55) mixt. contg. 25% 1,2-dichlorobutane (3:7680) + 50% 1,3-dichlorobutane (3:7925) + 25% 1,4-dichlorobutane (3:5835). — $\bar{C}$ (1 mole) with $SbCl_5$ (1 mole) gives on warming (56) 2,3-dichlorobutane (3:7615).]

$\bar{C}$ with Br_2 in pres. of Fe gives (57) 1,2-dibromobutane [Beil. I-120, I_1-(83)], b.p. 166°.

Reactions of the halogen atom of $\bar{C}$. Note that in $\bar{C}$ the chlorine atom is much less reactive than that of *sec.*-butyl chloride (3:7125) or *ter*-butyl chloride (3:7045).

[For study of hydrolysis of $\bar{C}$ in pres. and abs. of acid see (58).]

[For study of rate of reactn. of $\bar{C}$ with LiI, NaI, or KI in acetone see (59) (60).]

[For study of rate of reactn. of $\bar{C}$ with Na *n*-propylate see (61).]

[$\bar{C}$ with aniline as directed yields (62) *N*-(*n*-butyl)aniline and/or *N,N*-di-(*n*-butyl)aniline; for analogous study of $\bar{C}$ with *N*-methylaniline (63), *N*-ethylaniline (63), *o*-toluidine (64), *p*-toluidine (64), *unsym.-m*-xylidine (65) see indic. refs.]

[$\bar{C}$ with C_6H_6 + $AlCl_3$ gives (69% yield (66)) *sec.*-butylbenzene (1:7490) (note isomerization of carbon chain) (*for comparison of reactivity of* $\bar{C}$ *with other n-butyl halides see (67)*); $\bar{C}$ with C_6H_6 + Al/Hg gives both (68) *sec.*-butylbenzene (1:7490) and *n*-butylbenzene

(1:7515). — $\bar{C}$ with toluene + $AlCl_3$ gives (45% yield (69) of a mixt. of both *m*- and *p*-*sec.*-butyltoluenes.]

[$\bar{C}$ with C_6H_6 in dry liq. HCl at 195° under press. gives (70) 30% yield *sec.*-butylbenzene (1:7490) + 60% di-(*sec.*-butyl)benzene; for analogous behavior of $\bar{C}$ with toluene see (70).]

[$\bar{C}$ with CO + $AlCl_3$ or similar cat. under press. yields (71) acids and ketones.]

Reaction of $\bar{C}$ to form organometallic cpds. [$\bar{C}$ with metallic Li in dry ether under N_2 gives (yields: 75–80% (72), 77% (73), 70–75% (74)) *n*-butyllithium (for study of rate of formn. of *n*-BuLi as compared with *n*-BuBr, C_6H_5Br, C_6H_5I see (85)); this prod. with dry CO_2 *in ether at 0° gives (45% yield (75)) di-n-butyl ketone (1:5493) or with CO_2 in* C_6H_6 at room temp. also (75) tri-*n*-butylcarbinol; for study of relative reactivity of *n*-BuLi as compared with *n*-BuMgBr, C_6H_5MgBr, etc., see (76); note, however, that full chemistry of *n*-BuLi cannot be discussed here.]

[$\bar{C}$ with metallic Na in pet. ether yields (77) *n*-butylsodium; on carbonation with CO_2 this prod. gives (77) (78) (79) (80) both *n*-valeric acid (1:1060) and *n*-propylmalonic acid; for study of reactn. of *n*-BuNa with C_6H_6 see (77); *note, however, that full chemistry of* *n*-BuNa cannot be covered here.]

$\bar{C}$ with Mg in dry ether gives (yields: 98.5% (81), 91.2% (82) (83), 85% (84)) *n*-BuMgCl; for studies on rate of formn. of *n*-BuMgCl (as compared with C_6H_5MgBr, *or with other* *n*-Bu halides, etc.) (85), on effect of rapid addn of $\bar{C}$ on yield (83), on effect of concentration of $\bar{C}$ (84) see indic. refs.; for study of equilibrium composition of ether solns. of *n*-BuMgCl see (86) (87); for study of competitive reaction of mixts. of $\bar{C}$ with *n*-BuBr and with *n*-BuI in formn. of RMgX see (88). — For certain important reactions of *n*-BuMgCl see below but note that full chemistry of this cpd. cannot be included here.

[$\bar{C}$ with Mg + trace of I_2 but *without solvent* at 79–82° for 3 hrs. gives (10% *yield* (89)) *n*-octane (1:8655); $\bar{C}$ + Mg + I_2 in toluene in similar fashion gives (6% yield (89)) *p*-(*n*-butyl)toluene.]

Ⓓ **n-Valeric acid** (1:1060) q.v. [From $\bar{C}$ by conversion to *n*-BuMgCl (see above) and carbonation with CO_2 (yields: 72–73% (90), 80% (91)) (note that this prod. may be accompanied by *more or less di-n-butyl ketone (1:5493) and tri-n-butylcarbinol* (91)), or by conversion of $\bar{C}$ with KCN to *n*-valeronitrile and hydrolysis of the latter with 67% H_2SO_4 (52) (92).]

Ⓓ ***n*-Valeranilide**: m.p. 62–63° u.c. (93), 63° cor. (94). [From $\bar{C}$ by conversion to *n*-BuMgCl (see above) and reactn. in dry ether with phenyl isocyanate (93) (42) cf. (93).]

Ⓓ **n-Valero-*p*-toluidide**: m p. 72–73° u.c. (93). [From $\bar{C}$ by conversion to *n*-BuMgCl *(see above) and reactn. in dry ether with p-tolyl isocyanate* (93).] — [Note that this derivative does not afford good distinction from *n*-amyl chloride (3:7460) for which the corresp. *n*-capro-*p*-toluidide has m.p. 74–75° u.c. (93)]

Ⓓ ***n*-Valero-α-naphthalide**: m p. 109–110° u.c. (93). [From $\bar{C}$ by conversion to *n*-BuMgCl (see above) and reactn. in dry ether with α-naphthyl isocyanate (93).] — [Note that this derivative does *not* afford good distinction from isoamyl chloride (3:7365) *for which the corresp. isocaproic α-naphthalide has m p. 110–111° u c.* (93).]

—— ***n*-Butyl mercuric chloride** (*n*-BuHgCl): m.p. 130° cor. (95), 129° (96), 127.5° (98), 126° (96), 125.5° (97), 125° (99). [Prepd. indirectly but should be easily preparable from *n*-BuMgCl + $HgCl_2$ cf. (98), *since it has been similarly prepd. from n-BuMgBr* (95)]

Ⓓ **S-(*n*-Butyl)isothiourea picrate**: m.p 177° (100). [From $\bar{C}$ (1 g.) with thiourea (1 g.) in alc. (10 ml.) on refluxing for 2 hrs., then adding PkOH (1 g.), htg. until a clear soln. results, then cooling (100).] — [Note that this derivative does not dis-

tinguish $\bar{C}$ from *n*-propyl chloride (3:7040) for which the corresp. *S*-(*n*-propyl)-isothiourea picrate has m.p. 176° (100), nor from isoamyl chloride (3:7365) for which the corresp. *S*-(isoamyl)isothiourea picrate has m.p. 173° (100).]

—— *N*-(*n*-Butyl)phthalimide (1-(*N*-phthalimido)butane): cryst. from dil. AcOH, m.p. 34° (101), b.p. 311.8° cor. at 758 mm. (102). [Prepd. indirectly from *n*-butylamine (101) (102); direct prepn., e.g., from $\bar{C}$ + K phthalimide in pres. of KI never reported and m.p. too low to serve as good derivative.]

Ⓓ *N*-(*n*-Butyl)-3-nitrophthalimide: pr. from CS_2, m.p. 71–72° (103). [From $\bar{C}$ with K 3-nitrophthalimide on refluxing for 10 hrs. (103); for photographs of crystals see (104).]

Ⓓ *N*-(*n*-Butyl)tetrachlorophthalimide: pl. from alc., m.p. 153–154° (105). [From $\bar{C}$ with K tetrachlorophthalimide by htg. at 200° for 10 hrs. (105).]

Ⓓ *N*-(*n*-Butyl)saccharin: cryst. from dil. alc., m.p. 38° (106). [From $\bar{C}$ with sodium saccharin in aq. butylcarbitol (1:6517) contg. KI on refluxing for 30 min. (106).]

—— *N*-(*n*-Butyl)-*N*-(*p*-bromobenzenesulfonyl)-*p*-anisidide: cryst. from 75% alc., m.p. 74.5° u.c. (107). [This prod. has not been reported from $\bar{C}$ but has been obt. from *n*-BuBr with *N*-(*p*-bromobenzenesulfonyl)-*p*-anisidide in alc. KOH after 1 hr. reflux (107).]

—— *p*-(*n*-Butoxy)benzoic acid: m.p. 147–148° (108), changing to a cloudy viscous liq. clearing sharply at 160° (108) cf. (109). [From $\bar{C}$ with ethyl *p*-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (108)]. — [Note, however, that this prod. does not distinguish $\bar{C}$ from *n*-propyl chloride for which the corresp. *p*-(*n*-propoxy)benzoic acid has m.p. 145.5–147°; the two prods. do, of course, have slightly different Neut. Eqs.]

—— *n*-Butyl 2,4,6-triiodophenyl ether: m.p. 66° cor. (110). [This prod. has not been reported for $\bar{C}$ itself but has been obtd. from *n*-BuBr with 2,4,6-triiodophenol in abs. alc. NaOEt on refluxing for 30 min. (110).]

—— *n*-Butyl α-naphthyl ether: b.p. 308.5° cor. (111), 310° (112) (corresp. picrate, m.p. 88.0° cor., Neut. Eq. 429 (111)).

—— *n*-Butyl β-naphthyl ether: b.p. 309.0° cor. (111), 311° (112); m.p. 33.0–33.5° (111) (corresp. picrate, m.p. 67.0–67.5° cor. (111), 67° (113)).

3:7165 *ter*-BUTYL HYPOCHLORITE $(CH_3)_3C—OCl$ C_4H_9OCl Beil. I —
(Trimethylcarbinyl hypochlorite) I_1—
I_2-(415)

B.P. 79.6° at 750 mm. (1) $D_4^{18} = 0.9583$ (1)
77–79° (16)

Pale yellow mobile liquid with characteristic irritating odor. — $\bar{C}$ violently attacks the eyes and mucous membranes. — $\bar{C}$ is relatively stable and if protected from bright light can be kept at ordinary temps. for months with little or no decomposition (1). $\bar{C}$ should, however, be handled with care since it is particularly susceptible to photochemical decomposition which may occur with explosive violence (2).

[For prepn. of $\bar{C}$ from *ter*-butyl alcohol (1:6140) + Cl_2 + alk. in pract. quant. yield *see* (1) (2) (3), *60% yield* (16); *from ter-butyl alc.* (1:6140) + HOCl in CCl_4 *see* (15); *for* manufacture of $\bar{C}$ see (4).] [For use in bleaching of textiles, fruits, etc., see (5) (6) (7).]

[For general survey of reactns. of $\bar{C}$ see (8); for study of reactns. of $\bar{C}$ with olefins (2) (13) (16) (17) (18) or olefins contg. activating groups (9) (10), with group $R_2C{=}N.MgX$ (3), *or with Schiff's bases* (11) (12) *see indic. refs.; for study of* $\bar{C}$ *in Friedel-Crafts reactn. see* (14).]

$\bar{C}$ on sufficient htg. or on exposure to bright sunlight yields (1) acetone (1:5400) + methyl chloride (3:7005). — [For data on stability of $\bar{C}$ in aq. or in CCl_4 see (15).]

$\bar{C}$ with aq. KI acidified with AcOH *yields* I_2 (use in detn. of $\bar{C}$ (1)).

[For prepn. of $\bar{C}$ from propionic acid (1:1025) with PCl_5 (77% yield (11)), with PCl_3 *(yields: 67.5% (12), 61% (13), 46% (14))* (15) (16) *(note that excess* PCl_3 *may not be*

used since its b.p., 76°, is too close to that of $\bar{C}$ for subsequent sepn.), with $PCl_3 + ZnCl_2$ (91% yield (11)), with $SOCl_2$ (4) (note that excess $SOCl_2$ may not be used since its b.p., 79°, is almost identical with that of $\bar{C}$), with benzoyl chloride (3:6240) (yield 84–89% (8)) (17), with sodium chlorosulfonate (18), with benzenesulfonyl chloride + NaCl (18), with $Cl_2 + S_2Cl_2$ in cold (37% yield (19)), with $SiCl_4$ in xylene at 50° (50% yield (20)), or with acetonitrile + HCl gas at 0° (21) see indic. refs., for prepn. of $\bar{C}$ from propionic anhydride (1:1100) with phosgene (3:5000) + cat. as directed see (22).]

[$\bar{C}$ with Cl_2 (67) in CCl_4 in sunlight (15) at 0° (23) or in dark at 40° (24) or $\bar{C}$ with SO_2Cl_2 in CCl_4 in pres. of dibenzoyl peroxide refluxed 4–6 hrs. in dark (25) gives a mixt. contg. mainly β-chloropropionyl chloride (3:5690) accompanied also by α-chloropropionyl chloride (3:5320) yield: 60% β isomer + 40% α isomer (25)), note that in the pres. of I_2 instead of dibenzoyl peroxide only α-chloropropionyl chloride (3:5320) (45% yield (26)) is produced (25).]

[$\bar{C}$ with Br_2 (1 mole) at 80° evolves HCl and gives (100% yield (12)) (27) (28) α-bromopropionyl *bromide* [Beil. II-256, II_1-(230)], *b.p. 153–155° (12); the reaction is accelerated by light, but the photobromination is retarded by* O_2 *(29).*]

[$\bar{C}$ with Na propionate on htg. (14) (30) or $\bar{C}$ with Ag propionate on distn. (31) gives (80% yield (31)) propionic anhydride (1:1100).]

[$\bar{C}$ passed over heated Ni cat. decomposes (32) into ethylene, HCl + CO, accompanied by smaller amts. methane, hydrogen, and CO_2. — $\bar{C}$ with Na in abs. ether is claimed (33) to yield the dipropionate of hexen-3-diol-3,4 [Beil. II-242], b.p. 108–109° at 10 mm. (33).]

[$\bar{C}$ with *ter*-butyl MgBr in dry ether yields (34) not only the expected coupling product *ter*-butyl methyl ketone (pinacolone) (1:5425) but also diethyl ketone (1:5420), propanol-1 (1:6150), and propionic acid (1:1025) accompanied by the propionates of *ter*-butyl-ethyl-carbinol (2,2-dimethylpentanol-3) [Beil. I_1-(207), I_2-(446)] and of diethylcarbinol (pentanol-3) (1:6175) (reduction products) — $\bar{C}$ with C_6H_5MgBr in ether gives (57% yield (35)) diphenyl-ethyl-carbinol [Beil. VI-687, VI_1-(331)], m.p. 95°, but $\bar{C}$ with C_6H_5MgBr with $CdCl_2$ in ether gives (76% yield (36)) ethyl phenyl ketone (propiophenone) (1:5525).]

[$\bar{C}$ + 2,5-dimethylpyrrole *N*-magnesyl bromide in dry ether gives (by rearr.) (37) 3-propionyl-2,5-dimethylpyrrole, colorless cryst. from AcOH, m.p. 102.5° (37); $\bar{C}$ with benzimidazyl *N*-magnesyl bromide in dry ether yields (38) (39) *N*-(propionyl)benzimidazole, m.p. 125° (38) (39) (corresp. picrate, m.p. 228° (38) (39)).]

[$\bar{C}$ + ethyl acetoacetate + Mg in C_6H_6 refluxed 2 hrs., treated with aq. gives (36% yield (40)) *ethyl α-propionylacetoacetate, b.p. 104–106° at 12 mm. (40) (isolated as Cu enolate,* m.p. 78–79°, blue ndls. from MeOH/aq., violet ndls. from pet. ether (40)).]

[$\bar{C}$ with $FeCl_3$ (1 mole) on warming evolves HCl and gives a prod. which with aq. gives (31% yield (41)) (42) diethyl ketone (1:5420) + CO_2, or with alc. yields (43) ethyl α-propionylpropionate [Beil. III-686, III_1-(436).]

[$\bar{C}$ with equal wt. $ClSO_3H$ stood at room temp. 5–10 days, poured into aq. (44), or $\bar{C}$ with tripropylamine in lgr. (45) gives (cf. (42)) in small yield 3,5-dimethyl-2-ethyl-6-hydroxypyrone-4 [Beil. XVII-453], cryst. from aq. or AcOH, m.p. 151° (45).]

[$\bar{C}$ with olefins or cyclo-olefins (cyclenes) in pres. of cat. adds to unsatn. yielding chloroketones; e.g., $\bar{C}$ with ethylene + $AlCl_3$ at 0° gives (50% yield (46)) (47) β-chloroethyl ketone (1-chloropentanone-3) (3:9268), $\bar{C}$ with trimethylethylene (2-methylbutene-2) (1:8220) + $SnCl_4$ gives (57% yield (48)) 2-chloro-2,3-dimethylhexanone-4, b.p. 74–78° at 17 mm., $D_4^{14} = 0.975$ (48) (note that this prod. on htg. with dimethylaniline loses HCl giving (60% yield (48)) of a mixt. of 2,3-dimethylhexen-2-one-4, b.p. 164–166° at 750 mm., $D_4^{13} = 0.872$, $n_D^{13} = 1.4535$ (semicarbazone, m.p. 200° (48)) and 2,3-dimethylhexen-1-one-4, b.p. 158–162° at 750 mm., $D_4^{13} = 0.862$, $n_D^{13} = 1.4450$ (semicarbazone, m.p. 108–110° (48)); $\bar{C}$ with cyclohexene (1:8070) + $SnCl_4$ gives a prod. which with dimethylaniline loses HCl

to cyclohexen-1-yl ethyl ketone, b.p. 90° at 10 mm., $D_4^{13.5} = 0.981$, $n_D^{13.5} = 1.6005$ (oxime, m.p. 79°, semicarbazone, m.p. 195° (49)). — Note, however, that addn. of C̄ to certain types of olefins is followed by *spontaneous* loss of HCl so that the unsatd. ketone *forms the direct product*; e.g., *C̄ with isobutylene* (2-methylpropene-1) + $SnCl_4$ gives (30% yield (48)) 2-methylhexen-2-one-4, b.p. 147–148° at 760 mm., $D_4^{15} = 0.850$, $n_D^{15} = 1.4496$ (48) (semicarbazone, m.p. 163° (48)).]

[C̄ with aromatic hydrocarbons + cat. evolves HCl yielding *corresp.* ketones: e.g., C̄ with C_6H_6 + $AlCl_3$ in CS_2 gives (84% yield (10)) (50) ethyl phenyl ketone (propiophenone) (1:5525); C̄ with toluene (1:7405) + $AlCl_3$ in CS_2 gives (yields: 60% (51), 50% (52)) (53) ethyl *p*-tolyl ketone [Beil. VII-317, VII_1-(170)], b.p. 238–239°; for analogous reactions of C̄ with *o*-xylene (1:7430) (54), 2-methylnaphthalene (1:7605) (55), anthracene (1:7285) (56), phenanthrene (1:7240) (57), or acenaphthene (1:7225) (58) see indic. refs.; for analogous reactions of C̄ with heterocyclic systems, e.g., C̄ + 2-nitrofuran + $TiCl_4$ (59) or C̄ + *thiophene* + P_2O_5 *at 210° for 10–12 hrs.* (60), see indic. refs.]

[C̄ with alcs. reacts normally yielding *corresp.* esters: e.g., C̄ with MeOH *yields* methyl propionate (1:3020), C̄ with EtOH yields ethyl propionate (1:3070), etc.; for use of Mg in reaction of C̄ with tertiary alcs., e.g., C̄ + *ter*-butyl alc. (1:6140) + Mg giving (68% yield (61)) *ter*-butyl propionate, b.p. 115–116.5° (61), or C̄ + *ter*-amyl alc. (1:6160) + Mg *giving* (75% yield (61)) *ter*-amyl *propionate*, b.p. 153–156° at 710 mm. (61), see indic. refs.]

[C̄ with phenols gives the corresp. phenol esters: e.g., C̄ with phenol gives (62) phenyl propionate (1:3696), etc.; note, however, that these phenol esters on htg. with $AlCl_3$ in appropriate solvents, *especially nitrobenzene, undergo the Fries rearr. yielding o- and p-*propiophenols; this complete sequence is often carried through without *isolation* of the intermediate ester, e.g., for C̄ + phenol + $AlCl_3$ giving directly *o*-hydroxypropiophenone [Beil. VIII-102, $VIII_1$-(547)] (50% yield) and *p*-hydroxypropiophenone [Beil. VIII-102 (25% *yield*) see (63); *for key refs. on direct rearr. of phenyl propionate to these products* see (64) (65); scores of analogous cases with other phenols or their ethers cannot be included here.]

[C̄ with certain hydroxy-azo-compounds in dry ether yields addn. cpds. usually (but *not always*) *of 1:1 type: e.g., C̄ with p-hydroxy-azobenzene* [Beil. XVI-96, XVI_1-(233)], m.p. 152°, in dry ether on stdg. at room temp. ppts. 1:1 cpd., m.p. 162° (66); *for numerous* analogous cases using homologous hydroxy-azo cpds. see (66).]

C̄ hydrolyzes with aq. yielding propionic acid (1:1025); for the amide, anilide, *p*-toluidide, and other derivs. *corresp. to* C̄ *see under propionic acid* (1:1025).

3:7175 1-CHLOROBUTYNE-2 $CH_3—C{\equiv}C—CH_2Cl$ C_4H_5Cl Beil. S.N. 12

(γ-Methylpropargyl chloride)

B.P. 81–84° (1)

Pale yel. oil.

[For prepn. of C̄ (44% yield) from butyn-2-ol-1 + PCl_5 in ether see (1).]

C̄ in ether/acetone soln. on treatment with K_2CO_3 + phenol gives (57% yield) γ-methylpropargyl phenyl ether, b.p. 123–126° at 25 mm., n_D^{20} = 1.3894 (1).

3:7175 (1) Hurd, Cohen, *J. Am. Chem. Soc.* **53**, 1074–1075 (1931).

3:7195 CHLOROMETHYL ETHYL ETHER C_3H_7OCl Beil. I - 581

$ClCH_2.O.C_2H_5$ I₁-(304) I₂-(645)

B.P. 83° at 763.1 mm.	**(1)**	D_4^{20} = **1.0263** (3)	n_D^{20} = **1.40398** (1)
82°	**(2)**	**1.0127** (1)	
81–82°	**(3)**	D_4^{15} = **1.0188** (1)	n_D^{12} = **1.0282** (3) (7)
80°	**(4)**		
79–80°	**(5) (6)**		

C̄ undergoes some decompn. at b.p.

[For prepn. from ethyl alc. (1:6130) + trioxymethylene (1:0080) + dry HCl see (3) (1); from ethyl alc. + formalin + HCl (42–44% yield (6)) see (6).]

C̄ on shaking with aq. readily hydrolyzes yielding formaldehyde (1:0145), ethyl alc. (1:6130), + HCl.

to cyclohexen-1-yl ethyl ketone, b.p. 90° at 10 mm., $D_4^{13.5} = 0.981$, $n_D^{13.5} = 1.5005$ (oxime, m.p. 79°, semicarbazone, m.p. 195° (49)). — Note, however, that addn. of Č to certain types of olefins is followed by *spontaneous* loss of HCl so that the unsatd. ketone forms the direct product; e.g., Č with isobutylene (2-methylpropene-1) + $SnCl_4$ gives (30% yield (48)) 2-methylhexen-2-one-4, b.p. 147–148° at 760 mm., $D_4^{15} = 0.859$, $n_D^{15} = 1.4496$ (48) (semicarbazone, m.p. 163° (48)).]

[Č with aromatic hydrocarbons + cat. evolves HCl yielding corresp. ketones: e.g., Č with C_6H_6 + $AlCl_3$ in CS_2 gives (84% yield (19)) (50) ethyl phenyl ketone (propiophenone) (1:5525); Č with toluene (1:7405) + $AlCl_3$ in CS_2 gives (yields: 60% (51), 50% (52)) (53) ethyl p-tolyl ketone [Beil. VII-317, VII₁-(170)], b.p. 238–239°; for analogous reactions of Č with o-xylene (1:7430) (54), 2-methylnaphthalene (1:7605) (55), anthracene (1:7285) (56), phenanthrene (1:7240) (57), or acenaphthene (1:7225) (58) see indic. refs.; for analogous reactions of Č with heterocyclic systems, e.g., Č + 2-nitrofuran + $TiCl_4$ (59) or Č + thiophene + P_2O_5 at 210° for 10–12 hrs. (60), see indic. refs.]

[Č with alcs. reacts normally yielding corresp. esters: e.g., Č with MeOH yields methyl propionate (1:3020), Č with EtOH yields ethyl propionate (1:3070), etc.; for use of Mg in reaction of Č with tertiary alcs., e.g., Č + *ter*-butyl alc. (1:6140) + Mg giving (68% yield (61)) *ter*-butyl propionate, b.p. 115–116.5° (61), or Č + *ter*-amyl alc. (1:6160) + Mg giving (75% yield (61)) *ter*-amyl propionate, b.p. 153–156° at 710 mm. (61), see indic. refs.]

[Č with phenols gives the corresp. phenol esters: e.g., Č with phenol gives (62) phenyl propionate (1:3696), etc.; note, however, that these phenol esters on htg. with $AlCl_3$ in appropriate solvents, especially nitrobenzene, undergo the Fries rearr. yielding o- and p-propiophenols; this complete sequence is often carried through without isolation of the intermediate ester, e.g., for Č + phenol + $AlCl_3$ giving directly o-hydroxypropiophenone [Beil. VIII-102, VIII₁-(547)] (50% yield) and p-hydroxypropiophenone (Beil. VIII-102 (25% yield) see (63); for key refs. on direct rearr. of phenyl propionate to these products see (64) (65); scores of analogous cases with other phenols or their ethers cannot be included here.]

[Č with certain hydroxy-azo-compounds in dry ether yields addn. cpds. usually (but not always) of 1:1 type: e.g., Č with p-hydroxy-azobenzene [Beil. XVI-96, XVI₁-(233)], m.p. 152°, in dry ether on stdg. at room temp. ppts. 1:1 cpd., m.p. 162° (66); for numerous analogous cases using homologous hydroxy-azo cpds. see (66).]

Č hydrolyzes with aq. yielding propionic acid (1:1025); for the amide, anilide, p-toluidide, and other derivs. corresp. to Č see under propionic acid (1:1025).

3:7175 1-CHLOROBUTYNE-2 $CH_3—C{\equiv}C—CH_2Cl$ C_4H_5Cl Beil. S.N. 12

(γ-Methylpropargyl chloride)

B.P. 81-84° (1)

Pale yel. oil.

[For prepn. of Č (41% yield) from butyn-2-ol-1 + PCl_3 in ether see (1).]

Č in ether/acetone soln. on treatment with K_2CO_3 + phenol gives (57% yield) γ-methylpropargyl phenyl ether, b.p. 123-126° at 25 mm., n_D^{20} = 1.5391 (1).

3:7175 (1) Hurd, Cohen, *J. Am. Chem. Soc.* 53, 1074-1075 (1931).

3:7195 CHLOROMETHYL ETHYL ETHER C_3H_7OCl Beil. I - 581

$ClCH_2.O.C_2H_5$ I_1-(304) I_2-(645)

B.P. 83° at 763.1 mm. (1)		D_4^{20} = 1.0263 (3)	n_D^{17} = 1.40308 (1)
82°	(2)	1.0127 (1)	
81-82°	(3)	D_4^{15} = 1.0188 (1)	n_D^{12} = 1.0282 (3) (7)
80°	(4)		
79-80°	(5) (6)		

Č undergoes some decompn. at b.p.

[For prepn. from ethyl alc. (1:6130) + trioxymethylene (1:0080) + dry HCl see (3) (1); from ethyl alc. + formalin + HCl (42-44% yield (6)) see (6).]

Č on shaking with aq. readily hydrolyzes yielding formaldehyde (1:0145), ethyl alc. (1:6130), + HCl.

3:7200 1-CHLORO-2,2-DIMETHYLPROPANE $C_5H_{11}Cl$ Beil. I - 141
(Neopentyl chloride; I₁-(50)
ter-butylcarbinyl chloride) I₂—

B.P.		F.P.		
84.4°	at 760 mm. (1)	−20° (1) (4)	D_4^{20} = 0.866 (1)	n_D^{20} = 1.4042 (1)
83.9°	at 750 mm. (1)		*0.865* (3)	1.4043 (3)
83.5°	at 740 mm. (1)			
83.3–84.5°	(2)			
82–83.5°	*at 734 mm.* (3)			
24°	at 80 mm. (4)			

[For prepn. of C̄ (30% yield (3)) from neopentane (tetramethylmethane) (1:8499) by chlorination in light at 0° see (4) (3) (1). — C̄ *cannot* (1) (5) (contrary to earlier claims (6)) be prepared from neopentyl alc. (*ter*-butylcarbinol) (1:5812) even with $SOCl_2$ + pyridine (13).]

C̄ is stable for long periods of time even at 200° (1). — C̄ is extraordinarily unreactive giving none of the ordinary alkyl halide reactns. except the formn. of the corresponding Grignard reagent.

C̄ in dil. ether soln. reacts slowly with Mg giving (1) (90% yield (8)) neopentyl MgCl. [For reactn. of R.Mg.Cl with CO_2 see (12).]

[For reactns. of C̄ with C_6H_6 + $AlCl_3$ (2), or with metallic Na (10), or with NaPr (11) see indic. refs.]

C̄ is unchanged after htg. 20 hrs. at 100° with alc. KOH (1) or htg. with CuCN at 90° in a s.t. for 200 hrs. (1) or after treatment with KI in acetone (1) or after 6 hrs. refluxing with 6% Na/Hg (11).

- Ⓓ *ter*-Butylacetanilide (β,β-dimethyl-*n*-butyranilide): m.p. 131° (1), 130–131° (3), 129–130° (3). [From R.MgCl by reactn. with phenyl isocyanate (1).]
- Ⓓ Neopentyl mercuric chloride: m.p. 117–118° (3), 116.5–117° (1). [From RMgCl with $HgCl_2$ (1) (3) in dry ether (90% yield (3)).] [For reactn. of R.MgCl with di-*p*-tolylmercury giving di-neopentylmercury, b.p. 67–69° at 3 mm., m.p. 31–33°, see (9).] [For reactn. of RHgCl with KBr giving 82% yield neopentyl bromide, b.p. 104.8° at 732 mm., or with I_2 giving 92% yield neopentyl iodide, b.p. 70° at 100 mm., see (3).]

3:7205 1-CHLOROBUTENE-2 $CH_3CH{=}CH.CH_2Cl$ C_4H_7Cl Beil. I - 205
(Crotonyl chloride, I_1—
α-chloro-β-butylene, γ-methylallyl chloride) I_2-(176)

B.P. 84° at 750 mm. (1)	D_4^{20} = 0.9340 (3)	n_D^{20} = 1.4350 (1) (2) (17)
84–85° (2)	0.9316 (7)	1.4351 (5)
83.8° (3)		1.4352 (7)
83° (7)		1.4356 (3)
80° (4)		1.4359 (6)
45.6–45.7° at 191 mm. (5)		
43.7–44.0° at 177 mm. (5)		
−2° at 18 mm. (6)		

Because of the close interrelationship of C̄ with the isomeric 3-chlorobutene-1 (3:7090) some confusion exists regarding the nomenclature. The compound here described (1-chlorobutene-2) is by some authors designated as crotyl chloride; this name, however, is better reserved for the equilibrium mixture of 1-chlorobutene-2 and 3-chlorobutene-1 as indicated by (7).

Pure C̄ (in the absence of catalysts) is quite stable (1) and may be kept at room temperature as long as a year (5) without significant increase in n_D^{20}. However, in the presence of $FeCl_3$, HCl, or $CuCl_2$ + HCl, C̄ is in part isomerized to 3-chlorobutene-1 and an equilibrium mixt. is formed. The composition of this equilibrium mixt. depends upon the temperature, catalyst, and other factors. E g., with $FeCl_3$ the equilibrium mixt. conts. 50% C̄; with 1 mole HCl it conts. 75% C̄. Although the two compounds can easily be separated by careful fractional distillation (5) yet consideration must always be given to the possible formation during chem. reaction of the derivatives of the other isomer. The refractive index of mixts. of 1-chlorobutene-2 and 3-chlorobutene-1 is a linear function of the composition (1). Although *cis* and *trans* stereoisomers of C̄ are possible, no record of their isolation has been published.

[For the prepn. of a mixt. of C̄ + 3-chlorobutene-1 from butadiene-1,3 + HCl see (1) (7) (8) (9); for prepn. of C̄ from crotonyl alcohol with PCl_3 + pyridine see (3) (6), with HCl + Cu_2Cl_2 see (1), with conc. HCl see (5).]

C̄ passed over soda-lime in an iron furnace at 530–550° yields (11) butadiene-1,3. [Use in prepn. of 1,2,3,4-tetrabromobutane (11).]

[For study of reactivity of C̄ with KI soln. at 20° or NaOEt soln. at 20° and 50° see (3); for reaction with Mg, Zn, etc., see (12); for use in formn. of cellulose ethers see (13); for study of hydrolysis of C̄ under various conditions see (16); for behavior of C̄ with cuprous cyanide see (17).]

—— **Crotonyl 3,5-dinitrobenzoate:** cryst. from alc., m.p. 54° (9). [This cpd. has never been reported from C̄ but only (cf., however (15)) from the corresp. bromide via reaction with silver 3,5-dinitrobenzoate in ether (9); it is possible that the material of m.p. 54° represents a mixt. of the two esters corresponding to crotonyl bromide and the isomeric 3-bromobutene-1 since from the former a 3,5-dinitrobenzoate, m.p. 51°, 50–51° (15), and from the latter a 3,5-dinitrobenzoate, m.p. 59°, have been reported (14).

3:7210 1-CHLOROBUTADIENE-1,3 C_4H_5Cl Beil. S.N. 12

$H_2C{=}CH{-}CH{=}CH{-}Cl$

B.P. 85° (1) $D_{23}^{23} = 0.9601$ (2) $n_D^{20} = 1.470$ (3)
68° (2) $n_D^{23} = 1.4733$ (2)

[For prepn. of $\bar{C}$ from either 1,2-dichlorobutene-3 (3:5350) or 1,4-dichlorobutene-2 (3:5725) by htg. with 2 pts. powdered KOH to about 90° see (1) (3); from solid 1,1,2,3,4-pentachlorobutane (3:0750) in 80% yield (2) or from liq. diastereoisomer (3:9068) in 60% yield (2) with Zn dust in alc. see (2).]

$\bar{C}$ on stdg. (1) (2) polymerizes to a dark resinous mass (4).

3:7210 (1) Muskat, Northrup, *J. Am. Chem. Soc.* **52**, 4054–4055 (1930). (2) Prins, *Rec. trav. chim.* **56**, 119–125 (1937). (3) Muskat (to du Pont), U.S. 2,038,593, Apr. 28, 1936; *Cent.* **1936**, II 3359; *C.A.* **30**, 3912 (1936). (4) I. G. Farbenindustrie, French 769,472, Aug. 27, 1934; *Cent.* **1935**, I 1946.

3:7212 CHLOROACETALDEHYDE $Cl{-}CH_2{-}CHO$ C_2H_3OCl Beil. I - 610
I_1-(327)
I_2-(675)

B.P. 85–86° (1)
85.0–85.5° cor. at 748 mm. (2)
84.5–85° at 759 mm. (3)

Colorless liq. with sharp and penetrating odor; vigorously attacks mucous membrane. — $\bar{C}$ with aq. forms (2) a crystn. hemihydrate, $\bar{C}.\frac{1}{2}H_2O$; this does not have a sharp m.p. but about 43–50° begins to liquefy and on further htg. yields $\bar{C}$, whose vapor may be dried by passing over anhydr. $CuSO_4$ (2) (3); this hemihydrate is sol. in aq. from which it may be recovered by evaporation in a stream of dry CO_2; it is also sol. in alc. or ether, sepg. unchanged on evapn. of solvent (2) (for prepn. (60% yield) from glycerol α-monochlorohydrin (3:9038) by oxidn. with HIO_4 see (40)). — $\bar{C}$ also forms (4) with EtOH a liq. chloroacetaldehyde ethylalcoholate (chloroacetaldehyde ethyl-hemi-acetal), but in excess alc. on protracted stdg. at room temp. (4) this is converted to chloroacetaldehyde diethylacetal (3:8228), or on treatment with dry HCl yields (4) α,β-dichloroethyl ethyl ether (3:5640).

[For prepn. of $\bar{C}$ from its crystn. trimer (3:2300) by distn. at ord. press. see (2) (5) (6); from chloroacetaldehyde diethylacetal (3:8228) by htg. at 150° in CO_2 with anhydr. oxalic acid (2), AcOH (2), or dil. H_2SO_4 (2) (7) see indic. refs.; from chloroacetaldehyde ethylalcoholate (see above) by htg. with anhydr. oxalic acid at 150° (90% yield) see (8) (note that the actn. of Cl_2 on paraldehyde (1:0170) gives acc. to conditions either $\bar{C}$ (9) or α,α,β-trichloro-*n*-butyraldehyde (butylchloral) (3:5910) (10) (11)).]

[For prepn. of $\bar{C}$ from vinyl chloride (3:7010) with Cl_2 + aq. in the dark at 35° see (12) (13) (14) (15); from methylene dichloride (3:5020) with formaldehyde + SO_2Cl_2 at 300° with cat. see (16); from α,β-dichloroethyl ethyl ether (3:5640) with conc. H_2SO_4 see (17); from α,β-dichloroethyl acetate on distn. with a little $ZnCl_2$ (acetyl chloride also formed) (18) or from α,β-dichloroethyl benzoate similarly (benzoyl chloride also being formed) (19) or from α,β-dichloroethyl laurate (lauroyl chloride also being formed) (19) see indic. refs.]

[For formn. of C̄ from sodium β,β-dichloro-α-hydroxypropionate on boilg. with aq. see (20); from β-chloroethylidene-diurethane on warming with dil. HCl see (21); from acetaldehyde (1:0100) with ethyl hypochlorite followed by distn. with anhydr. oxalic acid see (22); from chloroacetaldehyde-sulfonic acid [Beil. I_2-(818)] by treatment with steam in 60% H_2SO_4 (23) or by htg. with 80% H_2SO_4 (24) see indic. refs.]

C̄ gives positive fuchsin-aldehyde test (1). — C̄ reduces $NH_4OH/AgNO_3$ on warming (2).

C̄ does not oxidize in the air (2) but is oxidized by conc. HNO_3 (2) (20) or by AgOH (20) or by dil. H_2O_2 (25) to chloroacetic acid (3:1370). — C̄ on treatment as directed (26) with halogen magnesium alcoholate (e.g., EtOMgCl) is reduced to β-chloroethanol (3:5552).

C̄ on stdg. in s.t. is rapidly converted to an amorphous polymer (2); C̄ (or its hemihydrate) on shaking with ½ vol. cold conc. H_2SO_4 yields (1) a cryst. trimer, 2,4,6-tris-(chloromethyl)-trioxane-1,3,5 (3:2300), m.p. 87–87.5°, which on distn. at ord. press. depolymerizes to C̄.

The hemihydrate of C̄ htd. *alone or in pres. of a few drops of conc. H_2SO_4 condenses* with itself yielding (27) (28) *α,γ-dichlorocrotonaldehyde* [Beil. I-731, I_2-(789)].

[C̄ warmed with EtOH (4) or the ethylalcoholate of C̄ in EtOH treated with dry HCl gas (8) yields chloroacetaldehyde diethylacetal (3:8228), b.p. 157°, and in the latter case also (4) α,β-dichloroethyl ethyl ether (3:5640).]

[C̄ with KCN yields (29) (7) an oily prod. (cyanohydrin?) which by hydrolysis with HCl gives β-chlorolactic acid [Beil. III-286, III_1-(110), III_2-(209)] + AcOH, C̄ + NaCN+ BzCl yields (30) α-benzoxy-β-chlorolactonitrile; note, however, that C̄ boiled with alc. KCN yields (31) EtOAc, or with aq. KCN yields (31) AcOH.]

[For behavior of C̄ with AcCl (2), Ac_2O (32), see indic. refs.; C̄ with ethyl diazoacetate yields (3) ethyl γ-chloroacetoacetate (3:6375); C̄ with EtMgBr in ether yields (6) 1-chlorobutanol-2 (3:8025); C̄ with nitromethane as directed (33) yields 1-chloro-3-nitropropanol-2, with nitroethane, 1-chloro-3-nitrobutanol-2; C̄ with thioformamide (35) or C̄ + formamide + P_2S_5 (34) yields thiazole [Beil. XXVII-15, $XXVII_1$-(207)], m.p. 116°.]

—— **Chloroacetaldoxime:** lachrymatory oil dec. on distn. at 10 mm. (36). [From C̄ with 4 moles $NH_2OH.HCl$ (36).]

Ⓓ **Chloroacetaldehyde semicarbazone:** ndls. from alc., m.p. 148° (37), 134–135° dec. (38), 134° (40). [From C̄ + semicarbazide hydrochloride + NaOAc (37).]

—— **Chloroacetaldehyde dimethone:** unreported. [Note that C̄ with warm alc. soln. of "dimethone" ("dimedone") (dimethyldihydroresorcinol) not only condenses normally but also loses HCl yielding (39) same prod., m.p. 227° u.c., 237.5° cor. (39), *as obtd. from hydroxyacetaldehyde.*]

83.0–84.5°	at 744 mm.	(6)				**1.40520**	(28)
51°	at 238 mm.	(7)				**1.4055**	(7)
37–38°	at 150 mm.	(8)					
						$n_D^{13.5}$ = **1.4082**	(10)

C̄ with aq. forms binary const.-boilg. mixt., b.p. 76° (2); C̄ with aq. + *ter*-amyl alc. (1:6160) forms a ternary const.-boilg. mixt. (2).

[For prepn. of C̄ from *ter*-amyl alc. (1:6160) with HCl gas see (11); with conc. HCl (yield: 93–98% (12), 65% (13)) see (12) (13); with PCl_3 (41% yield (6)) or PCl_3 + $ZnCl_2$ (98% yield (14)) see (6) (14); with PCl_5 (80% yield (14)) see (1) (14); with $SOCl_2$ (yield: 99% (14), 41% (6)) see (14) (6); with acetyl chloride see (6); with oxalyl chloride (3:5060) (yield 18% (6)) see (15) (6); with diphosgene (3:5515) see (16); with *p*-nitrobenzoyl chloride see (17).]

[For prepn. of C̄ from isopropyl-methyl-carbinol (2-methylbutanol-3) (1:6170) by

rearr. with conc. HCl + $ZnCl_2$ (80% yield (7)), or with HCl on long stdg. (97% yield (7)), or with PCl_5 (76% yield (7)), or with $SOCl_2$ + pyridine (73% yield (7)) see (7).]

[For prepn. of Č from *trimethylethylene (2-methylbutene-2) (1:8220) by addn. of* HCl see (18) (19) (20); from isopropylethylene (3-methylbutene-1) (1:8200) see (5).]

[For formn. of Č from 2-methylbutane (isopentane) (1:8500) by shaking 2 min. with diisobutylene hydrochloride (3:8113) + $AlCl_3$ see (29).]

Č very rapidly loses HCl by boilg. aq., e.g., 88.6% in 15 min., 94.9% in 30 min., 95.4% in 60 min. (7). Note that hydrolysis with *hot* aq. or aq. Na_2CO_3 gives exclusively olefins (20) (6) but that with *cold* aq. or *cold* aq. NaOH some *ter*-amyl alc. *(1:6160) is also formed* (20), although the latter may result from hydration of the olefin. [For further studies of hydrolysis of Č see (2) (6) (20) (21) (22).]

Č on passing over $BaCl_2$ + soda-lime at 350–400°C *gives* (85% *yield* (5)) a mixture of trimethylethylene (2-methylbutene-2) (1:8220) + *unsym.*-ethyl-methyl-ethylene (2-methylbutene-1) *(1:8210).*

Č with Mg in dry ether gives (yield: 73.6% (23), 38% (26)) RMgCl; this with CO_2 gives (60% yield (13)) dimethyl-ethyl-acetic acid (1:1113) q.v. (see also derivatives below).

Č with Ag 3,5-dinitrobenzoate does *not* (24) yield expected *ter*-amyl 3,5-dinitrobenzoate.

Ⓓ **Dimethyl-ethyl-acetanilide:** m.p. 90–91° u.c. (25), 92° cor. (26), 91.4° (27). [From RMgCl + phenyl isocyanate (25) (26).] [Note that this same product results by rearr., however, from similar treatment of the RMgCl cpds. from 3-chlor-2-methylbutane (3:7275) *q.v.*]

Ⓓ **Dimethyl-ethyl-acet-*p*-toluidide:** m.p. 83.0–83.5° u.c. (25), 83.3° (27). [From RMgCl + *p-tolyl isocyanate (25).*]

Ⓓ **Dimethyl-ethyl-acet-α-naphthalide:** m.p. 137–138° u.c. (25). [From RMgCl + α-naphthyl isocyanate (25).]

3:7225 4-CHLOROBUTADIENE-1,2 C_4H_5Cl Beil. S.N. 12

$$\begin{array}{l}\mathrm{Cl}\\ |\\ \mathrm{H_2C{-}CH{=}C{=}CH_2}\end{array}$$

B.P. 88° (1)

Č represents the initial step in the formn. of 3-chlorobutadiene-1,3 ("Chloroprene") (3:7080) by addn. of aq. HCl (1) (2) to vinylacetylene; under certain conditions Č can

be isolated as the major reactn. product, but it readily undergoes isomerization to "Chloroprene" especially in the presence of certain salts, e.g., CuCl (3). When sufficient HCl is present the reactn. proceeds further (1) with formn. of 2,4-dichlorobutene-2 (3:5550).

$\bar{C}$ shaken with 3 pts. 18% HCl contg. CuCl for 16 hrs. at 20° gives (4) (3) (2) butadiene-1,3 ("Chloroprene") (3:7080), the rest being chloroprene polymer. — $\bar{C}$ with 3% dry $FeCl_3$ spontaneously evolves heat and yields (4) chloroprene (3:7080).

$\bar{C}$ stirred with aq. Na_2CO_3 at 60–90° for 15 hrs. gives (10) (50% yield (4)) 4-hydroxybutadiene-1,2, colorless lachrymatory, strongly vesicant liq. with sharp pungent odor, misc. aq. and org. solvents, b.p. 126–128° at 756 mm., 68–70° at 53 mm., $D_4^{20} = 0.9164$, $n_D^{20} = 1.4759$. [This prod. on cat. hydrogenation gives (4) butanol-1 (1:6180) but is unaffected by refluxing with alc. NaOEt, 25% aq. H_2SO_4, or 2% aq. HCl; for many other reactns. and derivatives see (4) (10).]

$\bar{C}$ in 80% alc. or in acetone with NaI, stood for 3 hrs. then diluted with aq., gives (46% yield (4)) 4-iodobutadiene-1,2, b.p. 43–45° at 38 mm., $D_D^{20} = 1.7129$, $n_D^{20} = 1.5709$ (4), which on htg. at 125–130° polymerizes vigorously to iodoprene. — $\bar{C}$ with alc. NaCN yields (5) 4-cyanobutadiene-1,3 (β-vinylacrylonitrile), b.p. 135–138° at 760 mm., 65–68° at 58 mm., 48–50° at 28 mm., $D_4^{20} = 0.8644$, $n_D^{20} = 1.4880$ (5). — $\bar{C}$ with liq. NH_3 at −40 to −50° yields (6) (7) *tris*-(butadien-1,2-yl-4)amine (for extension to many other amines see (7)).

$\bar{C}$ added dropwise to 3 vols. conc. H_2SO_4 at −5° to +3°, then poured onto ice, yields (1) 4-chlorobutanone-2 (3:7640), b.p. 120–122° at 760 mm. (1).

$\bar{C}$ with Cl_2 yields (8) (9) mixt. of 2,3,4-trichlorobutene-1 (3:9064) and 1,2,4-trichlorobutene-2 (3:9062) which reacts further to produce 1,2,2,3,4-pentachlorobutane (3:9070).

$\bar{C}$ in aq. Na_2CO_3 suspension, oxidized with $KMnO_4$, yields (1) chloroacetic acid (3:1370), but neither acetic acid nor oxalic acid. — $\bar{C}$ in $CHCl_3$ treated with O_3 for 12 hrs. at 0°, then with aq., yields (1) formaldehyde (1:0145) and chloroacetaldehyde (3:7212) (the latter not detected directly but only after $KMnO_4$ oxidn. (1) to chloroacetic acid (3:1370)).

86°	(4)		

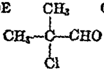
[For prepn. from propionaldehyde (1:0110) with PCl_5 (36–37% yield (1)) together with other products see (1) (3) (5); for formn. (19.6%) (together with other products) from propane by vapor-phase chlorination at 400° see (6) (7) (8); for formn. from 1-chloropropene-1 (3:7030) by addn. of HCl at 0° in presence of $FeCl_3$ see (2).]

$\bar{C}$ on hydrolysis yields propionaldehyde (1:0110); for study of behavior of $\bar{C}$ with boilg. aq. + trace of $NaHCO_3$ or with boilg. aq. + Fe see (6).

$\bar{C}$ with alc. KOH yields (5) 1-chloropropene-1 (3:7030) q.v.

3:7230 [illegible] *J. Am. Chem. Soc.* 63, 2477 (1941). (2) Kharasch, Engel- [illegible] 65, 106 (1935). [illegible] II 458- [illegible] 1941). [illegible] Hass, [illegible] June 4, 1935; *Cent.* 1936, I 1500.

3:7235 α-CHLORO-ISOBUTYRALDEHYDE (2-Chloro-2-methylpropanal-1)



C_4H_7OCl Beil. I - 675; I_1—; I_2—

B.P. 90° (1) (2) $D_4^{15} = 1.053$ (1) (2)

Colorless liq with piquant odor suggestive of chloral.

[For prepn. of $\bar{C}$ from 2-methylpropanol-1 (isobutyl alc.) (1:6165) with Cl_2 see (1) (2); from α,β-dichloroisobutyl isobutyl ether (see below) by htg. with aq. at 100° see (1) (2); from α-chloroisobutyraldehyde diisobutylacetal (see below) with anhydrous oxalic acid (1:0535) or with Ac_2O (1:1015) on htg. see (2); $\bar{C}$ is *not* (2) formed by chlorination of isobutyraldehyde (1:0120).]

$\bar{C}$ reduces Tollens' reagt., Fehling's soln., or $KMnO_4$ (1) (2); $\bar{C}$ on oxidn. with alk. $KMnO_4$ yields (2) α-hydroxyisobutyric acid (1:0431), m.p. 79°.

$\bar{C}$ adds $NaHSO_3$ yielding a compd. from which $\bar{C}$ is regenerated with difficulty (1) (2).

$\bar{C}$ on shaking with conc. H_2SO_4 (½ vol.) yields (1) (2) the corresp. trimer, viz., para-α chloro-isobutyraldehyde (2,4,6-*tris*-(α-chloroisopropyl)trioxane-1,3,5) (3:3220), m.p. 107° (1) (2).

[$\bar{C}$ with isobutyl alc. (1:6165) treated with HCl gas gives (2) α,β-dichloroisobutyl isobutyl ether, b.p. 192.5° at 760 mm., 83° at 15 mm., $D_4^{15} = 1.031$, $n_D^{19} = 1.437$ (2), also obtd. from isobutyl alc. directly with Cl_2 in the cold (2); note that this prod. with aq. on htg. gives $\bar{C}$ + α-chloroisobutyraldehyde di-isobutylacetal, b.p. 218° at 760 mm., 102° at 15 mm., $D_4^{15} = 0.9355$, $n_D^{17} = 1.428$ (2).]

[$\bar{C}$ (or the above α-chloroisobutyraldehyde di-isobutylacetal) with ethyl carbamate satd. with HCl gas gives (2) α-chloroisobutylidene *bis*-urethane $(CH_3)_2C(Cl).CH(NH.COOC_2H_5)_2$, m.p. 122° (2).]

[For complex behavior of $\bar{C}$ with MeMgBr see (3).]

—— α-Chloro-isobutyraldoxime: m.p. 96–97° (4). [Prepd. indirectly from isobutylene with amyl nitrite + HCl (4).]

3:7240 3-CHLOROPENTENE-2

C_5H_9Cl Beil. I —; I_1—; I_2-(185)

B.P. 91–92° (1); 90–92° at 781 mm. (2) $D_{20}^{20} = 0.9125$ (2) $n_D^{20} = 1.423$ (1)

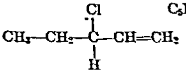
Two geometrical stereoisomers of C̄ are possible but as yet unrecognized.

[For prepn. of C̄ (together with 2-chloropentene-2 (3:7285) and other prods.) from methyl *n*-propyl ketone (1:5415) with PCl_5 see (1); for prepn. of C̄ (together with other prods.) from diethyl ketone (propione) (1:5420) with PCl_5 (1) followed by treatment with alc. KOH (2) see (1) (2).]

C̄ with $NaNH_2$ in xylene at 130° gives (3) a little pentyne-2 (1:8040) and on subsequent pouring of the reactn. mixt. into water also pentyne-1 (1:8025).

3:7240 (1) [illegible] 1925). [illegible] (3) [illegible]

3:7260 3-CHLOROPENTENE-1 C_5H_9Cl Beil. I —
(α-Ethylallyl chloride) I_1—
I_2-(182)



B.P. 93–94° at 759.3 mm. (1) $n_D^{23} = 1.4224$ (4)
92–93° (2) (3)
50–50.2° at 150 mm. (5) $D_4^{20} = 0.8978$ (1) $n_D^{20} = 1.4254$ (1)

Note: C̄ by virtue of facile allylic transposition is readily converted to an equilibrium mixt. with its synionic isomer, 1-chloropentene-2 (3:7470) q.v.; reactns. of C̄ may therefore frequently yield also the corresponding derivatives of the isomer.

[For prepn. of C̄ (or its mixt. with 1-chloropentene-2 (3:7470)) from ethyl-vinyl-carbinol (penten-1-ol-3) with dry HCl (1) (3) (5) (7), with aq. HCl at 0° (6), with PCl_3 at 45° (4) or in cold with pyridine (7) or dimethylaniline (7) (55–59% (7)), with $SOCl_2$ alone (24% yield (7)) or in ether (24% yield (7)), or with dimethylaniline (43% yield (7)) see indic. refs.] [C̄ is separable from the accompanying isomer by careful fractional distillation (5) (7).]

C̄ on long shaking with aq. Na_2CO_3 gives (7) in very poor yield penten-1-ol-3 accompanied by much penten-3-ol-1 and other products. — C̄ with alc. NaOEt gives (4) the corresp. ethyl ether, viz., 3-ethoxypentene-1, b.p. 102°, $D_-^{23} = 0.7768$, $n_D^{23} = 1.3986$, accompanied by the isomeric 1-ethoxypentene-2, b.p. 123°, $D_-^{23} = 0.7930$, $n_D^{23} = 1.4099$ (4).

[For extensive study of behavior of C̄ with KOAc + AcOH, with AgOAc, with *N*-methylaniline, with diethylamine, etc., see (7); for reactn. of C̄ with phenol in pres. of K_2CO_3 + acetone see (5).]

Ⓓ *N*-(Penten-1-yl-3)phthalimide [*N*-(α-ethylallyl)phthalimide]: colorless cryst. from alc., m.p. 78–79° (7). [From C̄ on htg. with K phthalimide in a s.t. at 190–200° for 2½ hrs.; yield is only about half that obtd. from 1-chloropentene-3, the corresp. deriv. of which always accompanies that from C̄ (7).]

3:7280 2-CHLOROPENTENE-1

$CH_3.CH_2.CH_2.C(Cl){=}CH_2$ C_5H_9Cl Beil. I-210, I_1—, I_2—

B.P. 95–97° (1)

The structure of this material is inadequately supported; the prod. may very possibly be identical with 2-chloropentene-2 (3:7285) q.v.

[For prepn. of C̄ from 2,2-dichloropentane (3:7755) with alc. KOH see (1).]

C̄ on further treatment with alc. KOH yields (1) pentyne-1 (1:8025), b.p. 39.7°.

3:7280 (1) Bruylants, *Ber.* **8**, 411 (1875).

3:7285 2-CHLOROPENTENE-2

$CH_3.CH_2.CH{=}C(Cl).CH_3$ C_5H_9Cl Beil. I—, I_1—, I_2-(185)

B.P. 95–97° (1)
88–89° at 760 mm. (2)
45° at 130 mm. (2)

D_-^{24} = 0.903 (2) **n_D^{24} = 1.421 (2)**

Two geom. stereoisomers of C̄ are possible but as yet unrecognized.

[For prepn. of C̄ from 2,2-dichloropentane (3:7755) with boilg. 10% alc. KOH see (1); from pentanone-2 (1:5415) with PCl_5 see (2).]

C̄ with conc. H_2SO_4 followed by aq. yields (1) methyl-*n*-propyl ketone (pentanone-2 (1:5415), b p. 102°.

[C̄ with $NaNH_2$ in xylene at 130° followed by ice water gives (3) pentyne-1 (1:8025).]

C̄ on oxidn. with $KMnO_4$ yields (1) propionic acid (1:1025) + AcOH (1:1010).

3:7285 (1) Lemke, Tishchenko, *J. Gen. Chem.* (*U.S.S.R.*) **7**, 1995–1998 (1937); *Cent.* **1939**, I 2398; *C.A.* **32**, 482 (1938). (2) Bourgeul, *Ann. chim.* (10) **3**, 369–370 (1925); *Bull. soc. chim.* (4) **35**, 1633 (1924). (3) Bourgeul, *Ann. chim.* (10) **3**, 220, 370 (1925).

3:7290 3-CHLORO-2-METHYLBUTADIENE-1,3 C_5H_7Cl Beil. S.N. 12

(2-Chloro-3-methylbutadiene-1,3;
"β-Chloroisoprene")

B.P. 93° at 760 mm. (1) $D_4^{20} = 0.9593$ (1) $n_D^{20} = 1.4689$ (1)
41° at 113 mm. (1) (2)
37° at 105 mm. (1)

[For prepn. of C̄ (40% yield (1)) from 2-methylbutene-1-yne-3 by treatment as specified (1) with HCl + Cu_2Cl_2 + NH_4Cl see (1) (2) (10); for prepn. (60% yield (3) (4)) from 2,3,3-trichloro-2-methylbutane (3:4755) with quinoline (2 moles) at 140–225° see (3) (4).]

C̄ readily polymerizes; for details see (1) (2). [For prepn. of plastic polymers from C̄ see (5).]

C̄ htd. in s.t. 16 hrs. at 160° with SO_2 in ord. (not dry) ether yields (6) (7) (10) by 1,4-addition a compd. designated (6) (7) as 1,1-dioxo-3-chloro-4-methylthiacyclopentene-3, ndls. from aq. (7) or alc. (6), m.p. 120.0–120.5° (6) (7). [For extensive study of this prod. see (7).] [The corresponding selenium analog, in very poor (2%) yield from C̄ + SeO_2 in $CHCl_3$ (8), has m.p. 110° dec. (8).]

C̄ (1 g.) with 1,4-naphthoquinone (1:9040) htd. at 100° for ½ hr. gives (1) on cooling 2-chloro-3-methyltetrahydroanthraquinone, white ndls. from acetone, m.p. 165–166° u.c. (1); this prod. on suspension in dil. alc. NaOH and oxidn. of the blue soln. with air until yel., followed by dilution with aq., gives (1) 2-chloro-3-methylanthraquinone, cryst. from AcOH, m.p. 214–215° u.c. (1), 215° u.c. (9).
